Support Matrix

Before installing Cloudera Streaming Analytics, review the supported components, databases, connectors and the default ports in use for Flink and SQL Stream Builder (SSB).

System Requirements

Before installing Cloudera Streaming Analytics, you should verify that you meet the system requirements. Other than CDP Private Cloud Base, you should also check the latest supported version of the needed components.

For detailed information about the supported versions of CDP Private Cloud Base, operating systems and databases, see the Cloudera Support Matrix.

Apache Flink support	1.14	
Cloudera Runtime component support		
CDP Private Cloud Base	7.1.7, 7.1.7 SP1, 7.1.7 SP2, 7.1.7 SP3	7.1.8
Kafka[1]	2.5.0	3.1.1
Schema Registry	0.10.0	0.10.0
Streams Messaging Manager	2.1.0	2.3.0
HBase	2.2.3	2.4.6
HDFS	3.1.1	3.1.1
Atlas	2.1.0	2.2.0
Kudu	1.15.0	1.15.0
Hive	3.1.3	3.1.3

Connector support	
JDBC PostgreSQL	9.6-12
JDBC MySQL	5.7, 8
JDBC Hive	3.1.3
CDC PostgreSQL	9.6-12
CDC MySQL	5.7, 8
CDC Oracle	19.0.0
CDC Db2	11.5
CDC SQL Server	2007-2022

Related Information

Cloudera Runtime component versions

Flink API Support

Cloudera Streaming Analytics (CSA) offers support for three fundamental layers of the Apache Flink API. You can use DataStream API, the ProcessFunction API and a selected subset of the SQL API to develop your Flink streaming applications.

---

[1] Connecting to Kafka that is running on remote CDH6 or HDP3 is also supported.

From the DataStream and ProcessFunction APIs, the following are supported based on the support annotations provided by the Apache Flink community.

Stable (@Public)	Evolving (@PublicEvolving)
• DataStream API	• ProcessFunction • Stream Join • Interval Join • Stateful operators • FsStatebackend with HDFS • RocksDBStateBackend with HDFS

Note: CSA does not support batch processing (DataSet API).

Default ports for Flink and SSB

You need to use the default ports of Flink and SSB when you need to reach or connect to their services. The default port are set in Cloudera Manager, but can be changed if required.

The following table lists the default ports and the corresponding property file names for Flink and SQL Stream Builder (SSB). The ports are set by default in Cloudera Manager. You can change the ports as required using the configuration properties.

Component	Service	Port	Configuration property
Flink	Flink Dashboard	18211	historyserver.web.port
SQL Stream Builder	Streaming SQL Engine	18121	server.port
	Materialized View Engine	18131	server.port
SQL Stream Builder with Load Balancer	Streaming SQL Engine	8080	ssb.sse.loadbalancer.server.port
	Secured Streaming SQL Engine	8445	ssb.sse.loadbalancer.server.secure.port
	Materialized View Engine	8081	ssb.mve.loadbalancer.server.port
	Secured Materialized View Engine	8444	ssb.mve.loadbalancer.server.secure.port

For the default port list of the Cloudera Runtime components, see the *Ports Used by Cloudera Runtime Components* document.

Related Information

Ports Used by Cloudera Runtime Components

Installation

You can review the different deployment scenarios for Cloudera Streaming Analytics. After you have decided by one of the deployment scenarios, you can start the installation process by adding the CSD and Parcel in Cloudera Manager, then adding and configuring Flink and SQL Stream Builder (SSB) services.

Deployment scenarios

The application you want to build determines the Streaming Anaytics deployment process on CDP Private Cloud Base. You can choose between building either a DataStream application or a SQL streaming application.

You can deploy Streaming Analytics on Private Cloud Base depending on the application you want to build.

- DataStream application using only Flink. In this case, you need to create a Flink application cluster.
- SQL Streaming application using Flink with SQL Stream Builder. In this case, you need to create a Streaming SQL cluster.

You can use the following workflow to have an understanding of the deployment process:
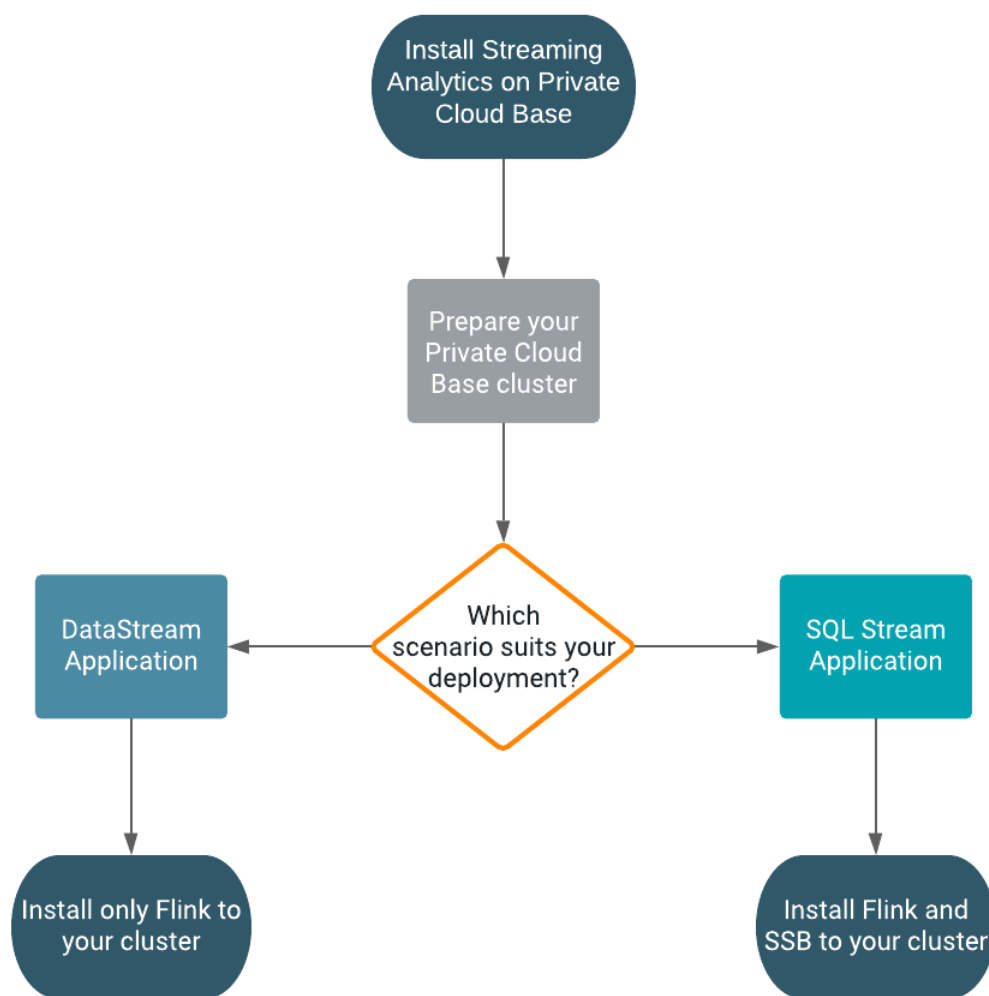

Cluster service layout with Flink

In Cloudera Streaming Analytics (CSA), Flink has mandatory dependencies with HDFS, YARN, and Zookeeper. You need to assign the Flink Gateway and HistoryServer roles to the host, based on the mandatory dependencies.

Flink jobs are executed as YARN applications. HDFS is used to store recovery and log data, while ZooKeeper is used for high availability coordination for jobs. In a standard layout, an Apache Kafka cluster is often located close to the YARN cluster executing the Flink cluster.

The Flink Gateway is collocated with YARN and HDFS Gateways. The Flink HistoryServer is collocated with an HDFS role, which can be either an active role or a Gateway. Use the following general service layout when collocating Flink roles and dependencies.

Cluster service layout with SSB

In Cloudera Streaming Analytics (CSA), SQL Stream Builder (SSB) has mandatory dependencies with Flink and Kafka. But due to its dependency with Flink, you also need to add YARN, HDFS and Zookeeper as a mandatory service on your cluster. You need to assign the SSB roles in the same way as you assign the Flink roles.
Installing CSD and Parcel

For installing Cloudera Streaming Analytics (CSA), you need to upload the downloaded Flink and SQL Stream Builder (SSB) Custom Service Descriptor (CSD) files to the default CSD directory, and add the CSA parcel to your cluster using Cloudera Manager.

Before you begin

- Download the Flink and SSB CSD and parcel files.

  For more information about download Flink and SSB artifacts, see the Download location section.
- Install CDP Private Cloud Base.

  For more information about installing CDP Private Cloud Base and Cloudera Manager, see the CDP Private Cloud Base documentation.

Procedure

1. Place the CSD files in the /opt/cloudera/csd/ folder (default CSD directory).

   ```
   wget -P /opt/cloudera/csd/ https://USER:PASSWORD@archive.cloudera.com/p/
   csa/1.7.0.0/csd/FLINK-1.14.0-csa1.7.0.0-cdh7.1.7.0-551-26280481.jar
   ```

   ```
   wget -P /opt/cloudera/csd/ https://USER:PASSWORD@archive.clouder
   a.com/p/csa/1.7.0.0/csd/SQL_STREAM_BUILDER-1.14.0-csa1.7.0.0-
   cdh7.1.7.0-551-26280481.jar
   ```

   Cloudera Manager automatically detects the CSD files.
2. Change the ownership of the CSD files.

   ```
   chown cloudera-scm:cloudera-scm /opt/cloudera/csd/FLINK-1.14.0-csa1.7.0.0-
   cdh7.1.7.0-551-26280481.jar
   ```

   ```
   chown cloudera-scm:cloudera-scm /opt/cloudera/cs
   d/SQL_STREAM_BUILDER-1.14.0-csa1.7.0.0-cdh7.1.7.0-551-26280481.jar
   ```

3. Restart Cloudera Manager and CMS services for the changes to take effect.

   ```
   systemctl restart cloudera-scm-server
   ```

4. Log into Cloudera Manager.
5. Select Parcels on the Home > Hosts tab in the main navigation bar.
6. Click on Parcel Repositories & Network Settings tab.
7. Add the new Remote Parcel Repository URL for CSA.

   ```
   https://USER:PASSWORD@archive.cloudera.com/p/csa/1.7.0.0/parcels/
   ```

   Note: Make sure that the Remote Parcel Repository URL uses HTTPS link. To install a different version of the parcel, you can change the URL as needed.

8. Enter your download credentials to HTTP authentication username override for Cloudera Repositories and HTTP authentication password override for Cloudera Repositories.
9. Click Save & Verify Configuration to commit the change.
10. Click Close.
    You are redirected to the Parcels page.
11. Search for Flink, and click Download to download the parcel to the local repository.
12. After the download is completed, click Distribute to distribute the parcel to all clusters.
13. After the parcel is distributed, click Activate to activate the parcel.
14. Click OK when confirmation is required.

    For more details, follow the standard procedure from the GUI or the API.

Results

You have added the Flink and SSB CSD files, and the parcel to your cluster.

What to do next

Add Flink as a service in Cloudera Manager. After adding Flink as a service, you are able to add SSB service to your cluster.

Related Information

Installing CDP Private Cloud Base

Add Flink as a Service

Adding Flink as a Service

You need to use the Add Service wizard in Cloudera Manager to include the Flink service on your cluster. When assigning roles, you must install Flink, HDFS, and YARN roles on the same node from where the Flink jobs are submitted.

Before you begin

- Make sure that the Flink CSD file is in the /opt/cloudera/csd folder.
- Make sure that the CSA parcel is added to Cloudera Manager.
- Check that the following components are installed on your cluster:

Mandatory components	Optional components
YARN	Kafka
HDFS	HBase
Zookeeper	Schema Registry
	Streams Messaging Manager
	Kudu
	Hive
	Atlas

Procedure

1. Open Cloudera Manager.
2. On the Home screen, select the drop-down menu to the right of your cluster.
3. Select Add Service.
4. From the list, select Flink as the type of service, then click Continue.
   The Add Service wizard is displayed.
5. Choose HBase and Hive as Optional dependency if needed for the source and sink solution, then click Continue.
6. Assign the Flink Dashboard role to one of the hosts, and the Flink Gateway role to every host.

   > **Note:**
   >
   > Make sure that you installed Flink, HDFS, and YARN Gateway roles on the same machine that will be used to submit Flink jobs. The Flink Dashboard role also depends on having HDFS client configurations on the same machine. The HDFS client configurations can either be provided by an HDFS daemon role implicitly or can be deployed by an HDFS Gateway role explicitly. Furthermore, the YARN Gateway role must be added to the same host as the Flink Dashboard role to resolve the YARN Resource Manager URL.

7. Click Continue.

8. Review the changes needed for your service.

   You can leave this page blank as the settings can be configured after the Flink service is added. You can configure the security settings at Flink > Configuration > Security .

9. Click Continue and wait until the first run of the Flink service is completed.

10. Click Continue and then Finish.
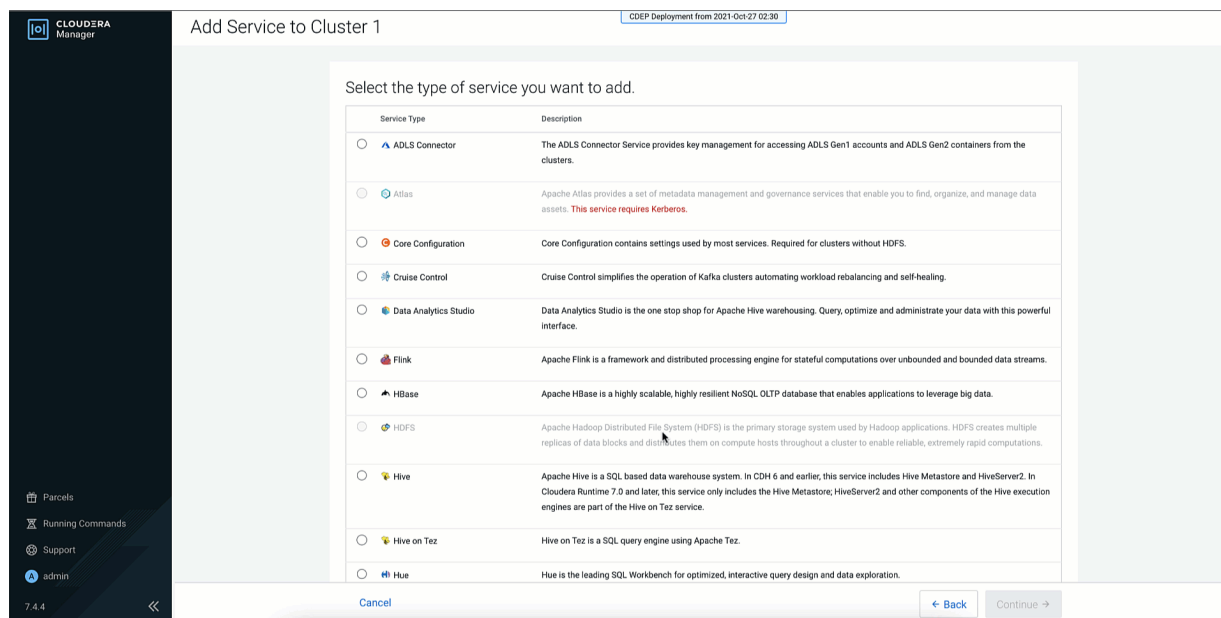

Results

You have added Flink as a service in Cloudera Manager.

Installing CSD and parcel

Add SSB as a Service

Setting up your HDFS Home directory

You need an HDFS Home directory to store temporary logs and data of your application to run a Flink job. You must set up the HDFS Home directory for your user to avoid error when using Flink.

About this task

To run a Flink job, your HDFS Home directory has to exist. If it does not exist, you receive an error message similar to the following:

```
Permission denied: user=$USER_NAME, access=WRITE, inode="/user".
```

Procedure

Create HDFS Home directory. Ask your HDFS administrator to perform the following (or obtain HDFS administrator role).

Options	Command
Kerberos enabled	```kinit hdfs```
	```hdfs dfs -mkdir /user/$USER_NAME```
	```hdfs dfs -ch own $USER_NAME:$USER_NAME /us er/$USER_NAME```
Kerberos disabled	```HADOOP_USER_NAME=hdfs hdfs dfs -mkdi r /user/$USER_NAME```
	```HADOOP_USER_NAME=hdfs hdfs dfs - chown $USER_NAME:$USER_NAME /us er/$USER_NAME```

In case of an enterprise environment, you can use Hue to set up the Home directory by enabling automatic synchronization for users. For more information, see the Cloudera Runtime documentation.

Setting the Java executable for the Flink client

To avoid error when using Flink, you must set the Java_home environment manually through the command line for the Flink clients. The configuration in Cloudera Manager only applies to services, and not to clients.

About this task

Cloudera Manager offers a configuration for the JAVA_HOME environment variable under Hosts > All Hosts > Configuration . However, this only applies to services (for example YARN NodeManager or Flink HistoryServer) and does not propagate to clients such as the JVM created locally by the Flink executable. JVM uses the Bigtop utility under /usr/bin/bigtop-detect-javahome to automatically detect the JAVA_HOME.

Procedure

Set a fixed value for JAVA_HOME:

```
> cat /etc/default/bigtop-utils
export JAVA_HOME=/usr/java/default
```

Note:

Cloudera recommends providing the same value set in Cloudera Manager. It is also recommended to set it uniformly on all the nodes to avoid confusion. This is a known issue in the Cloudera Community.

Configuring Databases for SSB

Before adding SQL Stream Builder (SSB) as a service to your cluster, you need to manually configure the databases to use SSB. The databases are used to store the metadata information of the Streaming SQL Engine and the Materialized Views.

SSB supports the following databases:

Database	Streaming SQL Engine	Materialized View Engine
MySQL/MariaDB	Supported	Not supported
PostgreSQL	Supported	Supported
Oracle DB	Supported	Not supported

For more information about the supported versions of the databases, see the CSA-specific System Requirements.

Setting up MySQL/MariaDB database for SSB

After installing MySQL/MariaDB server, you must rename the JDBC connector, and create a database with credentials for SQL Stream Builder (SSB) to be able to install the service on your cluster. You also must install the MySQL Python connector to integrate with the Streaming SQL Engine.

Before you begin

You need to install and configure MySQL or MariaDB based on which one you plan to use, before setting up the databases for SSB. To install and configure MySQL or MariaDB, you must complete the basic steps mentioned in the Private Cloud Base documentation.

- Install and configure MySQL for Cloudera Software
- Install and configure MariaDB for Cloudera Software

Installing the MySQL JDBC connector

1. Download the MySQL JDBC Driver from the MySQL website.
2. Extract the JDBC driver JAR file from the downloaded file with the following command:

```
tar zxvf mysql-connector-java-8.0.27.tar.gz
```

3. Rename the JDBC jar file to mysql-connector-java.jar.

```
mv mysql-connector-java-8.0.27-bin.jar mysql-connector-java.jar
```

4. Copy the MySQL JDBC jar file to your host.

   This host must be the same host where you plan to assign the Streaming SQL Engine service role. The service roles are assigned as a next step when installing SQL Stream Builder as a service in Cloudera Manager.

```
scp <LOCATION>/mysql-connector-java.jar root@<YOUR_HOSTNAME>:
```

   You will be prompted to provide your password.
5. Access the host on your cluster.

   This host must be the same host where you have added the JDBC jar file.

```
ssh root@<your_hostname>
```

   You will be prompted to provide your password.
6. Copy the MySQL JDBC jar file to /usr/share/java folder using the following command.

```
sudo mkdir -p /usr/share/java
sudo cp <LOCATION>/mysql-connector-java.jar /usr/share/java
```

7. Check if the MySQL connector is in the folder with ls command.

Creating MySQL/MariaDB database for SSB

1. Access a host on your cluster.

   This host must be the same host where you plan to assign the Streaming SQL Engine service role. The service roles are assigned as a next step when installing SQL Stream Builder as a service in Cloudera Manager.

   ```
   ssh root@<your_hostname>
   ```

   You will be prompted to provide your password.

2. Log in as the root user to MySQL:

   ```
   mysql -u root -p
   Enter password:
   ```

3. Create databases for the Streaming SQL Engine:

   ```
   CREATE DATABASE ssb_admin DEFAULT CHARACTER SET utf8 DEFAULT COLLATE utf
   8_general_ci;
   ```

4. Grant all privileges for the database:

   ```
   GRANT ALL ON ssb_admin.* TO 'ssb_admin'@'%' IDENTIFIED BY '<password>';
   ```

5. Confirm that you have created the Streaming SQL Engine database:

   ```
   SHOW DATABASES;
   ```

Setting up PostgreSQL database for SSB

After installing PostgreSQL server, you must rename the JDBC connector, and create a database with credentials for SQL Stream Builder (SSB) before installing the service on your cluster. You also must install the PostgreSQL Python connector to integrate with the Streaming SQL Engine.

Before you begin

You need to install and configure PostgreSQL, before setting up the databases for SSB. To install and configure PostgreSQL, you must complete the basic steps mentioned in the Private Cloud Base documentation.

- Install and configure PostgreSQL for Cloudera Software

Installing the PostgreSQL JDBC connector

1. Download the PostgreSQL JDBC Driver from the PostgreSQL website.
2. Rename the JDBC jar file to postgresql-connector-java.jar.

   ```
   mv postgresql-jdbc.jar postgresql-connector-java.jar
   ```

3. Copy the PostgreSQL JDBC jar file to your host.

   This host must be the same host where you plan to assign the Streaming SQL Engine service role. The service roles are assigned as a next step when installing SQL Stream Builder as a service in Cloudera Manager.

   ```
   scp <LOCATION>/postgresql-connector-java.jar root@<YOUR_HOSTNAME>:
   ```

   You will be prompted to provide your password.

4. Access the host on your cluster.

   This host must be the same host where you have added the JDBC jar file.

   ```
   ssh root@<your_hostname>
   ```

   You will be prompted to provide your password.

5. Copy the PostgreSQL JDBC jar file to /usr/share/java folder using the following command:

```
sudo mkdir -p /usr/share/java
sudo cp <LOCATION>/postgresql-connector-java.jar /usr/share/java
```

6. Check if the PostgreSQL connector is in the folder with ls command.

Creating PostgreSQL database for SSB

1. Access a host on your cluster.

This host must be the same host where you plan to assign the Materialized Views Engine and Streaming SQL Engine service role. The service roles are assigned as a next step when installing SQL Stream Builder as a service in Cloudera Manager.

```
ssh root@<your_hostname>
```

You will be prompted to provide your password.

2. Connect to PostgreSQL:

```
sudo -u postgres psql
```

3. Create a database for the SQL Stream Builder metadata:

```
CREATE ROLE ssb_admin LOGIN PASSWORD '<password>';
CREATE DATABASE ssb_admin OWNER ssb_admin ENCODING 'UTF8';
```

4. Create a database for the Materialized View Engine:

```
CREATE ROLE ssb_mve LOGIN PASSWORD '<password>';
CREATE DATABASE ssb_mve OWNER ssb_mve ENCODING 'UTF8';
```

5. Confirm that you have created the Streaming SQL Engine and Materialized View Engine database using the \l command.

Setting up Oracle database for SSB

After installing Oracle database server, you must rename the JDBC connector, and create a database with credentials for SQL Stream Builder (SSB) before installing the service on your cluster. You also must install the Oracle Python connector to integrate with the Streaming SQL Engine.

Before you begin

You need to install and configure Oracle database, before setting up the databases for SSB. To install and configure Oracle DB, you must complete the basic steps mentioned in the Private Cloud Base documentation.

• Install and configure Oracle Database for Cloudera Software

Installing the Oracle JDBC connector

1. Download the Oracle JDBC Driver from the Oracle website.
2. Rename the JDBC jar file to oracle-connector-java.jar.

```
mv ojdbc8-19.3.0.0.jar oracle-connector-java.jar
```

3. Copy the Oracle JDBC jar file to your host.

This host must be the same host where you plan to assign the Streaming SQL Engine service role. The service roles are assigned as a next step when installing SQL Stream Builder as a service in Cloudera Manager.

```
scp <LOCATION>/oracle-connector-java.jar root@<YOUR_HOSTNAME>:
```

You will be prompted to provide your password.

4. Access the host on your cluster.

This host must be the same host where you have added the JDBC jar file.

```
ssh root@<your_hostname>
```

You will be prompted to provide your password.

5. Copy the Oracle JDBC jar file to /usr/share/java folder using the following command:

```
sudo mkdir -p /usr/share/java
sudo cp <LOCATION>/oracle-connector-java.jar /usr/share/java
sudo chmod 644 /usr/share/java/oracle-connector-java.jar
```

6. Check if the Oracle connector is in the folder with ls command.

Creating Oracle database for SSB

1. Access a host on your cluster.

This host must be the same host where you plan to assign the Streaming SQL Engine service role. The service roles are assigned as a next step when installing SQL Stream Builder as a service in Cloudera Manager.

```
ssh root@<your_hostname>
```

You will be prompted to provide your password.

2. Log in to the Oracle client:

```
sqlplus system@localhost
Enter password: ******
```

3. Create a user and schema for Streaming SQL Engine:

```
create user ssb_admin identified by <password> default tablespace ssb_ad
min;
grant CREATE SESSION to ssb_admin;
grant CREATE TABLE to ssb_admin;
grant CREATE SEQUENCE to ssb_admin;
grant EXECUTE on sys.dbms_lob to ssb_admin;
```

4. Grant a quota on the ssb_admin tablespace where the tables will be created:

```
ALTER USER ssb_admin quota 100m on ssb_admin;
```

You can also create unlimited space with the following command:

```
ALTER USER ssb_admin quota unlimited on ssb_admin;
```

5. Confirm that you have created the Streaming SQL Engine and Materialized View Engine database using the \l command.

Adding SSB as a Service

You need to use the Add Service wizard in Cloudera Manager to have the SQL Stream Builder (SSB) service on your cluster.

Before you begin

- Make sure that the SSB CSD file is in the /opt/cloudera/csd folder.
- Make sure that the CSA parcel is added to Cloudera Manager.

- Make sure that you have installed and configured the SSB databases correctly, and installed the required Java drivers as well.
- Check that the following components are installed on your cluster:

Mandatory components	Optional components
Flink	Schema Registry
Kafka	Kudu
	Hive

Procedure

1. Open Cloudera Manager.
2. On the Home screen, select the drop-down menu to the right of your cluster.
3. Select Add Service.
4. From the list, select SQL Stream Builder as the type of service, then click Continue.
   The Add Service wizard launches.
5. Assign the SQL Stream Engine and Materialized View Engine service roles to hosts, then click Continue.

   You need to assign the service roles based on where you have created the databases, and where you have assigned the Flink and Kafka roles.

   > **Note:** If you want to enable High Availability for SSB, assign the Load Balancer service role to the same host.

6. Connect the SSB service to a database.

   > **Important:** You must install and configure MySQL/MariaDB, PostgreSQL or Oracle database before adding SSB as a service. In case you did not set up any database for your cluster, see the *Configuring databases for SSB* documentation.

   a) Select MySQL, PostgreSQL or Oracle as the type of database.

   > **Important:** If you plan to use Materialized Views in SSB, you must install PostgreSQL database.

   b) Choose the host on which you want to add the database.

   You must add the databases to the same host where you have assigned the service roles.
   c) Provide a name to the database.
   d) Provide the user and password of the created database.
   e) Click Test connection.

7. Review the changes needed for your service.

In case you are using MySQL or Oracle for the Streaming SQL Engine, and PostgreSQL for Materialized Views, you will be prompted to provide information about the database for Materialized View Engine. Provide the database hostname with the default port, your user and password in the Materialized View Engine fields.

DB Connector Jar Directory	SQL Stream Builder (Service-Wide)	ⓘ
db_connector_jar_dir ⚙ db_connector_jar_dir	/usr/share/java/	
Database URL (JDBC)	Materialized View Engine Default Group ↺ Undo	ⓘ
ssb.mve.datasource.url ⚙ ssb.mve.datasource.url	jdbc:postgresql://docs-test-1.vpc.cloudera.com:5432/ssb_mve	
Database User	Materialized View Engine Default Group ↺ Undo	ⓘ
ssb.mve.datasource.username ⚙ ssb.mve.datasource.username	ssb_mve	
Database Password	Materialized View Engine Default Group ↺ Undo	ⓘ
ssb.mve.datasource.password ⚙ ssb.mve.datasource.password	··········	
Streaming SQL Console External Lib Path	Streaming SQL Console Default Group	ⓘ
console.external.python.lib.path ⚙ console.external.python.lib.path	/usr/share/python3	

> **Note:** You can configure the security properties for SQL Stream Builder in this step, or after adding the service in the Configuration page. For more information about configuring security, see the *Manage security* documentation for SQL Stream Builder.

In case you have enabled High Availability for SSB by adding the Load Balancer role, you need to add the SSB service host url to the following configurations:

Load-Balancer URL	SQL Stream Builder (Service-Wide) ↺ Undo
loadbalancer.url ⚙ loadbalancer.url	docstest-1.docstest.root.hwx.site
Load-Balancer Host	Load Balancer Default Group ↺ Undo
loadbalancer.url ⚙ loadbalancer.url	docstest-1.docstest.root.hwx.site

> ⚠ **Warning:** When using Active Directory (AD) Kerberos authentication you must add the SSB service host to the loadbalancer.url parameter. This also applies when you are not using High Availability for SSB. Without the loadbalancer.url the installation of SSB fails. If the installation fails, you need to provide the SSB service host to the loadbalancer.url configuration, and regenerate the keytab with Administration > Security > Kerberos Credentials > Generate Missing Credentials steps.

8. Click Continue and wait until the first run of the SSB service is completed.

9. Click Continue and then Finish.

Install and configure MariaDB for Cloudera Software

Install and configure PostgreSQL for Cloudera Software

Install and configure Oracle database for Cloudera Software

Configuring MySQL/MariaDB for SSB

Configuring PostgreSQL for SSB

Configuring Oracle database for SSB

Enabling High Availability for SSB

High Availability for SQL Stream Builder (SSB) SSB can be enabled using a Load Balancer. To enable the Load Balancer for SSB after the SSB service is installed, you need to add the Load Balancer instance to the SSB cluster.

Procedure

1. Go to your cluster in Cloudera Manager.

2. Select SQL Stream Builder from the list of services.

3. Click Actions > Add Role Instances .

The Add Role Instances wizard is displayed.

4. On the Assign Roles page, click Select hosts for Load Balancer.

5. Select a host and click OK.

You can add additional SQL Stream Engine and Materialized View Engine servers to boost performance:

a) Select hosts for SQL Stream Engine.

b) Select hosts for Materialized View Engine.

c) Click OK > Continue .

6. Click Continue.

The newly added hosts are displayed on the Instances tab.

7. Select all the newly added hosts.

8. Click Actions for Selected > Start .

9. Update the Load Balancer URL and Host.

    a) Click Configuration.

    b) Search for *LOAD-BALANCER URL.*

    c) Provide the host url where the SSB service is installed.

Load-Balancer URL	SQL Stream Builder (Service-Wide) ↺ Undo
loadbalancer.url ⚙ loadbalancer.url	docstest-1.docstest.root.hwx.site
Load-Balancer Host	Load Balancer Default Group ↺ Undo
loadbalancer.url ⚙ loadbalancer.url	docstest-1.docstest.root.hwx.site

10. Restart Cloudera Manager.

```
sudo service cloudera-scm-server restart
```

11. Access the Streaming SQL Console with Load Balancer.

    a) Go to your cluster in Cloudera Manager.

    b) Select SQL Stream Builder from the list of services.

    c) Click Web UI > SQLStreamBuilder Load Balanced (recommended) .

Results

You have a load balanced instance of SSB. You can reach the load balanced instance of Streaming SQL Console from the SSB service page in Cloudera Manager.

Upgrade

You can upgrade Flink a SQL Stream Builder (SSB) from an older version to the latest by chaning the CSD and Parcel in Cloudera Manager, and restarting the services. After the upgrade is completed, you can migrate your Flink and SQL jobs to the new services.

Upgrading Flink service

To upgrade the Flink service to the latest version in Cloudera Streaming Analytics, you need to create new application versions, stop your Flink applications with savepoint, upgrade the CSA artifacts and resume your Flink applications from savepoint.

Creating new Flink application versions

You need to build new versions of your existing Flink applications by updating the Cloudera Streaming Analytics (CSA) dependencies to the latest version.

You need to verify that your new application versions are compatible with the planned CSA release. For example, if you build your project with Maven, you need to increment your version number in the pom.xml.

Old version: <flink.version>x.x.x-csax.x.x.x</flink.version>

New version: <flink.version>y.y.y-csay.y.y.y</flink.version>

Stopping Flink applications

You must stop your Flink applications before updating the artifacts. You can use the stop command to create a savepoint of your application. You can also use the cancel command to stop your Flink application without creating a savepoint.

About this task

You can use savepoints to resume the application state after the upgrade.

Procedure

1. Determine the related Flink job IDs.

```
flink list
```

2. Stop your Flink applications.

You have two choices:

- Stop your applications with a savepoint to store the application state.

```
flink stop <Flink job ID>
```

The command returns an HDFS path, which is the automatically created savepoint that stores the application state.

- Cancel your applications without creating a savepoint.

```
flink cancel <Flink job ID>
```

Use this method if you do not need to restore the application state after the upgrade.

Upgrading CSA artifacts for Flink service

You need to upgrade the Cloudera Streaming Analytics (CSA) artifacts to the newer version by manually deleting the old CSD file from the repository, and adding the latest CSD file to the same location.

Procedure

1. Download the new CSD files from the Download location.

In case you are upgrading to the latest CSA version that includes SQL Stream Builder (SSB), you also must download the SSB CSD, and add it to the /opt/cloudera/csd folder with the new Flink CSD. For more information, see the Installing parcel and CSD documentation.

2. Delete the old CSD version from /opt/cloudera/csd.

3. Copy the new artifacts to the /opt/cloudera/csd folder.

> ⚠️ **Warning:** The upgrade process fails if you only add the new parcel file in Cloudera Manager. You must add the Flink and SSB CSD to the /opt/cloudera/csd folder as well.

4. Ensure that you maintain the appropriate file ownership and access the attributes if needed.

5. Restart the Cloudera Manager Server with the following command:

- RHEL 7 Compatible, SLES 12, Ubuntu: systemctl restart   cloudera-scm-server
- RHEL 6 Compatible: service cloudera-scm-server   restart

6. Restart the Cloudera Management Services.

7. Install and activate the new CSA parcel from Cloudera Manager.

8. Restart the Flink service when prompted in the wizard.

For more information about the general process of Service Management, see the Cloudera Manager documentation.

Resuming Flink applications

After updating the Cloudera Streaming Analytics artifacts, you can resume your application by the Flink run command. In case you have stopped your application by creating a savepoint, you must add the savepoint location to the command.

If you had stopped your Flink applications with a savepoint, you must define the path to the savepoint with an additional -s <savepointPath> parameter to the original run command.

```
flink run -d -ynm YarnApplicationName -s <savepointPath> application.jar
```

To start your stateless applications or stateful applications with an empty application state, use the original Flink run command.

⚠️ **Important:**

Additional TLS related properties were added to the Gateway role. If you previously enabled TLS on your cluster, you can define Gateway TLS/SSL Client Trust Store File and Gateway TLS/SSL Client Trust Store Password configurations. You can set {{CM_AUTO_TLS}} as the property values when using Auto TLS in Cloudera Manager.

Gateway TLS/SSL Client Trust Store File	Gateway Default Group ↩	?
security.ssl.rest.truststore	{{CM_AUTO_TLS}}	
Gateway TLS/SSL Client Trust Store Password	Gateway Default Group ↩	?
security.ssl.rest.truststore-password	••••••	

You can verify your settings by running the flink list -yD security.ssl.rest.enabled=true command.

Related Information

Running a Flink job

Upgrading SQL Stream Builder service

To upgrade the SQL Stream Builder service to the latest version in Cloudera Streaming Analytics, you need to stop your SQL jobs, update the CSA artifacts and resume your SQL jobs on the Streaming SQL Console.

Related Information

Downloading CSA

Installing CSD and parcels

Adding SSB as a service

Stopping SQL Stream jobs

Before upgrading SQL Stream Builder, you need to stop your running jobs on the SQL Jobs page of Streaming SQL Console, and stop all Flink and SQL Stream Builder related YARN sessions. Otherwise Flink is not able to submit applications to YARN after upgrading the artifacts.

Procedure

1. Navigate to the Streaming SQL Console.
   a) Go to your cluster in Cloudera Manager.
   b) Select SQL Stream Builder from the list of services.
   c) Click SQLStreamBuilder Console.
2. Select SQL Jobs on the main menu.

Job State	Name	ID	User	Start Time	Link
STOPPED ⋮	elated_swirles	5195	admin		

SQL Jobs   Running Stopped All   ↻ Reload

3. Click on the job you want to stop.

You can further filter down the results, by directly searching for the job name in the Search field.

4. Click on the Remote job control button.

5. Click Stop.

After you stop the SQL job on Streaming SQL Console, go back to Cloudera Manager to stop the YARN session.

6. Navigate to the YARN Resource Manager to stop the SQL Stream Builder YARN job.

    a) Select YARN from the list of Services.

    b) Select YARN.

    c) Select Applications.

       The running SSB applications are displayed.

7. Select the application you need to stop.

8. Click Settings.

9. Click Kill application.

Upgrading CSA artifacts for SQL Stream Builder service

You need to upgrade the Cloudera Streaming Analytics (CSA) artifacts to the newer version by manually deleting the old CSD file from the repository, deactivating the old parcel and installing the latest CSD file and parcel.

Procedure

1. Stop the SQL Stream Builder service on your cluster.

    a) Go to your cluster in Cloudera Manager.

    b) Select SQL Stream Builder from the list of services.

    c) Click Action > Stop.

2. Download the new CSD files from the Download location.

3. Delete the old CSD version from /opt/cloudera/csd.

    a) Access the host where the CSD is stored.

```
ssh root@<HOSTNAME>
cd /opt/cloudera/csd
rm FLINK-1.14.0-csa1.6.2.0-cdh7.1.7.0-551-23013538.jar
rm SQL_STREAM_BUILDER-1.14.0-csa1.6.2.0-cdh7.1.7.0-551-23013538.jar
```

4. Copy the new artifacts to the /opt/cloudera/csd folder.

> ⚠️ **Warning:** The upgrade process fails if you only add the new parcel file in Cloudera Manager. You must add the Flink and SSB CSD to the /opt/cloudera/csd folder as well.

```
scp <DOWNLOAD_LOCATION>/FLINK-1.14.0-csa1.7.0.0-
cdh7.1.7.0-551-26280481.jar root@<HOSTNAME>/opt/cloudera/csd:
scp <LOCATION>/SQL_STREAM_BUILDER-1.14.0-csa1.7.0.0-
cdh7.1.7.0-551-26280481.jar root@<HOSTNAME>/opt/cloudera/csd:
```

5. Ensure that you maintain the appropriate file ownership and access the attributes if needed.

```
chown cloudera-scm:cloudera-scm /opt/cloudera/csd/FLINK-1.14.0-csa1.7.0.0-
cdh7.1.7.0-551-26280481.jar
chown cloudera-scm:cloudera-scm /opt/cloudera/c
sd/SQL_STREAM_BUILDER-1.14.0-csa1.7.0.0-cdh7.1.7.0-551-26280481.jar
```

**6.** Restart the Cloudera Manager Server with the following command:

    • RHEL 7 Compatible, SLES 12, Ubuntu: systemctl restart   cloudera-scm-server

    • RHEL 6 Compatible: service cloudera-scm-server   restart

7. Restart the Cloudera Management Services.

Due to the backend changes of SSB, after adding the new CSD, the SSB service will not work which is indicated in the list of services in the following way:

The following error message is displayed when reviewing the configuration issue:
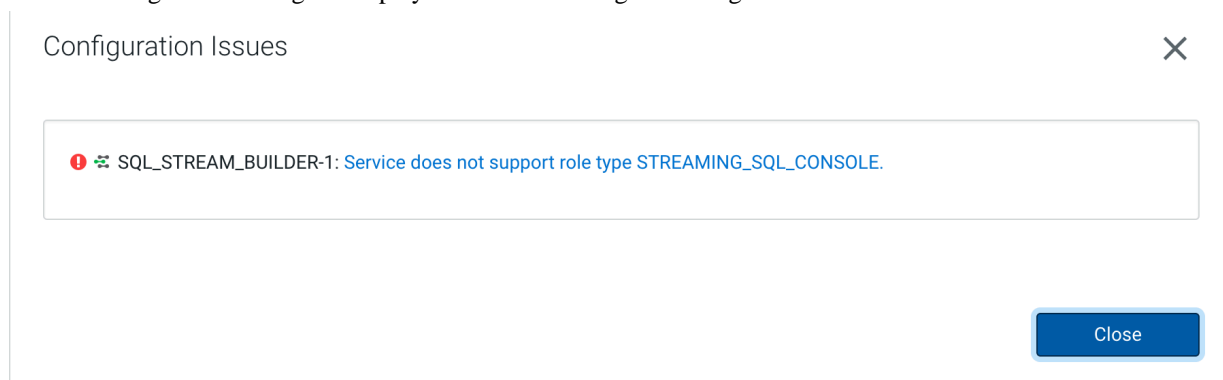

This means that you need to manually remove the Streaming SQL Console role, and restart the Streaming SQL Engine role after activating the new parcel.

8. Select Parcels on the **Home > Hosts** tab in the Cloudera Manager main navigation bar.

9. Click on Parcel Repositories & Network Settings tab.

10. Add the new Remote Parcel Repository URL for CSA.

```
https://USER:PASSWORD@archive.cloudera.com/p/csa/1.7.0.0/parcels/
```

> **Note:** Make sure that the Remote Parcel Repository URL uses HTTPS link. To install a different version of the parcel, you can change the URL as needed.

11. Click Save & Verify Configuration to commit the change.

12. Click Close.

You are redirected to the Parcels page.

13. Deactivate the old version of the parcel on the **Parcels** page.

14. Download, activate and distribute the new version of the parcel.

15. Select the Activate option when prompted in the wizard.

For more information about the general process of Service Management, see the Cloudera Manager documentation.

16. Delete the Streaming SQL Console role from your cluster.

  a) Stop the SQL Stream Builder service using Actions > Stop next to the SQL Stream Builder service name.

  b) Select the SQL Stream Builder service.

  c) Select the Streaming SQL Console role.

  d) Click Actions for Selected > Delete .

17. Update the Admin Database for the SSB service.

  a) Click Actions > Update Admin Database next to the SQL Stream Builder service name.

18. Start the SQL Stream Builder service.

  a) Click Actions > Start next to the SQL Stream Builder service name.

19. Refresh your keytab in Streaming SQL Console.

  a) Select SQL Stream Builder from the list of services.

  b) Click SQLStreamBuilder Console.

     The **Streaming SQL Console** opens in a new window.

  c) Select your username on the left main menu of Streaming SQL Console.

  d) Click Manage keytab.

  e) Provide your password again.

  f) Click Refresh Keytab.

Resuming SQL jobs

After upgrading the SQL Stream Builder service in Cloudera Manager, resume your SQL jobs by restarting them using the SQL jobs page of Streaming SQL Console.

Procedure

1. Navigate to the Streaming SQL Console.

  a) Go to your cluster in Cloudera Manager.

  b) Select SQL Stream Builder from the list of services.

  c) Click SQLStreamBuilder Console.

2. Select SQL Jobs on the main menu.

3. Click on the job you want to restart.

4. Click Remote job control.

5. Click Execute.

If it is needed, you can edit the job by loading it to the SQL Editor using the Load Job, and execute it on the **Console** page.

Migration

You can migrate your Flink service and SQL jobs to different clusters. When migrating the Flink service, you need to resubmit your Flink jobs on the new cluster. For migrating your SQL jobs you can use a migration tool in command line or the REST API.

Migrating Flink service to a different host

The Flink Dashboard role cannot be directly migrated from one host to another. You need to delete the existing role and add a new one to the host where you want to migrate the Flink Dashboard role. As Flink has mandatory dependencies for YARN, ZooKeeper and HDFS, these services should already be on the target host.

Before you begin

- Make sure that you have stopped your Flink jobs with savepoints, and saved your Cloudera Manager configurations.

  For more information, see the Stopping Flink applications and the Backing up the Cloudera Manager configuration documentations.
- Make sure that YARN, Zookeeper and HDFS services are already installed on the target host.

Procedure

1. Go your cluster in Cloudera Manager.

2. Select Flink from the list of services.

3. Click Instances.

4. Check the box for the Flink Dashboard role.

5. Click Action for Selected > Stop to stop the Flink Dashboard role.

6. Click Action for Selected > Restart to delete the Flink Dashboard role.

   When deleting the Flink Dashboard role, an error message will be displayed as the Flink Dashboard role is mandatory for the Flink service:

   ```
   Service FLINK-1 has 0 Flink Dashboards. Flink requires at least 1 Flink
   Dashboard.
   ```

7. Add a new Flink Dashboard role instance to the target host.
   a) Click Add Role Instances.

      The **Add Role Instances** wizard appears.
   b) Assign the Flink Dashboard role to a host.
   c) Review the changes.
   d) Click Finish.

      The new role is stopped when added.

8. Check the box for the Flink Dashboard role.

9. Click Action for Selected > Restart to restart the new Flink Dashboard role.

10. Migrate the Flink configurations, and submit your Flink jobs to the host where the newly added Flink Dashboard role is running.

What to do next
Start your Flink applications from savepoint and restore the Cloudera Manager configurations.

Migrating SQL jobs

You can migrate your SQL jobs using the SQL Stream Builder (SSB) job migration tool. The migration tool can be used from Command Line Interface (CLI) or using the SSB REST API. The migration tool enables you to export your SQL jobs with configurations, and import them to a different cluster or deployment when needed.

You can migrate you SQL jobs either using the API Explorer or the SSB migration tool from CLI. The migration process consists of exporting and importing the details of the SQL job. No matter which migration option you choose, the underlying process is the same as both solutions are based on calling the SSB REST API endpoints. However, when using the API Explorer, you need to manual copy and paste the job details between the endpoints. The migration tool in CLI automatically takes care of accessing this information.

Before migrating your SQL jobs, you need to stop the job if it is in a running state. To stop the SQL job you can use the Stop button either under the SQL window on the Compose page, or next to the running job on the SQL Jobs tab. Make a note of the SQL job name as you need to provide it for the job migration.

For API Explorer

1. Access the API Explorer.

   a. Click API Explorer on the main menu of Streaming SQL Console.
2. Open the GET/api/v1/ssb/jobs/{jobsName} operation.
3. Paste the copied job name to jobName.
4. Provide your username.
5. Click Execute.

   The details about the job is exported, and returned in a JSON string. To import the job, you need to copy the JSON detail and add it to the POST request.
6. Copy the JSON string.
7. Open the POST/api/v1/ssb/jobs/{jobsName} operation.
8. Provide a job name.
9. Provide your username.

10. Click Execute.

The job is imported to the Streaming SQL Console, and is listed under the **SQL jobs** tab with a stopped status.

For CLI

1. Connect to your cluster using ssh.
2. Use the following command to export the job:

```
ssb-job-migration -api <cluster_hostname> -o job-export -j <jobname> -f
<target_filename>
```

3. Use the following command to import the job:

```
ssb-job-migration -api <cluster_hostname> -o job-import -j <jobname> -f
<source_filename>
```

The job is imported to the Streaming SQL Console, and is listed under the **SQL jobs** tab with a stopped status.
