About using Hue

Hue provides a one-stop querying experience in Cloudera Data Platform (CDP) that leverages Hive, Impala, and Unified Analytics SQL engines.

Accessing and using Hue in Cloudera Data Warehouse

Get started using Hue by analyzing and visualizing your data with Impala and Hive SQL query engines.

About this task

To try Hue without having an account, try running sample queries on http://demo.gethue.com/.

Before you begin

Hue uses your LDAP credentials that you have configured for the CDP cluster.

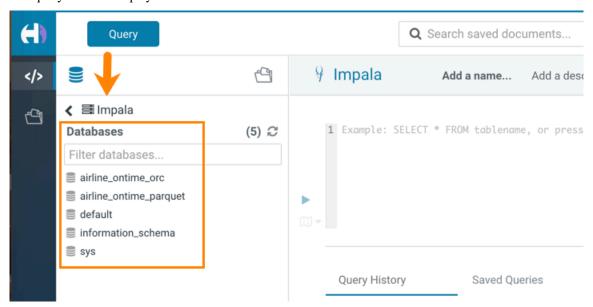

Procedure

- 1. Log into the CDP web interface and navigate to the Data Warehouse service.
- 2. In the Data Warehouse service, navigate to the **Overview** page.

Note: You can also launch Hue from the Virtual Warehouse page using the same steps.

- 3. To run Impala queries:
 - a) On the **Overview** page under Virtual Warehouses, click on the Hue button. The query editor is displayed:

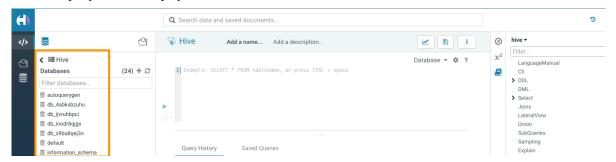

- b) Click a database to view the tables it contains.When you click a database, it sets it as the target of your query in the main query editor panel.
- c) Type a query in the editor panel and click the run icon to run the query.

Note: Use the Impala language reference to get information about syntax in addition to the SQL autocomplete feature that is built in. To view the language reference, click the book icon to the right of the query editor panel.

- **4.** To run Hive queries:
 - a) On the **Overview** page under Virtual Warehouses, click on the Hue button. The Hive query editor is displayed:

- b) Click a database to view the tables it contains.When you click a database, it sets it as the target of your query in the main query editor panel.
- c) Type a query in the editor panel and click the run icon to run the query.

Note: Use the Hive language reference to get information about syntax in addition to the SQL autocomplete feature that is built in. To view the language reference, click the book icon to the right of the query editor panel.

Viewing Hive query details

You can search Hive query history, compare two queries, download debug bundles for troubleshooting, and view query details, a graphical representation of the query execution plan, and DAG information on the Job Browser page in Hue.

Viewing Hive query history

The Queries tab on the Job Browser page in Hue displays all the queries that were run on all Hive Virtual Warehouses within a Database Catalog from various query interfaces, such as Beeline, Hive Warehouse Connector (HWC), Tableau, Hue, and other JDBC BI clients and tools.

About this task

Only Query Processor Administrators can view historical queries of all users to monitor resource utilization and control costs from the Hue Job Browser. Non-admin users can view only their queries.

Queries are retained in the backend database for 30 days by default, after which they are cleaned up. You can change the clean-up interval from the Database Catalog configurations.

Procedure

- 1. Go to the Cloudera Data Warehouse (CDW) web interface and open Hue from your Virtual Warehouse.
- 2. Click Jobs from the left assist panel.
 - The **Job Browser** page is displayed.
- 3. Click Queries.

The Hive queries that were run for the past seven days are displayed. You can select the time period for which you want to view the historical data.

You can also filter queries by their status.

Viewing Hive query information

The Query Info tab provides information such as, the Hive query ID, the user who executed the query, the start time, the end time, the total time taken to execute the query, the tables that were read and written, application ID, Directed Acyclic Graph (DAG) IDs, session ID, LLAP app ID, thread ID, and the queue against which the query was run.

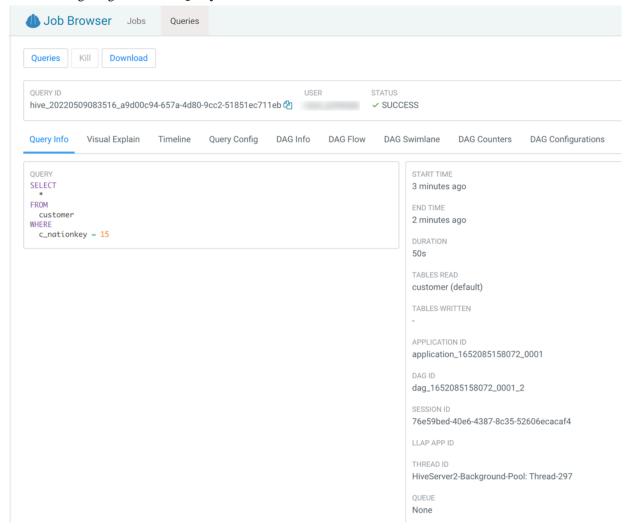

Procedure

- 1. Go to the Cloudera Data Warehouse (CDW) web interface and open Hue from your Virtual Warehouse.
- 2. Click Jobs from the left assist panel.

The **Job Browser** page is displayed.

3. Go to the Queries tab and click on the query for which you want to view the query details.

The following image shows the **Query Info** tab on the Hue web interface:

Viewing explain plan for a Hive query

The Visual Explain feature provides a graphical representation of the query execution plan. The Explain plan is read from right to left. It provides details about every stage of query execution.

Procedure

- 1. Go to the Cloudera Data Warehouse (CDW) web interface and open Hue from your Virtual Warehouse.
- Click Jobs from the left assist panel.The Job Browser page is displayed.
- 3. Go to the Queries tab and click on the query for which you want to view the query details.

4. Click on Visual Explain.

The following image shows the Visual Explain tab on the Hue web interface:

5. (Optional) Click \perp to download the query explain plan in JSON format.

Viewing Hive query timeline

The Timeline tab provides a visual representation of Hive performance logs and shows the time taken by each stage of the query execution.

About this task

Following are the stages in which a query is executed:

- Pre-execution and DAG construction: It is the first phase of query execution and is executed on the Hive engine. It
 constitutes the time taken to compile, parse, and build the Directed Acyclic Graph (DAG) for the next phase of the
 query execution.
- DAG submission: It is the second phase in which the DAG that was generated in Hive is submitted to the Tez engine for execution.
- DAG runtime: It shows the time taken by the Tez engine to execute the DAG.
- Post-execution: It is the last phase of query execution in which the files in S3/ABFS are moved or renamed.

Duration data about each phase are distilled into more granular metrics based on query execution logs.

Procedure

- 1. Go to the Cloudera Data Warehouse (CDW) web interface and open Hue from your Virtual Warehouse.
- 2. Click Jobs from the left assist panel.

The **Job Browser** page is displayed.

- 3. Go to the Queries tab and click on the query for which you want to view the query details.
- 4. Click on Timeline.

The following image shows the **Timeline** tab on the Hue web interface:

Viewing configurations for a Hive query

The Query Config tab provides the configuration properties and settings that are used in a Hive query. You can use this tab to verify that configuration property values align with your expectations.

Procedure

1. Go to the Cloudera Data Warehouse (CDW) web interface and open Hue from your Virtual Warehouse.

- 2. Click Jobs from the left assist panel.
 - The **Job Browser** page is displayed.
- 3. Go to the Queries tab and click on the query for which you want to view the query details.
- 4. Click on Query Config.

The following image shows the **Query Config** tab on the Hue web interface:

Query Info	Visual Explain	Timeline	Query Config	DAG Info	DAG Flow	DAG Swimlane
Config Name			Config Va	lue		
hadoop.secu	urity.group.mapping	g.ldap.posix.at	ttr uidNumb	er

yarn.nodema	anager.process-kill-	wait.ms	5000			
yarn.miniclu	ster.use-rpc		false			
io.map.index	c.interval		128			

Viewing DAG information for a Hive query

Directed Acyclic Graph (DAG) is created by the Hive engine every time you query the Hive Virtual Warehouse. The Hive SQL queries are compiled and converted into a Tez execution graph also known as a DAG. DAG is a collection of vertices where each vertex executes a fragment of the query or script. Hue provides a web interface to view detailed information about DAGs.

About this task

Directed connections between vertices determine the order in which they are executed. For example, the vertex to read a table must be run before a filter can be applied to the rows of that table. As another example, consider a vertex that reads a user table that is very large and distributed across multiple computers and multiple racks. Reading the table is achieved by running many tasks in parallel.

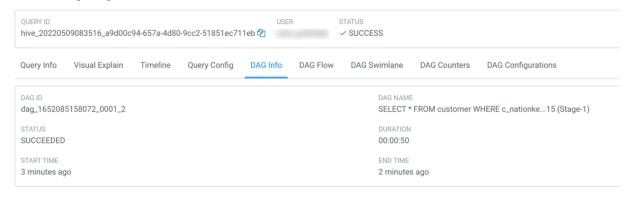

Important: The DAG information tabs (**DAG Info, DAG Flow, DAG Swimlane, DAG Counters, DAG Configurations**) are displayed only if the Tez engine is used for query execution. The Tez engine is typically utilized for complex queries.

Procedure

- 1. Go to the Cloudera Data Warehouse (CDW) web interface and open Hue from your Virtual Warehouse.
- **2.** Click Jobs from the left assist panel.
 - The **Job Browser** page is displayed.
- 3. Go to the Queries tab and click on the query for which you want to view the query details.
- Click DAG Info to see the DAG ID, DAG name, the status of the query, the time taken to execute the DAG, start time, and end time.

The following image shows the **DAG Info** tab on the Hue web interface:

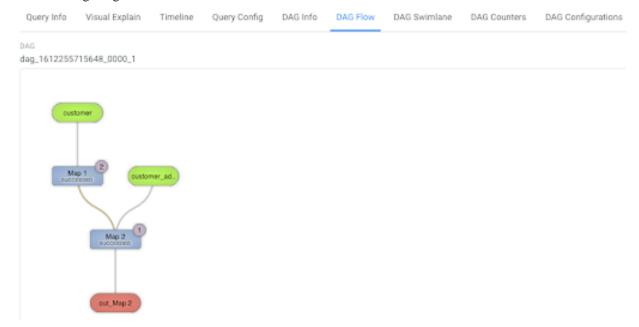

The following table lists and describes the status of the Tez job:

Status	Description
Submitted	The DAG is submitted to Tez but is not running
Running	The DAG is currently running
Succeeded	The DAG was completed successfully
Failed	The DAG failed to complete successfully
Killed	The DAG was stopped manually
Error	An internal error occurred when executing the DAG

5. Click DAG Flow to see the DAG in the form of a flowchart.

You can gain insight into the complexity and the progress of executing jobs, and investigate the vertices that have failures or are taking a long time to complete.

The following image shows the **DAG Flow** tab on the Hue web interface::

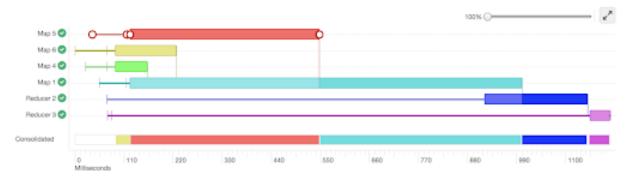

Here, the input to vertices Map 1 and Map 2 are the tables displayed in green boxes. Next, Map 2 depends on the result set generated by Map 1. Map 2 is the last vertex in the DAG flow and after it completes its execution, the query output is written to a file in a filesystem such as S3 or ABFS.

There are a few options to change the layout of the DAG flow. You can hide the input and the output nodes to view only the task vertices by clicking the Toggle source/sink visibility button. You can switch between the horizontal and vertical orientation by clicking the Toggle orientation button.

6. Click DAG Swimlane to see the DAG of the vertices against time.

Each mapping and reducing task is a vertex. Each horizontal bar of the swimlane represents the total time taken by the vertex to complete the execution. The vertical lines indicate the time when the vertex was initialized, the time when the vertex started, the time when the first task started, the time when the last task was completed, and the time when the vertex finished its execution. When you mouse over the vertical line, the bubble displays the stage of the vertex execution and provides a timestamp. The vertical lines connecting two vertices denote the dependency of a vertex on another vertex.

The following image shows the **DAG Swimlane** tab on the Hue web interface:

In this example, Map 1 depends on the results of Map 5. Map 1 will finish its execution only when Map 5 finishes its execution successfully. Similarly, Reducer 2 depends on Map 1 to complete its execution.

The consolidated timeline shows the percentage of time each vertex took to complete executing.

7. Click DAG Counters to see details such as the number of bytes read and written, number of tasks that initiated and ran successfully, amount of CPU and memory consumed, and so on.

The **DAG Counters** tab provides a way to measure the progress or the number of operations that occur within a generated DAG. Counters are used to gather statistics for quality control purposes or problem diagnosis.

The following image shows the **DAG Counters** tab on the Hue web interface:

Query Info	Visual Explain	Timeline	Query Config	DAG Info	DAG Flow	DAG Swimlane	DAG Counters	DAG Configuration
Group Name		Counter Na	Counter Name		DAG: dag_1652085158072_0001_2			
org.apache.t	ez.common.count	ers.DAGCount	er NUM_SUC	CEEDED_TAS	SKS	54

mapreduce.clie	nt.libjars.wildcar	rd	true					
hive.zookeeper	.kerberos.enable	d	false					

Terminating Hive queries

If a query is running for longer than expected, or you have accidentally triggered it, then you can stop the query to free up the resources. Hue also allows you to stop multiple queries at once.

About this task

Note: This feature is available only for Hive queries. Only admin users or Hue superusers can stop running queries.

Procedure

- 1. Go to the Cloudera Data Warehouse (CDW) web interface and open Hue from your Virtual Warehouse.
- 2. Click Jobs from the left assist panel.
 - The Job Browser page is displayed.
- **3.** Go to the **Queries** tab.
 - A list of queries that were run is displayed.
- **4.** Select the queries that you want to stop and click Kill.

Comparing Hive queries in Hue

You can compare two queries to know how each query is performing in terms of speed and cost-effectiveness. Hue compares various aspects of the two queries, based on which you can identify what changed between the executions of those two queries, and you can debug performance-related issues between different runs of the same query.

About this task

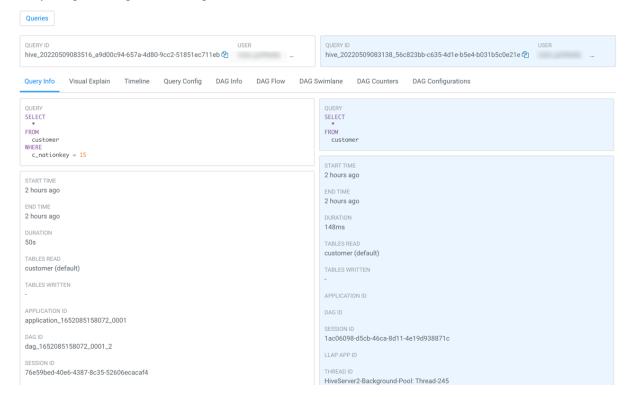

The query comparison report provides you a detailed side-by-side comparison of your queries.

For Hive queries, it includes recommendations for optimizing each query, metadata about the queries, visual explain for each query, query timeline, query configuration, Directed Acyclic Graph (DAG) information, DAG flows, DAG swimlanes, DAG counters, and DAG configurations.

Procedure

- 1. Go to the Cloudera Data Warehouse (CDW) web interface and open Hue from your Virtual Warehouse.
- **2.** Click Jobs from the left assist panel.
 - The **Job Browser** page is displayed.
- 3. Go to the Queries tab.
 - A list of queries that were run is displayed.
- **4.** Select the two queries you want to compare and click Compare.

Query comparison report for Hive queries:

How to run a stored procedure from Hue in Cloudera Data Warehouse

HPL/SQL allows you to implement business logic using variables, expressions, flow-of-control statements, and iterations. HPL/SQL makes SQL-on-Hadoop more dynamic. You can leverage your existing procedural SQL skills, and use functions and statements to make your typical ETL development more productive. In Cloudera Data Warehouse, Hue provides a smart interface to run stored procedures.

Note: This feature is available only for Hive queries.

To run stored procedures from Hue, create a Hive Virtual Warehouse in CDW and enable the hplsql option in the hue-safety-valve field.

The following example creates a procedure and returns records by passing a cursor:

```
print 'Hello world';/
CREATE PROCEDURE greet(name STRING)
```

```
BEGIN
 PRINT 'Hello ' | name;
END;/
CREATE PROCEDURE even(cur OUT SYS_REFCURSOR)
BEGIN
  OPEN cur FOR
SELECT n FROM NUMBERS
WHERE MOD(n, 2) == 0;
END; /
CREATE PROCEDURE set_message(IN name STRING, OUT result STRING)
BEGIN
 SET result = 'Hello, ' | name | '!';
END;
-- Call the procedure and print the results
DECLARE str STRING;
CALL set_message('world', str);
PRINT str;
```

Attention: In the hplsql mode, you must terminate the commands using the forward slash (/). The semicolon (;) is used throughout procedure declarations and can no longer be relied upon to terminate a query in the editor.

Note: HPL/SQL does not support all types of Hive statements, such as JOIN or EXPLAIN. Refer to the HPL/SQL Reference for more information.

Enabling stored procedures for Hive in Cloudera Data Warehouse

To create, edit, and drop procedures and functions that are written in Hive Hybrid Procedural SQL (HPL/SQL) using the Hue query editor in CDW, you must enable the hplsql option in the hue-safety-valve field.

About this task

Important: Hue enables you to switch between Hive and HPL/SQL interpreters. By default, the regular Hive interpreter is enabled when you create a Hive Virtual Warehouse. To enable the HPL/SQL interpreter, you must update the configuration in the hue-safety-valve field in your Hive Virtual Warehouse. However, updating the hue-safety-valve overrides the default configuration. Therefore, to use both Hive and HPL/SQL interpreters, you must enable both by updating the configuration in the hue-safety-valve field.

Procedure

- 1. Log in to the Data Warehouse service as an administrator.
- **2.** Go to Virtual Warehouse Edit CONFIGURATIONS Hue and select hue-safety-valve from the Configuration files drop-down list.
- **3.** Add the following lines in the hue-safety-valve:

```
[notebook]
  [[interpreters]]
   [[[hive]]]
   name=Hive
   interface=hiveserver2
  [[[hplsql]]]
   name=Hplsql
   interface=hiveserver2
```

- 4. Click APPLY.
- 5. Restart the Virtual Warehouse.

Enabling the SQL editor autocompleter

Autocompleter provides finely tuned SQL suggestions for Hive and Impala dialects while you enter queries into the editor window. See Brand new Autocompleter for Hive and Impala in the Hue blog.

About this task

Autocompleter is enabled by default. To manually enable or disable it, open the editor configuration panel and edit settings as follows:

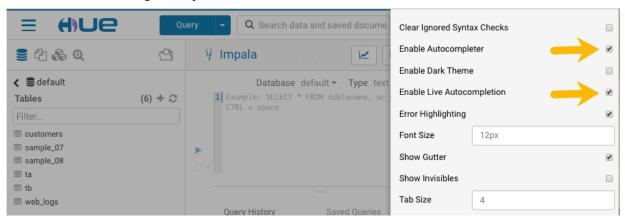

Procedure

- 1. Log in to Hue and go to either the Hive or Impala editor.
- 2. Place your cursor in the editor window and then use one of the following keyboard shortcuts to open the editor configuration panel:
 - On a Mac system, use the Command key followed by a hyphen and then a comma:
 Command-.
 - On a Windows system, use the Ctrl key followed by a hyphen and then a comma:
 Ctrl-.

Tip: Type a question mark (?) anywhere but in the active editor window to open a menu of editor keyboard shortcuts.

3. To enable autocompletion, check the box adjacent to Enable Autocompleter. When you check Enable Autocompleter, Enable Live Autocompletion is automatically enabled as well. Place your cursor in the editor window to close the configuration panel.

- **4.** To disable autocompletion:
 - Uncheck Enable Live Autocompletion but leave Enable Autocompleter checked, and then place your cursor in
 the editor window to close the configuration panel. This disables live autocompletion, but if you want to use
 autocompletion while building your queries in the editor, enter the following key stroke sequence to activate
 autocompletion: Ctrl + Space Key
 - Uncheck both Enable Autocompleter and Enable Live Autocompletion, and then click in the editor to close the configuration panel. This disables all autocompletion functionality.

Using governance-based data discovery

Hue can use the metadata tagging, indexing, and search features available in Apache Atlas data management. After integrating Hue with Atlas, classifications and indexed entities can be accessed and viewed in Hue. This topic shows you how to use metadata classifications in Hue.

Integration between Hue and Atlas is enabled by default, but if your administrator has disabled it, it must be reenabled before you can use governance-based data discovery.

In Cloudera Data Warehouse, you can only view tags that are created in Atlas in Hue. You must create tags in Atlas.

Searching metadata tags

The SQL Editor in Hue provides a search text box where you can search on the metadata tags or classifications that are associated with your databases, tables, and columns.

About this task

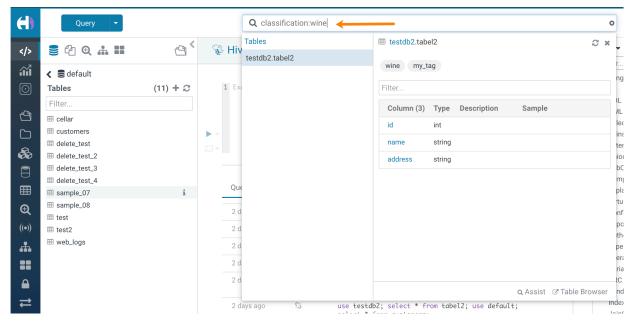

You can search for tags or classifications in either the Hive or the Impala editors.

Note: On clusters that use Apache Ranger for role-based access control, the Search mechanism does not display counts of popular values. Ranger ensures that Hue users can view only entities to which their user role (as configured and managed by Ranger) has been granted specific permissions.

Procedure

- 1. Go to Query Editor Impala or Hive.
- **2.** To locate the tags or classifications in Apache Atlas, in the metadata search box located just to the right of the Query drop-down menu, type a tag: or classification: facet followed by its name. For example, type classification: wine as shown in the following image:

After you type the search facet and the tag or classification name in the search box, the *<DATABASE>*.*<TABLE>* where the tag or classification is found is returned. Click the *<DATABASE>*.*<TABLE>* to view the tags and classifications that have been defined for it.

Using Amazon S3 with Hue

Hue can read to and write to an Amazon S3 bucket.

Note:

Using Azure Data Lake Storage Gen2 with Hue

Hue can read to and write to an Azure Data Lake Storage (ADLS) Gen2.

Note:

Only Hue superusers can view and access the ABFS file browser.

Granting permission to access S3 and ABFS File Browser in Hue

Only admin users can view and access S3 or ABFS File Browser in Hue after enabling it. You must manually grant application permissions to non-admin users and groups for them to be able to view and access S3 and ABFS File Browsers in Hue.

About this task

The following table lists the application permissions for each cloud storage type:

Cloud storage	Hue application permission
S3	filebrowser.s3_access:Access to S3 from filebrowser and filepick er.
ABFS (ADLS Gen2)	filebrowser.abfs_access:Access to ABFS from filebrowser and filepicker.
ADLS (Gen1)	filebrowser.adls_access:Access to ADLS from filebrowser and filepicker.
GS	Access to GS from filebrowser and filepicker.

Before you begin

You can only assign Hue application permissions to groups or users within a group. Add the users to a group to whom you want to grant access to the S3 or ABFS File Browsers.

Important: The "default" group in Hue does not have the permissions required to view S3 or ABFS File Browsers, by default. If your users belong to the default group, then you must manually grant the required permissions.

Procedure

- 1. Open Hue from Cloudera Data Warehouse Virtual Warehouse as an EnvironmentAdmin.
- 2. Go to admin Manage Users Groups.
- 3. Click on the group to whom you want to grant the filebrowser application permissions.
- **4.** On the **Edit** [*****GROUP-NAME*****] page, select the required permission under the permission section and click Update group.

Supported non-ASCII and special characters in Hue

Auto-generated files may often introduce non-alphanumeric characters in the file and directory names that Hue does not support. This might cause the files or directories to not appear on the Hue File Browser. Review the list of non-alphanumeric, non-ASCII, diacritics (accents) characters supported in Hue for the following operations: upload, create, list in folder, view, and rename.

Table 1: Supported characters on HDFS

Special character symbol	Description	Filename support	Folder name support
~	Tilde	Fully supported	Fully supported

Special character symbol	Description	Filename support	Folder name support
@	Ampersat	Fully supported	Fully supported
#	Hash	Partially supported. Not supported for rename operations.	Unsupported
\$	Dollar sign	Fully supported	Fully supported
&	Ampersand	Fully supported	Fully supported
(Left paranthesis	Fully supported	Fully supported
)	Right paranthesis	Fully supported	Fully supported
*	Asterisk	Fully supported	Fully supported
!	Exclamation mark	Fully supported	Fully supported
+	Plus	Fully supported	Fully supported
=	Equal	Fully supported	Fully supported
