- [HIVE-15363](#) - Execute hive-blobstore tests using ProxyLocalFileSystem
- [HIVE-15367](#) - CTAS with LOCATION should write temp data under location directory rather than database location
- [HIVE-15385](#) - Failure to inherit permissions when running HdfsUtils.setFullFileStatus(..., false) causes queries to fail
- [IMPALA-1169](#) - Admission control info on the queries debug webpage
- [IMPALA-1286](#) - Extract common conjuncts from disjunctions.
- [IMPALA-1430](#) - IMPALA-4108: codegen all builtin aggregate functions
- [IMPALA-1616](#) - Improve the Memory Limit Exceeded error report
- [IMPALA-1654](#) - General partition exprs in DDL operations.
- [IMPALA-1702](#) - Enforce single-table consistency in query analysis
- [IMPALA-1788](#) - Fold constant expressions

- [IMPALA-2013](#) - Reintroduce steps for checking HBase health in run-hbase.sh
- [IMPALA-2057](#) - Better error message for incorrect avro decimal column declaration
- [IMPALA-2521](#) - Add clustered hint to insert statements
- [IMPALA-2523](#) - Make HdfsTableSink aware of clustered input
- [IMPALA-2789](#) - More compact mem layout with null bits at the end.
- [IMPALA-2864](#) - Ensure that client connections are closed after a failed Open()
- [IMPALA-2890](#) - Support ALTER TABLE statements for Kudu tables
- [IMPALA-2905](#) - Move QueryResultSet implementations into separate module
- [IMPALA-2905](#) - Handle coordinator fragment lifecycle like all others
- [IMPALA-2916](#) - Add warning to query profile if debug build
- [IMPALA-2925](#) - Mark test_alloc_update as xfail.
- [IMPALA-3002](#) - IMPALA-1473: Cardinality observability cleanup
- [IMPALA-3125](#) - Fix assignment of equality predicates from an outer-join On-clause
- [IMPALA-3126](#) - Conservative assignment of inner-join On-clause predicates
- [IMPALA-3167](#) - Fix assignment of WHERE conjunct through grouping agg + OJ
- [IMPALA-3200](#) - move bufferpool under runtime
- [IMPALA-3201](#) - in-memory buffer pool implementation
- [IMPALA-3201](#) - reservation implementation for new buffer pool
- [IMPALA-3202](#) - refactor scratch file management into TmpFileMgr
- [IMPALA-3202](#) - DiskIoMgr improvements for new buffer pool
- [IMPALA-3211](#) - provide toolchain build id for bootstrapping
- [IMPALA-3221](#) - Copyright / license audit
- [IMPALA-3229](#) - Don't assume that AUX exists just because of shell env
- [IMPALA-3308](#) - Get expr-test passing on PPC64LE
- [IMPALA-3314](#) - Fix Avro schema loading for partitioned tables
- [IMPALA-3342](#) - Add thread counters to monitor plan fragment execution
- [IMPALA-3346](#) - DeepCopy() Kudu rows into Impala tuples
- [IMPALA-3348](#) - Avoid per-slot check vector size in KuduScanner
- [IMPALA-3398](#) - Add docs to main Impala branch
- [IMPALA-3420](#) - use gold by default
- [IMPALA-3481](#) - Use Kudu ScanToken API for scan ranges
- [IMPALA-3491](#) - Use unique db in test_scanners.py and test_aggregation.py
- [IMPALA-3491](#) - Use unique database fixture in test_partitioning.py
- [IMPALA-3491](#) - Use unique database fixture in test_insert_parquet.py
- [IMPALA-3491](#) - Use unique database fixture in test_nested_types.py
- [IMPALA-3491](#) - Use unique database fixture in test_ddl.py
- [IMPALA-3552](#) - Make incremental stats max serialized size configurable
- [IMPALA-3567](#) - Part 2, IMPALA-3899: factor out PHJ builder
- [IMPALA-3567](#) - move ExecOption profile helpers to RuntimeProfile
- [IMPALA-3586](#) - Clean up union-node.h/cc to enable improvements.
- [IMPALA-3644](#) - Make predicate order deterministic
- [IMPALA-3671](#) - Add query option to limit scratch space usage
- [IMPALA-3676](#) - Use clang as a static analysis tool
- [IMPALA-3710](#) - Kudu DML should ignore conflicts, pt2
- [IMPALA-3710](#) - Kudu DML should ignore conflicts by default
- [IMPALA-3713](#) - ,IMPALA-4439: Fix Kudu DML shell reporting
- [IMPALA-3718](#) - Add test_cancellation tests for Kudu
- [IMPALA-3718](#) - Support subset of functional-query for Kudu
- [IMPALA-3719](#) - Simplify CREATE TABLE statements with Kudu tables
- [IMPALA-3724](#) - Support Kudu non-covering range partitions

- [IMPALA-3725](#) - Support Kudu UPSERT in Impala
- [IMPALA-3726](#) - Add support for Kudu-specific column options
- [IMPALA-3739](#) - Enable stress tests on Kudu
- [IMPALA-3771](#) - Expose kudu client timeout and set default
- [IMPALA-3786](#) - Replace "cloudera" with "apache"
- [IMPALA-3786](#) - Replace "cloudera" with "apache"
- [IMPALA-3788](#) - Fix Kudu ReadMode flag checking
- [IMPALA-3788](#) - Add flag for Kudu read-your-writes
- [IMPALA-3788](#) - Support for Kudu 'read-your-writes' consistency
- [IMPALA-3808](#) - Add incubating DISCLAIMER from the Incubator Branding Guide
- [IMPALA-3809](#) - Show Kudu-specific column metadata in DESCRIBE.
- [IMPALA-3812](#) - Fix error message for unsupported types
- [IMPALA-3815](#) - clean up cross-compiled comparator
- [IMPALA-3823](#) - Add timer to measure Parquet footer reads
- [IMPALA-3838](#) - IMPALA-4495: Codegen EvalRuntimeFilters() and fixes filter stats updates
- [IMPALA-3853](#) - More RAT cleaning.
- [IMPALA-3853](#) - squeasel is MIT (and dual copyright) not Apache
- [IMPALA-3872](#) - allow providing PyPi mirror for python packages
- [IMPALA-3875](#) - Thrift threaded server hang in some cases
- [IMPALA-3884](#) - Support TYPE_TIMESTAMP for HashTableCtx::CodegenAssignNullValue()
- [IMPALA-3902](#) - Scheduler improvements for running multiple fragment instances on a single backend
- [IMPALA-3905](#) - Add single-threaded scan node.
- [IMPALA-3912](#) - test_random_rpc_timeout is flaky.
- [IMPALA-3918](#) - Fix straggler Cloudera -> ASF license headers
- [IMPALA-3920](#) - TotalStorageWaitTime counter not populated for fragments with Kudu scan node
- [IMPALA-3943](#) - Address post-merge comments.
- [IMPALA-3971](#) - IMPALA-3229: Bootstrap an Impala dev environment
- [IMPALA-3973](#) - add position and occurrence to instr()
- [IMPALA-3980](#) - qgen: re-enable Hive as a target database
- [IMPALA-3983](#) - /IMPALA-3974: Delete function jar resources after load
- [IMPALA-4000](#) - Restricted Sentry authorization for Kudu Tables
- [IMPALA-4006](#) - Fix typo in buildall.sh introduced in
- [IMPALA-4006](#) - dangerous rm -rf statements in scripts
- [IMPALA-4008](#) - Don't bake ExprContext pointers into IR code
- [IMPALA-4008](#) - don't bake in hash table and hash join pointers
- [IMPALA-4011](#) - Remove / reword messages when statestore messages are late
- [IMPALA-4020](#) - Handle external conflicting changes to HMS gracefully
- [IMPALA-4023](#) - don't attach buffered tuple streams to batches
- [IMPALA-4026](#) - Implement double-buffering for BlockingQueue
- [IMPALA-4028](#) - Improve message for improper Sentry config to make extra spaces visible
- [IMPALA-4037](#) - IMPALA-4038: fix locking during query cancellation
- [IMPALA-4042](#) - Preserve root types when substituting grouping exprs
- [IMPALA-4047](#) - Remove occurrences of 'CDH'/'cdh' from repo
- [IMPALA-4048](#) - Misc. improvements to /sessions
- [IMPALA-4054](#) - Remove serial test workarounds for IMPALA-2479.
- [IMPALA-4056](#) - Fix toSql() of DistributeParam
- [IMPALA-4058](#) - benchmark byteswap on misaligned memory
- [IMPALA-4074](#) - Configuration items duplicate in template of YARN
- [IMPALA-4080](#) - IMPALA-3638: Introduce ExecNode::Codegen()
- [IMPALA-4087](#) - TestFragmentLifecycle.test_failure_in_prepare

- [IMPALA-4091](#) - Fix backend unit to log in logs/be_tests.
- [IMPALA-4096](#) - Allow clean.sh to work from snapshots
- [IMPALA-4097](#) - Crash in kudu-scan-node-test
- [IMPALA-4098](#) - Open()/Close() partition exprs once per fragment instance.
- [IMPALA-4100](#) - 4112: Qgen: Replace EXTRACT UDF + IS [NOT] DISTINCT FROM in HiveSqlWriter
- [IMPALA-4101](#) - qgen: Hive join predicates should only contains equality functions
- [IMPALA-4102](#) - Remote Kudu reads should be reported
- [IMPALA-4104](#) - add DCHECK to ConsumeLocal() and fix tests
- [IMPALA-4110](#) - IMPALA-3853: npm.js uses Artistic License 2
- [IMPALA-4110](#) - Clean up issues found by Apache RAT
- [IMPALA-4110](#) - Apache RAT script on Impala tarballs
- [IMPALA-4111](#) - backend death tests should not produce minidumps
- [IMPALA-4116](#) - Remove 'cdh' from version string again
- [IMPALA-4116](#) - Remove 'cdh' from version string
- [IMPALA-4117](#) - Factor simple scheduler test code into own files
- [IMPALA-4118](#) - extract encryption utils from BufferedBlockMgr
- [IMPALA-4122](#) - qgen: fix bitrotted cluster unit tests
- [IMPALA-4123](#) - Fast bit unpacking
- [IMPALA-4134](#) - IMPALA-3704: Kudu INSERT improvements
- [IMPALA-4136](#) - testKudu planner test hangs if Kudu is not supported
- [IMPALA-4138](#) - Fix AcquireState() for batches that change capacity
- [IMPALA-4142](#) - qgen: Hive does not support CTEs inside sub-query blocks
- [IMPALA-4155](#) - Update default partition when table is altered
- [IMPALA-4160](#) - Remove some leftover Llama references
- [IMPALA-4160](#) - Remove Llama support.
- [IMPALA-4171](#) - Remove JAR from repo.
- [IMPALA-4180](#) - Synchronize accesses to RuntimeState::reader_contexts_
- [IMPALA-4187](#) - Switch RPC latency metrics to histograms
- [IMPALA-4188](#) - Leopard: support external Docker volumes
- [IMPALA-4193](#) - Warn when benchmarks run with sub-optimal CPU settings
- [IMPALA-4194](#) - Bump version to 2.8.0
- [IMPALA-4199](#) - Add 'SNAPSHOT' to Impala version
- [IMPALA-4204](#) - Remove KuduScanNodeTest
- [IMPALA-4205](#) - fix tmp-file-mgr-test under ASAN
- [IMPALA-4206](#) - Add column lineage regression test.
- [IMPALA-4207](#) - test infra: move Hive options from connection to cluster options
- [IMPALA-4213](#) - Fix Kudu predicates that need constant folding
- [IMPALA-4230](#) - ASF policy issues from 2.7.0 rc3.
- [IMPALA-4231](#) - fix codegen time regression
- [IMPALA-4232](#) - qgen: Hive does not support aggregates inside specific analytic clauses
- [IMPALA-4234](#) - Remove astyle config file, looks outdated.
- [IMPALA-4239](#) - fix buffer pool test failures in release build
- [IMPALA-4240](#) - qgen: Add "ParseException line missing)" to Known Errors for Hive
- [IMPALA-4241](#) - remove spurious child queries event
- [IMPALA-4253](#) - impala-server.backends.client-cache.total-clients shows negative value
- [IMPALA-4258](#) - Remove duplicated and unused test macros
- [IMPALA-4259](#) - build Impala without any test cluster setup
- [IMPALA-4260](#) - Alter table add column drops all the column stats
- [IMPALA-4266](#) - Java udf returning string can give incorrect results
- [IMPALA-4269](#) - Codegen merging exchange node

- [IMPALA-4270](#) - Gracefully fail unsupported queries with `mt_dop > 0`.
- [IMPALA-4274](#) - hang in buffered-block-mgr-test
- [IMPALA-4277](#) - remove unneeded LegacyTCLIService
- [IMPALA-4277](#) - remove references for unsupported s3/s3n connectors
- [IMPALA-4277](#) - allow overriding of Hive/Hadoop versions/locations
- [IMPALA-4278](#) - Don't abort Catalog startup quickly if HMS is not present
- [IMPALA-4283](#) - Ensure Kudu-specific lineage and audit behavior
- [IMPALA-4285](#) - /IMPALA-4286: Fixes for Parquet scanner with `MT_DOP > 0`.
- [IMPALA-4287](#) - EE tests fail to run when `KUDU_IS_SUPPORTED=false`
- [IMPALA-4289](#) - Mark agg slots of `NDV()` functions as non-nullable
- [IMPALA-4291](#) - Reduce LLVM module's preparation time
- [IMPALA-4294](#) - Make `check-schema-diff.sh` executable from anywhere.
- [IMPALA-4295](#) - XFAIL wildcard SSL test
- [IMPALA-4299](#) - add `buildall.sh` option to start test cluster
- [IMPALA-4300](#) - Speed up BloomFilter::Or with SIMD
- [IMPALA-4302](#) - ,IMPALA-2379: constant expr arg fixes
- [IMPALA-4303](#) - Do not `reset()` qualifier of union operands.
- [IMPALA-4309](#) - Introduce Expr rewrite phase and supporting classes
- [IMPALA-4310](#) - Make `push_to_asf.py` respect `--apache_remote`
- [IMPALA-4314](#) - Standardize on MT-related data structures
- [IMPALA-4325](#) - StmtRewrite lost parentheses of CompoundPredicate
- [IMPALA-4330](#) - Fix JSON syntax in `generate_metrics.py`
- [IMPALA-4335](#) - Don't send 0-row batches to clients
- [IMPALA-4338](#) - test infra data migrator: include tables' primary keys in PostgreSQL
- [IMPALA-4339](#) - ensure coredumps end up in `IMPALA_HOME`
- [IMPALA-4340](#) - explain how to install `postgresql-9.5` or higher
- [IMPALA-4343](#) - IMPALA-4354: qgen: model INSERTs; write INSERTs from query model
- [IMPALA-4348](#) - / IMPALA-4333: Improve coordinator fragment cancellation
- [IMPALA-4350](#) - Crash with `vlog level 2` in hash join node
- [IMPALA-4352](#) - test infra: store Impala/Kudu primary keys in object model
- [IMPALA-4357](#) - Fix `DROP TABLE` to pass analysis if the table fails to load
- [IMPALA-4362](#) - Misc. fixes for PFE counters
- [IMPALA-4363](#) - Add Parquet timestamp validation
- [IMPALA-4365](#) - Enabling end-to-end tests on a remote cluster
- [IMPALA-4369](#) - Avoid `DCHECK` in Parquet scanner with `MT_DOP > 0`
- [IMPALA-4371](#) - Incorrect `DCHECK-s` in `hdfs-parquet-table-writer`
- [IMPALA-4372](#) - 'Describe formatted' returns types in upper case
- [IMPALA-4374](#) - Use new syntax for creating TPC-DS/H tables in Kudu stress test
- [IMPALA-4377](#) - Fix Java UDF-arg buffer use-after-free in `UdfExecutorTest`.
- [IMPALA-4379](#) - Fix and test Kudu table type checking, follow up
- [IMPALA-4379](#) - Fix and test Kudu table type checking
- [IMPALA-4380](#) - Remove 'cloudera' from hostnames in `bin/generate_minidump_collection_testdata.py`
- [IMPALA-4381](#) - Incorrect AVX version of BloomFilter::Or
- [IMPALA-4383](#) - Ensure plan fragment report thread is always started
- [IMPALA-4384](#) - NPE when cols list has trailing comma
- [IMPALA-4388](#) - Fix query option reset in tests
- [IMPALA-4391](#) - fix dropped statuses in scanners
- [IMPALA-4392](#) - restore `PeakMemoryUsage` to DataSink profiles
- [IMPALA-4397](#) - addendum: remove stray semicolon
- [IMPALA-4397](#) - IMPALA-3259: reduce codegen time and memory

- [IMPALA-4403](#) - Implement SHOW RANGE PARTITIONS for Kudu tables
- [IMPALA-4406](#) - Add cryptography export control notice
- [IMPALA-4408](#) - Omit null bytes for Kudu scans with no nullable slots.
- [IMPALA-4409](#) - respect lock order in QueryExecState::CancelInternal()
- [IMPALA-4410](#) - Safer tear-down of RuntimeState
- [IMPALA-4411](#) - Kudu inserts violate lock ordering and could deadlock
- [IMPALA-4412](#) - Per operator timing in profile summary is incorrect when mt_dop > 0
- [IMPALA-4415](#) - Fix unassigned scan range of size 1
- [IMPALA-4421](#) - Send custom cluster & process failure test results to logs/
- [IMPALA-4427](#) - leopard: make DOCKER_IMAGE_NAME required
- [IMPALA-4432](#) - Handle internal codegen disabling properly
- [IMPALA-4433](#) - Always generate testdata using the same time zone setting
- [IMPALA-4434](#) - In Python, ".split('\n') is ['']", which has length 1
- [IMPALA-4435](#) - Fix in-predicate-benchmark linking by moving templates
- [IMPALA-4436](#) - StringValue::StringCompare() should match strncmp()
- [IMPALA-4437](#) - fix crash in disk-io-mgr
- [IMPALA-4437](#) - hit DCHECK in buffered-block-mgr-test
- [IMPALA-4438](#) - Serialize test_failpoints.py to reduce memory pressure
- [IMPALA-4440](#) - lineage timestamps can go backwards across daylight savings transitions
- [IMPALA-4441](#) - Divide-by-zero in RuntimeProfile::SummaryStatsCounter::SetStats
- [IMPALA-4442](#) - Fix FE ParserTests UnsatisfiedLinkError
- [IMPALA-4444](#) - Transfer row group resources to row batch on scan failure
- [IMPALA-4446](#) - expr-test fails under ASAN
- [IMPALA-4447](#) - Rein in overly broad sed that dirties the tree
- [IMPALA-4450](#) - qgen: use string concatenation operator for postgres queries
- [IMPALA-4452](#) - Always call AggFnEvaluator::Open() before AggFnEvaluator::Init()
- [IMPALA-4454](#) - test_kudu.TestShowCreateTable flaky
- [IMPALA-4455](#) - MemPoolTest.TryAllocateAligned failure: sizeof v. alignof
- [IMPALA-4458](#) - Fix resource cleanup of cancelled mt scan nodes.
- [IMPALA-4461](#) - Make sure data gets loaded for wide hbase tables.
- [IMPALA-4465](#) - Don't hold process wide lock while serializing Runtime Profile in GetRuntimeProfileStr()
- [IMPALA-4466](#) - Improve Kudu CRUD test coverage
- [IMPALA-4470](#) - Avoid creating a NumericLiteral from NaN/infinity/-0
- [IMPALA-4476](#) - Use unique_database to stop races in test_udfs.py
- [IMPALA-4477](#) - Bump Kudu version to latest master
- [IMPALA-4477](#) - Upgrade Kudu version to latest master
- [IMPALA-4477](#) - Upgrade Kudu version to latest master
- [IMPALA-4477](#) - Upgrade Kudu version to latest master
- [IMPALA-4478](#) - Initial Kudu client mem tracking for sink
- [IMPALA-4479](#) - Use correct isSet() thrift function when evaluating constant bool exprs
- [IMPALA-4480](#) - zero_length_region_ must be as aligned as max_align_t
- [IMPALA-4488](#) - HS2 GetOperationStatus() should keep session alive
- [IMPALA-4490](#) - Only generate runtime filters for hash join nodes.
- [IMPALA-4493](#) - fix string-compare-test when using clang
- [IMPALA-4494](#) - Fix crash in SimpleScheduler
- [IMPALA-4497](#) - Fix Kudu client crash w/ SASL initialization
- [IMPALA-4498](#) - crash in to_utc_timestamp/from_utc_timestamp
- [IMPALA-4502](#) - test_partition_ddl_predicates breaks on non-HDFS filesystems
- [IMPALA-4504](#) - fix races in PlanFragmentExecutor regarding status reporting
- [IMPALA-4509](#) - Initialise Sasl-specific mutex

- [IMPALA-4510](#) - Selectively filter args for metric verification tests
- [IMPALA-4511](#) - Add missing total_time_counter() to PFE::Exec()
- [IMPALA-4512](#) - Add a script that builds Impala on stock Ubuntu 14.04
- [IMPALA-4514](#) - Fix broken exhaustive builds caused by non-nullable columns
- [IMPALA-4516](#) - Don't hold process wide lock connection_to_sessions_map_lock_ while cancelling queries
- [IMPALA-4518](#) - CopyStringVal() doesn't copy null string
- [IMPALA-4519](#) - increase timeout in TestFragmentLifecycle
- [IMPALA-4522](#) - Bound Kudu client threads to avoid stress crash
- [IMPALA-4523](#) - Correct max VARCHAR size to 65535 (2¹⁶ - 1).
- [IMPALA-4525](#) - follow-on: cleanup error handling
- [IMPALA-4525](#) - fix crash when codegen mem limit exceeded
- [IMPALA-4527](#) - Columns in Kudu tables created from Impala default to "NULL"
- [IMPALA-4529](#) - speed up parsing of identifiers
- [IMPALA-4532](#) - Fix use-after-free in ProcessBuildInputAsync()
- [IMPALA-4535](#) - Remove 'auto' from parameter list
- [IMPALA-4539](#) - fix bug when scratch batch references I/O buffers
- [IMPALA-4540](#) - Function call in DCHECK crashes scheduler
- [IMPALA-4541](#) - fix test dimensions for test_codegen_mem_limit
- [IMPALA-4542](#) - Fix use-after-free in some BE tests
- [IMPALA-4550](#) - Fix CastExpr analysis for substituted slots
- [IMPALA-4553](#) - ntpd must be synchronized for kudu to start.
- [IMPALA-4554](#) - fix projection of nested collections with mt_dop > 0
- [IMPALA-4557](#) - Fix flakiness with FLAGS_stress_free_pool_alloc
- [IMPALA-4561](#) - Replace DISTRIBUTE BY with PARTITION BY in CREATE TABLE
- [IMPALA-4562](#) - Fix for crash on kerberized clusters w/o Kudu support
- [IMPALA-4564](#) - ,IMPALA-4565: mt_dop fixes for old aggs and joins
- [IMPALA-4566](#) - Kudu client glog contention can cause timeouts
- [IMPALA-4567](#) - Fix test_kudu_alter_table exhaustive failures
- [IMPALA-4570](#) - shell tarball breaks with certain setuptools versions
- [IMPALA-4571](#) - Push IN predicates to Kudu
- [IMPALA-4572](#) - Run COMPUTE STATS on Parquet tables with MT_DOP=4
- [IMPALA-4574](#) - Do not treat UUID() like a constant expr
- [IMPALA-4577](#) - Adjust maximum size of row batch queue with MT_DOP
- [IMPALA-4578](#) - Pick up bound predicates for Kudu scan nodes.
- [IMPALA-4579](#) - SHOW CREATE VIEW fails for view containing a subquery
- [IMPALA-4580](#) - Fix crash with FETCH_FIRST when #rows < result cache size
- [IMPALA-4584](#) - Make alter table operations on Kudu tables synchronous
- [IMPALA-4585](#) - Allow the \$DATABASE template in the CATCH section
- [IMPALA-4586](#) - don't constant fold in backend
- [IMPALA-4592](#) - Improve error msg for non-deterministic predicates
- [IMPALA-4594](#) - WriteSlot and CodegenWriteSlot handle escaped NULL slots differently
- [IMPALA-4595](#) - Ignore discarded functions after linking
- [IMPALA-4608](#) - Fix fragment completion times for INSERTs
- [IMPALA-4609](#) - prefix thread counters in fragment profile
- [IMPALA-4613](#) - Make sure timers are finished before sending report profile
- [IMPALA-4614](#) - Set eval cost of timestamp literals.
- [IMPALA-4619](#) - Allow NULL as default value in Kudu tables
- [IMPALA-4628](#) - Disable broken kudu test to unblock GVOs
- [IMPALA-4630](#) - remove debug webpage easter egg
- [IMPALA-4633](#) - Change broken gflag default for Kudu client mem

- [IMPALA-4636](#) - Correct Suse Linux distro string
- [IMPALA-4636](#) - Add support for SLES12 for Kudu integration
- [IMPALA-4638](#) - Run queries with MT_DOP through admission control
- [IMPALA-4642](#) - Fix TestFragmentLifecycle failures; kudu test must wait
- [IMPALA-4654](#) - KuduScanner must return when ReachedLimit()
- [IMPALA-4659](#) - fuzz test fixes
- [IMPALA-4739](#) - ExprRewriter fails on HAVING clauses
- [IMPALA-4765](#) - Avoid using several loading threads on one table
- [IMPALA-4768](#) - Improve logging of table loading
- [IMPALA-3905](#) - Add single-threaded scan node
- [IMPALA-4262](#) - LZO-scanner fails when reading large index files from S3
- [IMPALA-4277](#) - Merge "build against hadoop components in different location" into cdh5-trunk
- [IMPALA-4277](#) - build against hadoop components in different location
- [IMPALA-4322](#) - test_scanners_fuzz.py hits a DCHECK
- [IMPALA-4391](#) - fix dropped status in scanners
- [OOZIE-2194](#) - oozie job -kill doesn't work with spark action
- [OOZIE-2225](#) - Fix test failures for
- [OOZIE-2225](#) - Add wild card filter for gathering jobs
- [OOZIE-2273](#) - MiniOozie does not work outside of Oozie
- [OOZIE-2430](#) - amendAdd root logger for hive,sqoop action
- [OOZIE-2430](#) - Add root logger for hive,sqoop action
- [OOZIE-2471](#) - Show child job url tab for distcp
- [OOZIE-2503](#) - show ChildJobURLs to spark action
- [OOZIE-2517](#) - Add support for startCreatedTime and endCreatedTime filters for coord and bundles
- [OOZIE-2520](#) - SortBy filter for ordering the jobs query results
- [OOZIE-2547](#) - Add mapreduce.job.cache.files to spark action
- [OOZIE-2552](#) - Update ActiveMQ version for security and other fixes
- [OOZIE-2563](#) - Pass spark-defaults.conf to spark action
- [OOZIE-2569](#) - Adding yarn-site, core-site, hdfs-site and mapred-site into spark launcher
- [OOZIE-2606](#) - Set spark.yarn.jars to fix Spark 2.0 with Oozie
- [OOZIE-2621](#) - Use hive-exec-<version>-core instead of hive-exec in oozie-core
- [OOZIE-2658](#) - -driver-class-path can overwrite the classpath in SparkMain
- [OOZIE-2678](#) - Oozie job -kill doesn't work with tez jobs
- [OOZIE-2705](#) - Oozie Spark action ignores spark.executor.extraJavaOptions and spark.driver.extraJavaOptions
- [OOZIE-2731](#) - Set yarn.nodemanager.disk-health-checker.max-disk-utilization-per-disk-percentage to a higher value in tests
- [PARQUET-358](#) - Add support for Avro's logical types API
- [PARQUET-415](#) - Fix ByteBuffer Binary serialization
- [PIG-4052](#) - TestJobControlSleep, TestInvokerSpeed are unreliable
- [SENTRY-1260](#) - Improve error handling when ArrayIndexOutOfBoundsException in PathsUpdate.parsePath causes MetastoreCacheInitializer initialization to fail
- [SENTRY-1270](#) - Improve error handling - Database with malformed URI causes NPE in HMS plugin during DDL
- [SENTRY-1489](#) - Categorize end-to-end (e2e) tests into slow and regular tests (adapting tests for timeout)
- [SENTRY-1497](#) - Create a Sentry scale test tool to add various objects and privileges into Sentry and HMS
- [SPARK-1239](#) - Improve fetching of map output statuses
- [SPARK-8425](#) - Add blacklist mechanism for task scheduling

- [SPARK-18117](#) - [CORE] Add test for TaskSetBlacklist
- [SPARK-18535](#) - Redact sensitive information from Spark logs and UI
- [SPARK-18546](#) - [CORE] Fix merging shuffle spills when using encryption
- [SPARK-18547](#) - [CORE] Propagate I/O encryption key when executors register
- [SQOOP-2983](#) - OraOop export has degraded performance with wide tables
- [SQOOP-3013](#) - Configuration "tmpjars" is not checked for empty strings before passing to MR
- [SQOOP-3028](#) - Include stack trace in the logging of exceptions in ExportTool
- [SQOOP-3034](#) - HBase import should fail fast if using anything other than as-textfile
- [SQOOP-3066](#) - Introduce an option + env variable to enable/disable SQOOP-2737 feature
- [SQOOP-3069](#) - Get OracleExportTest#testUpsertTestExport in line with SQOOP-3066
- [ZOOKEEPER-1576](#) - Zookeeper cluster - failed to connect to cluster if one of the provided IPs causes java.net.UnknownHostException
- [ZOOKEEPER-1917](#) - (Apache Zookeeper logs cleartext admin passwords) to address CVE-2014-0085
- [ZOOKEEPER-2402](#) - (Document client side properties)

Issues Fixed in CDH 5.9.x

The following topics describe issues fixed in CDH 5.9.x, from newest to oldest release. You can also review [What's New In CDH 5.9.x](#) on page 1825 or [Known Issues in CDH 5](#) on page 1944.

Issues Fixed in CDH 5.9.3

Upstream Issues Fixed

The following upstream issues are fixed in CDH 5.9.3:

- [FLUME-2798](#) - Malformed Syslog messages can lead to OutOfMemoryException
- [FLUME-3080](#) - Close failure in HDFS Sink might cause data loss
- [FLUME-3085](#) - HDFS Sink can skip flushing some BucketWriters, might lead to data loss

- [HADOOP-11400](#) - GraphiteSink does not reconnect to Graphite after 'broken pipe'
- [HADOOP-11599](#) - Client#getTimeout should use IPC_CLIENT_PING_DEFAULT when IPC_CLIENT_PING_KEY is not configured
- [HADOOP-12672](#) - RPC timeout should not override IPC ping interval
- [HADOOP-13503](#) - Improve SaslRpcClient failure logging
- [HADOOP-13988](#) - KMSSClientProvider does not work with WebHDFS and Apache Knox w/ProxyUser
- [HADOOP-14029](#) - Fix KMSSClientProvider for non-secure proxyuser use case
- [HDFS-10715](#) - NPE when applying AvailableSpaceBlockPlacementPolicy
- [HDFS-11445](#) - FSCK shows overall health status as corrupt even one replica is corrupt
- [YARN-6360](#) - Prevent FS state dump logger from cramming other log files
- [YARN-6453](#) - fairscheduler-statedump.log gets generated regardless of service
- [HBASE-15837](#) - Memstore size accounting is wrong if postBatchMutate() throws exception
- [HBASE-16630](#) - Fragmentation in long running Bucket Cache
- [HBASE-16739](#) - Timed out exception message should include encoded region name
- [HBASE-16977](#) - VerifyReplication should log a printable representation of the row keys
- [HBASE-17501](#) - guard against NPE while reading FileTrailer and HFileBlock
- [HBASE-17673](#) - Monitored RPC Handler not shown in the WebUI
- [HBASE-17688](#) - MultiRowRangeFilter not working correctly if given same start and stop RowKey
- [HBASE-17710](#) - HBase in standalone mode creates directories with 777 permission
- [HBASE-17717](#) - Explicitly use "sasL" ACL scheme for hbase superuser
- [HBASE-17731](#) - Fractional latency reporting in MultiThreadedAction
- [HBASE-17798](#) - RpcServer.Listener.Reader can abort due to CancelledKeyException
- [HBASE-17970](#) - Set yarn.app.mapreduce.am.staging-dir when starting MiniMRCluster
- [HBASE-18096](#) - Limit HFileUtil visibility and add missing annotations
- [HIVE-9481](#) - allow column list specification in INSERT statement
- [HIVE-9567](#) - JSON SerDe not escaping special chars when writing char/varchar data
- [HIVE-11141](#) - Improve RuleRegExp when the Expression node stack gets huge
- [HIVE-11418](#) - Dropping a database in an encryption zone with CASCADE and trash enabled fails
- [HIVE-11428](#) - Performance: Struct IN() clauses are extremely slow
- [HIVE-11671](#) - Optimize RuleRegExp in DPP codepath
- [HIVE-11842](#) - Improve RuleRegExp by caching some internal data structures
- [HIVE-13390](#) - Partial backport of HIVE-13390. Backported only httpclient 4.5.2 and httpcore 4.4.4 for fixing the Apache Hive SSL vulnerability bug.
- [HIVE-14178](#) - Hive::needsToCopy should reuse FileUtils::equalsFileSystem
- [HIVE-14380](#) - Queries on tables with remote HDFS paths fail in "encryption" checks.
- [HIVE-14564](#) - Column Pruning generates out of order columns in SelectOperator which cause ArrayIndexOutOfBoundsException.
- [HIVE-14943](#) - Partial Backport of HIVE-14943 - Base Implementation (of HIVE-10924)
- [HIVE-16297](#) - Improving hive logging configuration variables
- [HIVE-16394](#) - HoS does not support queue name change in middle of session
- [HIVE-16413](#) - Create table as select does not check ownership of the location
- [HIVE-16459](#) - Forward channelInactive to RpcDispatcher
- [HIVE-16593](#) - SparkClientFactory.stop may prevent JVM from exiting
- [HIVE-16646](#) - Alias in transform ... as clause shouldn't be case sensitive
- [HIVE-16660](#) - Not able to add partition for views in hive when sentry is enabled
- [HIVE-16693](#) - beeline "source" command freezes if you have a comment in it?
- [HUE-4897](#) - [core] Import document call should provide information about the import
- [HUE-5225](#) - [core] Prevent Oozie and Job Designer duplicate example documents from being installed
- [HUE-5303](#) - [editor] Avoid XSS in the viewmodel options
- [HUE-5349](#) - [search] Query definitions can include js XSS injection

- [HUE-5659](#) - [home] Ignore history dependencies when importing document from different cluster
- [HUE-5816](#) - Changing default setting as "allowed_hosts=*"
- [HUE-5850](#) - [sentry] Prevent creating roles with empty names
- [HUE-6075](#) - [oozie] Remove email body for schema 0.1
- [HUE-6109](#) - [core] Remove the restriction on Document2 invalid chars
- [HUE-6115](#) - [core] Fix document paths for names with unicode characters
- [HUE-6131](#) - [hive] Select partition values based on the actual datatypes of the partition column
- [HUE-6133](#) - [home] Stricter check for activeEntry existence
- [HUE-6133](#) - [home] Avoid search blinking
- [HUE-6133](#) - [home] Typing on the search box crashes IE 11
- [HUE-6144](#) - [oozie] Add generic XSL template to workflow graph parser
- [HUE-6161](#) - [doc2] Log failures and continue while converting documents
- [HUE-6193](#) - [converter] Retain last_executed time when creating doc2 object
- [HUE-6197](#) - [impala] Fix XSS Vulnerability in the old editors' error messages
- [HUE-6212](#) - [oozie] Prevent XSS injection from packets
- [HUE-6212](#) - [oozie] Prevent XSS injection in coordinator cron frequency field
- [HUE-6228](#) - [core] Disable touchscreen detection on Nicescroll
- [HUE-6250](#) - [frontend] Losing # fragment of full URL on login redirect
- [HUE-6261](#) - [oozie] Avoid JS error preventing workflow action status update
- [HUE-6262](#) - [core] Converter should separate history docs from saved docs
- [HUE-6263](#) - [converter] Delete Doc2 object incase of exception
- [HUE-6264](#) - [converter] Decrease memory usage for users with very high document1 objects
- [HUE-6266](#) - [converter] Remove unnecessary call to document link
- [HUE-6295](#) - [doc2] Avoid unrelated DB calls in sync_documents after import
- [HUE-6310](#) - [doc2] [doc2] Create missing doc1 links for delete and copy operations
- [HUE-6407](#) - [pig] Play button doesn't come back after killing the running pig job
- [HUE-6446](#) - [oozie] User cant edit shared coordinator or bundle
- [HUE-6604](#) - [oozie] Fix timestamp conversion to server timezone
- [HUE-6710](#) - [notebook] Raise Django 403 builtin
- [HUE-6710](#) - [notebook] Application reachable directly by users without granted access
- [IMPALA-3794](#) - Workaround for Breakpad ID conflicts
- [IMPALA-4293](#) - query profile should include error log
- [IMPALA-4383](#) - Ensure plan fragment report thread is always started
- [IMPALA-4409](#) - respect lock order in QueryExecState::CancelInternal()
- [IMPALA-4615](#) - Fix create_table.sql command order
- [IMPALA-4787](#) - Optimize APPX_MEDIAN() memory usage
- [IMPALA-5088](#) - Fix heap buffer overflow
- [IMPALA-5193](#) - Initialize decompressor before finding first tuple
- [IMPALA-5197](#) - Erroneous corrupted Parquet file message
- [IMPALA-5252](#) - Fix crash in HiveUdfCall::GetStringVal() when mem_limit exceeded
- [IMPALA-5253](#) - Use appropriate transport for StatestoreSubscriber
- [IMPALA-5355](#) - Fix the order of Sentry roles and privileges
- [IMPALA-5469](#) - Fix exception when processing catalog update
- [OOZIE-2739](#) - Remove property expansion pattern from ShellMain's log4j properties content
- [OOZIE-2816](#) - Strip out the first command word from Sqoop action if its "sqoop"
- [OOZIE-2818](#) - Can't overwrite oozie.action.max.output.data on a per-workflow basis
- [OOZIE-2844](#) - Increase stability of Oozie actions when log4j.properties is missing or not readable
- [PARQUET-389](#) - Support predicate push down on missing columns.
- [SENTRY-1422](#) - JDO deadlocks while processing grant while a background thread processes Notificationlogs
- [SENTRY-1476](#) - SentryStore is subject to JDQL injection

- [SENTRY-1505](#) - CommitContext isn't used by anything and should be removed
- [SENTRY-1515](#) - Cleanup exception handling in SentryStore
- [SENTRY-1517](#) - SentryStore should actually use function getMSentryRole to get roles
- [SENTRY-1557](#) - getRolesForGroups(),getRoleNamesForGroups() does too many trips to the the DB
- [SENTRY-1594](#) - TransactionBlock should become generic
- [SENTRY-1609](#) - DelegateSentryStore is subject to JDQL injection
- [SENTRY-1615](#) - SentryStore should not allocate empty objects that are immediately returned
- [SENTRY-1625](#) - PrivilegeOperatePersistence can use QueryParamBuilder
- [SENTRY-1714](#) - MetastorePlugin.java should quietly return from renameAuthzObject() when both paths are null
- [SENTRY-1759](#) - UpdatableCache leaks connections
- [SOLR-8836](#) - Return 400, and a SolrException when an invalid json is provided to the update handler instead of 500.
- [SOLR-9153](#) - Update Apache commons beanutils version to 1.9.2
- [SOLR-9527](#) - Improve distribution of replicas when restoring a collection
- [SOLR-9848](#) - Lower solr.cloud.wait-for-updates-with-stale-state-pause back down from 7 seconds.
- [SOLR-10076](#) - Hiding keystore and truststore passwords from /admin/info/* outputs
- [SOLR-10430](#) - Add ls command to ZkCLI for listing sub-dirs
- [SPARK-14930](#) - Race condition in CheckpointWriter.stop()
- [SPARK-16533](#) - Spark application not handling preemption messages
- [SPARK-16845](#) - org.apache.spark.sql.catalyst.expressions.GeneratedClass\$SpecificOrdering" grows beyond 64 KB
- [SPARK-16873](#) - force spill NPE
- [SPARK-17316](#) - Don't block StandaloneSchedulerBackend.executorRemoved
- [SPARK-17485](#) - Failed remote cached block reads can lead to whole job failure
- [SPARK-19019](#) - PySpark does not work with Python 3.6.0
- [SPARK-19263](#) - DAGScheduler should avoid sending conflicting task set.
- [SPARK-19537](#) - Move pendingPartitions to ShuffleMapStage.
- [SPARK-19688](#) - Spark on Yarn Credentials File set to different application directory
- [SPARK-20922](#) - Unsafe deserialization in Spark LauncherConnection
- [SQOOP-2896](#) - Sqoop exec job fails with SQLException Access denied for user
- [SQOOP-3123](#) - Import from oracle using oraoop with map-column-java to avro fails if special characters encounter in table name or column name
- [ZOOKEEPER-2040](#) - Server to log underlying cause of SASL connection problems

Issues Fixed in CDH 5.9.2

Upstream Issues Fixed

The following upstream issues are fixed in CDH 5.9.2:

- [FLUME-2171](#) - Add Interceptor to remove headers from event
- [FLUME-2812](#) - Fix semaphore leak causing java.lang.Error: Maximum permit count exceeded in MemoryChannel
- [FLUME-2889](#) - Fixes to DateTime computations
- [FLUME-2999](#) - Kafka channel and sink should enable statically assigned partition per event via header
- [FLUME-3027](#) - Change Kafka Channel to clear offsets map after commit
- [FLUME-3031](#) - Change sequence source to reset its counter for event body on channel exception
- [FLUME-3049](#) - Make HDFS sink rotate more reliably in secure mode
- [HADOOP-7930](#) - Kerberos relogin interval in UserGroupInformation should be configurable
- [HADOOP-11619](#) - FTPFileSystem should override getDefaultPort.
- [HADOOP-12655](#) - TestHttpServer.testBindAddress bind port range is wider than expected.
- [HADOOP-13433](#) - Race in UGI.reloginFromKeytab
- [HADOOP-13590](#) - Retry until TGT expires even if the UGI renewal thread encountered exception.
- [HADOOP-13627](#) - Have an explicit KerberosAuthException for UGI to throw, text from public constants
- [HADOOP-13641](#) - Update UGI#spawnAutoRenewalThreadForUserCreds to reduce indentation

- [HADOOP-13749](#) - KMSSClientProvider combined with KeyProviderCache can result in wrong UGI being used
- [HADOOP-13805](#) - UGI.getCurrentUser() fails if user does not have a keytab associated
- [HADOOP-13838](#) - KMSTokenRenewer should close providers
- [HADOOP-13953](#) - Make FTPFileSystem's data connection mode and transfer mode configurable
- [HADOOP-14003](#) - Make additional KMS tomcat settings configurable
- [HADOOP-14195](#) - CredentialProviderFactory\$getProviders is not thread-safe
- [HDFS-10763](#) - Open files can leak permanently due to inconsistent lease update
- [HDFS-11160](#) - VolumeScanner reports write-in-progress replicas as corrupt incorrectly
- [HDFS-11229](#), [HDFS-11056](#) - failed to close meta file
- [HDFS-11275](#) - Check groupEntryIndex and throw a helpful exception on failures when removing ACL.
- [HDFS-11292](#) - log lastWrittenTxId etc info in logSyncAll
- [HDFS-11306](#) - Print remaining edit logs from buffer if edit log can't be rolled
- [HDFS-11363](#) - Need more diagnosis info when seeing Slow waitForAckedSeqno.
- [HDFS-11379](#) - DFSInputStream may infinite loop requesting block locations
- [MAPREDUCE-6172](#) - TestDbClasses timeouts are too aggressive
- [MAPREDUCE-6571](#) - JobEndNotification info logs are missing in AM container syslog
- [MAPREDUCE-6763](#) - Shuffle server listen queue is too small
- [MAPREDUCE-6817](#) - The format of job start time in JHS is different from those of submit and finish time.
- [MAPREDUCE-6839](#) - TestRecovery.testCrashed failed
- [YARN-2306](#) - Add test for leakage of reservation metrics in fair scheduler.
- [YARN-2336](#) - Fair scheduler's REST API returns a missing '[' bracket JSON for deep queue tree
- [YARN-3251](#) - Fixed a deadlock in CapacityScheduler when computing absoluteMaxAvailableCapacity in LeafQueue
- [YARN-3933](#) - FairScheduler: Multiple calls to completedContainer are not safe.
- [YARN-3957](#) - FairScheduler NPE In FairSchedulerQueueInfo causing scheduler page to return 500.
- [YARN-4363](#) - In TestFairScheduler, testcase should not create FairScheduler redundantly.
- [YARN-4544](#) - All the log messages about rolling monitoring interval are shown with WARN level
- [YARN-4555](#) - TestDefaultContainerExecutor#testContainerLaunchError fails on non-english locale environment
- [YARN-5136](#) - Error in handling event type APP_ATTEMPT_REMOVED to the scheduler
- [YARN-5752](#) - TestLocalResourcesTrackerImpl#testLocalResourceCache times out
- [YARN-5859](#) - TestResourceLocalizationService#testParallelDownloadAttemptsForPublicResource sometimes fails
- [YARN-5890](#) - FairScheduler should log information about AM-resource-usage and max-AM-share for queues
- [YARN-5920](#) - Fix deadlock in TestRMHA.testTransitionedToStandbyShouldNotHang
- [YARN-6042](#) - Dump scheduler and queue state information into FairScheduler DEBUG log.
- [YARN-6151](#) - FS preemption does not consider child queues over fairshare if the parent is under.
- [YARN-6175](#) - FairScheduler: Negative vcore for resource needed to preempt.
- [YARN-6264](#) - AM not launched when a single vcore is available on the cluster.
- [HBASE-12949](#) - Scanner can be stuck in infinite loop if the HFile is corrupted
- [HBASE-15125](#) - BackportHBaseFsck's adoptHdfsOrphan function creates region with wrong end key boundary
- [HBASE-15328](#) - sanity check the redirect used to send master info requests to the embedded regionserver.
- [HBASE-15378](#) - Scanner cannot handle heartbeat message with no results
- [HBASE-15587](#) - FSTableDescriptors.getDescriptor() logs stack trace erroneously
- [HBASE-15931](#) - Add log for long-running tasks in AsyncProcess HBASE-16289 AsyncProcess stuck messages need to print region/server
- [HBASE-15955](#) - Disable action in CatalogJanitor#setEnabled should wait for active cleanup scan to finish
- [HBASE-16032](#) - Possible memory leak in StoreScanner
- [HBASE-16062](#) - Improper error handling in WAL Reader/Writer creation
- [HBASE-16146](#) - Counters are expensive.
- [HBASE-16238](#) - It's useless to catch SESSIONEXPIRED exception and retry in RecoverableZooKeeper
- [HBASE-16266](#) - Do not throw ScannerTimeoutException when catch UnknownScannerException

- [HBASE-16304](#) - HRegion#RegionScannerImpl#handleFileNotFoundException may lead to deadlock when trying to obtain write lock on updatesLock
- [HBASE-16350](#) - Undo server abort from HBASE-14968
- [HBASE-16429](#) - FSHLog: deadlock if rollWriter called when ring buffer filled with appends
- [HBASE-16460](#) - Can't rebuild the BucketAllocator's data structures when BucketCache uses FileIOEngine
- [HBASE-16604](#) - Scanner retries on IOException can cause the scans to miss data
- [HBASE-16662](#) - Fix open POODLE vulnerabilities
- [HBASE-16721](#) - Concurrency issue in WAL unflushed seqId tracking
- [HBASE-16807](#) - RegionServer will fail to report new active Hmaster until HMaster/RegionServer failover.
- [HBASE-16841](#) - Data loss in MOB files after cloning a snapshot and deleting that snapshot
- [HBASE-16931](#) - Setting cell's seqId to zero in compaction flow might cause RS down.
- [HBASE-16960](#) - RegionServer hang when aborting
- [HBASE-17020](#) - keylen in midkey() dont computed correctly
- [HBASE-17023](#) - Region left unassigned due to AM and SSH each thinking others would do the assignment work
- [HBASE-17044](#) - Fix merge failed before creating merged region leaves meta inconsistent
- [HBASE-17058](#) - Lower epsilon used for jitter verification from HBASE-15324
- [HBASE-17069](#) - RegionServer writes invalid META entries for split daughters in some circumstances
- [HBASE-17072](#) - CPU usage starts to climb up to 90-100% when using G1GC; purge ThreadLocal usage
- [HBASE-17206](#) - FSHLog may roll a new writer successfully with unflushed entries
- [HBASE-17241](#) - Avoid compacting already compacted mob files with _del files
- [HBASE-17265](#) - Region left unassigned in master failover when region failed to open
- [HBASE-17275](#) - Assign timeout may cause region to be unassigned forever
- [HBASE-17328](#) - Properly dispose of looped replication peers
- [HBASE-17381](#) - ReplicationSourceWorkerThread can die due to unhandled exceptions
- [HBASE-17409](#) - Limit jsonp callback name to prevent xss
- [HBASE-17452](#) - Failed taking snapshot - region Manifest proto-message too large
- [HBASE-17522](#) - Handle JVM throwing runtime exceptions when we ask for details on heap usage the same as a correctly returned 'undefined'.
- [HBASE-17558](#) - ZK dumping jsp should escape HTML.
- [HBASE-17561](#) - table status page should escape values that may contain arbitrary characters.
- [HBASE-17675](#) - ReplicationEndpoint should choose new sinks if a SaslException occurs
- [HIVE-7723](#) - Explain plan for complex query with lots of partitions is slow due to in-efficient collection used to find a matching ReadEntity
- [HIVE-10329](#) - Hadoop reflectionutils has issues ADDENDUM The backport only includes the ADDENDUM part which has the ReflectionUtils class.
- [HIVE-11594](#) - Analyze Table for column names with embedded spaces
- [HIVE-11849](#) - NPE in HiveHBaseTableShapshotInputFormat in query with just count(*)
- [HIVE-12179](#) - Add option to not add spark-assembly.jar to Hive classpath
- [HIVE-12349](#) - NPE in ORG SARG for IS NULL queries on Timestamp and Date column
- [HIVE-12465](#) - Hive might produce wrong results when (outer) joins are merged
- [HIVE-12619](#) - Switching the field order within an array of structs causes the query to fail
- [HIVE-12768](#) - Thread safety: binary sortable serde decimal deserialization
- [HIVE-12780](#) - Fix the output of the history command in Beeline
- [HIVE-12789](#) - Fix output twice in the history command of Beeline
- [HIVE-12976](#) - MetaStoreDirectSql doesn't batch IN lists in all cases
- [HIVE-13129](#) - CliService leaks HMS connection
- [HIVE-13149](#) - Remove some unnecessary HMS connections from HS2
- [HIVE-13240](#) - GroupByOperator: Drop the hash aggregates when closing operator
- [HIVE-13539](#) - HiveHFileOutputFormat searching the wrong directory for HFiles
- [HIVE-13864](#) - Beeline ignores the command that follows a semicolon and comment

- [HIVE-13866](#) - flatten callstack for directSQL errors
- [HIVE-13895](#) - HoS start-up overhead in yarn-client mode
- [HIVE-13904](#) - Ignore case when retrieving ColumnInfo from RowResolver
- [HIVE-13936](#) - Add streaming support for row_number
- [HIVE-14210](#) - ExecDriver should call jobclient.close() to trigger cleanup
- [HIVE-14693](#) - Some partitions will be left out when partition number is the multiple of the option hive.msck.repair.batch.size
- [HIVE-14764](#) - Enabling "hive.metastore.metrics.enabled" throws OOM in HiveMetastore
- [HIVE-14819](#) - FunctionInfo for permanent functions shows TEMPORARY FunctionType
- [HIVE-14820](#) - RPC server for spark inside HS2 is not getting server address properly
- [HIVE-14924](#) - MSCK REPAIR table with single threaded is throwing null pointer exception
- [HIVE-15282](#) - Different modification times are used when an index is built and when its staleness is checked
- [HIVE-15291](#) - Comparison of timestamp fails if only date part is provided
- [HIVE-15338](#) - Wrong result from non-vectorized DATEDIFF with scalar parameter of type DATE/TIMESTAMP
- [HIVE-15346](#) - "values temp table" should not be an input
- [HIVE-15410](#) - WebHCat supports get/set table property with its name containing period and hyphen
- [HIVE-15485](#) - Addendum toInvestigate the DoAs failure in HoS
- [HIVE-15485](#) - Investigate the DoAs failure in HoS
- [HIVE-15517](#) - NOT (x <=> y) returns NULL if x or y is NULL
- [HIVE-15551](#) - memory leak in directsql for mysql+bonecp specific initialization
- [HIVE-15572](#) - Improve the response time for query canceling when it happens during acquiring locks
- [HIVE-15735](#) - In some cases, view objects inside a view do not have parents.
- [HIVE-15782](#) - query on parquet table returns incorrect result when hive.optimize.index.filter is set to true
- [HIVE-15872](#) - The PERCENTILE_APPROX UDAF does not work with empty set
- [HIVE-15997](#) - Resource leaks when query is cancelled
- [HIVE-16019](#) - Query fails when group by/order by on same column with uppercase name
- [HIVE-16024](#) - MSCK Repair Requires nonstrict hive.mapred.mode
- [HIVE-16047](#) - Shouldn't try to get KeyProvider unless encryption is enabled
- [HIVE-16156](#) - FileSinkOperator should delete existing output target when renaming
- [HIVE-16175](#) - Possible race condition in InstanceCache
- [HUE-3079](#) - [jb] Display jobs from JHS (YARN and Spark) and their logs when not in RM
- [HUE-4546](#) - [editor] Cannot execute any Hive query: 'NoneType' object has no attribute 'update_data'
- [HUE-4969](#) - [core] Rename ini properties for sasl buffer to be standard, fixing Support hive.server2.thrift.sasl.qop="auth-conf"
- [HUE-5268](#) - [editor] Autocompleter should not suggest columns without tables
- [HUE-5281](#) - [core] Log real user real ip when using a load balancer
- [HUE-5295](#) - [desktop] Avoid microsecond comparison for last_modified field MySQL < 5.6 doesn't support microsecond precision. <https://code.djangoproject.com/ticket/19716>. Do not change the last_modified field when migrating history queries
- [HUE-5305](#) - [home] Fix empty share document modal and improve sharing UX
- [HUE-5310](#) - [search] Use Doc2 modal in search_controller
- [HUE-5390](#) - [assist] Fix for incorrect column order
- [HUE-5408](#) - [oozie] Support old docs while saving shared workflow
- [HUE-5476](#) - [core] Fix TTL is_idle middleware check
- [HUE-5482](#) - [home] Handle multiple home/trash directories by merging them into one.
- [HUE-5533](#) - [home] Improve home page load time
- [HUE-5602](#) - [jb] Make date filter more user friendly. Add start time filter in jobs page. Make start time filter compatible with python2.6.

- [SPARK-18750](#) - [YARN] Avoid using "mapValues" when allocating containers.
- [SPARK-19178](#) - [SQL][Backport-to-1.6] convert string of large numbers to int should return null
- [SQOOP-2349](#) - Add command line option for setting transaction isolation levels for metadata queries
- [SQOOP-2896](#) - Sqoop exec job fails with SQLException Access denied for user
- [SQOOP-2909](#) - Oracle related ImportTest fails after SQOOP-2737
- [SQOOP-2911](#) - Fix failing HCatalogExportTest caused by SQOOP-2863
- [SQOOP-2950](#) - Sqoop trunk has consistent UT failures - need fixing
- [SQOOP-2990](#) - Sqoop(oracle) export [updateTableToOracle] with "--update-mode allowinsert" : app fails with java.sql.SQLException: Missing IN or OUT parameter at index
- [SQOOP-3013](#) - Configuration "tmpjars" is not checked for empty strings before passing to MR
- [SQOOP-3028](#) - Include stack trace in the logging of exceptions in ExportTool
- [SQOOP-3053](#) - Create a cmd line argument for sqoop.throwOnError and use it through SqoopOptions
- [SQOOP-3055](#) - Fixing MySQL tests failing due to ignored test inputs/configuration
- [SQOOP-3057](#) - Fixing 3rd party Oracle tests failing due to invalid case of column names
- [SQOOP-3066](#) - Introduce an option + env variable to enable/disable SQOOP-2737 feature
- [SQOOP-3068](#) - Enhance error (tool.ImportTool: Encountered IOException running import job: java.io.IOException: Expected schema) to suggest workaround
- [SQOOP-3069](#) - Get OracleExportTest#testUpsertTestExport in line with SQOOP-3066
- [SQOOP-3071](#) - Fix OracleManager to apply localTimeZone correctly in case of Date objects too
- [SQOOP-3072](#) - Reenable escaping in ImportTest#testProductWithWhiteSpaceImport for proper execution
- [SQOOP-3081](#) - use OracleEscapeUtils.escapeIdentifier in OracleUpsertOutputFormat instead of inline appending quotes
- [SQOOP-3124](#) - Fix ordering in column list query of PostgreSQL connector to reflect the logical order instead of adhoc ordering
- [SQOOP-3140](#) - Removing deprecated mapred.map.max.attempts, mapred.reduce.max.attempts entries and using the new constants directly from Hadoop instead
- [SQOOP-3159](#) - Sqoop (export + --table) with Oracle table_name having '\$' fails with error

Issues Fixed in CDH 5.9.1

Upstream Issues Fixed

The following upstream issues are fixed in CDH 5.9.1:

- [AVRO-1943](#) - Fix test TestNettyServerWithCompression.testConnectionsCount
- [CRUNCH-592](#) - Job fails for null ByteBuffer value in Avro tables
- [FLUME-2797](#) - Use SourceCounter for SyslogTcpSource
- [FLUME-2844](#) - SpillableMemoryChannel must start ChannelCounter
- [FLUME-2982](#) - Add localhost escape sequence to HDFS sink
- [FLUME-3020](#) - Improve HDFS Sink escape sequence substitution
- [HADOOP-10300](#) - Allowed deferred sending of call responses
- [HADOOP-12453](#) - Support decoding KMS Delegation Token with its own Identifier
- [HADOOP-12483](#) - Maintain wrapped SASL ordering for postponed IPC responses
- [HADOOP-12973](#) - Make DU pluggable
- [HADOOP-12974](#) - Create a CachingGetSpaceUsed implementation that uses df
- [HADOOP-12975](#) - Add jitter to CachingGetSpaceUsed's thread
- [HADOOP-13034](#) - Log message about input options in distcp lacks some items
- [HADOOP-13072](#) - WindowsGetSpaceUsed constructor should be public
- [HADOOP-13317](#) - Add logs to KMS server-side to improve supportability
- [HADOOP-13353](#) - LdapGroupsMapping getPassword should not return null when IOException throws

- [HADOOP-13526](#) - Add detailed logging in KMS for the authentication failure of proxy user
- [HADOOP-13558](#) - UserGroupInformation created from a Subject incorrectly tries to renew the Kerberos ticket
- [HADOOP-13579](#) - Fix source-level compatibility after HADOOP-11252
- [HADOOP-13638](#) - KMS should set UGI's Configuration object properly
- [HADOOP-13669](#) - KMS Server should log exceptions before throwing
- [HADOOP-13693](#) - Remove the message about HTTP OPTIONS in SPNEGO initialization message from kms audit log
- [HDFS-4210](#) - Throw helpful exception when DNS entry for JournalNode cannot be resolved
- [HDFS-6962](#) - ACLs inheritance conflict with umaskmode
- [HDFS-7413](#) - Some unit tests should use NameNodeProtocols instead of FSNameSystem
- [HDFS-7415](#) - Move FSNameSystem.resolvePath() to FSDirectory
- [HDFS-7420](#) - Delegate permission checks to FSDirectory
- [HDFS-7463](#) - Simplify FSNamesystem#getBlockLocationsUpdateTimes
- [HDFS-7478](#) - Move org.apache.hadoop.hdfs.server.namenode.NNConf to FSNamesystem
- [HDFS-7517](#) - Remove redundant non-null checks in FSNamesystem#getBlockLocations
- [HDFS-7964](#) - Add support for async edit logging
- [HDFS-8224](#) - Schedule a block for scanning if its metadata file is corrupt
- [HDFS-8269](#) - getBlockLocations() does not resolve the .reserved path and generates incorrect edit logs when updating the atime
- [HDFS-8709](#) - Clarify automatic sync in FSEditLog#logEdit
- [HDFS-8809](#) - HDFS fsck reports under construction blocks as CORRUPT
- [HDFS-9038](#) - DFS reserved space is erroneously counted towards non-DFS used
- [HDFS-9601](#) - NNThroughputBenchmark.BlockReportStats should handle NotReplicatedYetException on adding block
- [HDFS-9630](#) - DistCp minor refactoring and clean up
- [HDFS-9638](#) - Improve DistCp Help and documentation
- [HDFS-9781](#) - FsDatasetImpl#getBlockReports can occasionally throw NullPointerException
- [HDFS-9820](#) - Improve distcp to support efficient restore to an earlier snapshot
- [HDFS-10216](#) - Distcp -diff throws exception when handling relative path
- [HDFS-10270](#) - TestJMXGet:testNameNode() fails
- [HDFS-10298](#) - Document the usage of distcp -diff option
- [HDFS-10312](#) - Large block reports can fail to decode at NameNode due to 64 MB protobuf maximum length restriction
- [HDFS-10313](#) - Distcp need to enforce the order of snapshot names passed to -diff
- [HDFS-10397](#) - Distcp should ignore -delete option if -diff option is provided instead of exiting
- [HDFS-10556](#) - DistCpOptions should be validated automatically
- [HDFS-10559](#) - DiskBalancer: Use SHA1 for Plan ID
- [HDFS-10567](#) - Improve plan command help message
- [HDFS-10609](#) - Uncaught InvalidEncryptionKeyException during pipeline recovery can abort downstream applications
- [HDFS-10641](#) - TestBlockManager#testBlockReportQueueing fails intermittently
- [HDFS-10652](#) - Add a unit test for HDFS-4660
- [HDFS-10722](#) - Fix race condition in TestEditLog#testBatchedSyncWithClosedLogs
- [HDFS-10760](#) - DataXceiver#run() should not log InvalidToken exception as an error
- [HDFS-10822](#) - Log DataNodes in the write pipeline
- [HDFS-10879](#) - TestEncryptionZonesWithKMS#testReadWrite fails intermittently
- [HDFS-10962](#) - TestRequestHedgingProxyProvider is unreliable
- [HDFS-10963](#) - Reduce log level when network topology cannot find enough datanodes
- [HDFS-11012](#) - Unnecessary INFO logging on DFSClients for InvalidToken
- [HDFS-11040](#) - Add documentation for HDFS-9820 distcp improvement
- [HDFS-11056](#) - Concurrent append and read operations lead to checksum error

- [MAPREDUCE-4784](#) - TestRecovery occasionally fails
- [MAPREDUCE-6628](#) - Potential memory leak in CryptoOutputStream
- [MAPREDUCE-6641](#) - TestTaskAttempt fails in trunk
- [MAPREDUCE-6670](#) - TestJobListCache#testEviction sometimes fails on Windows with timeout
- [MAPREDUCE-6718](#) - add progress log to JHS during startup
- [MAPREDUCE-6728](#) - Give fetchers hint when ShuffleHandler rejects a shuffling connection
- [MAPREDUCE-6738](#) - TestJobListCache.testAddExisting failed intermittently in slow VM testbed
- [MAPREDUCE-6771](#) - RMContainerAllocator sends container diagnostics event after corresponding completion event
- [MAPREDUCE-6798](#) - Fix intermittent failure of TestJobHistoryParsing.testJobHistoryMethods
- [YARN-2977](#) - Fixed intermittent TestNMClient failure
- [YARN-3601](#) - Fix UT TestRMFailover.testRMWebAppRedirect
- [YARN-3654](#) - ContainerLogsPage web UI should not have meta-refresh
- [YARN-3722](#) - Merge multiple TestWebAppUtils into o.a.h.yarn.webapp.util.TestWebAppUtils
- [YARN-4004](#) - container-executor should print output of docker logs if the docker container exits with non-0 exit status
- [YARN-4017](#) - container-executor overuses PATH_MAX
- [YARN-4092](#) - Fixed UI redirection to print useful messages when both RMs are in standby mode
- [YARN-4245](#) - Generalize config file handling in container-executor
- [YARN-4255](#) - container-executor does not clean up Docker operation command files
- [YARN-4820](#) - ResourceManager web redirects in HA mode drops query parameters
- [YARN-4940](#) - yarn node -list -all fail if RM starts with decommissioned node
- [YARN-5001](#) - Aggregated Logs root directory is created with wrong group if nonexistent
- [YARN-5107](#) - TestContainerMetrics fails
- [YARN-5246](#) - NMWebAppFilter web redirects drop query parameters
- [YARN-5704](#) - Provide configuration knobs to control enabling/disabling new/work in progress features in container-executor
- [YARN-5837](#) - NPE when getting node status of a decommissioned node after an RM restart
- [YARN-5862](#) - TestDiskFailures.testLocalDirsFailures failed
- [HBASE-15324](#) - Jitter can cause desiredMaxFileSize overflow in ConstantSizeRegionSplitPolicy and trigger unexpected split
- [HBASE-15430](#) - Failed taking snapshot - Manifest proto-message too large
- [HBASE-15856](#) - Do not cache unresolved addresses for connections
- [HBASE-16172](#) - Unify the retry logic in ScannerCallableWithReplicas and RpcRetryingCallerWithReadReplicas
- [HBASE-16270](#) - Handle duplicate clearing of snapshot in region replicas
- [HBASE-16294](#) - hbck reporting "No HDFS region dir found" for replicas
- [HBASE-16345](#) - RpcRetryingCallerWithReadReplicas#call() should catch some RegionServer Exceptions
- [HBASE-16360](#) - TableMapReduceUtil addHBaseDependencyJars has the wrong class name for PrefixTreeCodec
- [HBASE-16699](#) - Overflows in AverageIntervalRateLimiter's refill() and getWaitInterval()
- [HBASE-16767](#) - Mob compaction needs to clean up files in /hbase/mobdir/.tmp and /hbase/mobdir/.tmp/.bulkload when running into IO exceptions
- [HBASE-16824](#) - Writer.flush() can be called on already closed streams in WAL roll
- [HIVE-9570](#) - Investigate test failure on union_view.q
- [HIVE-10007](#) - Support qualified table name in analyze table compute statistics for columns
- [HIVE-10384](#) - BackportRetryingMetaStoreClient does not retry wrapped TTransportExceptions
- [HIVE-10728](#) - Deprecate unix_timestamp(void) and make it deterministic
- [HIVE-10965](#) - Direct SQL for stats fails in 0-column case
- [HIVE-11901](#) - StorageBasedAuthorizationProvider requires write permission on table for SELECT statements
- [HIVE-12077](#) - MSCK Repair table should fix partitions in batches
- [HIVE-12083](#) - HIVE-10965 introduces Thrift error if partNames or colNames are empty

- [HIVE-12475](#) - Parquet schema evolution within array<struct<>> does not work
- [HIVE-12646](#) - Revert "beeline and HIVE CLI do not parse"
- [HIVE-12757](#) - Fix TestCodahaleMetrics#testFileReporting
- [HIVE-12891](#) - Hive fails when java.io.tmpdir is set to a relative location
- [HIVE-13058](#) - Add session and operation_log directory deletion messages
- [HIVE-13198](#) - Authorization issues with cascading views
- [HIVE-13237](#) - Select parquet struct field with uppercase throws NPE
- [HIVE-13381](#) - Backport introduced potential differences in the q-file output which need to be investigated further
- [HIVE-13381](#) - Timestamp and date should have precedence in type hierarchy over string group
- [HIVE-13429](#) - Tool to remove dangling scratch directory
- [HIVE-13620](#) - Merge llap branch work to master
- [HIVE-13625](#) - Hive Prepared Statement when executed with escape characters in parameter fails
- [HIVE-13645](#) - Beeline needs null-guard around hiveVars and hiveConfVars read
- [HIVE-13997](#) - Insert overwrite directory does not overwrite existing files
- [HIVE-14173](#) - NPE was thrown after enabling directsql in the middle of session
- [HIVE-14205](#) - Hive does not support union type with AVRO file format
- [HIVE-14313](#) - Test failure TestMetaStoreMetrics.testConnections
- [HIVE-14383](#) - SparkClientImpl should pass principal and keytab to spark-submit instead of calling kinit explicitly
- [HIVE-14395](#) - Add the missing data files to Avro union tests (HIVE-14205 addendum)
- [HIVE-14421](#) - FS.deleteOnExit holds references to _tmp_space.db files
- [HIVE-14426](#) - Extensive logging on info level in WebHCat
- [HIVE-14436](#) - Hive 1.2.1/Hitting "ql.Driver: FAILED: IllegalArgumentException Error"
- [HIVE-14538](#) - beeline throws exceptions with parsing Hive config when using !sh statement
- [HIVE-14697](#) - Cannot access kerberized HS2 Web UI
- [HIVE-14715](#) - Hive throws NumberFormatException with query with Null value
- [HIVE-14743](#) - ArrayIndexOutOfBoundsException - HBASE-backed views' query with JOINS
- [HIVE-14762](#) - Add logging while removing scratch space
- [HIVE-14784](#) - Operation logs are disabled automatically if the parent directory does not exist
- [HIVE-14799](#) - Query operation are not thread safe during its cancellation
- [HIVE-14805](#) - Subquery inside a view will have the object in the subquery as the direct input
- [HIVE-14810](#) - Fix failing test: TestMetaStoreMetrics.testMetaDataCounts.
- [HIVE-14817](#) - Shutdown the SessionManager timeoutChecker thread properly upon shutdown
- [HIVE-14839](#) - Improve the stability of TestSessionManagerMetrics
- [HIVE-14889](#) - Beeline leaks sensitive environment variables of HiveServer2
- [HIVE-15054](#) - Hive insertion query execution fails on Hive on Spark
- [HIVE-15061](#) - Metastore types are sometimes case sensitive
- [HIVE-15090](#) - Temporary DB failure can stop ExpiredTokenRemover thread
- [HIVE-15231](#) - Query on view with CTE and alias fails with table not found error
- [HUE-4941](#) - [editor] Content Security Policy directive blocks an image when navigating on marker map
- [HUE-5041](#) - [editor] Hue export large file to HDFS doesn't work on non-default database
- [HUE-4631](#) - [home] DB transaction failing because of atomic block on home page
- [HUE-5218](#) - [search] Validate dashboard sharing works
- [HUE-5028](#) - [security] Share Oozie workflow with modify permission;however, the user can't edit the shared WF
- [HUE-5163](#) - [security] Speed up initial page rendering
- [IMPALA-3949](#) - Log error message in FileSystemUtil.copyToLocal()
- [IMPALA-4076](#) - Fix runtime filter sort compare method
- [IMPALA-4099](#) - Fix the error message while loading UDFs with no JARs
- [IMPALA-4120](#) - Incorrect results with LEAD() analytic function
- [IMPALA-4135](#) - Thrift threaded server times out connections during high load
- [IMPALA-4153](#) - Fix count(*) on all blank("") columns - test

- [IMPALA-4170](#) - Fix identifier quoting in COMPUTE INCREMENTAL STATS
- [IMPALA-4196](#) - Cross compile bit-byte-functions
- [IMPALA-4223](#) - Handle truncated file read from HDFS cache
- [IMPALA-4237](#) - Fix materialization of 4-byte decimals in data source scan node
- [IMPALA-4246](#) - SleepForMs() utility function has undefined behavior for > 1s
- [IMPALA-4301](#) - Fix IGNORE NULLS with subquery rewriting
- [IMPALA-4336](#) - Cast exprs after unnesting union operands
- [IMPALA-4387](#) - Validate decimal type in Avro file schema
- [IMPALA-4751](#) - For unknown query IDs, /query_profile_encoded?query_id=123 starts with an empty line.
- [IMPALA-4423](#) - Correct but conservative implementation of Subquery.equals().
- [OOZIE-1814](#) - Oozie should mask any passwords in logs and REST interfaces
- [OOZIE-2582](#) - Populating external child IDs for action failures

- [PIG-3807](#) - Pig creates wrong schema after dereferencing nested tuple fields with sorts
- [PIG-3818](#) - PIG-2499 is accidentally reverted
- [SENTRY-858](#) - Add a test case for "Database prefix is not honoured when executing grant statement"
- [SENTRY-1313](#) - Database prefix is not honoured when executing grant statement
- [SENTRY-1429](#) - Backport and fix conflicts in SENTRY-1454
- [SENTRY-1464](#) - Fix Sentry e2e test failure in org.apache.sentry.tests.e2e.dbprovider.TestDbUriPermissions.testAlterPartitionLocationPrivileges
- [SQLR-9310](#) - PeerSync fails on a node restart due to IndexFingerPrint mismatch
- [SPARK-12009](#) - Avoid re-allocating YARN container while driver wants to stop all executors
- [SPARK-12339](#) - Added a NullPointerException for executor stage kill from web UI
- [SPARK-12392](#) - Optimize a location order of broadcast blocks by considering preferred local hosts
- [SPARK-12941](#) - Spark-SQL JDBC Oracle dialect fails to map string datatypes to Oracle VARCHAR datatype
- [SPARK-12966](#) - ArrayType(DecimalType) support in Postgres JDBC
- [SPARK-13242](#) - codegen fallback in case-when if there many branches
- [SPARK-13328](#) - Poor read performance for broadcast variables with dynamic resource allocation
- [SPARK-16625](#) - General data types to be mapped to Oracle
- [SPARK-16711](#) - YarnShuffleService does not re-init properly on YARN rolling upgrade
- [SPARK-17171](#) - DAG lists all partitions in the graph
- [SPARK-17433](#) - YarnShuffleService does not handle moving credentials levelDb
- [SPARK-17611](#) - Make shuffle service test really test authentication
- [SPARK-17644](#) - Do not add failedStages when abortStage for fetch failure
- [SPARK-17696](#) - Partial backport to branch-1.6.
- [SQOOP-2884](#) - Document --temporary-rootdir
- [SQOOP-2915](#) - Fixing Oracle-related unit tests
- [SQOOP-2952](#) - Fix Sqoop1 (import + --hbase-bulkload) row key not added into column family
- [SQOOP-2983](#) - OraOop export has degraded performance with wide tables
- [SQOOP-2986](#) - Add validation check for --hive-import and --incremental lastmodified
- [SQOOP-3021](#) - ClassWriter fails if a column name contains a backslash character
- [SQOOP-3034](#) - HBase import should fail fast if using anything other than as-textfile

Issues Fixed in CDH 5.9.0

CDH 5.9.0 fixes the following issues.

Apache Flume

Use SourceCounter for SyslogTcpSource

Bug: [FLUME-2797](#)

SyslogTcpSource uses a deprecated class. Use the newer SouceCounter class for SyslogTcpSource, and mark SyslogTcpSouce as deprecated.

SpillableMemoryChannel must start ChannelCounter

Bug: [FLUME-2844](#)

When using SpillableMemoryChannel, a bug causes the values of all metrics of channel component monitoring system to be zero.

Add localhost escape sequence to HDFS sink

Bug: [FLUME-2982](#)

The HDFS sink should just use localhost escape sequence instead of having to pass in a header and use the host interceptor.

Apache Hadoop

When removing a stored block, use stored BlockInfo for updating UnderReplicatedBlocks

Cloudera Bug: CDH-33233

During the removal of a stored block, BlockManager UnderReplicatedBlocks needs to be updated with the stored BlockInfo instead of the incoming Block, so that the Block with the correct generation stamp is used to calculate any pending replication that needs to be triggered.

Fix a race condition in MetricsSourceAdapter.updateJmxCache

Bug: [HADOOP-11361](#)

KMS Server should log exceptions before throwing

Cloudera Bug: CDH-45378

Bug: [HADOOP-13669](#)[HADOOP-13317](#)

When KMS throws an exception, it is not logged anywhere, and the exception message can only be seen from the client side, not the stacktrace

LdapGroupsMapping getPassword should not return null when IOException throws

Bug: [HADOOP-13353](#)

When IOException throws in getPassword(), getPassword() returns a null string. This causes setConf() to throw a java.lang.NullPointerException.

Add detailed logging in KMS for the authentication failure of a proxy user

Bug: [HADOOP-13526](#)

The log message from AuthenticationFilter.java indicates that the user was successfully authenticated. However, when the filter on DelegationTokenAuthenticationFilter is called, it hits an exception and there is no log message

UserGroupInformation created from a Subject incorrectly tries to renew the Kerberos ticket

Bug: [HADOOP-13558](#)

Cloudera Bug: CDH-45245

KMS should set UGI Configuration object properly

Bug: [HADOOP-13638](#)

The Configuration object in UGI in KMS server is not initialized properly, so it does not load core-site.xml from KMSConfiguration.KMS_CONFIG_DIR.

Throw helpful exception when DNS entry for JournalNode cannot be resolved

Bug: [HDFS-4210](#)

Cloudera Bug: CDH-43377

FSDirectory and FSNameSystem issues

Bug: [HDFS-7415](#) [HDFS-7420](#) [HDFS-7463](#) [HDFS-7478](#) [HDFS-7517](#) [HDFS-8269](#)

Cloudera Bug: CDH-44736

Schedule a block for scanning if its metadata file is corrupt

Bug: [HDFS-8224](#)

Cloudera Bug: CDH-44945

A block with corrupt metadata is not scheduled for scanning by BlockPoolSliceScanner, so it is not reported as corrupt.

DiskBalancer: Use SHA1 for plan ID

Bug: [HDFS-10559](#)

SHA1 should be used as the plan ID instead of Sha512 because much shorter and easier to handle.

Improve plan command help message

Bug: [HDFS-10567](#)

The help message for the plan command needs to be clarified and corrected.

PlanCommand#getThrsoldPercentage should not use throughput value

Bug: [HDFS-10600](#)

Cloudera Bug: CDH-41858

Namenode should use loginUser(hdfs) to generateEncryptedKey

Bug: [HDFS-10643](#)

HDFS namenode login user (hdfs) should always be used when talking to KMS to generateEncryptedKey for new file creation.

DataXceiver#run() should not log InvalidToken exception as an error

Bug: [HDFS-10760](#)

Cloudera Bug: CDH-32905

When the client has an expired token and refetches a new token, the DataNode logs an error.

Log DataNodes in the write pipeline

Bug: [HDFS-10822](#)

Cloudera Bug: CDH-43898

You cannot tell which DataNodes are involved in the write pipeline. A DEBUG trace should be added to print the list of DataNodes in the pipeline.

Reduce log level when network topology cannot find enough DataNodes

Bug: [HDFS-10963](#)

Cloudera Bug: CDH-44288

The warning-level log event should be reduced to help prevent unnecessary concern about the event.

Unnecessary INFO logging on DFSclients for InvalidToken

Bug: [HDFS-11012](#)

Cloudera Bug: CDH-32905

InvalidBlockTokenException should be changed to DEBUG to help prevent unnecessary concern about the event.

Potential memory leak in CryptoOutputStream

Bug: [MAPREDUCE-6628](#)

A potential memory leak in `CryptoOutputStream.java` allocates two direct byte buffers (`inBuffer` and `outBuffer`) that are freed when `close()` method is called.

Add progress log to JHS during startup

Bug: [MAPREDUCE-6718](#)

When the JHS starts up, it initializes the internal caches and storage through the `HistoryFileManager`. If a large number of finished jobs exist, this startup phase can last minutes without logging progress.

RMContainerAllocator sends container diagnostics event after corresponding completion event

Bug: [MAPREDUCE-6771](#)

Diagnostics information may never get into `.jhist` file, so when the job completes, the diagnostics information associated with the failed task attempts is empty.

yarn node -list -all fails if ResourceManager starts with decommissioned node

Bug: [YARN-4940](#)

Apache HBase

Superuser does not consider the keytab credentials

Bug: [HBASE-15622](#)

The superuser added by default (the process running HBase) does not take in consideration the keytab credential.

Do not cache unresolved addresses for connections

Bug: [HBASE-15856](#)

During periods where DNS is not working properly, caching can occur for connections to Master or RegionServers where the initial hostname resolution and the resolution is never reattempted. This causes clients to get `UnknownHostException` for any calls.

Overflows in AverageIntervalRateLimiter's refill() and getWaitInterval()

Bug: [HBASE-16699](#)

Mob compaction needs to clean up files in `/hbase/mobdir/.tmp` and `/hbase/mobdir/.tmp/.bulkload` when running into IO exceptions

Bug: [HBASE-16767](#)

Apache Hive

WebUI Elapsed Time may mislead users to mean query run time

Bug: [HIVE-13420](#)

Cloudera Bug: CDH-39011

When running queries from Hue, WebUI's elapsed time continuously increases.

Table not found error when trying to refresh column statistics in Metastore Manager

Bug: [HIVE-10007](#)

Cloudera Bug: CDH-42873

When you try to refresh column statistics in the Metastore Manager, it fails with the following error message:

```
Error while compiling statement: FAILED: SemanticException
[Error 10001]: Line 1:157 Table not found ''
```

StorageBasedAuthorizationProvider requires write permission on table for SELECT

Bug: [HIVE-11901](#)

Cloudera Bug: CDH-43893

StorageBasedAuthorizationProvider requires write permission on table for SELECT statements.

Subquery inside a view will have the object in the subquery as the direct input

Bug: [HIVE-14805](#)

Cloudera Bug: CDH-45077

Hive query fails from HUE for some users

Bug: [HIVE-14784](#)

Cloudera Bug: CDH-44088

Operation logging is disabled automatically for the query if for some reason the parent directory (named after the Hive session ID) created when the session is established gets deleted.

Hive throws NumberFormatException with query with Null value

Bug: [HIVE-14715](#)

Cloudera Bug: CDH-44193

Hue

[editor] Improved autocompleter

Bug: [HUE-4039](#)

[editor] Improve result table scroll performance and fix header positioning

Bug: [HUE-4910](#)

[editor] Progress status and truncating warning when direct downloading results as Excel

Bug: [HUE-4438](#)

[fb] Allow to browse S3 (other filesystems)

Bug: [HUE-2915](#)

[editor] Export query result to S3

Bug: [HUE-4367](#)

[metastore] UX create table from a file, S3 or from a directory

Bug: [HUE-4425](#)

[core] Missing some security related response headers

Bug: [HUE-4372](#)

Wildcard Certificates not supported

Cloudera Bug: CDH-39117

Hue now supports wildcard certificates and certificates using Subject Alternative Name (SAN).

Cookie without HttpOnly flag set

Cloudera Bug: CDH-41607

The HttpOnly flag is now in the response header, preventing cookies from being accessed through a client side script.

Password reveal should be disabled

Cloudera Bug: CDH-41952

The Password Reveal button is now disabled on Internet Explorer.

Web server and platform version disclosure should be prevented

Cloudera Bug: CDH-41953

Web server and platform versions were removed from the response headers.

Apache Oozie

Oozie Web Console returns 500 error when Oozie server runs on JDK 8u75 or higher

Bug: [OOZIE-2533](#)

Cloudera Bug: CDH-40362

The Oozie Web Console returns a 500 error when the Oozie server is running on JDK 8u75 and higher. The Oozie server still functions, and you can use the Oozie command line, REST API, Java API, or the Hue Oozie Dashboard to review status of those jobs.

Oozie should mask any passwords in logs and REST interfaces

Bug: [OOZIE-1814](#)

The following passwords are currently visible in the instrumentation log, REST endpoints, WebUI, and CLI and should be masked:

```
javax.net.ssl.trustStorePassword
oozie.https.keystore.pass
HADOOP_CREDSTORE_PASSWORD
OOZIE_HTTPS_KEYSTORE_PASSWORD
OOZIE_HTTPS_TRUSTSTORE_PASSWORD
```

Cloudera Search

Crunchindexertool YARN job reports success even when indexing fails

Cloudera Bug: CDH-45888

When running a Spark indexer job that fails due to shards being down, Kerberos failures, or other problems), the YARN final status is still reported as SUCCEEDED when it should be failed.

Upstream Issues Fixed

The following upstream issues are fixed in CDH 5.9.0:

- [FLUME-2797](#) - Use SourceCounter for SyslogTcpSource
- [FLUME-2844](#) - SpillableMemoryChannel must start ChannelCounter
- [FLUME-2909](#) - Upgrade RAT to 0.11
- [FLUME-2920](#) - Kafka Channel Should Not Commit Offsets When Stopping
- [HADOOP-11031](#) - Design Document for Credential Provider API
- [HADOOP-11149](#) - Increase the timeout of TestZKFailoverController
- [HADOOP-11180](#) - Change log message "token.Token: Cannot find class for token kind kms-dt" to debug
- [HADOOP-11814](#) - Reformat hadoop-annotations, o.a.h. classification.tools
- [HADOOP-11872](#) - hadoop dfs command prints message about using "yarn jar" on Windows (branch-2 only)
- [HADOOP-12465](#) - Incorrect Javadoc in WritableUtils.java
- [HADOOP-12537](#) - S3A to support Amazon STS temporary credentials
- [HADOOP-12548](#) - Read s3a creds from a Credential Provider
- [HADOOP-12589](#) - Fix intermittent test failure of TestCopyPreserveFlag
- [HADOOP-12613](#) - TestFind.processArguments occasionally fails
- [HADOOP-12636](#) - Prevent ServiceLoader failure init for unused FileSystems
- [HADOOP-12723](#) - S3A: Add ability to plug in any AWSCredentialsProvider
- [HADOOP-12800](#) - Copy docker directory from 2.8 to 2.7/2.6 repos to enable pre-commit Jenkins runs
- [HADOOP-12847](#) - Hadoop daemonlog should support https and SPNEGO for Kerberized cluster
- [HADOOP-12893](#) - Verify LICENSE.txt and NOTICE.txt

- [HADOOP-12928](#) - Update netty to 3.10.5.Final to sync with ZooKeeper
- [HADOOP-12991](#) - Conflicting default ports in DelegateToFileSystem
- [HADOOP-13098](#) - Dynamic LogLevel setting page should accept case-insensitive log level string
- [HADOOP-13103](#) - Group resolution from LDAP may fail on javax.naming.ServiceUnavailableException
- [HADOOP-13154](#) - S3AFileSystem printAmazonServiceException/printAmazonClientException appear copy and paste of AWS examples
- [HADOOP-13189](#) - FairCallQueue makes callQueue larger than the configured capacity
- [HADOOP-13192](#) - org.apache.hadoop.util.LineReader cannot handle multibyte delimiters correctly
- [HADOOP-13202](#) - Avoid possible overflow in org.apache.hadoop.util.bloom.BloomFilter#getNBytes
- [HADOOP-13228](#) - Add delegation token to the connection in DelegationTokenAuthenticator
- [HADOOP-13254](#) - Create framework for configurable disk checkers
- [HADOOP-13290](#) - Appropriate use of generics in FairCallQueue
- [HADOOP-13297](#) - Add missing dependency in setting maven-remote-resource-plugin to fix builds
- [HADOOP-13298](#) - Fix the leftover L&N files in hadoop-build-tools/src/main/resources/META-INF/
- [HADOOP-13316](#) - Enforce Kerberos authentication for required ops in DelegationTokenAuthenticator
- [HADOOP-13350](#) - Additional fix to LICENSE and NOTICE
- [HADOOP-13351](#) - TestDFSClientSocketSize buffer size tests are flaky
- [HADOOP-13362](#) - DefaultMetricsSystem leaks the source name when a source unregisters
- [HADOOP-13380](#) - TestBasicDiskValidator should not write data to /tmp
- [HADOOP-13395](#) - Enhance TestKMSAudit
- [HADOOP-13443](#) - KMS should check the type of underlying keyprovider of KeyProviderExtension before falling back to default
- [HADOOP-13461](#) - NPE in KeyProvider.rollNewVersion
- [HADOOP-13476](#) - CredentialProviderFactory fails at class loading from libhdfs (JNI)
- [HADOOP-13494](#) - ReconfigurableBase can log sensitive information
- [HADOOP-13526](#) - Add detailed logging in KMS for the authentication failure of proxy user
- [HADOOP-13558](#) - UserGroupInformation created from a Subject incorrectly tries to renew the Kerberos ticket
- [HADOOP-13579](#) - Fix source-level compatibility after HADOOP-11252
- [HADOOP-13638](#) - KMS should set UGI's Configuration object properly
- [HDFS-2580](#) - NameNode#main(...) can make use of GenericOptionsParser
- [HDFS-4176](#) - EditLogTailer should call rollEdits with a timeout
- [HDFS-7415](#) - Move FSNameSystem.resolvePath() to FSDirectory
- [HDFS-7420](#) - Delegate permission checks to FSDirectory
- [HDFS-7463](#) - Simplify FSNamesystem#getBlockLocationsUpdateTimes
- [HDFS-7478](#) - Move org.apache.hadoop.hdfs.server.namenode.NNConf to FSNamesystem
- [HDFS-7517](#) - Remove redundant non-null checks in FSNamesystem#getBlockLocations
- [HDFS-7934](#) - Update RollingUpgrade rollback documentation: should use bootstrapstandby for standby NN
- [HDFS-8101](#) - DFSClient use of non-constant DFSConfigKeys pulls in WebHDFS classes at runtime
- [HDFS-8224](#) - Schedule a block for scanning if its metadata file is corrupt
- [HDFS-8269](#) - getBlockLocations() does not resolve the .reserved path and generates incorrect edit logs when updating the atime
- [HDFS-8521](#) - Add VisibleForTesting annotation to BlockPoolSlice#selectReplicaToDelete
- [HDFS-8600](#) - TestWebHdfsFileSystemContract.testGetFileBlockLocations fails in branch-2.7
- [HDFS-8608](#) - Merge HDFS-7912 to trunk and branch-2 (track BlockInfo instead of Block in UnderReplicatedBlocks and PendingReplicationBlocks)
- [HDFS-8633](#) - Fix setting of dfs.datanode.readahead.bytes in hdfs-default.xml to match DFSConfigKeys
- [HDFS-8682](#) - Should not remove decommissioned node while calculating the number of live/dead decommissioned nodes
- [HDFS-8780](#) - Fetching live/dead datanode list with arg true for removeDecommissionNode, returns list with decom node
- [HDFS-9033](#) - dfsadmin -metasave prints "NaN" for cache used%

- [HDFS-9048](#) - DistCp documentation is out-of-date
- [HDFS-9413](#) - getContentSummary() on standby should throw StandbyException
- [HDFS-9530](#) - ReservedSpace is not cleared for abandoned Blocks
- [HDFS-9533](#) - seen_txid in the shared edits directory is modified during bootstrapping
- [HDFS-9601](#) - NNThroughputBenchmark.BlockReportStats should handle NotReplicatedYetException on adding block
- [HDFS-9696](#) - Garbage snapshot records linger forever
- [HDFS-9765](#) - TestBlockScanner#testVolumeliteratorWithCaching fails intermittently
- [HDFS-9781](#) - FsDatasetImpl#getBlockReports can occasionally throw NullPointerException
- [HDFS-10225](#) - DataNode hot swap drives should disallow storage type changes
- [HDFS-10245](#) - Fix the findbugs warnings in branch-2.7
- [HDFS-10335](#) - Mover\$Processor#chooseTarget() always chooses the first matching target storage group
- [HDFS-10336](#) - TestBalancer failing intermittently because of not resetting UserGroupInformation completely
- [HDFS-10347](#) - Namenode report bad block method doesn't log the bad block or datanode
- [HDFS-10458](#) - getFileEncryptionInfo should return quickly for non-encrypted cluster
- [HDFS-10474](#) - hftp copy fails when file name with Chinese+special char in branch-2
- [HDFS-10623](#) - Remove unused import of httpClient.HttpConnection from TestWebHdfsTokens
- [HDFS-10625](#) - VolumeScanner to report why a block is found bad
- [HDFS-10641](#) - TestBlockManager#testBlockReportQueueing fails intermittently
- [HDFS-10653](#) - Optimize conversion from path string to components
- [HDFS-10688](#) - BPSERVICEActor may run into a tight loop for sending block report when hitting IOException
- [HDFS-10691](#) - FileDistribution fails in hdfs oiv command due to ArrayIndexOutOfBoundsException
- [HDFS-10693](#) - metaSave should print blocks, not LightweightHashSet
- [HDFS-10703](#) - HA NameNode Web UI should show last checkpoint time
- [HDFS-10716](#) - In Balancer, the target task should be removed when its size < 0
- [HDFS-10879](#) - TestEncryptionZonesWithKMS#testReadWrite fails intermittently
- [HDFS-10962](#) - TestRequestHedgingProxyProvider is flaky
- [HDFS-10963](#) - Reduce log level when network topology cannot find enough datanodes
- [MAPREDUCE-6242](#) - Progress report log is incredibly excessive in application master
- [MAPREDUCE-6259](#) - IllegalArgument Exception due to missing job submit time
- [MAPREDUCE-6374](#) - Distributed Cache File visibility should check permission of full path
- [MAPREDUCE-6533](#) - testDetermineCacheVisibilities of TestClientDistributedCacheManager is broken
- [MAPREDUCE-6628](#) - Potential memory leak in CryptoOutputStream
- [MAPREDUCE-6633](#) - AM should retry map attempts if the reduce task encounters compression related errors
- [MAPREDUCE-6641](#) - TestTaskAttempt fails in trunk
- [MAPREDUCE-6652](#) - Add configuration property to prevent JHS from loading jobs with a task count greater than X
- [MAPREDUCE-6718](#) - Add progress log to JHS during startup
- [MAPREDUCE-6724](#) - Single shuffle to memory must not exceed Integer#MAX_VALUE
- [MAPREDUCE-6741](#) - Add MR support to redact job conf properties
- [MAPREDUCE-6751](#) - Add debug log message when splitting is not possible due to unsplitable compression
- [MAPREDUCE-6771](#) - RMContainerAllocator sends container diagnostics event after corresponding completion event
- [YARN-3212](#) - RMNode State Transition Update with DECOMMISSIONING state
- [YARN-3226](#) - UI changes for decommissioning node
- [YARN-3445](#) - Cache runningApps in RMNode for getting running apps on given NodeId
- [YARN-4556](#) - TestFifoScheduler.testResourceOverCommit fails
- [YARN-4568](#) - Fix message when NodeManager runs into errors initializing the recovery directory
- [YARN-4702](#) - FairScheduler: Allow setting maxResources for ad hoc queues
- [YARN-4940](#) - yarn node -list -all failed if RM start with decommissioned node

- [YARN-5024](#) - TestContainerResourceUsage#testUsageAfterAMRestartWithMultipleContainers random failure
- [YARN-5343](#) - TestContinuousScheduling#testSortedNodes fails intermittently
- [YARN-5434](#) - Add -client|server argument for graceful decommission
- [YARN-5483](#) - Optimize RMAAppAttempt#pullJustFinishedContainers
- [YARN-5549](#) - AMLauncher#createAMContainerLaunchContext() should not log the command to be launched indiscriminately
- [YARN-5566](#) - Client-side NM graceful decom is not triggered when jobs finish
- [YARN-5655](#) - TestContainerManagerSecurity#testNMTokens is asserting
- [HBASE-15396](#) - Enhance mapreduce.TableSplit to add encoded region name
- [HBASE-15856](#) - Don't cache unresolved addresses for connections
- [HBASE-15889](#) - String case conversions are locale-sensitive, used without locale
- [HBASE-15891](#) - Closeable resources potentially not getting closed if exception is thrown
- [HBASE-15946](#) - Eliminate possible security concerns in Store File metrics
- [HBASE-16023](#) - Fastpath for the FIFO rpcscheduler
- [HBASE-16035](#) - Nested AutoCloseables might not all get closed
- [HBASE-16096](#) - Backport. Cleanly remove replication peers from ZooKeeper
- [HBASE-16140](#) - Bump owasp.esapi from 2.1.0 to 2.1.0.1
- [HBASE-16294](#) - hbck reporting "No HDFS region dir found" for replicas
- [HBASE-16379](#) - [replication] Minor improvement to replication/copy_tables_desc.rb
- [HBASE-16450](#) - Shell tool to dump replication queues
- [HBASE-16699](#) - Overflows in AverageIntervalRateLimiter's refill() and getWaitInterval()
- [HBASE-16767](#) - Mob compaction needs to clean up files in /hbase/mobdir/.tmp and /hbase/mobdir/.tmp/.bulkload when running into IO exceptions
- [HIVE-4570](#) - Add more information to GetOperationStatus in HiveServer2 when query is still executing
- [HIVE-6758](#) - Beeline doesn't work with -e option when started in background
- [HIVE-9013](#) - Hive set command exposes metastore db password
- [HIVE-9302](#) - Beeline add commands to register local jdbc driver names and jars
- [HIVE-9570](#) - Investigate test failure on union_view
- [HIVE-9657](#) - Use new parquet Types API builder to construct data types
- [HIVE-10190](#) - CBO: AST mode checks for TABLESAMPLE with AST.toString().contains
- [HIVE-10485](#) - Create md5 UDF
- [HIVE-10624](#) - Update the initial script to make beeline bucked cli as default and allow user choose old hive cli by env
- [HIVE-10684](#) - Fix the unit test failures for HIVE-7553 after HIVE-10674 removed the binary jar files
- [HIVE-10705](#) - Update tests for HIVE-9302 after removing binaries
- [HIVE-10722](#) - External table creation with msck in Hive can create unusable partition
- [HIVE-10755](#) - Rework on HIVE-5193 to enhance the column oriented table access
- [HIVE-10824](#) - Need to update start script changes in .cmd files
- [HIVE-10904](#) - Use beeline-log4j.properties for migrated CLI [beeline-cli Branch]
- [HIVE-10965](#) - Direct SQL for stats fails in 0-column case
- [HIVE-11028](#) - Tez: table self join and join with another table fails with IndexOutOfBoundsException
- [HIVE-11226](#) - BeeLine-Cli: support hive.cli.prompt in new CLI
- [HIVE-11236](#) - BeeLine-Cli: use the same output format as old CLI in the new CLI
- [HIVE-11280](#) - Support executing script file from hdfs in new CLI [Beeline-CLI branch]
- [HIVE-11316](#) - Use datastructure that doesnt duplicate any part of string for ASTNode::toStringTree()
- [HIVE-11336](#) - Support initial file option for new CLI [beeline-cli branch]
- [HIVE-11352](#) - Avoid the double connections with 'e' option [beeline-cli branch]
- [HIVE-11375](#) - Broken processing of queries containing NOT (x IS NOT NULL and x <> 0)
- [HIVE-11490](#) - Lazily call ASTNode::toStringTree() after tree modification
- [HIVE-11624](#) - Beeline-cli: support hive.cli.print.header in new CLI [beeline-cli branch]

- [HIVE-11637](#) - Support hive.cli.print.current.db in new CLI [beeline-cli branch]
- [HIVE-11640](#) - Shell command doesn't work for new CLI [Beeline-cli branch]
- [HIVE-11717](#) - nohup mode is not supported for new hive CLI
- [HIVE-11746](#) - Connect command should not to be allowed from user [beeline-cli branch]
- [HIVE-11796](#) - CLI option is not updated when executing the initial files [beeline-cli]
- [HIVE-11943](#) - Set old CLI as the default Client when using Hive script
- [HIVE-11944](#) - Address the review items on HIVE-11778
- [HIVE-11990](#) - Loading data inpath from a temporary table dir fails on Windows
- [HIVE-12018](#) - beeline --help doesn't return to original prompt
- [HIVE-12080](#) - Support auto type widening (int->bigint & float->double) for Parquet table
- [HIVE-12083](#) - HIVE-10965 introduces thrift error if partNames or colNames are empty
- [HIVE-12215](#) - Exchange partition does not show outputs field for post/pre execute hooks
- [HIVE-12246](#) - Orc FileDump fails with Missing CLI jar
- [HIVE-12259](#) - Command containing semicolon is broken in Beeline
- [HIVE-12345](#) - Followup for HIVE-9013 : Hidden conf vars still visible through beeline
- [HIVE-12475](#) - Parquet schema evolution within array<struct<>> does not work
- [HIVE-12590](#) - Repeated UDAFs with literals can produce incorrect result
- [HIVE-12721](#) - Add UUID built in function
- [HIVE-12785](#) - View with union type and UDF to the struct is broken
- [HIVE-12834](#) - Fix to accept the arrow keys in BeeLine CLI
- [HIVE-12983](#) - Provide a builtin function to get Hive version
- [HIVE-12987](#) - Add metrics for HS2 active users and SQL operations
- [HIVE-13058](#) - Add session and operation_log directory deletion messages
- [HIVE-13093](#) - Hive metastore does not exit on start failure
- [HIVE-13151](#) - Clean up UGI objects in FileSystem cache for transactions
- [HIVE-13198](#) - Authorization issues with cascading views
- [HIVE-13237](#) - Select parquet struct field with upper case throws NPE
- [HIVE-13381](#) - Timestamp and date should have precedence in type hierarchy than string group
- [HIVE-13420](#) - Clarify HS2 WebUI Query 'Elapsed Time'
- [HIVE-13462](#) - HiveResultSetMetaData.getPrecision() fails for NULL columns
- [HIVE-13502](#) - Beeline doesnt support session parameters in JDBC URL as documentation states
- [HIVE-13620](#) - Merge llap branch work to master
- [HIVE-13625](#) - Hive Prepared Statement when executed with escape characters in parameter fails
- [HIVE-13645](#) - Beeline needs null-guard around hiveVars and hiveConfVars read
- [HIVE-13670](#) - Improve Beeline connect/reconnect semantics
- [HIVE-13783](#) - Display a secondary prompt on beeline for multi-line statements
- [HIVE-13788](#) - hive msck listpartitions need to make use of directSQL instead of datanucleus
- [HIVE-13953](#) - Issues in HiveLockObject equals method
- [HIVE-13964](#) - Add a parameter to beeline to allow a properties file to be passed in
- [HIVE-13984](#) - Use multi-threaded approach to listing files for msck
- [HIVE-13987](#) - Clarify current error shown when HS2 is down
- [HIVE-13997](#) - Insert overwrite directory doesn't overwrite existing files
- [HIVE-14001](#) - Beeline doesn't give out an error when takes either "-e" or "-f" in command instead of both
- [HIVE-14013](#) - Describe table doesn't show unicode properly
- [HIVE-14037](#) - java.lang.ClassNotFoundException for the jar in hive.reloadable.aux.jars.path in mapreduce
- [HIVE-14074](#) - RELOAD FUNCTION should update dropped functions
- [HIVE-14075](#) - BeeLine.java.orig was accidentally committed during HIVE-14001 patch
- [HIVE-14085](#) - Allow type widening primitive conversion on hive/parquet tables
- [HIVE-14090](#) - JDOExceptions thrown by the Metastore have their full stack trace returned to clients
- [HIVE-14135](#) - Beeline output not formatted correctly for large column widths

- [HUE-4998](#) - [impala] get_configuration is not being closed
- [HUE-4999](#) - [impala] Set default Impala idle_session_timeout to 1 hour
- [HUE-5007](#) - [core] Get ride of bad utf8 character when doing make-locale
- [HUE-5007](#) - [core] Update localization for de, es, fr, ja, ko, zh
- [HUE-5014](#) - [core] Prevent copying a Document folder into itself which then creates a recursive depth issue
- [HUE-5040](#) - [notebook] Keep the progress bar to 99% orange until the status of query is READY
- [HUE-5041](#) - [editor] Hue export large file to HDFS doesn't work on non-default database
- [HUE-5050](#) - [core] Logout fails for local login when multiple backends are used
- [IMPALA-1112](#) - Remove some unnecessary code from cross-compilation
- [IMPALA-1240](#) - add back spilling sort now that sorter is not flaky
- [IMPALA-1440](#) - test for insert mem limit
- [IMPALA-3018](#) - Address various small memory allocation related bugs
- [IMPALA-1619](#) - Support 64-bit allocations
- [IMPALA-1633](#) - GetOperationStatus should set errorMessage and sqlState
- [IMPALA-1671](#) - Print time and link to coordinator web UI once query is submitted in shell
- [IMPALA-1683](#) - Allow REFRESH on a single partition
- [IMPALA-2347](#) - Reuse metastore client connections in Catalog
- [IMPALA-2459](#) - Implement next_day date/time UDF
- [IMPALA-2700](#) - ASCII NUL characters are doubled on insert into text tables
- [IMPALA-2767](#) - Web UI call to force expire sessions
- [IMPALA-2878](#) - Fix Base64Decode error and remove duplicate codes
- [IMPALA-2885](#) - ScannerContext::Stream objects should be owned by ScannerContext
- [IMPALA-2979](#) - Fix scheduling on remote hosts
- [IMPALA-3018](#) - Don't return NULL on zero length allocations
- [IMPALA-3063](#) - Separate join inversion from join ordering
- [IMPALA-3084](#) - Cache the sequence of table ref and materialized tuple ids during analysis
- [IMPALA-3181](#) - Add noexcept to some functions
- [IMPALA-3201](#) - buffer pool header only
- [IMPALA-3206](#) - Enable codegen for AVRO_DECIMAL
- [IMPALA-3210](#) - last/first_value() support for IGNORE NULLS
- [IMPALA-3223](#) - Remove boost multiprecision in thirdparty
- [IMPALA-3225](#) - Add script to push from gerrit to ASF
- [IMPALA-3227](#) - generate test TPC data sets during data load
- [IMPALA-3253](#) - Modify gen_build_version.sh to always output the right version
- [IMPALA-3336](#) - qgen: do not randomly generate query options
- [IMPALA-3376](#) - Extra definition level when writing Parquet files
- [IMPALA-3418](#) - The Impala FE project relies on Z-tools snapshot builds
- [IMPALA-3442](#) - Replace '> >' with '>>' in template decls

- [IMPALA-3449](#) - Kudu deploy.py should find clusters by displayName
- [IMPALA-3454](#) - Kudu deletes may fail if subqueries are used
- [IMPALA-3470](#) - DecompressorTest is flaky
- [IMPALA-3491](#) - Merge test_hbase_metadata.py into compute_stats.py. Use unique db fixture
- [IMPALA-3501](#) - ee tests: detect build type and support different timeouts based on the same
- [IMPALA-3507](#) - update binutils version to fix slow linking
- [IMPALA-3521](#) - Impalad should communicate with the statestore after binding to the hs2 and besswax ports
- [IMPALA-3530](#) - Clean up test_ddl.py. Part 1
- [IMPALA-3567](#) - Part 1: groundwork to make Join build sides DataSinks
- [IMPALA-3575](#) - Add retry to backend connection request and rpc timeout
- [IMPALA-3587](#) - Get rid of not_default_fs skip marker
- [IMPALA-3600](#) - Add missing admission control tests
- [IMPALA-3606](#) - Fix Java NPE when trying to add an existing partition
- [IMPALA-3611](#) - track unused Disk IO buffer memory
- [IMPALA-3627](#) - Clean up RPC structures in ImpalaInternalService
- [IMPALA-3632](#) - Add script for running cppclean over the BE code
- [IMPALA-3647](#) - track runtime filter memory in separate tracker
- [IMPALA-3656](#) - Hitting DCHECK/CHECK does not write minidumps
- [IMPALA-3664](#) - S3A test_keys_do_not_work fails
- [IMPALA-3674](#) - Lazy materialization of LLVM module bitcode
- [IMPALA-3677](#) - Write minidump on SIGUSR1
- [IMPALA-3682](#) - Don't retry unrecoverable socket creation errors
- [IMPALA-3687](#) - Prefer Avro field name during schema reconciliation
- [IMPALA-3715](#) - Include total usage of JVM memory
- [IMPALA-3715](#) - Include more info by default in Impala debug memz webpage
- [IMPALA-3716](#) - Add Memory Tab in query's Details page
- [IMPALA-3727](#) - Change microbenchmarks to use percentile-based reporting
- [IMPALA-3729](#) - batch_size=1 coverage for avro scanner
- [IMPALA-3734](#) - C++11 - Replace boost:shared_ptr with std:: equivalent
- [IMPALA-3736](#) - Move Impala HTTP handlers to a separate class
- [IMPALA-3737](#) - Local filesystem build failed loading custom schemas
- [IMPALA-3751](#) - fix clang build errors and warnings
- [IMPALA-3753](#) - Disable create table test for old aggs and joins
- [IMPALA-3756](#) - Fix wrong argument type in HiveStringsTest
- [IMPALA-3757](#) - Add missing lock in RuntimeProfile::ComputeTimeInProfile
- [IMPALA-3762](#) - Download Python requirements before they are needed
- [IMPALA-3763](#) - download_requirements fixes
- [IMPALA-3764](#) - fuzz test HDFS scanners and fix parquet bugs found
- [IMPALA-3767](#) - bootstrap_virtualenv fails to find cython distribution
- [IMPALA-3774](#) - fix download_requirements for older Python versions
- [IMPALA-3778](#) - Fix ASF packaging build
- [IMPALA-3779](#) - Disable cache pool reader thread when HDFS isn't running
- [IMPALA-3780](#) - avoid many small reads past end of block
- [IMPALA-3786](#) - Remove "Cloudera" from impalad webpage title
- [IMPALA-3790](#) - AC tests timeout in codecoverage builds
- [IMPALA-3799](#) - Make MAX_SCAN_RANGE_LENGTH accept formatted quantities
- [IMPALA-3806](#) - remove a few modern shell idioms to improve RHEL5 support
- [IMPALA-3817](#) - Ensure filter hash function is the same on all hardware
- [IMPALA-3839](#) - Fix race condition in impala_cluster.py
- [IMPALA-3843](#) - Update warning for non-SSSE3 CPUs

- [IMPALA-3845](#) - Split up hdfs-parquet-scanner.cc into more files/components
- [IMPALA-3852](#) - Remove Derby and Shiro FE dependencies
- [IMPALA-3854](#) - Fix use-after-free in HdfsTextScanner::Close()
- [IMPALA-3856](#) - Fix BinaryPredicate normalization for Kudu
- [IMPALA-3857](#) - KuduScanNode race on returning "optional" threads
- [IMPALA-3864](#) - qgen: reduce likelihood of create_query() exceptions
- [IMPALA-3866](#) - consistent user-facing terminology for scratch dirs
- [IMPALA-3881](#) - Add DataTables 1.10.12 to www/
- [IMPALA-3886](#) - Improve log of pip_download.py
- [IMPALA-3892](#) - qgen: always run Impala with -convert_legacy_hive_parquet_utc_timestamps=true
- [IMPALA-3905](#) - Add HdfsScanner::GetNext() interface and implementation for Parquet
- [IMPALA-3906](#) - Materialize implicitly referenced IR functions
- [IMPALA-3914](#) - SKIP_TOOLCHAIN_BOOTSTRAP skips Python package downloads
- [IMPALA-3918](#) - Remove Cloudera copyrights and add ASF license header
- [IMPALA-3923](#) - fix overflow in BufferedTupleStream::GetRows()
- [IMPALA-3924](#) - Ubuntu16 support
- [IMPALA-3936](#) - BufferedBlockMgr fixes for Pin() while write in flight
- [IMPALA-3939](#) - Data loading may fail on tpch kudu
- [IMPALA-3943](#) - Do not throw scan errors for empty Parquet files
- [IMPALA-3946](#) - fix MemPool integrity issues with empty chunks
- [IMPALA-3952](#) - Clear scratch batch mem pool if Open() failed
- [IMPALA-3953](#) - Fixes for KuduScanNode BE test failure
- [IMPALA-3954](#) - Add unique_database to scanner test
- [IMPALA-3957](#) - Test failure in S3 build: TestLoadData.test_load
- [IMPALA-3964](#) - Fix crash when a count(*) is performed on a nested collection
- [IMPALA-3969](#) - stress test: add option to set common query options
- [IMPALA-3972](#) - Improve display of /varz page
- [IMPALA-3992](#) - bad shell error message when running nonexistent file
- [IMPALA-3223](#) - Fix the include path for Hadoop's header files
- [IMPALA-3253](#) - Modify gen_build_version.sh to always output the right version
- [IMPALA-3832](#) - Merge "fix DCHECK calling AddDetail() on an OK status" into cdh5-trunk
- [IMPALA-3832](#) - fix DCHECK calling AddDetail() on an OK status
- [IMPALA-3905](#) - Fixes for the modified HdfsScanner interface
- [OOZIE-1814](#) - Oozie should mask any passwords in logs and REST interfaces
- [OOZIE-2244](#) - Oozie should mask passwords in the logs when logging command arguments
- [OOZIE-2349](#) - Method getCoordJobInfo(String jobId, String filter, int offset, int length, boolean desc) is not present in LocalOozieClientCoord
- [OOZIE-2362](#) - SQL injection in BulkJPAExecutor
- [OOZIE-2402](#) - oozie-setup.sh sharelib create takes a long time on large clusters
- [OOZIE-2447](#) - Illegal character 0x0 oozie client
- [OOZIE-2462](#) - When calling ParamChecker.notNull() in CoordActionsIgnoreXCommand.java, 'Action' should be passed instead of 'Action cannot be null'
- [OOZIE-2467](#) - Oozie can shutdown itself on long GC pause
- [OOZIE-2475](#) - Oozie does not cleanup action dir of killed actions
- [OOZIE-2476](#) - When one of the action from fork fails with transient error, WF never joins
- [OOZIE-2493](#) - TestDistcpMain deletes action.xml from wrong filesystem
- [OOZIE-2515](#) - Duplicate information for 'Changing endtime/pausetime of a Bundle Job' in CommandLineTool wiki
- [OOZIE-2516](#) - Update web service documentation for jobs API
- [OOZIE-2539](#) - Incorrect property key is used for 'hive log4j configuration file for execution mode'
- [OOZIE-2541](#) - Possible resource leak in Hive2Credentials

- [OOZIE-2542](#) - Option to disable OpenJPA BrokerImpl finalization
- [OOZIE-2546](#) - Improperly closed resources in OozieDBCLI
- [OOZIE-2551](#) - Feature request: epoch timestamp generation
- [OOZIE-2552](#) - Update ActiveMQ version for security and other fixes
- [OOZIE-2553](#) - Cred tag is required for all actions in the workflow even if an action does not require it
- [OOZIE-2556](#) - TestAbandonedCoordChecker.testCatchupJob is flaky
- [OOZIE-2574](#) - Oozie to support replication-enabled mysql urls
- [OOZIE-2578](#) - Oozie example distcp job fails to run within an encrypted zone with checksum match error
- [OOZIE-2579](#) - Bulk kill tests in TestBulkWorkflowXCommand might fail because of a race condition
- [OOZIE-2581](#) - Oozie should reset SecurityManager in finally block
- [OOZIE-2587](#) - Disable SchedulerService on certain tests
- [OOZIE-2603](#) - Give thread pools a meaningful name in CallableQueueService and SchedulerService
TestCoordActionsKillXCommand.testActionKillCommandActionNumbers and testActionKillCommandDate
- [OOZIE-2623](#) - Oozie should use a dummy OutputFormat
- [OOZIE-2632](#) - Provide database dump/load functionality to make database migration easier
- [OOZIE-2660](#) - Create documentation for DB Dump/Load functionality
- [PIG-2949](#) - JsonLoader only reads arrays of objects
- [PIG-3413](#) - JsonLoader fails the pig job in case of malformed json input
- [PIG-3619](#) - Update piggybank to include XPath function
- [PIG-3664](#) - Piggy Bank XPath UDF can't be called
- [PIG-3730](#) - Performance issue in SelfSpillBag
- [PIG-3970](#) - Increase PermGen size, tests ran out of memory
- [PIG-4355](#) - Piggybank: XPath cant handle namespace in xpath, nor can it return more than one match
- [PIG-4787](#) - CHD:14987: BackportLog JSONLoader exception while parsing records
- [SENTRY-1201](#) - Sentry ignores database prefix for MSCK statement
- [SENTRY-1208](#) - Make HOST implied in privileges if not specified explicitly
- [SENTRY-1228](#) - SimpleFileProviderBackend error message, remove missing spaces
- [SENTRY-1230](#) - Add filesystem tests to test Sentry with user data storage on S3
- [SENTRY-1231](#) - Sentry doesn't secure index location uri, when do "CREATE INDEX LOCATION "/uri"
- [SENTRY-1252](#) - grantServerPrivilege and revokeServerPrivilege should treat * and ALL as synonyms when action is not explicitly specified
- [SENTRY-1253](#) - SentryShellKafka incorrectly sets component as "KAFKA"
- [SENTRY-1265](#) - Sentry service should not require a TGT
- [SENTRY-1269](#) - Converter vs Convertor - spelling inconsistent
- [SENTRY-1292](#) - Reorder DBModelAction EnumSet
- [SENTRY-1293](#) - Avoid converting string permission to Privilege object
- [SENTRY-1299](#) - Add a test case to verify SentryStore#verifySentryStoreSchema works
- [SENTRY-1311](#) - Improve usability of URI privileges by supporting mixed use of URIs with and without scheme
- [SENTRY-1320](#) - Truncate table db_name.table_name fails
- [SENTRY-1334](#) - backport[column level privileges] test and add test for CTAS and Create View AS SELECT (cross databases cases)
- [SENTRY-1345](#) - ACLS on table folder disappear after insert for unpartitioned tables
- [SENTRY-1376](#) - Fix alter property case correctly - Deletes ACLS on the table
- [SENTRY-1378](#) - Login fails for a secure Sentry Web UI
- [SENTRY-1416](#) - kafka-sentry tool service name default is different from KafkaSentryAuthorizer default service name
- [SENTRY-1429](#) - TestHDFSIntegration improvements
- [SENTRY-1454](#): Fix intermittent timeout issue for TestHDFSIntegration
- [SENTRY-1447](#) - When s3 is configured as HDFS defaultFS and Hive Warehouse Dir, need to fix some e2e test failures
- [SENTRY-1450](#) - Have privilege converter set by Kafka binding

- [SENTRY-1453](#) - Enable passing sentry client cache configs from Kafka conf
- [SENTRY-1233](#) - Logging improvements for `SentryConfigToolSolr`.
- [SENTRY-1119](#) - Allow data engines to obtain the `ActionFactory` directly from the configuration, instead of having hardcoded component-specific classes. This will allow external data engines to integrate with Sentry easily.
- [SENTRY-1229](#) - Added a basic configurable cache to `SentryGenericProviderBackend`.
- [SOLR-5750](#) - Backup/Restore API for SolrCloud
- [SOLR-5922](#) - Add support for adding core properties to SolrJ Collection Admin Request calls
- [SOLR-6637](#) - Solr should have a way to restore a core
- [SOLR-6761](#) - Ability to ignore commit and optimize requests from clients when running in SolrCloud mode
- [SOLR-7294](#) - Migrate API fails with 'Invalid status request: notfoundretried 6times' message
- [SOLR-7374](#) - Backup/Restore should provide a param for specifying the directory implementation it should use
- [SOLR-7766](#) - Support creation of a coreless collection
- [SOLR-8449](#) - Multiple restores on the same core does not work
- [SOLR-9055](#) - Make collection backup/restore extensible
- [SOLR-9242](#) - Collection level backup/restore should provide a param for specifying the repository implementation it should use
- [SOLR-9269](#) - Ability to create/delete/list snapshots for a solr core
- [SOLR-9310](#) - PeerSync fails on a node restart due to `IndexFingerPrint` mismatch
- [SOLR-9326](#) - Ability to create/delete/list snapshots for a solr collection
- [SOLR-9441](#) - Solr collection backup on HDFS can only be manipulated by the Solr process owner
- [SPARK-10372](#) - [CORE] Basic test framework for entire spark scheduler
- [SPARK-12009](#) - [YARN] Avoid reallocating YARN container when driver wants to stop all executors

- [SPARK-13904](#) - [SCHEDULER] Add support for pluggable cluster manager
- [SPARK-14881](#) - [PYTHON] [SPARKR] pyspark and sparkR shell default log level should match spark-shell/Scala
- [SPARK-15714](#) - [CORE] Fix flaky o.a.s.scheduler.BlacklistIntegrationSuite
- [SPARK-15754](#) - [YARN] Not letting the credentials containing HDFS delegation tokens to be added in current user credential
- [SPARK-15865](#) - [CORE] Blacklist should not result in job hanging with less than 4 executors
- [SPARK-16711](#) - `YarnShuffleService` doesn't re-init properly on YARN rolling upgrade
- [SPARK-17171](#) - [WEB UI] DAG will list all partitions in the graph
- [SPARK-17433](#) - `YarnShuffleService` doesn't handle moving credentials levelDb
- [SPARK-17611](#) - [YARN][TEST] Make shuffle service test really test authentication
- [SPARK-17644](#) - [CORE] Do not add failedStages when abortStage for fetch failure
- [SPARK-17696](#) - [CORE] Partial backport of to branch-1.6
- [SQOOP-2938](#) - Mainframe import module extension to support data sets on tape
- [SQOOP-2952](#) - Fixing bug
- [SQOOP-3021](#) - `ClassWriter` fails if a column name contains a backslash character
- [ZOOKEEPER-2405](#) - `getTGT()` in `Login.java` mishandles confidential information
- [ZOOKEEPER-2477](#) - Documentation should refer to Java CLI shell and not C CLI shell

Issues Fixed in CDH 5.8.x

The following topics describe issues fixed in CDH 5.8.x, from newest to oldest release. You can also review [What's New In CDH 5.8.x](#) on page 1827 or [Known Issues in CDH 5](#) on page 1944.

Issues Fixed in CDH 5.8.5

Upstream Issues Fixed

The following upstream issues are fixed in CDH 5.8.5:

- [CRUNCH-592](#) - Job fails for null `ByteBuffer` value in Avro tables.

- [FLUME-1899](#) - Make SpoolDir work with subdirectories
- [FLUME-2171](#) - Add Interceptor to remove headers from event
- [FLUME-2652](#) - Documented transaction handling semantics incorrect in developer guide.
- [FLUME-2797](#) - Use SourceCounter for SyslogTcpSource
- [FLUME-2798](#) - Malformed Syslog messages can lead to OutOfMemoryException
- [FLUME-2812](#) - Fix semaphore leak causing java.lang.Error: Maximum permit count exceeded in MemoryChannel
- [FLUME-2844](#) - SpillableMemoryChannel must start ChannelCounter
- [FLUME-2889](#) - Fixes to DateTime computations
- [FLUME-2901](#) - Document Kerberos setup for Kafka channel
- [FLUME-2910](#) - AsyncHBaseSink: Failure callbacks should log the exception that caused them
- [FLUME-2913](#) - Don't strip SLF4J from imported classpaths
- [FLUME-2918](#) - Speed up TaildirSource on directories with many files
- [FLUME-2922](#) - Sync SequenceFile.Writer before calling hflush
- [FLUME-2923](#) - Bump asynchbase version to 1.7.0
- [FLUME-2934](#) - Document new cachePatternMatching option for TaildirSource
- [FLUME-2935](#) - Bump java target version to 1.7
- [FLUME-2948](#) - docs: Fix parameters on Replicating Channel Selector example
- [FLUME-2954](#) - Make raw data appearing in log messages explicit
- [FLUME-2963](#) - FlumeUserGuide: Fix error in Kafka Source properties table
- [FLUME-2972](#) - Handle offset migration in the new Kafka Channel
- [FLUME-2975](#) - docs: Fix NetcatSource example
- [FLUME-2982](#) - Add localhost escape sequence to HDFS sink
- [FLUME-2983](#) - Handle offset migration in the new Kafka Source
- [FLUME-2999](#) - Kafka channel and sink should enable statically assigned partition per event via header
- [FLUME-3020](#) - Improve HDFS Sink escape sequence substitution
- [FLUME-3027](#) - Change Kafka Channel to clear offsets map after commit
- [FLUME-3031](#) - Change sequence source to reset its counter for event body on channel exception
- [FLUME-3049](#) - Make HDFS sink rotate more reliably in secure mode
- [HADOOP-7930](#) - Kerberos relogin interval in UserGroupInformation should be configurable
- [HADOOP-8436](#) - NPE In getLocalPathForWrite (path, conf) when the required context item is not configured
- [HADOOP-8437](#) - getLocalPathForWrite should throw IOException for invalid paths
- [HADOOP-8934](#) - Shell command ls should include sort options
- [HADOOP-10048](#) - LocalDirAllocator should avoid holding locks while accessing the filesystem
- [HADOOP-10300](#) - Allowed deferred sending of call responses.
- [HADOOP-10971](#) - Add -C flag to make `hadoop fs -ls` print filenames only
- [HADOOP-11031](#) - Design Document for Credential Provider API
- [HADOOP-11361](#) - Fix a race condition in MetricsSourceAdapter.updateJmxCache
- [HADOOP-11400](#) - GraphiteSink does not reconnect to Graphite after 'broken pipe'
- [HADOOP-11469](#) - KMS should skip default.key.acl and whitelist.key.acl when loading key acl.
- [HADOOP-11599](#) - Client#getTimeout should use IPC_CLIENT_PING_DEFAULT when IPC_CLIENT_PING_KEY is not configured
- [HADOOP-11619](#) - FTPFileSystem should override getDefaultPort.
- [HADOOP-11901](#) - BytesWritable fails to support 2G chunks due to integer overflow
- [HADOOP-12252](#) - LocalDirAllocator should not throw NPE with empty string configuration
- [HADOOP-12453](#) - Support decoding KMS Delegation Token with its own Identifier
- [HADOOP-12483](#) - Maintain wrapped SASL ordering for postponed IPC responses.
- [HADOOP-12537](#) - S3A to support Amazon STS temporary credentials
- [HADOOP-12548](#) - Read s3a creds from a Credential Provider
- [HADOOP-12609](#) - Fix intermittent failure of TestDecayRpcScheduler.
- [HADOOP-12655](#) - TestHttpServer.testBindAddress bind port range is wider than expected.

- [HADOOP-12659](#) - Incorrect usage of config parameters in token manager of KMS
- [HADOOP-12672](#) - RPC timeout should not override IPC ping interval
- [HADOOP-12723](#) - S3A: Add ability to plug in any AWSCredentialsProvider
- [HADOOP-12963](#) - Allow using path style addressing for accessing the s3 endpoint.
- [HADOOP-12973](#) - Make DU pluggable.
- [HADOOP-12974](#) - Create a CachingGetSpaceUsed implementation that uses df
- [HADOOP-12975](#) - Add jitter to CachingGetSpaceUsed's thread
- [HADOOP-13034](#) - Log message about input options in distcp lacks some items
- [HADOOP-13072](#) - WindowsGetSpaceUsed constructor should be public
- [HADOOP-13079](#) - Add -q option to Ls to print ? instead of non-printable characters
- [HADOOP-13132](#) - Handle ClassCastException on AuthenticationException in LoadBalancingKMSClientProvider
- [HADOOP-13155](#) - Implement TokenRenewer to renew and cancel delegation tokens in KMS
- [HADOOP-13189](#) - FairCallQueue makes callQueue larger than the configured capacity
- [HADOOP-13251](#) - Authenticate with Kerberos credentials when renewing KMS delegation token
- [HADOOP-13255](#) - KMSClientProvider should check and renew tgt when doing delegation token operations
- [HADOOP-13263](#) - Reload cached groups in background after expiry.
- [HADOOP-13270](#) - BZip2CompressionInputStream finds the same compression marker twice in corner case, causing duplicate data blocks
- [HADOOP-13317](#) - Add logs to KMS server-side to improve supportability
- [HADOOP-13353](#) - LdapGroupsMapping getPassword shouldn't return null when IOException throws
- [HADOOP-13381](#) - KMS clients should use KMS Delegation Tokens from current UGI
- [HADOOP-13433](#) - Race in UGI.reloginFromKeytab
- [HADOOP-13434](#) - Add bash quoting to Shell class.
- [HADOOP-13437](#) - KMS should reload whitelist and default key ACLs when hot-reloading
- [HADOOP-13457](#) - Remove hardcoded absolute path for shell executable.
- [HADOOP-13487](#) - Hadoop KMS should load old delegation tokens from Zookeeper on startup
- [HADOOP-13503](#) - Improve SaslRpcClient failure logging
- [HADOOP-13526](#) - Add detailed logging in KMS for the authentication failure of proxy user
- [HADOOP-13558](#) - UserGroupInformation created from a Subject incorrectly tries to renew the Kerberos ticket
- [HADOOP-13579](#) - Fix source-level compatibility after HADOOP-11252
- [HADOOP-13590](#) - Retry until TGT expires even if the UGI renewal thread encountered exception.
- [HADOOP-13627](#) - Have an explicit KerberosAuthException for UGI to throw, text from public constants
- [HADOOP-13638](#) - KMS should set UGI's Configuration object properly
- [HADOOP-13641](#) - Update UGI#spawnAutoRenewalThreadForUserCreds to reduce indentation
- [HADOOP-13669](#) - Addendum patch 2 for KMS Server should log exceptions before throwing.
- [HADOOP-13693](#) - Remove the message about HTTP OPTIONS in SPNEGO initialization message from kms audit log.
- [HADOOP-13749](#) - KMSClientProvider combined with KeyProviderCache can result in wrong UGI being used
- [HADOOP-13805](#) - UGI.getCurrentUser() fails if user does not have a keytab associated
- [HADOOP-13838](#) - KMSTokenRenewer should close providers
- [HADOOP-13953](#) - Make FTPFileSystem's data connection mode and transfer mode configurable
- [HADOOP-14003](#) - Make additional KMS tomcat settings configurable
- [HADOOP-14104](#) - Client should always ask namenode for kms provider path
- [HADOOP-14195](#) - CredentialProviderFactory\$getProviders is not thread-safe
- [HDFS-4176](#) - EditLogTailer should call rollEdits with a timeout.
- [HDFS-4210](#) - Throw helpful exception when DNS entry for JournalNode cannot be resolved
- [HDFS-6434](#) - Default permission for creating file should be 644 for WebHdfs/HttpFS
- [HDFS-6962](#) - ACLs inheritance conflict with umaskmode
- [HDFS-7413](#) - Some unit tests should use NameNodeProtocols instead of FSNameSystem
- [HDFS-7415](#) - Move FSNameSystem.resolvePath() to FSDirectory

- [HDFS-7420](#) - Delegate permission checks to FSDirectory
- [HDFS-7463](#) - Simplify FSNamesystem#getBlockLocationsUpdateTimes
- [HDFS-7478](#) - Move org.apache.hadoop.hdfs.server.namenode.NNConf to FSNamesystem
- [HDFS-7517](#) - Remove redundant non-null checks in FSNamesystem#getBlockLocations
- [HDFS-7597](#) - DelegationTokenIdentifier should cache the TokenIdentifier to UGI mapping
- [HDFS-7964](#) - Add support for async edit logging
- [HDFS-8224](#) - Schedule a block for scanning if its metadata file is corrupt
- [HDFS-8269](#) - getBlockLocations() does not resolve the .reserved path and generates incorrect edit logs when updating the atime
- [HDFS-8581](#) - ContentSummary on / skips further counts on yielding lock
- [HDFS-8709](#) - Clarify automatic sync in FSEditLog#logEdit.
- [HDFS-8829](#) - Make SO_RCVBUF and SO_SNDBUF size configurable for DataTransferProtocol sockets and allow configuring auto-tuning
- [HDFS-8897](#) - Balancer should handle fs.defaultFS trailing slash in HA
- [HDFS-9038](#) - DFS reserved space is erroneously counted towards non-DFS used.
- [HDFS-9085](#) - Show renewer information in DelegationTokenIdentifier#toString
- [HDFS-9137](#) - DeadLock between DataNode#refreshVolumes and BPOfferService#registrationSucceeded.
- [HDFS-9141](#) - Thread leak in Datanode#refreshVolumes.
- [HDFS-9259](#) - Make SO_SNDBUF size configurable at DFSClient side for hdfs write scenario.
- [HDFS-9276](#) - Failed to Update HDFS Delegation Token for long running application in HA mode
- [HDFS-9365](#) - Balancer does not work with the HDFS-6376 HA setup.
- [HDFS-9461](#) - DiskBalancer: Add Report Command
- [HDFS-9530](#) - ReservedSpace is not cleared for abandoned Blocks
- [HDFS-9601](#) - NNThroughputBenchmark.BlockReportStats should handle NotReplicatedYetException on adding block.
- [HDFS-9630](#) - DistCp minor refactoring and clean up
- [HDFS-9638](#) - Improve DistCp Help and documentation.
- [HDFS-9700](#) - DFSClient and DFSOutputStream should set TCP_NODELAY on sockets for DataTransferProtocol
- [HDFS-9732](#) - Improve DelegationTokenIdentifier.toString() for better logging
- [HDFS-9781](#) - FsDatasetImpl#getBlockReports can occasionally throw NullPointerException
- [HDFS-9805](#) - Add server-side configuration for enabling TCP_NODELAY for DataTransferProtocol and default it to true
- [HDFS-9820](#) - Improve distcp to support efficient restore to an earlier snapshot
- [HDFS-9906](#) - Remove spammy log spew when a datanode is restarted.
- [HDFS-9939](#) - Increase DecompressorStream skip buffer size
- [HDFS-9958](#) - BlockManager#createLocatedBlocks can throw NPE for corruptBlocks on failed storages
- [HDFS-10216](#) - Distcp -diff throws exception when handling relative path
- [HDFS-10270](#) - TestJMXGet:testNameNode() fails
- [HDFS-10298](#) - Document the usage of distcp -diff option
- [HDFS-10312](#) - Large block reports may fail to decode at NameNode due to 64 MB protobuf maximum length restriction
- [HDFS-10313](#) - Distcp need to enforce the order of snapshot names passed to -diff.
- [HDFS-10336](#) - TestBalancer failing intermittently because of not resetting UserGroupInformation completely
- [HDFS-10381](#) - DataStreamer DataNode exclusion log message should be warning.
- [HDFS-10397](#) - Distcp should ignore -delete option if -diff option is provided instead of exiting
- [HDFS-10403](#) - DiskBalancer: Add cancel command
- [HDFS-10457](#) - DataNode should not auto-format block pool directory if VERSION is missing.
- [HDFS-10481](#) - HTTPFS server should correctly impersonate as end user to open file
- [HDFS-10500](#) - Diskbalancer: Print out information when a plan is not generated
- [HDFS-10501](#) - DiskBalancer: Use the default datanode port if port is not provided

- [HDFS-10512](#) - VolumeScanner may terminate due to NPE in DataNode.reportBadBlocks
- [HDFS-10516](#) - Fix bug when warming up EDEK cache of more than one encryption zone
- [HDFS-10517](#) - DiskBalancer: Support help command
- [HDFS-10525](#) - Fix NPE in CacheReplicationMonitor#rescanCachedBlockMap
- [HDFS-10541](#) - Diskbalancer: When no actions in plan, error message says "Plan was generated more than 24 hours ago"
- [HDFS-10544](#) - Balancer doesn't work with IPFailoverProxyProvider.
- [HDFS-10552](#) - DiskBalancer "-query" results in NPE if no plan for the node
- [HDFS-10556](#) - DistCpOptions should be validated automatically
- [HDFS-10559](#) - DiskBalancer: Use SHA1 for Plan ID
- [HDFS-10567](#) - Improve plan command help message
- [HDFS-10588](#) - False alarm in datanode log - ERROR - Disk Balancer is not enabled
- [HDFS-10598](#) - DiskBalancer does not execute multi-steps plan
- [HDFS-10600](#) - PlanCommand#getThrsoldPercentage should not use throughput value.
- [HDFS-10609](#) - Uncaught InvalidEncryptionKeyException during pipeline recovery may abort downstream applications
- [HDFS-10641](#) - TestBlockManager#testBlockReportQueueing fails intermittently.
- [HDFS-10643](#) - Namenode should use loginUser(hdfs) to generateEncryptedKey
- [HDFS-10681](#) - DiskBalancer: query command should report Plan file path apart from PlanID.
- [HDFS-10715](#) - NPE when applying AvailableSpaceBlockPlacementPolicy
- [HDFS-10722](#) - Fix race condition in TestEditLog#testBatchedSyncWithClosedLogs
- [HDFS-10760](#) - DataXceiver#run() should not log InvalidToken exception as an error
- [HDFS-10763](#) - Open files can leak permanently due to inconsistent lease update
- [HDFS-10822](#) - Log DataNodes in the write pipeline.
- [HDFS-10879](#) - TestEncryptionZonesWithKMS#testReadWrite fails intermittently
- [HDFS-10963](#) - Reduce log level when network topology cannot find enough datanodes
- [HDFS-11012](#) - Unnecessary INFO logging on DFSclients for InvalidToken
- [HDFS-11040](#) - Add documentation for HDFS-9820 distcp improvement
- [HDFS-11056](#) - Concurrent append and read operations lead to checksum error
- [HDFS-11160](#) - VolumeScanner reports write-in-progress replicas as corrupt incorrectly
- [HDFS-11229](#) - HDFS-11056 failed to close meta file
- [HDFS-11275](#) - Check groupEntryIndex and throw a helpful exception on failures when removing ACL.
- [HDFS-11292](#) - log lastWrittenTxId etc info in logSyncAll
- [HDFS-11306](#) - Print remaining edit logs from buffer if edit log can't be rolled
- [HDFS-11363](#) - Need more diagnosis info when seeing Slow waitForAckedSeqno.
- [HDFS-11379](#) - DFSInputStream may infinite loop requesting block locations
- [HDFS-11689](#) - New exception thrown by DFSClient%isHDFSEncryptionEnabled broke hacky hive code
- [MAPREDUCE-4784](#) - TestRecovery occasionally fails
- [MAPREDUCE-6172](#) - TestDbClasses timeouts are too aggressive
- [MAPREDUCE-6359](#) - In RM HA setup, Cluster tab links populated with AM hostname instead of RM
- [MAPREDUCE-6442](#) - Stack trace is missing when error occurs in client protocol provider's constructor
- [MAPREDUCE-6473](#) - Job submission can take a long time during Cluster initialization
- [MAPREDUCE-6571](#) - JobEndNotification info logs are missing in AM container syslog
- [MAPREDUCE-6628](#) - Potential memory leak in CryptoOutputStream
- [MAPREDUCE-6633](#) - AM should retry map attempts if the reduce task encounters commpression related errors
- [MAPREDUCE-6641](#) - TestTaskAttempt fails in trunk
- [MAPREDUCE-6670](#) - TestJobListCache#testEviction sometimes fails on Windows with timeout
- [MAPREDUCE-6680](#) - JHS UserLogDir scan algorithm sometime could skip directory with update in CloudFS (Azure FileSystem, S3, etc
- [MAPREDUCE-6718](#) - add progress log to JHS during startup
- [MAPREDUCE-6728](#) - Give fetchers hint when ShuffleHandler rejects a shuffling connection

- [MAPREDUCE-6738](#) - TestJobListCache.testAddExisting failed intermittently in slow VM testbed
- [MAPREDUCE-6761](#) - Regression when handling providers - invalid configuration ServiceConfiguration causes Cluster initialization failure
- [MAPREDUCE-6763](#) - Shuffle server listen queue is too small
- [MAPREDUCE-6771](#) - RMContainerAllocator sends container diagnostics event after corresponding completion event
- [MAPREDUCE-6798](#) - Fix intermittent failure of TestJobHistoryParsing.testJobHistoryMethods
- [MAPREDUCE-6817](#) - The format of job start time in JHS is different from those of submit and finish time.
- [MAPREDUCE-6839](#) - TestRecovery.testCrashed failed
- [YARN-2306](#) - Add test for leakage of reservation metrics in fair scheduler..
- [YARN-2336](#) - Fair scheduler's REST API returns a missing '[' bracket JSON for deep queue tree
- [YARN-2605](#) - [RM HA] Rest api endpoints doing redirect incorrectly.
- [YARN-2977](#) - Fixed intermittent TestNMClient failure.
- [YARN-3251](#) - Fixed a deadlock in CapacityScheduler when computing absoluteMaxAvailableCapacity in LeafQueue
- [YARN-3601](#) - Fix UT TestRMFailover.testRMWebAppRedirect
- [YARN-3654](#) - ContainerLogsPage web UI should not have meta-refresh
- [YARN-3722](#) - Merge multiple TestWebAppUtils into o.a.h.yarn.webapp.util.TestWebAppUtils
- [YARN-3933](#) - FairScheduler: Multiple calls to completedContainer are not safe.
- [YARN-3957](#) - FairScheduler NPE In FairSchedulerQueueInfo causing scheduler page to return 500.
- [YARN-4004](#) - container-executor should print output of docker logs if the docker container exits with non-0 exit status
- [YARN-4017](#) - container-executor overuses PATH_MAX
- [YARN-4092](#) - Addendum. Fixed UI redirection to print useful messages when both RMs are in standby mode
- [YARN-4245](#) - Generalize config file handling in container-executor
- [YARN-4255](#) - container-executor does not clean up docker operation command files
- [YARN-4363](#) - In TestFairScheduler, testcase should not create FairScheduler redundantly.
- [YARN-4411](#) - RMAAppAttemptImpl#createApplicationAttemptReport throws IllegalArgumentException
- [YARN-4459](#) - container-executor should only kill process groups
- [YARN-4544](#) - All the log messages about rolling monitoring interval are shown with WARN level
- [YARN-4555](#) - TestDefaultContainerExecutor#testContainerLaunchError fails on non-english locale environment
- [YARN-4556](#) - TestFifoScheduler.testResourceOverCommit fails
- [YARN-4820](#) - ResourceManager web redirects in HA mode drops query parameters
- [YARN-4866](#) - FairScheduler: AMs can consume all vcores leading to a livelock when using FAIR policy.
- [YARN-4878](#) - Expose scheduling policy and max running apps over JMX for Yarn queues.
- [YARN-4940](#) - yarn node -list -all failed if RM start with decommissioned node
- [YARN-4989](#) - TestWorkPreservingRMRestart#testCapacitySchedulerRecovery fails intermittently
- [YARN-5001](#) - Aggregated Logs root directory is created with wrong group if nonexistent
- [YARN-5048](#) - DelegationTokenRenewer#skipTokenRenewal may throw NPE
- [YARN-5077](#) - Fix FSLeafQueue#getFairShare() for queues with zero fairshare.
- [YARN-5107](#) - TestContainerMetrics fails.
- [YARN-5136](#) - Error in handling event type APP_ATTEMPT_REMOVED to the scheduler
- [YARN-5246](#) - NMWebAppFilter web redirects drop query parameters
- [YARN-5272](#) - Handle queue names consistently in FairScheduler.
- [YARN-5608](#) - TestAMRMClient.setup() fails with ArrayOutOfBoundsException
- [YARN-5704](#) - Provide config knobs to control enabling/disabling new/work in progress features in container-executor
- [YARN-5752](#) - TestLocalResourcesTrackerImpl#testLocalResourceCache times out
- [YARN-5837](#) - NPE when getting node status of a decommissioned node after an RM restart
- [YARN-5859](#) - TestResourceLocalizationService#testParallelDownloadAttemptsForPublicResource sometimes fails
- [YARN-5862](#) - TestDiskFailures.testLocalDirsFailures failed
- [YARN-5890](#) - FairScheduler should log information about AM-resource-usage and max-AM-share for queues

- [YARN-5920](#) - Fix deadlock in TestRMHA.testTransitionedToStandbyShouldNotHang
- [YARN-6042](#) - Dump scheduler and queue state information into FairScheduler DEBUG log.
- [YARN-6042](#) - Revert "Dump scheduler and queue state information into FairScheduler DEBUG log."
- [YARN-6042](#) - Dump scheduler and queue state information into FairScheduler DEBUG log.
- [YARN-6151](#) - FS preemption does not consider child queues over fairshare if the parent is under.
- [YARN-6175](#) - FairScheduler: Negative vcore for resource needed to preempt.
- [YARN-6264](#) - AM not launched when a single vcore is available on the cluster.
- [YARN-6359](#) - TestRM#testApplicationKillAtAcceptedState fails rarely due to race condition
- [YARN-6360](#) - Prevent FS state dump logger from cramming other log files
- [YARN-6453](#) - fairscheduler-statedump.log gets generated regardless of service
- [HBASE-12949](#) - Scanner can be stuck in infinite loop if the HFile is corrupted
- [HBASE-14644](#) - Region in transition metric is broken
- [HBASE-14818](#) - user_permission does not list namespace permissions
- [HBASE-14963](#) - Remove use of Guava Stopwatch from HBase client code
- [HBASE-15125](#) - BackportHBaseFsck's adoptHdfsOrphan function creates region with wrong end key boundary
- [HBASE-15324](#) - Jitter may cause desiredMaxFileSize overflow in ConstantSizeRegionSplitPolicy and trigger unexpected split
- [HBASE-15328](#) - sanity check the redirect used to send master info requests to the embedded regionserver.
- [HBASE-15378](#) - Scanner cannot handle heartbeat message with no results
- [HBASE-15430](#) - Failed taking snapshot - Manifest proto-message too large
- [HBASE-15465](#) - userPermission returned by getUserPermission() for the selected namespace does not have namespace set
- [HBASE-15496](#) - Throw RowTooBigException only for user scan/get
- [HBASE-15587](#) - FSTableDescriptors.getDescriptor() logs stack trace erroneously
- [HBASE-15613](#) - TestNamespaceCommand times out
- [HBASE-15621](#) - Suppress Hbase SnapshotHFile cleaner error messages when a snapshot is going on
- [HBASE-15683](#) - Min latency in latency histograms are emitted as Long.MAX_VALUE
- [HBASE-15698](#) - Increment TimeRange not serialized to server
- [HBASE-15746](#) - Remove extra RegionCoprocesor preClose() in RSRpcServices#closeRegion
- [HBASE-15808](#) - Reduce potential bulk load intermediate space usage and waste
- [HBASE-15856](#) - Don't cache unresolved addresses for connections
- [HBASE-15873](#) - ACL for snapshot restore / clone is not enforced
- [HBASE-15925](#) - provide default values for hadoop compat module related properties that match default hadoop profile.
- [HBASE-15931](#) - Add log for long-running tasks in AsyncProcess
- [HBASE-15955](#) - Disable action in CatalogJanitor#setEnabled should wait for active cleanup scan to finish
- [HBASE-16032](#) - Possible memory leak in StoreScanner
- [HBASE-16056](#) - Procedure v2 - fix master crash for FileNotFound
- [HBASE-16062](#) - Improper error handling in WAL Reader/Writer creation
- [HBASE-16093](#) - Fix splits failed before creating daughter regions leave meta inconsistent
- [HBASE-16135](#) - PeerClusterZnode under rs of removed peer may never be deleted
- [HBASE-16146](#) - Counters are expensive...
- [HBASE-16172](#) - Unify the retry logic in ScannerCallableWithReplicas and RpcRetryingCallerWithReadReplicas
- [HBASE-16194](#) - Should count in MSLAB chunk allocation into heap size change when adding duplicate cells
- [HBASE-16195](#) - Should not add chunk into chunkQueue if not using chunk pool in HeapMemStoreLAB
- [HBASE-16207](#) - can't restore snapshot without "Admin" permission
- [HBASE-16227](#) - [Shell] Column value formatter not working in scans. Tested : manually using shell.
- [HBASE-16238](#) - It's useless to catch SESSIONEXPIRED exception and retry in RecoverableZooKeeper
- [HBASE-16270](#) - Handle duplicate clearing of snapshot in region replicas
- [HBASE-16284](#) - Unauthorized client can shutdown the cluster

- [HBASE-16288](#) - HFile intermediate block level indexes might recurse forever creating multi TB files
- [HBASE-16294](#) - hbck reporting "No HDFS region dir found" for replicas
- [HBASE-16304](#) - HRegion#RegionScannerImpl#handleFileNotFoundException may lead to deadlock when trying to obtain write lock on updatesLock
- [HBASE-16317](#) - revert all ESAPI changes
- [HBASE-16319](#) - Fix TestCacheOnWrite after HBASE-16288
- [HBASE-16321](#) - ensure no findbugs-jsr305
- [HBASE-16340](#) - exclude Xerces implementation jars from coming in transitively.
- [HBASE-16345](#) - RpcRetryingCallerWithReadReplicas#call() should catch some RegionServer Exceptions
- [HBASE-16350](#) - Undo server abort from HBASE-14968
- [HBASE-16360](#) - TableMapReduceUtil addHBaseDependencyJars has the wrong class name for PrefixTreeCodec
- [HBASE-16429](#) - FSHLog: deadlock if rollWriter called when ring buffer filled with appends
- [HBASE-16460](#) - Can't rebuild the BucketAllocator's data structures when BucketCache uses FileIOEngine
- [HBASE-16604](#) - Scanner retries on IOException can cause the scans to miss data
- [HBASE-16662](#) - Fix open POODLE vulnerabilities
- [HBASE-16699](#) - Overflows in AverageIntervalRateLimiter's refill() and getWaitInterval()
- [HBASE-16721](#) - Concurrency issue in WAL unflushed seqld tracking
- [HBASE-16767](#) - Mob compaction needs to clean up files in /hbase/mobdir/.tmp and /hbase/mobdir/.tmp/.bulkload when running into IO exceptions
- [HBASE-16807](#) - , RegionServer will fail to report new active Hmaster until HMaster/RegionServer failover.
- [HBASE-16824](#) - Writer.flush() can be called on already closed streams in WAL roll
- [HBASE-16841](#) - Data loss in MOB files after cloning a snapshot and deleting that snapshot
- [HBASE-16931](#) - Setting cell's seqld to zero in compaction flow might cause RS down.
- [HBASE-16960](#) - RegionServer hang when aborting
- [HBASE-17020](#) - keylen in midkey() dont computed correctly
- [HBASE-17023](#) - Region left unassigned due to AM and SSH each thinking others would do the assignment work
- [HBASE-17044](#) - Fix merge failed before creating merged region leaves meta inconsistent
- [HBASE-17058](#) - Lower epsilon used for jitter verification from HBASE-15324
- [HBASE-17069](#) - RegionServer writes invalid META entries for split daughters in some circumstances
- [HBASE-17072](#) - CPU usage starts to climb up to 90-100% when using G1GC; purge ThreadLocal usage
- [HBASE-17206](#) - FSHLog may roll a new writer successfully with unflushed entries
- [HBASE-17241](#) - Avoid compacting already compacted mob files with _del files
- [HBASE-17265](#) - Region left unassigned in master failover when region failed to open
- [HBASE-17275](#) - Assign timeout may cause region to be unassigned forever
- [HBASE-17328](#) - Properly dispose of looped replication peers
- [HBASE-17381](#) - ReplicationSourceWorkerThread can die due to unhandled exceptions
- [HBASE-17409](#) - Limit jsonp callback name to prevent xss
- [HBASE-17452](#) - Failed taking snapshot - region Manifest proto-message too large
- [HBASE-17522](#) - Handle JVM throwing runtime exceptions when we ask for details on heap usage the same as a correctly returned 'undefined'.
- [HBASE-17558](#) - ZK dumping jsp should escape HTML.
- [HBASE-17561](#) - table status page should escape values that may contain arbitrary characters.
- [HBASE-17675](#) - ReplicationEndpoint should choose new sinks if a SaslException occurs
- [HBASE-17717](#) - Explicitly use "sasl" ACL scheme for hbase superuser
- [HIVE-6758](#) - Beeline doesn't work with -e option when started in background
- [HIVE-7443](#) - Fix HiveConnection to communicate with Kerberized Hive JDBC server and alternative JDKs
- [HIVE-7723](#) - Explain plan for complex query with lots of partitions is slow due to in-efficient collection used to find a matching ReadEntity
- [HIVE-10007](#) - Support qualified table name in analyze table compute statistics for columns
- [HIVE-10384](#) - BackportRetryingMetaStoreClient does not retry wrapped TTransportExceptions

- [HIVE-10728](#) - deprecate `unix_timestamp(void)` and make it deterministic
- [HIVE-10965](#) - direct SQL for stats fails in 0-column case
- [HIVE-11028](#) - Tez: table self join and join with another table fails with `IndexOutOfBoundsException`
- [HIVE-11141](#) - Improve `RuleRegExp` when the Expression node stack gets huge
- [HIVE-11243](#) - Changing log level in `Utilities.getBaseWork`
- [HIVE-11375](#) - Broken processing of queries containing NOT (`x IS NOT NULL` and `x <> 0`)
- [HIVE-11428](#) - Performance: Struct `IN()` clauses are extremely slow
- [HIVE-11432](#) - Hive macro give same result for different arguments
- [HIVE-11487](#) - Add `getNumPartitionsByFilter` api in metastore api
- [HIVE-11594](#) - Analyze Table for column names with embedded spaces
- [HIVE-11671](#) - Optimize `RuleRegExp` in DPP codepath
- [HIVE-11717](#) - nohup mode is not support for new hive
- [HIVE-11747](#) - Unnecessary error log is shown when executing a "INSERT OVERWRITE LOCAL DIRECTORY" cmd in the embedded mode
- [HIVE-11827](#) - STORED AS AVRO fails SELECT COUNT(*) when empty
- [HIVE-11842](#) - Improve `RuleRegExp` by caching some internal data structures
- [HIVE-11849](#) - NPE in `HiveHBaseTableShapshotInputFormat` in query with just count(*)
- [HIVE-11901](#) - `StorageBasedAuthorizationProvider` requires write permission on table for SELECT statements
- [HIVE-11980](#) - Follow up on HIVE-11696, exception is thrown from CTAS from the table with table-level serde is Parquet while partition-level serde is JSON
- [HIVE-12077](#) - MSCK Repair table should fix partitions in batches
- [HIVE-12083](#) - HIVE-10965 introduces thrift error if `partNames` or `colNames` are empty
- [HIVE-12179](#) - Add option to not add `spark-assembly.jar` to Hive classpath
- [HIVE-12277](#) - Hive macro results on `macro_duplicate.q` different after adding ORDER BY
- [HIVE-12349](#) - NPE in ORC SARG for IS NULL queries on Timestamp and Date columns
- [HIVE-12465](#) - Hive might produce wrong results when (outer) joins are merged
- [HIVE-12475](#) - Parquet schema evolution within `array<struct<>>` doesn't work
- [HIVE-12556](#) - Ctrl-C in beeline doesn't kill Tez query on HS2
- [HIVE-12619](#) - Switching the field order within an array of structs causes the query to fail
- [HIVE-12635](#) - Hive should return the latest hbase cell timestamp as the row timestamp value
- [HIVE-12768](#) - Thread safety: binary sortable serde decimal deserialization
- [HIVE-12780](#) - Fix the output of the history command in Beeline
- [HIVE-12785](#) - View with union type and UDF to the struct is broken
- [HIVE-12834](#) - Fix to accept the arrow keys in BeeLine CLI
- [HIVE-12891](#) - Hive fails when `java.io.tmpdir` is set to a relative location
- [HIVE-12976](#) - `MetaStoreDirectSql` doesn't batch IN lists in all cases
- [HIVE-13043](#) - Reload function has no impact to function registry
- [HIVE-13058](#) - Add session and operation_log directory deletion messages
- [HIVE-13090](#) - Hive metastore crashes on NPE with `ZooKeeperTokenStore`
- [HIVE-13129](#) - `ClService` leaks HMS connection
- [HIVE-13149](#) - Remove some unnecessary HMS connections from HS2
- [HIVE-13198](#) - Authorization issues with cascading views
- [HIVE-13237](#) - Select parquet struct field with upper case throws NPE
- [HIVE-13240](#) - `GroupByOperator`: Drop the hash aggregates when closing operator
- [HIVE-13372](#) - Hive Macro overwritten when multiple macros are used in one column
- [HIVE-13381](#) - Timestamp & date should have precedence in type hierarchy than string group
- [HIVE-13429](#) - Tool to remove dangling scratch dir
- [HIVE-13462](#) - `HiveResultSetMetaData.getPrecision()` fails for NULL columns
- [HIVE-13539](#) - `HiveHFileOutputFormat` searching the wrong directory for HFiles
- [HIVE-13590](#) - Kerberized HS2 with LDAP auth enabled fails in multi-domain LDAP case

- [HIVE-13620](#) - Merge llap branch work to master
- [HIVE-13625](#) - Hive Prepared Statement when executed with escape characters in parameter fails
- [HIVE-13645](#) - Beeline needs null-guard around hiveVars and hiveConfVars read
- [HIVE-13704](#) - Don't call DistCp.execute() instead of DistCp.run()
- [HIVE-13736](#) - View's input/output formats are TEXT by default.
- [HIVE-13749](#) - Memory leak in Hive Metastore
- [HIVE-13864](#) - Beeline ignores the command that follows a semicolon and comment
- [HIVE-13866](#) - flatten callstack for directSQL errors
- [HIVE-13884](#) - Disallow queries in HMS fetching more than a configured number of partitions
- [HIVE-13895](#) - HoS start-up overhead in yarn-client mode
- [HIVE-13932](#) - Hive SMB Map Join with small set of LIMIT failed with NPE

- [IMPALA-1346](#) - /1590/2344: fix sorter buffer mgmt when spilling
- [IMPALA-1619](#), [IMPALA-3018](#): Address various small memory allocation related bugs
- [IMPALA-1619](#) - Support 64-bit allocations.
- [IMPALA-1657](#) - Rework detection and reporting of corrupt table stats.
- [IMPALA-2864](#) - Ensure that client connections are closed after a failed Open()
- [IMPALA-3018](#) - Don't return NULL on zero length allocations.
- [IMPALA-3159](#) - impala-shell does not accept wildcard or SAN certificates
- [IMPALA-3167](#) - Fix assignment of WHERE conjunct through grouping agg + OJ.
- [IMPALA-3314](#) - Fix Avro schema loading for partitioned tables.

- [IMPALA-3344](#) - Simplify sorter and document/enforce invariants.
- [IMPALA-3441](#), [IMPALA-3659](#): check for malformed Avro data
- [IMPALA-3499](#) - Split catalog update
- [IMPALA-3552](#) - Make incremental stats max serialized size configurable
- [IMPALA-3575](#) - Add retry to backend connection request and rpc timeout
- [IMPALA-3628](#) - Fix cancellation from shell when security is enabled
- [IMPALA-3633](#) - cancel fragment if coordinator is gone
- [IMPALA-3646](#) - Handle corrupt RLE literal or repeat counts of 0.
- [IMPALA-3670](#) - fix sorter buffer mgmt bugs
- [IMPALA-3678](#) - Fix migration of predicates into union operands with an order by + limit.
- [IMPALA-3680](#) - Cleanup the scan range state after failed hdfs cache reads
- [IMPALA-3682](#) - Don't retry unrecoverable socket creation errors
- [IMPALA-3687](#) - Prefer Avro field name during schema reconciliation
- [IMPALA-3711](#) - Remove unnecessary privilege checks in getDbsMetadata()
- [IMPALA-3732](#) - handle string length overflow in avro files
- [IMPALA-3745](#) - parquet invalid data handling
- [IMPALA-3751](#) - fix clang build errors and warnings
- [IMPALA-3754](#) - fix TestParquet.test_corrupt_rle_counts flakiness
- [IMPALA-3776](#) - fix 'describe formatted' for Avro tables
- [IMPALA-3820](#) - Handle linkage errors while loading Java UDFs in Catalog
- [IMPALA-3861](#) - Replace BetweenPredicates with their equivalent CompoundPredicate.
- [IMPALA-3875](#) - Thrift threaded server hang in some cases
- [IMPALA-3884](#) - Support TYPE_TIMESTAMP for HashTableCtx::CodegenAssignNullValue()
- [IMPALA-3915](#) - Register privilege and audit requests when analyzing resolved table refs.
- [IMPALA-3930](#), [IMPALA-2570](#): Fix shuffle insert hint with constant partition exprs.
- [IMPALA-3940](#) - Fix getting column stats through views.
- [IMPALA-3949](#) - Log the error message in FileSystemUtil.copyToLocal()
- [IMPALA-3964](#) - Fix crash when a count(*) is performed on a nested collection.
- [IMPALA-3965](#) - TSSLSocketWithWildcardSAN.py not exported as part of impala-shell build lib
- [IMPALA-3983](#), [IMPALA-3974](#): Delete function jar resources after load
- [IMPALA-4019](#) - initialize member variables in HdfsTableSink
- [IMPALA-4020](#) - Handle external conflicting changes to HMS gracefully
- [IMPALA-4037](#), [IMPALA-4038](#): fix locking during query cancellation
- [IMPALA-4049](#) - fix empty batch handling NLJ build side
- [IMPALA-4076](#) - Fix runtime filter sort compare method
- [IMPALA-4099](#) - Fix the error message while loading UDFs with no JARs
- [IMPALA-4120](#) - Incorrect results with LEAD() analytic function
- [IMPALA-4135](#) - Thrift threaded server times-out connections during high load
- [IMPALA-4153](#) - Fix count(*) on all blank('') columns - test
- [IMPALA-4170](#) - Fix identifier quoting in COMPUTE INCREMENTAL STATS.
- [IMPALA-4180](#) - Synchronize accesses to RuntimeState::reader_contexts_
- [IMPALA-4196](#) - Cross compile bit-byte-functions
- [IMPALA-4223](#) - Handle truncated file read from HDFS cache
- [IMPALA-4237](#) - Fix materialization of 4 byte decimals in data source scan node.
- [IMPALA-4246](#) - SleepForMs() utility function has undefined behavior for > 1s
- [IMPALA-4260](#) - Alter table add column drops all the column stats
- [IMPALA-4263](#) - Fix wrong omission of agg/analytic hash exchanges.
- [IMPALA-4266](#) - Java udf returning string can give incorrect results
- [IMPALA-4282](#) - Remove max length check for type strings.
- [IMPALA-4293](#) - query profile should include error log

- [IMPALA-4295](#) - XFAIL wildcard SSL test
- [IMPALA-4336](#) - Cast exprs after unnesting union operands.
- [IMPALA-4363](#) - Add Parquet timestamp validation
- [IMPALA-4383](#) - Ensure plan fragment report thread is always started
- [IMPALA-4391](#) - fix dropped statuses in scanners
- [IMPALA-4423](#) - Correct but conservative implementation of Subquery.equals().
- [IMPALA-4433](#) - Always generate testdata using the same time zone setting
- [IMPALA-4449](#) - Revisit table locking pattern in the catalog This commit fixes an issue where multiple long-running operations on the same catalog object (e.g. table) can block other catalog operations from making progress.
- [IMPALA-4488](#) - HS2 GetOperationStatus() should keep session alive
- [IMPALA-4518](#) - CopyStringVal() doesn't copy null string
- [IMPALA-4539](#) - fix bug when scratch batch references I/O buffers
- [IMPALA-4550](#) - Fix CastExpr analysis for substituted slots
- [IMPALA-4579](#) - SHOW CREATE VIEW fails for view containing a subquery
- [IMPALA-4765](#) - Avoid using several loading threads on one table.
- [IMPALA-4767](#) - Workaround for HIVE-15653 to preserve table stats.
- [IMPALA-4779](#), [IMPALA-4780](#): Fix conditional functions built-in and Timestamp bounds
- [IMPALA-4787](#) - Optimize APPX_MEDIAN() memory usage
- [IMPALA-4916](#) - Fix maintenance of set of item sets in DisjointSet.
- [IMPALA-4995](#) - Fix integer overflow in TopNNNode::PrepareForOutput
- [IMPALA-4997](#) - Fix overflows in Sorter::Tupliterator
- [IMPALA-5005](#) - Don't allow server to send SASL COMPLETE msg out of order
- [IMPALA-5088](#) - Fix heap buffer overflow
- [IMPALA-5253](#) - Use appropriate transport for StatestoreSubscriber
- [IMPALA-4391](#) - fix dropped status in scanners
- [OOZIE-1814](#) - Oozie should mask any passwords in logs and REST interfaces
- [OOZIE-2068](#) - Configuration as part of sharelib
- [OOZIE-2194](#) - oozie job -kill doesn't work with spark action

- [OOZIE-2314](#) - Unable to kill old instance child job by workflow or coord rerun by Launcher
- [OOZIE-2329](#) - Make handling yarn restarts configurable
- [OOZIE-2345](#) - Parallel job submission for forked actions
- [OOZIE-2347](#) - Remove unnecessary new Configuration()/new jobConf() calls from oozie
- [OOZIE-2436](#) - Fork/join workflow fails with oozie.action.yarn.tag must not be null
- [OOZIE-2504](#) - Create a log4j.properties under HADOOP_CONF_DIR in Shell Action
- [OOZIE-2533](#) - Patch-1550 - workaround for
- [OOZIE-2555](#) - Oozie SSL enable setup does not return port for admin -servers
- [OOZIE-2567](#) - HCat connection is not closed while getting hcat cred
- [OOZIE-2584](#) - Eliminate Thread.sleep() calls in TestMemoryLocks
- [OOZIE-2589](#) - CompletedActionXCommand is hardcoded to wrong priority
- [OOZIE-2649](#) - Can't override sub-workflow configuration property if defined in parent workflow XML
- [OOZIE-2656](#) - OozieShareLibCLI uses op system username instead of Kerberos to upload jars
- [OOZIE-2678](#) - Oozie job -kill doesn't work with tez jobs
- [OOZIE-2739](#) - Remove property expansion pattern from ShellMain's log4j properties content
- [OOZIE-2742](#) - Unable to kill applications based on tag
- [OOZIE-2777](#) - Config-default.xml longer than 64k results in java.io.UTFDataFormatException
- [OOZIE-2818](#) - Can't overwrite oozie.action.max.output.data on a per-workflow basis
- [PIG-3807](#) - Pig creates wrong schema after dereferencing nested tuple fields with sorts
- [PIG-3818](#) - PIG-2499 is accidentally reverted
- [PIG-3970](#) - Increase PermGen size, tests ran out of memory

- [PIG-4052](#) - TestJobControlSleep, TestInvokerSpeed are unreliable
- [SENTRY-1201](#) - Sentry ignores database prefix for MSCK statement
- [SENTRY-1265](#) - Sentry service should not require a TGT as it is not talking to other kerberos services as a client
- [SENTRY-1311](#) - Improve usability of URI privileges by supporting mixed use of URIs with and without scheme
- [SENTRY-1313](#) - Database prefix is not honoured when executing grant statement
- [SENTRY-1345](#) - ACLs on table folder disappear after insert for unpartitioned tables
- [SENTRY-1520](#) - Provide mechanism for triggering HMS full snapshot
- [SOLR-5776](#) - backportEnabled SSL tests can easily exhaust random generator entropy and block. Set the server side to SHA1PRNG as in Steve's original patch. Use less SSL in a test run. refactor SSLConfig so that SSLTestConfig can provide SSLContexts using a NullSecureRandom to prevent SSL tests from blocking on entropy starved machines Alternate (psuedo random) NullSecureRandom for Constants.SUN_OS replace NullSecureRandom w/ NotSecurePsuedoRandom
- [SOLR-6295](#) - Fix child filter query creation to never match parent docs in SolrExampleTests
- [SOLR-7280](#) - /Missing test resources
- [SOLR-7280](#) - BackportLoad cores in sorted order and tweak coreLoadThread counts to improve cluster stability on restarts
- [SOLR-7866](#) - Harden code to prevent an unhandled NPE when trying to determine the max value of the version field.
- [SOLR-9091](#) - ZkController#publishAndWaitForDownStates logic is inefficient
- [SOLR-9236](#) - AutoAddReplicas will append an extra /tlog to the update log location on replica failover.
- [SOLR-9284](#) - The HDFS BlockDirectoryCache should not let it's keysToRelease or names maps grow indefinitely.
- [SOLR-9310](#), [SOLR-9524](#)
- [SOLR-9330](#) - Fix AlreadyClosedException on admin/mbeans?stats=true
- [SOLR-9699](#), [SOLR-4668](#): fix exception from core status in parallel with core reload
- [SOLR-9819](#) - Upgrade Apache commons-fileupload to 1.3.2, fixing a security vulnerability
- [SOLR-9848](#) - Lower solr.cloud.wait-for-updates-with-stale-state-pause back down from 7 seconds.
- [SOLR-9859](#) - backport ofreplication.properties cannot be updated after being written and neither replication.properties or index.properties are durable in the face of a crash. Don't log error on NoSuchFileException
- [SOLR-9901](#) - backport of SOLR-9899 Implement move in HdfsDirectoryFactory. SOLR-9899: StandardDirectoryFactory should use optimizations for all FilterDirectorys not just NRTCachingDirectory.
- [SOLR-10031](#) - Validation of filename params in ReplicationHandler
- [SOLR-10114](#) - backport of SOLR-9941 - Reordered delete-by-query can delete or omit child documents
- [SOLR-10119](#) - TestReplicationHandler assertion fixes part of
- [SOLR-10121](#), [SOLR-10116](#): BlockCache corruption with high concurrency
- [SOLR-10338](#) - backportConfigure SecureRandom non blocking for tests.

- [SPARK-18750](#) - [YARN] Avoid using "mapValues" when allocating containers.
- [SPARK-19178](#) - [SQL][Backport-to-1.6] convert string of large numbers to int should return null
- [SPARK-19263](#) - DAGScheduler should avoid sending conflicting task set.
- [SPARK-19537](#) - Move pendingPartitions to ShuffleMapStage.
- [SQOOP-2349](#) - Add command line option for setting transaction isolation levels for metadata queries
- [SQOOP-2561](#) - Special Character removal from Column name as avro data results in duplicate column and fails the import
- [SQOOP-2846](#) - Sqoop Export with update-key failing for avro data file
- [SQOOP-2884](#) - Document --temporary-rootdir
- [SQOOP-2896](#) - Sqoop exec job fails with SQLException Access denied for user
- [SQOOP-2906](#) - Optimization of AvroUtil.toAvroIdentifier
- [SQOOP-2909](#) - Oracle related ImportTest fails after SQOOP-2737
- [SQOOP-2911](#) - Fix failing HCatalogExportTest caused by SQOOP-2863
- [SQOOP-2915](#) - Fixing Oracle related unit tests
- [SQOOP-2920](#) - sqoop performance deteriorates significantly on wide datasets; sqoop 100% on cpu
- [SQOOP-2950](#) - Sqoop trunk has consistent UT failures - need fixing
- [SQOOP-2952](#) - Fixing bug
- [SQOOP-2971](#) - OraOop does not close connections properly
- [SQOOP-2983](#) - OraOop export has degraded performance with wide tables
- [SQOOP-2986](#) - Add validation check for --hive-import and --incremental lastmodified
- [SQOOP-2990](#) - Sqoop(oracle) export [updateTableToOracle] with "--update-mode allowinsert" : app fails with java.sql.SQLException: Missing IN or OUT parameter at index
- [SQOOP-2995](#) - backward incompatibility introduced by Custom Tool options
- [SQOOP-2999](#) - Sqoop ClassNotFoundException (org.apache.commons.lang3.StringUtils) is thrown when executing Oracle direct import map task
- [SQOOP-3013](#) - Configuration "tmpjars" is not checked for empty strings before passing to MR
- [SQOOP-3021](#) - ClassWriter fails if a column name contains a backslash character
- [SQOOP-3028](#) - Include stack trace in the logging of exceptions in ExportTool
- [SQOOP-3034](#) - HBase import should fail fast if using anything other than as-textfile
- [SQOOP-3053](#) - Create a cmd line argument for sqoop.throwOnError and use it through SqoopOptions

- [SQOOP-3055](#) - Fixing MySQL tests failing due to ignored test inputs/configuration
- [SQOOP-3057](#) - Fixing 3rd party Oracle tests failing due to invalid case of column names
- [SQOOP-3066](#) - Introduce an option + env variable to enable/disable SQOOP-2737 feature
- [SQOOP-3068](#) - Enhance error (tool.ImportTool: Encountered IOException running import job: java.io.IOException: Expected schema) to suggest workaround
- [SQOOP-3069](#) - Get OracleExportTest#testUpsertTestExport in line with SQOOP-3066
- [SQOOP-3071](#) - Fix OracleManager to apply localTimeZone correctly in case of Date objects too
- [SQOOP-3072](#) - Reenable escaping in ImportTest#testProductWithWhiteSpaceImport for proper execution
- [SQOOP-3081](#) - use OracleEscapeUtils.escapeldentifier in OracleUpsertOutputFormat instead of inline appending quotes
- [SQOOP-3123](#) - Introduce escaping logic for column mapping parameters (same what Sqoop already uses for the DB column names), thus special column names (e.g. containing '#' character) and mappings related to those columns can be in the same format (thus not confusing the end users), and also eliminates the related AVRO format clashing issues.
- [SQOOP-3124](#) - Fix ordering in column list query of PostgreSQL connector to reflect the logical order instead of adhoc ordering
- [SQOOP-3159](#) - Sqoop (export + --table) with Oracle table_name having '\$' fails with error

Issues Fixed in CDH 5.8.4

Upstream Issues Fixed

The following upstream issues are fixed in CDH 5.8.4:

- [AVRO-1943](#) - Unreliable test: TestNettyServerWithCompression.testConnectionsCount
- [CRUNCH-592](#) - Job fails for null ByteBuffer value in Avro tables
- [FLUME-2171](#) - Add Interceptor to remove headers from event
- [FLUME-2812](#) - Fix semaphore leak causing java.lang.Error: Maximum permit count exceeded in MemoryChannel
- [FLUME-2889](#) - Fixes to DateTime computations
- [FLUME-2997](#) - Fix unreliable test in SpillableMemoryChannel
- [FLUME-2999](#) - Kafka channel and sink should enable statically assigned partition per event via header
- [FLUME-3002](#) - Fix tests in TestBucketWriter
- [FLUME-3003](#) - Fix unreliable testSourceCounter in TestSyslogUdpSource
- [FLUME-3020](#) - Improve HDFS Sink escape sequence substitution
- [FLUME-3027](#) - Change Kafka Channel to clear offsets map after commit
- [FLUME-3031](#) - Change sequence source to reset its counter for event body on channel exception
- [HADOOP-7930](#) - Kerberos relogin interval in UserGroupInformation should be configurable
- [HADOOP-10300](#) - Deferred sending of call responses allowed
- [HADOOP-11031](#) - Design Document for Credential Provider API
- [HADOOP-12453](#) - Support decoding KMS Delegation Token with its own Identifier
- [HADOOP-12483](#) - Maintain wrapped SASL ordering for postponed IPC responses
- [HADOOP-12537](#) - S3A to support Amazon STS temporary credentials
- [HADOOP-12655](#) - TestHttpServer.testBindAddress bind port range is wider than expected
- [HADOOP-12723](#) - S3A to add ability to plug in any AWSCredentialsProvider
- [HADOOP-12973](#) - Make DU pluggable
- [HADOOP-12974](#) - Create a CachingGetSpaceUsed implementation that uses df
- [HADOOP-12975](#) - Add jitter to CachingGetSpaceUsed's thread
- [HADOOP-13034](#) - Log message about input options in distcp lacks some items
- [HADOOP-13072](#) - WindowsGetSpaceUsed constructor should be public
- [HADOOP-13317](#) - Add logs to KMS server-side to improve supportability
- [HADOOP-13590](#) - Retry until TGT expires even if the UGI renewal thread encountered exception
- [HADOOP-13641](#) - Update UGI#spawnAutoRenewalThreadForUserCreds to reduce indentation
- [HADOOP-13669](#) - Addendum patch 2 for KMS Server should log exceptions before throwing

- [HADOOP-13669](#) - Addendum patch for KMS Server should log exceptions before throwing
- [HADOOP-13669](#) - KMS Server should log exceptions before throwing
- [HADOOP-13693](#) - Remove the message about HTTP OPTIONS in SPNEGO initialization message from kms audit log
- [HADOOP-13838](#) - KMSTokenRenewer should close providers
- [HDFS-4176](#) - EditLogTailer should call rollEdits with a timeout
- [HDFS-6962](#) - ACLs inheritance conflict with umaskmode
- [HDFS-7413](#) - Some unit tests should use NameNodeProtocols instead of FSNameSystem
- [HDFS-7964](#) - Add support for async edit logging
- [HDFS-8709](#) - Clarify automatic sync in FSEditLog#logEdit
- [HDFS-9038](#) - DFS reserved space is erroneously counted towards non-DFS used
- [HDFS-9630](#) - DistCp minor refactoring and clean up
- [HDFS-9638](#) - Improve DistCp Help and documentation
- [HDFS-9820](#) - Improve distcp to support efficient restore to an earlier snapshot
- [HDFS-10216](#) - Distcp -diff throws exception when handling relative path
- [HDFS-10298](#) - Document the usage of distcp -diff option
- [HDFS-10312](#) - Large block reports may fail to decode at NameNode due to 64 MB protobuf maximum length restriction
- [HDFS-10313](#) - Distcp need to enforce the order of snapshot names passed to -diff
- [HDFS-10336](#) - TestBalancer failing intermittently because of not resetting UserGroupInformation completely
- [HDFS-10397](#) - Distcp should ignore -delete option if -diff option is provided instead of exiting
- [HDFS-10556](#) - DistCpOptions should be validated automatically
- [HDFS-10609](#) - Uncaught InvalidEncryptionKeyException during pipeline recovery may abort downstream applications
- [HDFS-10652](#) - Add a unit test for HDFS-4660
- [HDFS-10722](#) - Fix race condition in TestEditLog#testBatchedSyncWithClosedLogs
- [HDFS-10760](#) - DataXceiver#run() should not log InvalidToken exception as an error
- [HDFS-10763](#) - Open files can leak permanently due to inconsistent lease update
- [HDFS-11012](#) - Unnecessary INFO logging on DFSClients for InvalidToken
- [HDFS-11040](#) - Add documentation for HDFS-9820 distcp improvement
- [HDFS-11056](#) - Concurrent append and read operations lead to checksum error
- [HDFS-11160](#) - VolumeScanner reports write-in-progress replicas as corrupt incorrectly
- [HDFS-11229](#) - HDFS-11056 failed to close meta file
- [HDFS-11275](#) - Check groupEntryIndex and throw a helpful exception on failures when removing ACL
- [MAPREDUCE-6571](#) - JobEndNotification info logs are missing in AM container syslog
- [MAPREDUCE-6633](#) - AM should retry map attempts if the reduce task encounters compression related errors
- [MAPREDUCE-6728](#) - Give fetchers hint when ShuffleHandler rejects a shuffling connection

- [SQOOP-3021](#) - ClassWriter fails if a column name contains a backslash character

Issues Fixed in CDH 5.8.2

CDH 5.8.2 fixes the following issues.

Kerberos HS2 with LDAP authentication fails in a multi-domain LDAP case

In CDH 5.7, Hive introduced a feature to support HS2 with Kerberos plus LDAP authentication; but it broke compatibility with multi-domain LDAP cases on CDH 5.7.x and CDH 5.8.x versions.

Affected Versions: CDH 5.7.1, CDH 5.8.0, and CDH 5.8.1

Fixed in Versions: CDH 5.7.2 and higher, CDH 5.8.2 and higher

Bug: [HIVE-13590](#).

Workaround: None.

Apache Oozie

Oozie Web Console returns 500 error when Oozie server runs on JDK 8u75 or higher

Bug: [OOZIE-2533](#)

The Oozie Web Console returns a 500 error when the Oozie server is running on JDK 8u75 and higher. The Oozie server still functions, and you can use the Oozie command line, REST API, Java API, or the Hue Oozie Dashboard to review status of those jobs.

Upstream Issues Fixed

The following upstream issues are fixed in CDH 5.8.2:

- [FLUME-1899](#) - Make SpoolDir work with subdirectories
- [FLUME-2652](#) - Documented transaction handling semantics incorrect in developer guide.
- [FLUME-2901](#) - Document Kerberos setup for Kafka channel
- [FLUME-2910](#) - AsyncHBaseSink: Failure callbacks should log the exception that caused them
- [FLUME-2913](#) - Don't strip SLF4J from imported classpaths
- [FLUME-2918](#) - Speed up TaildirSource on directories with many files
- [FLUME-2922](#) - Sync SequenceFile.Writer before calling hflush
- [FLUME-2923](#) - Bump asynchbase version to 1.7.0
- [FLUME-2934](#) - Document new cachePatternMatching option for TaildirSource
- [FLUME-2935](#) - Bump java target version to 1.7
- [FLUME-2948](#) - docs: Fix parameters on Replicating Channel Selector example
- [FLUME-2954](#) - Make raw data appearing in log messages explicit

- [SQOOP-2999](#) - Sqoop ClassNotFoundException (org.apache.commons.lang3.StringUtils) is thrown when executing Oracle direct import map task

Issues Fixed in CDH 5.8.0

CDH 5.8.0 fixes the following issues.

Apache Flume

Flume fully compatible with Kafka 2.x

In release CDH 5.8.0, Flume is fully compatible with Kafka 2.x, including support for security features.

Apache HBase

Premature EOF detected in a WAL During Replication

Cloudera Bug: CDH-38113

During the parsing of a write-ahead log (WAL) during replication, an `InvalidProtobufException` can occur while reading the source RegionServer WAL, if `EOF` (end-of-file) is incorrectly detected before the actual end of the file. HBase stops reading the WAL after the EOF, and does not parse any bytes which occur after the EOF, causing data loss.

To work around this problem, Cloudera has patched HBase. HBase in CDH 5.8.0 and higher detect whether unparsed bytes exist after the `EOF`, and if so, the WAL is reset and re-read from the beginning, to attempt a clean read-through.

In testing, a single reset has been sufficient to work around observed data loss. However, the above change will retry a given WAL file indefinitely. On each attempt, a log message such as this will be emitted at the `WARN` level:

```
Processing end of WAL file '{}'. At position {}, which is too far away from
reported file length {}. Restarting WAL reading
```

Additional log detail are emitted at the `TRACE` level about file offsets seen while handling recoverable errors.

*Batch Get after Batch Put Does Not Fetch All Cells***Bug:** [HBASE-15811](#)**Cloudera Bug:** CDH-40344

A batch Get after a batch Put could fail to fetch cells that were written by the Get, resulting in a "read-your-writes" failure. This bug was exacerbated by high load on the client.

*Read Replica Failure For PUT Operation During Region Transition***Cloudera Bug:** CDH-39758

When the patch for HBASE-10794 was applied in CDH 5.4.4, a new bug was introduced, where, if the primary RegionServer becomes unavailable (for any reason, even a graceful shutdown), while a client is performing PUTs on that region, subsequent PUTs will fail.

*Latency Metrics Inaccurate for MultiGet Operations***Bug:** [HBASE-15673](#)**Cloudera Bug:** CDH-39422

Latency values are written after each row is processed. However, if `MultiGet` is enabled, some rows are not counted in the metrics. This causes the metrics for the 50th, 75th, and 90th percentiles to be reported as 0.

*Inconsistent Behavior Among DeleteColumnFamilyProcedure, CreateTableProcedure, and ModifyTableProcedure***Bug:** [HBASE-15456](#)**Cloudera Bug:** CDH-12345

If there is only one family in the table, `DeleteColumnFamilyProcedure` will fail. When `hbase.table.sanity.checks` is set to `false`, the HMaster logs a warning, but `CreateTableProcedure` and `ModifyTableProcedure` will now fail, where before they logged a warning, but succeeded. This makes the behavior of all three methods consistent.

*Failed hbase-spark Bulk Loads Leave Files Behind***Bug:** [HBASE-15271](#)**Cloudera Bug:** CDH-38145

When using the bulk load helper provided by the `hbase-spark` module, output files are now written into temporary files and only made available when the executor has successfully completed. Previously, failed executors would leave files behind, and these files would be picked up by subsequent bulk load commands, and spurious copies of some cells were written.

Apache Hive

With Sentry enabled, only Hive admin users have access to YARN job logs

As a prerequisite of enabling Sentry, Hive impersonation is turned off, which means all YARN jobs are submitted to the Hive job queue, and are run as the `hive` user. This is an issue because the YARN History Server now has to block users from accessing logs for their own jobs, since their own usernames are not associated with the jobs. As a result, end users cannot access any job logs unless they can get `sudo` access to the cluster as the `hdfs`, `hive` or other admin users.

In CDH 5.8 (and higher), Hive overrides the default configuration, `mapred.job.queue.name`, and places incoming jobs into the connected user's job queue, even though the submitting user remains `hive`. Hive obtains the relevant queue/username information for each job by using YARN's `fair-scheduler.xml` file.

Hue

Cannot query the `customers` table in Hue

Bug: [HUE-3040](#)

Cloudera Bug: CDH-33974

To query the `customers` table, users must re-create the parquet data for compatibility.

Cloudera Distribution of Apache Kafka

CDH 5.7 is not compatible with Cloudera Distribution of Apache Kafka 1.x

Cloudera Distribution of Apache Kafka 1.x is compatible with CDH 5.4+.

Apache Oozie

PySpark does not work from the Oozie Spark Action

Bug: [OOZIE-2482](#)

Cloudera Bug: CDH-36349

The Spark Action would typically fail with a message like, "key not found: SPARK_HOME," but other error messages were possible. After the fix, the Spark Action has the necessary changes to successfully run PySpark jobs. See [Oozie Spark Action Extension](#) for more details and an example. Cloudera makes the PySpark dependencies available.

Apache Sentry

Security

Sentry does not check privileges on the URI used for the `CREATE INDEX LOCATION '/path'` command

Bug: [SENTRY-1231](#)

The `CREATE INDEX LOCATION '/path'` command would succeed even if a user did not have the required URI privileges for the `/path`.

Upgraded `libthrift` to version 0.9.3 due to a security vulnerability

Cloudera Bug: CDH-40034

For details on the security vulnerability in the Apache Thrift client libraries, see [THRIFT-3231](#).

Hive Binding

`INSERT OVERWRITE DIRECTORY` command does not work correctly

Bug: [SENTRY-922](#)

The `INSERT OVERWRITE DIRECTORY` command would write table data into an HDFS directory (`hdfs://path/`), even if privileges are granted only for the local directory (`file://path/`).

`INSERT INTO` no longer requires URI privilege on partition locations

Bug: [SENTRY-1095](#)

The `INSERT INTO` Hive command adds location information to the partition description. Usually if location information is included, you must ensure that the user has privileges on the corresponding URI. However, in this case, since the partition locations are under the table directory and can be easily generated, these requirements have been relaxed.

Change default value of `sentry.hive.server`

Bug: [SENTRY-1112](#)

The default value for `sentry.hive.server` was changed from `server1` to an empty string.

Sentry Service

Sentry's Oracle upgrade scripts fails with `ORA-00955`

Bug: [SENTRY-1066](#)

Sentry upgrade scripts for Oracle would fail with error, `ORA-00955`, because during the upgrade, the script inadvertently creates an index with the same name as the constraint being dropped. The script will now run `DROP INDEX` before it adds the constraint again and completes the schema upgrade successfully.

`grantServerPrivilege()` and `revokeServerPrivilege()` should treat '*' and 'ALL' as synonyms

Bug: [SENTRY-1252](#)

The `grantServerPrivilege()` and `revokeServerPrivilege()` methods should treat `*` and `ALL` as synonyms when an action is not explicitly specified. Previously, if `grantServerPrivilege()` was called without an action, and followed up with a `revokeServerPrivilege()` invocation with an action such as `ALL`, the server-level privilege would not be revoked. This fix only applies to privileges that are granted after upgrading to CDH 5.8.

Sentry Debugging

Error in Hive Metastore Plugin (`renameAuthzObject`) log messages

Bug: [SENTRY-1169](#)

The `renameAuthzObject` plugin prints log messages with old path names in place of new path names.

Apache ZooKeeper

Upgrade Netty Due to Security Vulnerabilities

Bug: [ZOOKEEPER-2450](#)

Cloudera Bug: CDH-39988

Netty was upgraded from version 3.2.2 to 3.10.5 to resolve security vulnerabilities.

Fix Privacy Violation in Login.java

Bug: [ZOOKEEPER-2405](#)

Cloudera Bug: CDH-36673

In `Login.java`, `getTGT()` was logging confidential information in `DEBUG` mode. After the fix, only principals are logged.

Issues Fixed in CDH 5.7.x

The following topics describe issues fixed in CDH 5.7.x, from newest to oldest release. You can also review [What's New In CDH 5.7.x](#) on page 1829 or [Known Issues in CDH 5](#) on page 1944.

Issues Fixed in CDH 5.7.6

Upstream Issues Fixed

The following upstream issues are fixed in CDH 5.7.6:

- [AVRO-1943](#) - Flaky test: `TestNettyServerWithCompression.testConnectionsCount`.
- [FLUME-2908](#) - `NetcatSource` - `SocketChannel` not closed when session is broken.
- [FLUME-2997](#) - Fix flaky test in `SpillableMemoryChannel`.
- [FLUME-3002](#) - Fix tests in `TestBucketWriter`.
- [FLUME-3003](#) - Fix flaky test `SourceCounter` in `TestSyslogUdpSource`.
- [FLUME-3049](#) - Make HDFS sink rotate more reliably in secure mode.
- [HADOOP-7930](#) - Kerberos relogin interval in `UserGroupInformation` should be configurable.
- [HADOOP-11031](#) - Design Document for Credential Provider API.
- [HADOOP-11619](#) - `FTPFileSystem` should override `getDefaultPort`.
- [HADOOP-12453](#) - Support decoding KMS Delegation Token with its own Identifier.
- [HADOOP-12537](#) - S3A to support Amazon STS temporary credentials.
- [HADOOP-12655](#) - `TestHttpServer.testBindAddress` bind port range is wider than expected.
- [HADOOP-12723](#) - S3A: Add ability to plug in any `AWSCredentialsProvider`.
- [HADOOP-13034](#) - Log message about input options in `distcp` lacks some items.
- [HADOOP-13433](#) - Race in `UGI.reloginFromKeytab`.
- [HADOOP-13590](#) - Retry until TGT expires even if the UGI renewal thread encountered exception.
- [HADOOP-13627](#) - Have an explicit `KerberosAuthException` for UGI to throw, text from public constants.
- [HADOOP-13641](#) - Update `UGI#spawnAutoRenewalThreadForUserCreds` to reduce indentation.
- [HADOOP-13838](#) - `KMSTokenRenewer` should close providers.
- [HADOOP-13953](#) - Make `FTPFileSystem`'s data connection mode and transfer mode configurable.

- [HADOOP-14003](#) - Make additional KMS tomcat settings configurable.
- [HDFS-9428](#) - Fix intermittent failure of TestDNFencing.testQueueingWithAppend.
- [HDFS-9630](#) - DistCp minor refactoring and clean up.
- [HDFS-9638](#) - Improve DistCp Help and documentation.
- [HDFS-9764](#) - DistCp doesn't print value for several arguments including -numListstatusThreads.
- [HDFS-9804](#) - Allow long-running Balancer to login with keytab.
- [HDFS-9820](#) - Improve distcp to support efficient restore to an earlier snapshot.
- [HDFS-9888](#) - Allow resetting KerberosName in unit tests.
- [HDFS-10216](#) - Distcp -diff throws exception when handling relative path.
- [HDFS-10271](#) - Extra bytes are getting released from reservedSpace for append.
- [HDFS-10298](#) - Document the usage of distcp -diff option.
- [HDFS-10313](#) - Distcp need to enforce the order of snapshot names passed to -diff.
- [HDFS-10336](#) - TestBalancer failing intermittently because of not resetting UserGroupInformation completely
- [HDFS-10397](#) - Distcp should ignore -delete option if -diff option is provided instead of exiting.
- [HDFS-10556](#) - DistCpOptions should be validated automatically.
- [HDFS-10763](#) - Open files can leak permanently due to inconsistent lease update.
- [HDFS-11040](#) - Add documentation for HDFS-9820 distcp improvement.
- [HDFS-11056](#) - Concurrent append and read operations lead to checksum error.
- [HDFS-11160](#) - VolumeScanner reports write-in-progress replicas as corrupt incorrectly.
- [HDFS-11229](#) - HDFS-11056 failed to close meta file.
- [HDFS-11275](#) - Check groupEntryIndex and throw a helpful exception on failures when removing ACL.
- [HDFS-11292](#) - log lastWrittenTxId etc info in logSyncAll.
- [HDFS-11306](#) - Print remaining edit logs from buffer if edit log can't be rolled.
- [MAPREDUCE-6571](#) - JobEndNotification info logs are missing in AM container syslog.
- [MAPREDUCE-6763](#) - Shuffle server listen queue is too small.
- [MAPREDUCE-6798](#) - Fix intermittent failure of TestJobHistoryParsing.testJobHistoryMethods.
- [MAPREDUCE-6801](#) - Fix flaky TestKill.testKillJob.
- [MAPREDUCE-6817](#) - The format of job start time in JHS is different from those of submit and finish time.
- [MAPREDUCE-6831](#) - Flaky test TestJobImpl.testKilledDuringKillAbort
- [YARN-2306](#) - Add test for leakage of reservation metrics in fair scheduler.
- [YARN-3554](#) - Default value for maximum nodemanager connect wait time is too high.
- [YARN-4363](#) - In TestFairScheduler, testcase should not create FairScheduler redundantly.
- [YARN-4555](#) - TestDefaultContainerExecutor#testContainerLaunchError fails on non-english locale environment.
- [YARN-5752](#) - TestLocalResourcesTrackerImpl#testLocalResourceCache times out.
- [YARN-5837](#) - NPE when getting node status of a decommissioned node after an RM restart.
- [YARN-5859](#) - TestResourceLocalizationService#testParallelDownloadAttemptsForPublicResource sometimes fails
- [YARN-5862](#) - TestDiskFailures.testLocalDirsFailures failed.
- [YARN-5890](#) - FairScheduler should log information about AM-resource-usage and max-AM-share for queues.
- [YARN-5920](#) - Fix deadlock in TestRMHA.testTransitionedToStandbyShouldNotHang.
- [HBASE-15324](#) - Jitter may cause desiredMaxFileSize overflow in ConstantSizeRegionSplitPolicy and trigger unexpected split.
- [HBASE-15430](#) - Failed taking snapshot - Manifest proto-message too large.
- [HBASE-16172](#) - Unify the retry logic in ScannerCallableWithReplicas and RpcRetryingCallerWithReadReplicas.
- [HBASE-16270](#) - Handle duplicate clearing of snapshot in region replicas.
- [HBASE-16345](#) - RpcRetryingCallerWithReadReplicas#call() should catch some RegionServer Exceptions.
- [HBASE-16824](#) - Writer.flush() can be called on already closed streams in WAL roll.
- [HBASE-16841](#) - Data loss in MOB files after cloning a snapshot and deleting that snapshot.
- [HBASE-17058](#) - Lower epsilon used for jitter verification from HBASE-15324.
- [HBASE-17241](#) - Avoid compacting already compacted mob files with _del files.
- [HBASE-17452](#) - Failed taking snapshot - region Manifest proto-message too large.

- [HBASE-17522](#) - Handle JVM throwing runtime exceptions when we ask for details on heap usage the same as a correctly returned 'undefined'.
- [HIVE-10965](#) - direct SQL for stats fails in 0-column case.
- [HIVE-11849](#) - NPE in HiveHBaseTableShapshotInputFormat in query with just count(*).
- [HIVE-12083](#) - HIVE-10965 introduces thrift error if partNames or colNames are empty.
- [HIVE-12465](#) - Hive might produce wrong results when (outer) joins are merged.
- [HIVE-12619](#) - Switching the field order within an array of structs causes the query to fail.
- [HIVE-12780](#) - Fix the output of the history command in Beeline HIVE-12789: Fix output twice in the history command of Beeline.
- [HIVE-12891](#) - Hive fails when java.io.tmpdir is set to a relative location.
- [HIVE-12976](#) - MetaStoreDirectSql doesn't batch IN lists in all cases.
- [HIVE-13129](#) - CliService leaks HMS connection.
- [HIVE-13149](#) - Remove some unnecessary HMS connections from HS2.
- [HIVE-13240](#) - GroupByOperator: Drop the hash aggregates when closing operator.
- [HIVE-13539](#) - HiveHFileOutputFormat searching the wrong directory for HFiles.
- [HIVE-13696](#) - Modify FairSchedulerShim to dynamically reload changes to fair-scheduler.xml.
- [HIVE-13866](#) - flatten callstack for directSQL errors.
- [HIVE-14173](#) - NPE was thrown after enabling directsql in the middle of session.
- [HIVE-14764](#) - Enabling "hive.metastore.metrics.enabled" throws OOM in HiveMetastore.
- [HIVE-14820](#) - RPC server for spark inside HS2 is not getting server address properly.
- [HIVE-15054](#) - Hive insertion query execution fails on Hive on Spark.
- [HIVE-15090](#) - Temporary DB failure can stop ExpiredTokenRemover thread.
- [HIVE-15338](#) - Wrong result from non-vectorized DATEDIFF with scalar parameter of type DATE/TIMESTAMP.
- [HIVE-15410](#) - WebHCat supports get/set table property with its name containing period and hyphen.
- [HIVE-15551](#) - memory leak in directsql for mysql+bonecp specific initialization.
- [HUE-4662](#) - [security] fixing Hue - Wildcard Certificates not supported.
- [HUE-4466](#) - [security] deliver csrftoken cookie with secure bit set if possible.
- [HUE-5163](#) - [security] Speed up initial page rendering.
- [HUE-4916](#) - [core] Truncate last name to 30 chars on ldap import.
- [HUE-5050](#) - [core] Logout fails for local login when multiple backends are used.
- [HUE-5042](#) - [core.backend] Unable to kill jobs after Resource Manager failover.
- [HUE-4201](#) - [editor] Add warning about max limit of cells before truncation.
- [HUE-4968](#) - [oozie] Remove access to /oozie/import_workflow when v2 is enabled.
- [HUE-5218](#) - [search] Validate dashboard sharing works.
- [IMPALA-2864](#) - Ensure that client connections are closed after a failed Open()
- [IMPALA-3167](#) - Fix assignment of WHERE conjunct through grouping agg + OJ.
- [IMPALA-3552](#) - Make incremental stats max serialized size configurable
- [IMPALA-3698](#) - Fix Isilon permissions test
- [IMPALA-3861](#) - Replace BetweenPredicates with their equivalent CompoundPredicate.
- [IMPALA-3875](#) - Thrift threaded server hang in some cases
- [IMPALA-3983](#) - /IMPALA-3974: Delete function jar resources after load
- [IMPALA-4153](#) - Return valid non-NULL pointer for 0-byte allocations
- [IMPALA-4223](#) - Handle truncated file read from HDFS cache
- [IMPALA-4336](#) - Cast exprs after unnesting union operands.
- [IMPALA-4363](#) - Add Parquet timestamp validation
- [IMPALA-4423](#) - Correct but conservative implementation of Subquery.equals().
- [IMPALA-4433](#) - Always generate testdata using the same time zone setting
- [IMPALA-4449](#) - Revisit table locking pattern in the catalog
- [IMPALA-4488](#) - HS2 GetOperationStatus() should keep session alive
- [IMPALA-4550](#) - Fix CastExpr analysis for substituted slots

- [IMPALA-4579](#) - SHOW CREATE VIEW fails for view containing a subquery
- [IMPALA-4765](#) - Avoid using several loading threads on one table.
- [OOZIE-2194](#) - oozie job -kill doesn't work with spark action.
- [OOZIE-2243](#) - Kill Command does not kill the child job for java action.
- [OOZIE-2584](#) - Eliminate Thread.sleep() calls in TestMemoryLocks.
- [OOZIE-2678](#) - Oozie job -kill doesn't work with tez jobs.
- [OOZIE-2742](#) - Unable to kill applications based on tag.
- [PIG-5025](#) - Fix flaky test failures in TestLoad.java.
- [SENTRY-1260](#) - Improve error handling - ArrayIndexOutOfBoundsException in PathsUpdate.parsePath can cause MetastoreCacheInitializer initialization to fail.
- [SENTRY-1270](#) - Improve error handling - Database with malformed URI causes NPE in HMS plugin during DDL.
- [SENTRY-1520](#) - Provide mechanism for triggering HMS full snapshot.
- [SENTRY-1564](#) - Improve error detection and reporting in MetastoreCacheInitializer.java.
- [SOLR-9284](#) - The HDFS BlockDirectoryCache should not let it's keysToRelease or names maps grow indefinitely.
- [SOLR-9330](#) - Fix AlreadyClosedException on admin/mbeans?stats=true.
- [SOLR-10031](#) - Validation of filename params in ReplicationHandler.
- [SPARK-12241](#) - [YARN] Improve failure reporting in Yarn client obtainTokenForHBase().
- [SPARK-12523](#) - [YARN] Support long-running of the Spark On HBase and hive meta store.
- [SPARK-12966](#) - [SQL] ArrayType(DecimalType) support in Postgres JDBC.
- [SPARK-13566](#) - [CORE] Avoid deadlock between BlockManager and Executor Thread.
- [SPARK-13958](#) - Executor OOM due to unbounded growth of pointer array in...
- [SPARK-14204](#) - [SQL] register driverClass rather than user-specified class.
- [SPARK-16044](#) - [SQL] Backport input_file_name() for data source based on NewHadoopRDD to branch 1.6.
- [SPARK-17245](#) - [SQL][BRANCH-1.6] Do not rely on Hive's session state to retrieve HiveConf.
- [SPARK-17465](#) - [SPARK CORE] Inappropriate memory management in `org.apache.spark.storage.MemoryStore` may lead to memory leak.
- [SPARK-18750](#) - [YARN] Follow up: move test to correct directory in 2.1 branch.
- [SPARK-18750](#) - [YARN] Avoid using "mapValues" when allocating containers.
- [SQOOP-2349](#) - Add command line option for setting transaction isolation levels for metadata queries.
- [SQOOP-2880](#) - Provide argument for overriding temporary directory.
- [SQOOP-2884](#) - Document --temporary-rootdir.
- [SQOOP-2915](#) - Fixing Oracle related unit tests.
- [SQOOP-2983](#) - OraOop export has degraded performance with wide tables.
- [SQOOP-3013](#) - Configuration "tmpjars" is not checked for empty strings before passing to MR.
- [SQOOP-3028](#) - Include stack trace in the logging of exceptions in ExportTool.
- [SQOOP-3034](#) - HBase import should fail fast if using anything other than as-textfile.
- [SQOOP-3053](#) - Create a cmd line argument for sqoop.throwOnError and use it through SqoopOptions.
- [SQOOP-3055](#) - Fixing MySQL tests failing due to ignored test inputs/configuration.
- [SQOOP-3057](#) - Fixing 3rd party Oracle tests failing due to invalid case of column names.
- [SQOOP-3071](#) - Fix OracleManager to apply localTimeZone correctly in case of Date objects too.
- [SQOOP-3124](#) - Fix ordering in column list query of PostgreSQL connector to reflect the logical order instead of adhoc ordering.

Issues Fixed in CDH 5.7.5

Upstream Issues Fixed

The following upstream issues are fixed in CDH 5.7.5:

- [HADOOP-10300](#) - Allowed deferred sending of call responses
- [HADOOP-12483](#) - Maintain wrapped SASL ordering for postponed IPC responses
- [HADOOP-13317](#) - Add logs to KMS server-side to improve supportability
- [HADOOP-13558](#) - UserGroupInformation created from a Subject incorrectly tries to renew the Kerberos ticket

- [HADOOP-13638](#) - KMS should set UGI's Configuration object properly
- [HADOOP-13669](#) - KMS Server should log exceptions before throwing
- [HADOOP-13693](#) - Remove the message about HTTP OPTIONS in SPNEGO initialization message from kms audit log
- [HDFS-4176](#) - EditLogTailer should call rollEdits with a timeout
- [HDFS-6962](#) - ACLs inheritance conflict with umaskmode
- [HDFS-7413](#) - Some unit tests should use NameNodeProtocols instead of FSNameSystem
- [HDFS-7964](#) - Add support for async edit logging
- [HDFS-8224](#) - Schedule a block for scanning if its metadata file is corrupt
- [HDFS-8709](#) - Clarify automatic sync in FSEditLog#logEdit
- [HDFS-9038](#) - DFS reserved space is erroneously counted towards non-DFS used
- [HDFS-10178](#) - Permanent write failures can happen if pipeline recoveries occur for the first packet
- [HDFS-10609](#) - Uncaught InvalidEncryptionKeyException during pipeline recovery can abort downstream applications
- [HDFS-10641](#) - TestBlockManager#testBlockReportQueueing fails intermittently
- [HDFS-10722](#) - Fix race condition in TestEditLog#testBatchedSyncWithClosedLogs
- [HDFS-10760](#) - DataXceiver#run() should not log InvalidToken exception as an error
- [HDFS-10879](#) - TestEncryptionZonesWithKMS#testReadWrite fails intermittently
- [HDFS-10962](#) - TestRequestHedgingProxyProvider fails intermittently
- [HDFS-11012](#) - Unnecessary INFO logging on DFSClients for InvalidToken
- [MAPREDUCE-6633](#) - AM should retry map attempts if the reduce task encounters compression related errors
- [MAPREDUCE-6718](#) - Add progress log to JHS during startup

Issues Fixed in CDH 5.7.3

Upstream Issues Fixed

The following upstream issues are fixed in CDH 5.7.3:

- [FLUME-2821](#) - KafkaSourceUtil Can Log Passwords at Info remove logging of security related data in older releases.
- [FLUME-2913](#) - Don't strip SLF4J from imported classpaths.
- [FLUME-2922](#) - Sync SequenceFile.Writer before calling hflush
- [HADOOP-8751](#) - NPE in Token.toString() when Token is constructed using null identifier.
- [HADOOP-11361](#) - Fix a race condition in MetricsSourceAdapter.updateJmxCache.
- [HADOOP-11901](#) - BytesWritable fails to support 2G chunks due to integer overflow.
- [HADOOP-12659](#) - Incorrect usage of configuration parameters in token manager of KMS.
- [HADOOP-13263](#) - Reload cached groups in background after expiry.
- [HADOOP-13381](#) - KMS clients should use KMS Delegation Tokens from current UGI.
- [HADOOP-13457](#) - Remove hardcoded absolute path for shell executable.
- [HDFS-6434](#) - Default permission for creating file should be 644 for WebHdfs/HttpFS.
- [HDFS-7597](#) - DelegationTokenIdentifier should cache the TokenIdentifier to UGI mapping.
- [HDFS-8008](#) - Support client-side back off when the datanodes are congested.
- [HDFS-9276](#) - Failed to Update HDFS Delegation Token for long running application in HA mode.
- [HDFS-9466](#) - TestShortCircuitCache#testDataXceiverCleansUpSlotsOnFailure is flaky.
- [HDFS-9939](#) - Increase DecompressorStream skip buffer size.
- [HDFS-10512](#) - VolumeScanner may terminate due to NPE in DataNode.reportBadBlocks.
- [MAPREDUCE-6442](#) - Stack trace is missing when error occurs in client protocol provider's constructor.
- [MAPREDUCE-6473](#) - Job submission can take a long time during Cluster initialization.
- [MAPREDUCE-6675](#) - TestJobImpl.testUnusableNode failed
- [YARN-4459](#) - container-executor should only kill process groups.
- [YARN-4784](#) - Fairscheduler: defaultQueueSchedulingPolicy should not accept FIFO.
- [YARN-4866](#) - FairScheduler: AMs can consume all vcores leading to a livelock when using FAIR policy.
- [YARN-4878](#) - Expose scheduling policy and max running apps over JMX for Yarn queues.
- [YARN-5077](#) - Fix FSLeafQueue#getFairShare() for queues with zero fairshare.
- [YARN-5272](#) - Handle queue names consistently in FairScheduler.
- [HBASE-14963](#) - Remove use of Guava Stopwatch from HBase client code.
- [HBASE-15621](#) - Suppress Hbase SnapshotHFile cleaner error messages when a snapshot is going on.
- [HBASE-15808](#) - Reduce potential bulk load intermediate space usage and waste.
- [HBASE-16135](#) - PeerClusterZnode under rs of removed peer may never be deleted
- [HBASE-16207](#) - can't restore snapshot without "Admin" permission
- [HBASE-16227](#) - [Shell] Column value formatter not working in scans. Tested : manually using shell.
- [HBASE-16288](#) - HFile intermediate block level indexes might recurse forever creating multi TB files.
- [HBASE-16319](#) - Fix TestCacheOnWrite after HBASE-16288.
- [HIVE-11432](#) - Hive macro gives same result for different arguments.
- [HIVE-11487](#) - Add getNumPartitionsByFilter api in metastore api.
- [HIVE-11980](#) - Follow up on HIVE-11696, exception is thrown from CTAS from the table with table-level serde is Parquet while partition-level serde is JSON.
- [HIVE-12277](#) - Hive macro results on macro_duplicate.q different after adding ORDER BY.
- [HIVE-12635](#) - Hive should return the latest HBase cell timestamp as the row timestamp value.
- [HIVE-13043](#) - Reload function has no impact to function registry.
- [HIVE-13090](#) - Hive metastore crashes on NPE with ZooKeeperTokenStore.
- [HIVE-13372](#) - Hive Macro overwritten when multiple macros are used in one column.
- [HIVE-13704](#) - Do not call DistCp.execute() instead of DistCp.run().

- [HIVE-13749](#) - Memory leak in Hive Metastore.
- [HIVE-13884](#) - Disallow queries in HMS fetching more than a configured number of partitions
- [HIVE-14055](#) - directSql - getting the number of partitions is broken.
- [HIVE-14187](#) - JDOPersistenceManager objects remain cached if MetaStoreClient#close is not called.
- [HIVE-14209](#) - Add some logging info for session and operation management.
- [HIVE-14298](#) - NPE could be thrown in HMS when an ExpressionTree could not be made from a filter.
- [HIVE-14359](#) - Hive on Spark might fail in HS2 with LDAP authentication in a kerberized cluster.
- [HIVE-14457](#) - Partitions in encryption zone are still trashed though an exception is returned.
- [HUE-3481](#) - [assist] Do not sort the columns by name, instead use the creation order.
- [HUE-3842](#) - [core] HTTP 500 while emptying Hue 3.9 trash directory.
- [HUE-3845](#) - [sentry] Sometimes see group as editable on role section.
- [HUE-3880](#) - [core] Add importlib directly for Python 2.6.
- [HUE-3988](#) - [search] Support schemaless collections.
- [HUE-3999](#) - [oozie] list_oozie_workflow page should not break in case of bad json from oozie.
- [HUE-4265](#) - [beeswax] Bring back show preview in the assist.
- [HUE-4300](#) - [fb] Avoid double file listing call on folder search.
- [HUE-4333](#) - [core] Properly reset API_CACHE on failover.
- [HUE-4477](#) - [security] Select All is not filtering out the non visible roles from the selection .
- [HUE-4493](#) - [oozie] Fix sync-workflow action when Workflow includes sub-workflow.
- [HUE-4515](#) - [oozie] Remove oozie.bundle.application.path from properties when rerunning workflow.
- [IMPALA-3711](#) - Remove unnecessary privilege checks in getDbsMetadata().
- [IMPALA-3915](#) - Register privilege and audit requests when analyzing resolved table refs.
- [OOZIE-2391](#) - spark-opts value in workflow.xml is not parsed properly.
- [OOZIE-2537](#) - SqoopMain does not set up log4j properly.
- [SOLR-7280](#) - BackportLoad cores in sorted order and tweak coreLoadThread counts to improve cluster stability on restarts.
- [SOLR-9236](#) - AutoAddReplicas will append an extra /tlog to the update log location on replica failover.
- [SPARK-14963](#) - [YARN] Using recoveryPath if NM recovery is enabled.
- [SPARK-16505](#) - [YARN] Optionally propagate error during shuffle service startup.
- [SQOOP-2561](#) - Special Character removal from Column name as avro data results in duplicate column and fails the import.
- [SQOOP-2906](#) - Optimization of AvroUtil.toAvroIdentifier.
- [SQOOP-2971](#) - OraOop does not close connections properly.
- [SQOOP-2995](#) - Backward incompatibility introduced by Custom Tool options.

Issues Fixed in CDH 5.7.2

CDH 5.7.2 fixes the following issues.

Kerberized HS2 with LDAP authentication fails in a multi-domain LDAP case

In CDH 5.7, Hive introduced a feature to support HS2 with Kerberos plus LDAP authentication; but it broke compatibility with multi-domain LDAP cases on CDH 5.7.x and C5.8.x versions.

Affected Versions: CDH 5.7.1, CDH 5.8.0, and CDH 5.8.1

Fixed in Versions: CDH 5.7.2 and higher, CDH 5.8.2 and higher

Bug: [HIVE-13590](#).

Workaround: None.

Oozie

Oozie Web Console returns 500 error when Oozie server runs on JDK 8u75 or higher

Bug: [OOZIE-2533](#)

Cloudera Bug: CDH-40362

The Oozie Web Console returns a 500 error when the Oozie server is running on JDK 8u75 and higher. The Oozie server still functions, and you can use the Oozie command line, REST API, Java API, or the Hue Oozie Dashboard to review status of those jobs.

Upstream Issues Fixed

The following upstream issues are fixed in CDH 5.7.2:

- [FLUME-1899](#) - Make SpoolDir work with subdirectories
- [FLUME-2910](#) - AsyncHBaseSink: Failure callbacks should log the exception that caused them
- [FLUME-2918](#) - Speed up TaildirSource on directories with many files
- [HADOOP-8934](#) - Shell command ls should include sort options
- [HADOOP-10971](#) - Add -C flag to make `hadoop fs -ls` print filenames only
- [HADOOP-11409](#) - FileContext.getFileContext can stack overflow if default fs misconfigured
- [HADOOP-11432](#) - Fix SymlinkBaseTest#testCreateLinkUsingPartQualPath2.
- [HADOOP-12787](#) - KMS SPNEGO sequence does not work with WebHDFS
- [HADOOP-12841](#) - Update s3-related properties in core-default.xml.
- [HADOOP-12901](#) - Add warning log when KMSClientProvider cannot create a connection to the KMS server.
- [HADOOP-12963](#) - Allow using path style addressing for accessing the S3 endpoint.
- [HADOOP-13079](#) - Add -q option to Ls to print ? instead of non-printable characters
- [HADOOP-13132](#) - Handle ClassCastException on AuthenticationException in LoadBalancingKMSClientProvider
- [HADOOP-13155](#) - Implement TokenRenewer to renew and cancel delegation tokens in KMS
- [HADOOP-13251](#) - Authenticate with Kerberos credentials when renewing KMS delegation token
- [HADOOP-13255](#) - KMSClientProvider should check and renew TGT when doing delegation token operations
- [HDFS-8581](#) - ContentSummary on / skips further counts on yielding lock
- [HDFS-8829](#) - Make SO_RCVBUF and SO_SNDBUF size configurable for DataTransferProtocol sockets and allow configuring auto-tuning
- [HDFS-9085](#) - Show renewer information in DelegationTokenIdentifier#toString
- [HDFS-9259](#) - Make SO_SNDBUF size configurable at DFSClient side for hdfs write scenario.
- [HDFS-9365](#) - Balancer does not work with the HDFS-6376 HA setup.
- [HDFS-9405](#) - Warmup NameNode EDEK caches in background thread
- [HDFS-9700](#) - DFSClient and DFSOutputStream should set TCP_NODELAY on sockets for DataTransferProtocol
- [HDFS-9732](#) - Improve DelegationTokenIdentifier.toString() for better logging
- [HDFS-9805](#) - Add server-side configuration for enabling TCP_NODELAY for DataTransferProtocol and default it to true
- [HDFS-10360](#) - DataNode may format directory and lose blocks if current/VERSION is missing
- [HDFS-10381](#) - DataStreamer DataNode exclusion log message should be warning
- [HDFS-10396](#) - Using -diff option with DistCp may get "Comparison method violates its general contract" exception
- [HDFS-10481](#) - HTTPFS server should correctly impersonate as end user to open file
- [HDFS-10516](#) - Fix bug when warming up EDEK cache of more than one encryption zone
- [HDFS-10525](#) - Fix NPE in CacheReplicationMonitor#rescanCachedBlockMap
- [MAPREDUCE-6558](#) - multibyte delimiters with compressed input files generate duplicate records
- [MAPREDUCE-6577](#) - MR AM unable to load native library without MR_AM_ADMIN_USER_ENV set
- [MAPREDUCE-6635](#) - Unsafe long to int conversion in UncompressedSplitLineReader and IndexOutOfBoundsExpection
- [MAPREDUCE-6701](#) - Application Master log unavailable when clicking JobHistory's AM logs link
- [YARN-2605](#) - [RM HA] Rest API endpoints doing redirect incorrectly.
- [YARN-4812](#) - TestFairScheduler#testContinuousScheduling fails intermittently.
- [YARN-4916](#) - Revert "TestNMProxy.testNMProxyRPCRetry fails
- [YARN-5048](#) - DelegationTokenRenewer#skipTokenRenewal may throw NPE
- [HBASE-11625](#) - Reading datablock throws "Invalid HFile block magic" and can not switch to hdfs checksum
- [HBASE-13532](#) - Make UnknownScannerException less scary by giving more information in the exception string.

- [HBASE-14644](#) - Region in transition metric is broken

Issues Fixed in CDH 5.7.1

CDH 5.7.1 fixes the following issues.

Apache HBase

The ReplicationCleaner process can abort if its connection to ZooKeeper is inconsistent

Bug: [HBASE-15234](#)

If the connection with ZooKeeper is inconsistent, the ReplicationCleaner may abort, and the following event is logged by the HMaster:

```
WARN org.apache.hadoop.hbase.replication.master.ReplicationLogCleaner: Aborting
ReplicationLogCleaner
because Failed to get list of replicators
```

Unprocessed WALs accumulate.

The `seekBefore()` method calculates the size of the previous data block by assuming that data blocks are contiguous, and HFile v2 and higher store Bloom blocks and leaf-level INode blocks with the data. As a result, reverse scans do not work when Bloom blocks or leaf-level INode blocks are present when HFile v2 or higher is used.

Workaround: Restart the HMaster occasionally. The ReplicationCleaner restarts if necessary and process the unprocessed WALs.

Upstream Issues Fixed

The following upstream issues are fixed in CDH 5.7.1:

- [AVRO-1781](#) - Schema.parse is not thread safe
- [FLUME-2781](#) - Kafka Channel with parseAsFlumeEvent=true should write data as is, not as flume events
- [FLUME-2891](#) - Revert FLUME-2712 and FLUME-2886
- [FLUME-2897](#) - AsyncHBase sink NPE when Channel.getTransaction() fails
- [HADOOP-7139](#) - Allow appending to existing SequenceFiles
- [HADOOP-7817](#) - RawLocalFileSystem.append() should give FSDataOutputStream with accurate .getPos()
- [HADOOP-11321](#) - copyToLocal cannot save a file to an SMB share unless the user has Full Control permissions
- [HADOOP-11687](#) - Ignore x-* and response headers when copying an Amazon S3 object
- [HADOOP-12668](#) - Support excluding weak Ciphers in HttpServer2 through ssl-server.conf
- [HADOOP-12825](#) - Log slow name resolutions

- [HADOOP-12954](#) - Add a way to change `hadoop.security.token.service.use_ip`
- [HADOOP-12972](#) - `Lz4Compressor#getLibraryName` returns the wrong version number
- [HDFS-3519](#) - Checkpoint upload may interfere with a concurrent `saveNamespace`
- [HDFS-6520](#) - `hdfs fsck` passes invalid length value when creating `BlockReader`
- [HDFS-7600](#) - Refine `hdfs` admin classes to reuse common code
- [HDFS-8142](#) - `DistributedFileSystem` encryption zone commands should resolve relative paths
- [HDFS-8211](#) - `DataNode` UUID is always null in the JMX counter.
- [HDFS-8496](#) - Calling `stopWriter()` with `FSDatasetImpl` lock held may block other threads
- [HDFS-8855](#) - `Webhdfs` client leaks active `NameNode` connections
- [HDFS-9549](#) - `TestCacheDirectives#testExceedsCapacity` is flaky
- [HDFS-9589](#) - Block files which have been hardlinked should be duplicated before the `DataNode` appends to the them
- [HDFS-9949](#) - Add a test case to ensure that the `DataNode` does not regenerate its UUID when a storage directory is cleared
- [HDFS-10223](#) - `peerFromSocketAndKey` performs SASL exchange before setting connection timeouts
- [HDFS-10267](#) - Extra "synchronized" on `FsDatasetImpl#recoverAppend` and `FsDatasetImpl#recoverClose`
- [HDFS-10324](#) - Trash directory in an encryption zone should be pre-created with correct permissions
- [HDFS-10344](#) - `DistributedFileSystem#getTrashRoots` should skip encryption zone that does not have `.Trash`
- [MAPREDUCE-4785](#) - `TestMRApp` occasionally fails
- [MAPREDUCE-6297](#) - Task Id of the failed task in diagnostics should link to the task page
- [MAPREDUCE-6333](#) - `TestEvents`, `TestAMWebServicesTasks`, `TestAppController` are broken due to `MAPREDUCE-6297`
- [MAPREDUCE-6384](#) - Add the last reporting reducer info for too many fetch failure diagnostics
- [MAPREDUCE-6388](#) - Remove deprecation warnings from `JobHistoryServer` classes
- [MAPREDUCE-6485](#) - Create a new task attempt with failed map task priority if in-progress attempts are unassigned
- [MAPREDUCE-6513](#) - MR job got hanged forever when one NM unstable for some time
- [MAPREDUCE-6535](#) - `TaskID` default constructor results in NPE on `toString()`

- [HIVE-13243](#) - Hive drop table on encryption zone fails for external tables
- [HIVE-13251](#) - hive can't read the decimal in AVRO file generated from previous version
- [HIVE-13286](#) - Query ID is being reused across queries
- [HIVE-13295](#) - Improvement to LDAP search queries in HS2 LDAP Authenticator
- [HIVE-13300](#) - Hive on spark throws exception for multi-insert with join
- [HIVE-13302](#) - direct SQL: cast to date doesn't work on Oracle
- [HIVE-13376](#) - HoS emits too many logs with application state
- [HIVE-13401](#) - Kerberized HS2 with LDAP auth enabled fails kerberos/delegation token authentication
- [HIVE-13410](#) - PerfLog metrics scopes not closed if there are exceptions on HS2
- [HIVE-13500](#) - Fix OOM with explan output being logged
- [HIVE-13527](#) - Using deprecated APIs in HBase client causes zookeeper connection leaks
- [HIVE-13530](#) - Hive on Spark throws Kryo exception in some cases
- [HIVE-13570](#) - Some queries with Union all fail when CBO is off
- [HIVE-13585](#) - Add counter metric for direct sql failures
- [HIVE-13632](#) - CDH39911Hive failing on insert empty array into parquet table
- [HIVE-13657](#) - Spark driver stderr logs should appear in hive client logs
- [HUE-3171](#) - Fix vertical resize handle for queries with long descriptions
- [HUE-3171](#) - Long descriptions doesn't wrap and headers from table follows with horizontal scroll
- [HUE-3221](#) - Styling on column stats popup leaks on the tables page
- [HUE-3293](#) - Prevent document matching query error when going one home 1
- [HUE-3293](#) - Fix mis-switching to new home page when new editor is on
- [HUE-3293](#) - Move new editor flag to desktop

- [HUE-3303](#) - PostgreSQL requires data update and alter table operations in separate transactions
- [HUE-3310](#) - Prevent browsing job designs by API
- [HUE-3334](#) - Update test, now se send empty query instead of error
- [HUE-3334](#) - Skip checking for multi queries if there is no semi colon
- [HUE-3350](#) - Reverse browsing link to use the correct version of the editor
- [HUE-3398](#) - Filter out sessions with empty guid or secret key
- [HUE-3434](#) - Logs of finished Oozie workflow are not displayed
- [HUE-3436](#) - Retain old dependencies when saving a workflow
- [HUE-3437](#) - PamBackend does not honor ignore_username_case
- [HUE-3459](#) - Put stat popover on top
- [HUE-3459](#) - Fixed Flexbox for IE10
- [HUE-3459](#) - Use fixed positioning for assist panel
- [HUE-3459](#) - Revert sticky assist
- [HUE-3459](#) - Fix issue with single panel in metastore and new editor
- [HUE-3459](#) - Clear the height interval on update
- [HUE-3459](#) - Assist doesn't stretch to the end of the page in the old editors
- [HUE-3471](#) - Set the assist database on design update
- [HUE-3471](#) - Assist does not show the DB from the saved query
- [HUE-3476](#) - Clear any running intervals after closing the stats popover
- [HUE-3480](#) - Impala refresh pop-over won't close after assist action while open
- [HUE-3506](#) - Limit length of comments on table page
- [HUE-3511](#) - Reduce flickering of action icons when moving the pointer across several entries
- [HUE-3523](#) - Modify find_jobs_with_no_doc method to exclude jobs with no name
- [HUE-3528](#) - Call correct metrics api to avoid 500 error
- [HUE-3543](#) - Timeout prevents refreshing of the Assist tables/dbs
- [HUE-3594](#) - Smarter DOM based XSS filter on hashes
- [HUE-3601](#) - Spinner not positioned correctly
- [HUE-3613](#) - Empty div elements are added when scrolling the DB assist panel
- [HUE-3614](#) - Scrolling on assist in old editor also scrolls the editor
- [HUE-3637](#) - Avoid decode errors on attribute values
- [HUE-3650](#) - Notify of caught errors in the watch logs process
- [HUE-3651](#) - Upgrade Moment.js
- [HUE-3704](#) - Force enable notebook permissions
- [HUE-3716](#) - Add gen-py paths to hue.pth
- [HUE-3725](#) - 'SparkJob' object has no attribute 'amHostHttpAddress'
- [HUE-3731](#) - Send database on Impala refresh with invalidate
- [HUE-3741](#) - Display field validation errors on create table wizard
- [HUE-3800](#) - Job attempt logs not appearing for some Oozie jobs
- [HUE-3819](#) - Make the upload and create icons not disappear under 1180px
- [IMPALA-2076](#) - Correct execution time tracking for DataStreamSender
- [IMPALA-2502](#) - Don't redundantly repartition grouping aggregations
- [IMPALA-2892](#) - Buffered-tuple-stream-ir.cc is not cross-compiled
- [IMPALA-3133](#) - Wrong privileges after a REVOKE ALL ON SERVER statement
- [IMPALA-3139](#) - Fix drop table statement to not drop views and vice versa
- [IMPALA-3141](#) - Send dummy filters when filter production is disabled
- [IMPALA-3194](#) - Allow queries materializing scalar type columns in RC/sequence files
- [IMPALA-3220](#) - Skip logging empty ScannerContext's stream in parse error
- [IMPALA-3236](#) - Increase timeout for runtime filter tests
- [IMPALA-3238](#) - Avoid log spam for very large hash tables
- [IMPALA-3245](#), [IMPALA-3305](#): Fix crash with global filters when NUM_NODES=1

- [IMPALA-3269](#) - Remove authz checks on default table location in CTAS queries
- [IMPALA-3285](#) - Fix ASAN failure in webservice-test
- [IMPALA-3317](#) - Fix crash in sorter when spilling zero-length strings
- [IMPALA-3334](#) - Fix some bugs in query options' parsing.
- [IMPALA-3367](#) - Ensure runtime filters tests run on 3 nodes
- [IMPALA-3378](#), [IMPALA-3379](#): fix various JNI issues
- [IMPALA-3385](#) - Fix crashes on accessing error_log
- [IMPALA-3395](#) - Old HT filter code uses wrong expr type
- [IMPALA-3396](#) - Fix ConcurrentTimerCounter unit test "TimerCounterTest" failure.
- [IMPALA-3412](#) - Fix CHAR codegen crash in tuple comparator
- [IMPALA-3420](#) - Set IMPALA_THRIFT_VERSION patch level to +4
- [KITE-1108](#) - Add optional retry feature to loadSolr morphline command
- [KITE-1114](#) - Kite CLI json-import HDFS temp file path not multiuser safe
- [OOZIE-2429](#) - TestEventGeneration test is flakey
- [OOZIE-2466](#) - Repeated failure of TestMetricsInstrumentation.testSamplers
- [OOZIE-2486](#) - TestSLAEventsGetForFilterJPAExecutor is flakey
- [OOZIE-2490](#) - Oozie can't set hadoop.security.token.service.use_ip
- [SENTRY-922](#) - INSERT OVERWRITE DIRECTORY permission not working correctly
- [SENTRY-1112](#) - Change default value of "sentry.hive.server" to empty string
- [SENTRY-1164](#) - testCaseSensitivity test failure on a real cluster and also a minor improvements to testConcurrentClients to run locally. (Anne Yu, reviewed by Haohao).
- [SENTRY-1169](#) - MetastorePlugin#renameAuthzObject log message prints oldpathname as newpathname
- [SENTRY-1184](#) - Clean up HMSPaths.renameAuthzObject
- [SENTRY-1190](#) - IMPORT TABLE silently fails if Sentry is enabled
- [SOLR-6631](#) - DistributedQueue spinning on calling zookeeper getChildren()
- [SOLR-6879](#) - Have an option to disable autoAddReplicas temporarily for all collections.
- [SOLR-7493](#) - Requests aren't distributed evenly if the collection isn't present locally. Merges r1683946 and r1683948 from trunk.
- [SOLR-8551](#) - Make collection deletion more robust.
- [SOLR-8683](#) - Tune down stream closed logging
- [SOLR-8720](#) - ZkController#publishAndWaitForDownStates should use #publishNodeAsDown.
- [SOLR-8771](#) - Multi-threaded core shutdown creates executor per core
- [SOLR-8855](#) - The HDFS BlockDirectory should not clean up it's cache on shutdown.
- [SOLR-8856](#) - Do not cache merge or 'read once' contexts in the hdfs block cache.
- [SOLR-8857](#) - HdfsUpdateLog does not use configured or new default number of version buckets and is hard coded to 256.
- [SOLR-8869](#) - Optionally disable printing field cache entries in SolrFieldCacheMBean
- [SPARK-4452](#) - Shuffle data structures can starve others on the same thread for memory
- [SPARK-12614](#) - Don't throw non fatal exception from ask
- [SPARK-13622](#) - Issue creating level db for YARN shuffle service
- [SPARK-14242](#) - Avoid copy in compositeBuffer for frame decoder
- [SPARK-14290](#) - Avoid significant memory copy in Netty's tran...
- [SPARK-14363](#) - Fix executor OOM due to memory leak in the Sorter
- [SPARK-14477](#) - Allow custom mirrors for downloading artifacts in build/mvn
- [SPARK-14679](#) - Fix UI DAG visualization OOM.
- [SQOOP-2847](#) - Sqoop --incremental + missing parent --target-dir reports success with no data

Issues Fixed in CDH 5.7.0

CDH 5.7.0 fixes the following issues.

Apache Flume

TailDirSource throws FileNotFoundException Exception if ~/.flume directory is not created already

Bug: [FLUME-2773](#)

This fix ensures that any missing parent directories in the `positionFile` path (either default or user given input) are always created.

flume_env script should handle JVM parameters like -javaagent -agentpath -agentlib

Bug: [FLUME-2763](#)

This fix enables the `flume_env` script to handle JVM parameters such as `-javaagent`, `-agentpath` and `-agentlib`.

Kafka channel timeout property is overridden by default value

Bug: [FLUME-2734](#)

When the Kafka channel timeout property is passed to the Kafka consumer internally, it does not work as expected. It is overridden by the default value or the value specified by the `.timeout` property, which is undocumented. Now the `kafka.consumer.timeout.ms` value specified in the configuration takes effect like other Kafka consumer properties.

Apache Hadoop

ReplicationMonitor can infinitely loop in BlockPlacementPolicyDefault#chooseRandom()

Bug: [HDFS-4937](#)

Cloudera Bug: CDH-34043

When a large number of nodes are removed by refreshing node lists, the network topology is updated and the replication monitor thread may get stuck in the `while` loop of `chooseRandom()`.

Clean up temporary files after fsimage transfer failures

Bug: [HDFS-7373](#)

Cloudera Bug: CDH-19177

When an `fsimage` (or checkpoint) transfer fails, a temporary file is left in each storage directory. If the namespace is large, these files can take up a large amount of space.

Lease recovery should return true if the lease can be released and the file can be closed

Bug: [HDFS-8576](#)

Cloudera Bug: CDH-37212

`FSNamesystem#recoverLease` should return `true` when a lease is recovered both explicitly and implicitly—that is, when a lease recovery is successful and the file is closed, and also when a file is closed and the lease is released *without* a recovery.

fsck does not list correct file path when bad replicas or blocks are in a snapshot

Bug: [HDFS-9231](#)

Cloudera Bug: CDH-32221

When blocks are corrupt in a snapshot, the `fsck` command lists the original directory and not the snapshot directory. This happens even when the original file is deleted. The specific commands are `fsck -list-corruptfileblocks` and `fsck -list-corruptfileblocks -includeSnapshots`.

Make DataStreamer#block thread safe and verify generationStamp in commitBlock

Bug: [HDFS-9289](#)

Cloudera Bug: CDH-33723

When the client calls `updatePipeline`, a block might commit with an old `generationStamp`, causing replicas to look corrupt.

*Delayed heartbeat processing causes storm of subsequent heartbeats***Bug:** [HDFS-9305](#)**Cloudera Bug:** CDH-33589

The NameNode usually handles DataNode heartbeats quickly, but can be delayed for various reasons, such as a long garbage collection or lock contention. After the NameNode recovers, the DataNode sends a storm of heartbeat messages in a tight loop which, in a big cluster, can overload the NameNode and make cluster recovery difficult.

*FSImage may get corrupted after deleting snapshot***Bug:** [HDFS-9406](#)**Cloudera Bug:** CDH-33224

When deleting a snapshot that contains the last record of a given INode, the fsimage may become corrupt because the create list of the snapshot diff in the previous snapshot and the child list of the parent INodeDirectory are not cleaned.

Apache HBase

See also [Known Issues In CDH 5.7.0](#) on page 1973.

*Potential data loss after a RegionServerAbortedException***Bug:** [HBASE-13895](#)

If the master attempts to assign a region while handling a RegionServer abort, the returned RegionServerAbortedException is handled as though the region had been cleanly taken offline, so the new assignment is allowed to proceed. If the region is opened in its new location before WAL replay has completed, the replayed edits are ignored, or are later played back on top of new edits that happened after the region was opened. In either case, data can be lost.

Workaround: None.*Data loss can occur if a table has more than 2,147,483,647 columns***Bug:** [HBASE-15133](#)

Data loss can occur if a table has more than 2,147,483,647 (`Integer.MAX_INT`) columns, because some key variable types are INT rather than LONG.

Workaround: Adjust your schema to use fewer than `Integer.MAX_INT` columns.*Delete operations that occur during a region merge may be eclipsed by new Put operations***Bug:** [HBASE-13938](#)

The master's timestamp is not used when sending `hbase:meta` edits on region merges, so correct ordering of new region additions and old region deletes is not assured and data loss can occur if edits are applied in the wrong order.

Workaround: None.*RPC handler / task monitoring seems to be broken after 0.98***Bug:** [HBASE-14674](#)

After pluggable RPC scheduler, the way the tasks work for the handlers got changed. We no longer list idle RPC handlers in the tasks, but we register them dynamically to TaskMonitor through CallRunner. However, the IPC readers are still registered the old way (meaning that idle readers are listed as tasks, but not idle handlers).

From the javadoc of MonitoredRPCHandlerImpl, it seems that we are NOT optimizing the allocation for the MonitoredTask anymore, but instead allocate one for every RPC call breaking the pattern

*Conflicts between HBase Balancer and hbase:meta reassignment***Bug:** [HBASE-14536](#)

If `hbase:meta` is assigned to a `RegionServer` that becomes unavailable, and the HBase balancer has scheduled but not completed a plan to move `hbase:meta` to a different `RegionServer`, the `hbase:meta` becomes unassigned.

Workaround: None.

Regions can fail to transition in a write-heavy cluster with a small number of read handlers

Bug: [HBASE-13635](#)

On a write-heavy cluster configured with a small number of read handlers, all requests that are not mutations are sent to the read handlers, including `ReportRegionInTransition` requests. If these requests time out, the `RegionServer` is assumed to be unavailable, and the regions cannot transition correctly.

Workaround: None.

In a secured environment, when a RegionServer is stopped, znodes may not be cleaned up correctly

Bug: [HBASE-14581](#)

When a `RegionServer` process is stopped, the `zkcli` command is invoked to delete its `znodes`. In a secure cluster, the `zkcli` command does not authenticate to ZooKeeper and the deletion fails. This problem occurs because the `REGIONSERVER_OPTS` environment variable is not correctly passed when invoking the `zkcli` command.

Workaround: None.

Delays in RegionServer responses can cause a region to be closed indefinitely

Bug: [HBASE-14407](#)

Handling of region assignment by the master has a flaw when `RegionServer` responses are delayed due to network delays, system load, or other reasons. This flaw can cause the master to close a region indefinitely.

Workaround: Restart the `RegionServer` to force the region to be reassigned.

When a RegionServer crashes, replication peers can crash due to inode exhaustion from old WALs

Bug: [HBASE-14621](#)

The fix for [HBASE-12865](#) ensures that `loadWALsFromQueues` attempts a retry when the replication source version is changed while loading the replication queue. However, the fix introduced a bug in `ReplicationLogCleaner` that causes an infinite loop when a `RegionServer` crashes. As a result, old WALs are not cleaned up. In a cluster under high load, the inode limit on the replication peer `RegionServer` can be exhausted, causing the `RegionServer` to crash.

Workaround: None.

When a RegionServer crashes, cell-level visibility tags may be lost during WAL replay

Bug: [HBASE-15218](#)

When reading cells after a `RegionServer` crash, the `KeyValueCodec` and the `WallCellCodec` both use `NoTagsKeyValue`, which does not preserve visibility tags.

Workaround: None.

Column is not deleted if you do not pass the visibility label

Bug: [HBASE-14761](#)

If a column was created or modified with a visibility label, and you attempt to delete it without passing the visibility label, the column is not deleted. It is not visible using a `Scan` operation, but is visible using a raw `Scan`, and is marked with `deleteColumn`.

Workaround: None.

If multiple users are configured with the role `hbase.superuser`, an attempt to connect to a secure ZooKeeper instance fails

Bug: [HBASE-14425](#)

The `hbase.superuser` configuration option is a comma-separated list of users. A bug in the code to connect to a secure ZooKeeper causes the list to be evaluated as a single value, so a list of multiple users fails because no username matches the comma-separated list.

Workaround: Only specify a single user in the `hbase.superuser` configuration option.

Region split request audits are performed against the `hbase` user instead of the requesting user

Bug: [HBASE-14475](#)

When checking whether the requesting user has permission to perform a region split, the `hbase` user's permissions are checked instead of those of the requesting user. Due to this bug, `CREATE` is sufficient for the split, rather than `CREATE` and `ADMIN`. Because `CREATE` permissions are also sufficient for flushes and compactions, this issue is not severe in most environments.

Workaround: None.

Incorrect timestamp checking causes unpredictable deletes with `VisibilityScanDeleteChecker`.

Bug: [HBASE-13635](#)

Incorrect timestamp checking when `VisibilityScanDeleteChecker` is used causes unpredictable results when deleting cells. In some cases, the timestamp is deleted but the cell contents are not deleted. In other cases, a request to delete an entire row or to delete a version results in only a single cell being deleted.

Workaround: None.

A `BulkLoad` of an HFile with tags that requires splits does not preserve the tags

Bug: [HBASE-15035](#)

When an HFile is created with cell tags and is imported into HBase using a bulk load, the tags are present as expected when the HFile is loaded into a single region. However, if the bulk load spans multiple regions, the original HFile is automatically split into a set of HFiles corresponding to each of the regions the original HFile covers. Tags, including ACLs, TTLs, and MOB pointers, are not copied to the split files.

Workaround: None.

Restoring a snapshot from a table in a user-defined namespace causes a `URISyntaxException`

Bug: [HBASE-14578](#)

A table in a user-defined namespace uses a colon between the namespace and the table name (for instance, `example_ns:users`). This colon is interpreted incorrectly when restoring from a snapshot.

Workaround: None.

The `list_snapshots` HBase shell command shows all snapshots, regardless of the user's permission to view them

Bug: [HBASE-12552](#)

A user with no privileges to interact with a snapshot can list the snapshot using the `list_snapshots` HBase shell command.

Workaround: None.

`ExportSnapshot` or `DistCp` operations may fail on the Amazon `s3a://` protocol

Bug: None.

`ExportSnapshot` or `DistCP` operations may fail on AWS when using certain JDK 8 versions, due to an incompatibility between AWS Java SDK 1.9.x and the `joda-time` date-parsing module.

Workaround: Use `joda-time` 2.8.1 or higher, which is included in AWS Java SDK 1.10.1 or higher.

If HDFS is restarted while HBase is running, WALs being replicated may not close correctly

Bug: [HBASE-15019](#)

The RegionServer receiving the replicated WALs has no mechanism to be notified to perform a recovery if HDFS is restarted on the source cluster.

Workaround: Restart the RegionServer to force the master to trigger the lease recovery during WAL splitting.

The permissions of the .top/ directory are not explicitly set during LoadIncrementalHFiles operations

Bug: [HBASE-14005](#)

Permissions are not explicitly set on the .top/ directory created during LoadIncrementalHFiles. The permissions should be set the same as the .bottom/ and .tmp/ directories.

Workaround: None.

Nonfatal errors in the FSHLog subsystem are incorrectly logged as fatal errors

Bug: [HBASE-14042](#)

If an IOException causes a log roll to be requested, it is logged as a fatal event, although it should be logged as a warning.

Workaround: None.

FuzzyRowFilter may omit some rows if multiple fuzzy keys are present

Bug: [HBASE-14269](#)

If you use the FuzzyRowFilter for Scan operations, and you have multiple fuzzy keys, some rows may be omitted from the RowTracker.

Workaround: None.

The prefix-tree module is not automatically included in MapReduce jobs

Bug: [HBASE-15152](#)

JARs for prefix-tree module are not automatically included in YarnChildren processes. This causes a ClassNotFoundException.

Workaround: Manually add the prefix-tree JARs to the classpath if needed.

Values of some metrics may appear to be negative

Bug: [HBASE-12961](#)

Some metric value are stored in integers, and cannot accommodate real-world values. This causes metric values to appear to be negative.

Workaround: None.

The HBase Shell cannot handle Scan filters which contain non-UTF8 characters

Bug: [HBASE-15032](#)

The HBase Shell incorrectly handles filter strings which contain non-UTF8 characters.

Workaround: None.

Reverse scans do not work when Bloom blocks or leaf-level inode blocks are present

Bug: [HBASE-14283](#)

Because the seekBefore() method calculates the size of the previous data block by assuming that data blocks are contiguous, and HFile v2 and higher store Bloom blocks and leaf-level inode blocks with the data, reverse scans do not work when Bloom blocks or leaf-level inode blocks are present when HFile v2 or higher is used.

Workaround: None.

Apache Hive

Fix regression in bind and search logic for Hive external LDAP authentication

Bug: [HIVE-12885](#)

Cloudera Bug: CDH-35075

Fixes a regression in LDAP bind and search authentication from CDH 5.5.0.

Some queries using LEFT SEMI JOIN fail with IndexOutOfBoundsException

Bug: [HIVE-13082](#)

Cloudera Bug: CDH-37515

Some queries using LEFT SEMI JOIN fail with IndexOutOfBoundsException. Constant propagation optimization for these queries is now enabled.

BETWEEN predicate is not functioning correctly with predicate pushdown on Parquet tables

Bug: [HIVE-13039](#)

Cloudera Bug: CDH-37322

BETWEEN becomes exclusive in Parquet table when predicate pushdown (PPD) is enabled for Parquet tables, leading to potential incorrect results.

Performance degradation when running Hive queries against wide tables with Sentry enabled

Bug: [SENTRY-1007](#)

Cloudera Bug: CDH-35908

Fixes a performance regression due to inefficient authorization checks in the Sentry Hive binding for Hive tables that are wide (more than 100 columns).

Optionally cancel queries after configurable timeout waiting on compilation lock

Bug: [HIVE-12431](#)

Cloudera Bug: CDH-34693

Adds a new configuration option, `hive.server2.compile.lock.timeout`, that cancels queries if they are waiting for the compile lock for more than this amount of time. This applies only to queries waiting on compilation and does not cancel queries that are being compiled. By default, the timeout is unlimited.

Hue

The Hive Sample Table, customer, Cannot be Queried

Bug: [HUE-3040](#)

Cloudera Bug: CDH-35054

Users can now query the customer table in the Hive editor.

Apache Impala

For the list of Impala fixed issues, see [Issues Fixed in Impala for CDH 5.7.0](#) on page 2422.

See also [Apache Impala Known Issues](#) on page 1995 for issues that are known but not resolved yet.

MapReduce

MapReduce Rolling Upgrades To and From CDH 5.6.0 Fail

Cloudera Bug: CDH-38587

Users can now safely use rolling upgrade from releases CDH 5.6.0 and lower to CDH 5.7.0.

Cloudera Search

Reordered updates cause leaders and replicas to become out of sync

Bug: [SOLR-8586](#), [SOLR-8691](#)

Solr relied on checking leader/replica document synchronization by comparing the last 100 updates on the leader and replica for significant overlap, and then applying any missing updates from the leader. In certain cases, document updates could be significantly reordered, resulting in mismatches in the index, even when the last 100 documents

matched. Solr now implements hashing over the versions of all the documents to check for synchronization, eliminating a class of errors in which replicas and leaders could become out of sync.

Apache Sentry

Fixed Sentry Oracle upgrade script

Bug: [SENTRY-1066](#)

This fixes previous Sentry upgrade issues with Oracle (ORA-0955).

Tables with non-HDFS locations break Hive Metastore startup

Bug: [SENTRY-1044](#)

Tables with non-HDFS locations cause the HDFS/Sentry plugin to enter an invalid state and fail with the exception, Could not create Initial AuthzPaths or HMSHandler !!.

URI check is now case-sensitive

Bug: [SENTRY-968](#)

Sentry no longer ignores case when validating privileges for URIs.

TRUNCATE on empty partitioned table in Hive fails

Bug: [SENTRY-826](#)

PathsUpdate.parsePath(path) will throw an NPE when parsing relative paths

Bug: [SENTRY-1002](#)

Sentry now skips relative paths (that is, paths without a fully qualified scheme) rather than failing with a NPE.

The Sentry Server should not be updated if the CREATE/DROP operations fail

Bug: [SENTRY-1008](#)

Previously, even if a CREATE TABLE operation failed, the Sentry Server would still be updated with a path to the table. This has been fixed.

SimpleDBProviderBackend should retry the authorization process

Bug: [SENTRY-902](#)

This fix includes corrections to the retry logic to remove recursive calls and include a wait time between retries when authorization fails.

Support Hive RELOAD by updating the classpath for Sentry

Bug: [SENTRY-1003](#)

When Hive issues the RELOAD command, Sentry now gets the updated auxiliary JAR path from the `hive.reloadable.aux.jars.path` property.

RealTimeGet with explicit ids can bypass document-level authorization

Bug: [SENTRY-989](#)

Users can no longer bypass security by guessing the document IDs for the `RealTimeGet` command.

Updated Apache Shiro dependency

Bug: [SENTRY-1054](#)

External partitions referenced by more than one table can cause some unexpected behavior with Sentry HDFS sync

Bug: [SENTRY-953](#)

INSERT INTO command no longer requires URI privilege on partition location under table

Bug: [SENTRY-1095](#)

The checks on the Hive INSERT INTO command have been relaxed. The INSERT INTO command adds location information to the partition description. Although this requires a check on URI privileges, in this case location information can be generated even if the partition is under the table directory.

Improvement to the SentryAuthFilter error message when authentication fails

Bug: [SENTRY-1060](#)

Avoid logging all DataNucleus queries when debug logging is enabled

Bug: [SENTRY-945](#)

Logging DataNucleus queries when debugging can fill up 2 GB of log file space in less than five minutes.

getGroup and getUser should always return original HDFS values for paths that are not managed by Sentry

Bug: [SENTRY-936](#)

Paths that do not correspond to Hive metastore objects should not be affected by HDFS/Sentry sync.

Exceptions in MetastoreCacheInitializer should not prevent HMS from starting up

Bug: [SENTRY-957](#)

Instead of only throwing a runtime exception, this fix ensures failed tasks are first retried.

Set maximum message size for Thrift messages

Bug: [SENTRY-904](#)

This ensures that security scans and unformatted messages do not bring down the Sentry server by going out of bounds.

Allow SentryAuthorization setter path always fall through and update HDFS

Bug: [SENTRY-988](#)

Setting HDFS rules on Sentry-managed HDFS paths should not affect original HDFS rules

Bug: [SENTRY-944](#)

Removing and modifying ACLs on Sentry-managed paths that correspond to Hive metastore objects should not affect the original HDFS access rules.

Fix inconsistency in column-level privileges

Bug: [SENTRY-847](#)

If you have column-level privileges for a table, the SHOW columns operation should not require extra table-level privileges.

Performance Improvements

Improved performance for filtering Hive SHOW commands

Bug: [SENTRY-565](#)

HiveAuthzBinding has been improved to reduce the number of RPC calls when filtering SHOW commands.

Improved Sentry column-level performance for wide tables

Bug: [SENTRY-1007](#)

Apache Spark

Spark SQL does not support the char type

Spark SQL does not support the `char` type (fixed-length strings). Like unions, tables with such fields cannot be created from or read by Spark.

Spark SQL statements that can result in table partition metadata changes may fail

Because Spark does not have access to Sentry data, it may not know that a user has permissions to execute an operation and instead fail it. SQL statements that can result in table partition metadata changes, for example, "ALTER TABLE" or "INSERT", may fail.

Cloudera Bug: CDH-33446

Certain Spark MLlib features not supported

The following Spark MLlib features are now supported:

- `spark.ml`
- ML pipeline APIs

Streaming incompatibility between Spark 1.2 and 1.3

Applications built as a JAR with dependencies ("uber JAR") must be built for the specific version of Spark running on the cluster.

Cloudera Bug: CDH-26527

Workaround: Rebuild the JAR with the Spark dependencies in `pom.xml` pointing to the specific version of Spark running on the target cluster.

Spark SQL cannot retrieve data from a partitioned Hive table

When reading from a partitioned Hive table, Spark SQL cannot identify the column delimiter used and reads the full record as the first column entry.

Cloudera Bug: CDH-37189

Workaround: Contact Cloudera Support for information on how to deploy a patch to resolve the issue.

Tasks that fail due to YARN preemption can cause job failure

Bug: [SPARK-8167](#)

Tasks that are running on preempted executors will count as FAILED with an `ExecutorLostFailure`.

Apache Sqoop

Oracle connector not working with lowercase columns

Bug: [SQOOP-2723](#)

The Oracle connector now works with lowercase columns.

Run only one map task attempt during export

Bug: [SQOOP-2712](#)

In most scenarios, running multiple map task attempts by default when performing an export is not required. The default is now one map task attempt during export operations.

Do not dump data on error in TextExportMapper by default

Bug: [SQOOP-2651](#)

Dumping data in the `TextExportMapper` might unintentionally leak sensitive information to logs. The `enableDataDumpOnError` key is set to `false` by default. A user can set the value to `true` to intentionally write the data to the log.

Support of glob paths during export

Bug: [SQOOP-1281](#)

Glob paths are now supported for export.

Sqoop should support importing from table with column names containing some special characters

Bug: [SQOOP-2387](#)

Sqoop supports some special characters in column names. The specific list of characters depends on those supported for a particular database.

Avro export ignores --columns option

Bug: [SQOOP-1369](#)

AvroExportMapper now supports the `--columns` option to restrict the columns to export.

JDK

Java 8 (updates 60 and higher) has problems with joda-time and S3 requests

Bug: [SPARK-11413](#)

Cloudera Bug: CDH-31245

Versions of Java 1.8, from update 60 and higher (jdk1.8.0_60++), cause S3 to fail because joda-time cannot format time zones.

Issues Fixed in CDH 5.6.x

The following topics describe issues fixed in CDH 5.6.x, from newest to oldest release. You can also review [What's New In CDH 5.6.x](#) on page 1834 or [Known Issues in CDH 5](#) on page 1944.

Issues Fixed in CDH 5.6.1

CDH 5.6.1 fixes the following issues.

Apache Hadoop

FSImage may get corrupted after deleting snapshot

Bug: [HDFS-9406](#)

Cloudera Bug: CDH-33224

When deleting a snapshot that contains the last record of a given INode, the fsmimage may become corrupt because the create list of the snapshot diff in the previous snapshot and the child list of the parent `INodeDirectory` are not cleaned.

Apache HBase

The ReplicationCleaner process can abort if its connection to ZooKeeper is inconsistent

Bug: [HBASE-15234](#)

If the connection with ZooKeeper is inconsistent, the `ReplicationCleaner` may abort, and the following event is logged by the HMaster:

```
WARN org.apache.hadoop.hbase.replication.master.ReplicationLogCleaner: Aborting
ReplicationLogCleaner
because Failed to get list of replicators
```

Unprocessed WALs accumulate.

The `seekBefore()` method calculates the size of the previous data block by assuming that data blocks are contiguous, and HFile v2 and higher store Bloom blocks and leaf-level INode blocks with the data. As a result, reverse scans do not work when Bloom blocks or leaf-level INode blocks are present when HFile v2 or higher is used.

Workaround: Restart the HMaster occasionally. The `ReplicationCleaner` restarts if necessary and process the unprocessed WALs.

Upstream Issues Fixed

The following upstream issues are fixed in CDH 5.6.1:

- [FLUME-2632](#) - High CPU on KafkaSink
- [FLUME-2712](#) - Optional channel errors slows down the Source to Main channel event rate
- [FLUME-2781](#) - Kafka Channel with `parseAsFlumeEvent=true` should write data as is, not as flume events

- [FLUME-2886](#) - Optional Channels can cause OOMs
- [FLUME-2891](#) - Revert FLUME-2712 and FLUME-2886
- [FLUME-2897](#) - AsyncHBase sink NPE when Channel.getTransaction() fails
- [HADOOP-7139](#) - Allow appending to existing SequenceFiles
- [HADOOP-7817](#) - RawLocalFileSystem.append() should give FSDataOutputStream with accurate .getPos()
- [HADOOP-11171](#) - Enable using a proxy server to connect to S3a
- [HADOOP-11321](#) - copyToLocal cannot save a file to an SMB share unless the user has Full Control permissions
- [HADOOP-11687](#) - Ignore x-* and response headers when copying an Amazon S3 object
- [HADOOP-11722](#) - Some Instances of Services using ZKDelegationTokenSecretManager go down when old token cannot be deleted
- [HADOOP-12240](#) - Fix tests requiring native library to be skipped in non-native profile
- [HADOOP-12280](#) - Skip unit tests based on maven profile rather than NativeCodeLoader.isNativeCodeLoaded
- [HADOOP-12604](#) - Exception may be swallowed in KMSClientProvider
- [HADOOP-12605](#) - Fix intermittent failure of TestIPC.testIpcWithReaderQueuing
- [HADOOP-12668](#) - Support excluding weak Ciphers in HttpServer2 through ssl-server.conf
- [HADOOP-12699](#) - TestKMS#testKMSProvider intermittently fails during 'test rollover draining'
- [HADOOP-12715](#) - TestValueQueue#testgetAtMostPolicyALL fails intermittently
- [HADOOP-12718](#) - Incorrect error message by fs -put local dir without permission
- [HADOOP-12736](#) - TestTimedOutTestsListener#testThreadDumpAndDeadlocks sometimes times out
- [HADOOP-12825](#) - Log slow name resolutions
- [HADOOP-12954](#) - Add a way to change hadoop.security.token.service.use_ip
- [HADOOP-12972](#) - Lz4Compressor#getLibraryName returns the wrong version number
- [HDFS-6520](#) - hdfs fsck passes invalid length value when creating BlockReader
- [HDFS-8211](#) - DataNode UUID is always null in the JMX counter
- [HDFS-8496](#) - Calling stopWriter() with FSDataSetImpl lock held may block other threads
- [HDFS-8576](#) - Lease recovery should return true if the lease can be released and the file can be closed
- [HDFS-8785](#) - TestDistributedFileSystem is failing in trunk
- [HDFS-8855](#) - Webhdfs client leaks active NameNode connections
- [HDFS-9264](#) - Minor cleanup of operations on FsVolumeList#volumes
- [HDFS-9289](#) - Make DataStreamer#block thread safe and verify genStamp in commitBlock
- [HDFS-9347](#) - Invariant assumption in TestQuorumJournalManager.shutdown() is wrong
- [HDFS-9350](#) - Avoid creating temporary strings in Block.toString() and getBlockName()
- [HDFS-9358](#) - TestNodeCount#testNodeCount timed out
- [HDFS-9514](#) - TestDistributedFileSystem.testDFSClientPeerWriteTimeout failing; exception being swallowed
- [HDFS-9576](#) - HTrace: collect position/length information on read operations
- [HDFS-9589](#) - Block files which have been hardlinked should be duplicated before the DataNode appends to the them
- [HDFS-9612](#) - DistCp worker threads are not terminated after jobs are done
- [HDFS-9655](#) - NN should start JVM pause monitor before loading fsimage.
- [HDFS-9688](#) - Test the effect of nested encryption zones in HDFS downgrade
- [HDFS-9701](#) - DN may deadlock when hot-swapping under load
- [HDFS-9721](#) - Allow Delimited PB OIV tool to run upon fsimage that contains INodeReference
- [HDFS-9949](#) - Add a test case to ensure that the DataNode does not regenerate its UUID when a storage directory is cleared
- [HDFS-10223](#) - peerFromSocketAndKey performs SASL exchange before setting connection timeouts
- [HDFS-10267](#) - Extra "synchronized" on FsDataSetImpl#recoverAppend and FsDataSetImpl#recoverClose

- [IMPALA-2926](#) - Fix off-by-one bug in SelectNode::CopyRows()
- [IMPALA-2940](#) - Fix leak of dictionaries in Parquet scanner
- [IMPALA-3000](#) - Fix BitReader::Reset()
- [IMPALA-3034](#) - Verify all consumed memory of a MemTracker is always released at destruction time
- [IMPALA-3047](#) - Separate create table test with nested types
- [IMPALA-3054](#) - Disable probe side filters when spilling
- [IMPALA-3071](#) - Fix assignment of On-clause predicates belonging to an inner join
- [IMPALA-3085](#) - Unregister data sinks' MemTrackers at their Close() functions
- [IMPALA-3093](#) - ReopenClient() could NULL out 'client_key' causing a crash
- [IMPALA-3095](#) - Add configurable whitelist of authorized internal principals
- [IMPALA-3151](#) - Impala crash for avro table when casting to char data type
- [IMPALA-3194](#) - Allow queries materializing scalar type columns in RC/sequence files
- [KITE-1114](#) - Kite CLI json-import HDFS temp file path not multiuser safe, fix missing license header
- [OOZIE-2419](#) - HBase credentials are not correctly proxied
- [OOZIE-2466](#) - Repeated failure of TestMetricsInstrumentation.testSamplers
- [OOZIE-2486](#) - TestSLAEventsGetForFilterJPAExecutor is flakey
- [OOZIE-2490](#) - Oozie can't set hadoop.security.token.service.use_ip
- [SENTRY-748](#) - Improve test coverage of Sentry + Hive using complex views
- [SENTRY-835](#) - Drop table leaves a connection open when using metastorelistener
- [SENTRY-922](#) - INSERT OVERWRITE DIRECTORY permission not working correctly
- [SENTRY-972](#) - Include sentry-tests-hive hadoop test script in maven project
- [SENTRY-991](#) - Roles of Sentry Permission needs to be case insensitive
- [SENTRY-994](#) - SentryAuthorizationInfoX should override isSentryManaged
- [SENTRY-1002](#) - PathsUpdate.parsePath(path) will throw an NPE when parsing relative paths
- [SENTRY-1003](#) - Support "reload" by updating the classpath of Sentry function aux jar path during runtime
- [SENTRY-1007](#) - Sentry column-level performance for wide tables
- [SENTRY-1008](#) - Path should be not be updated if the create/drop table/partition event fails

- [SENTRY-1015](#) - Improve Sentry + Hive error message when user has insufficient privileges
- [SENTRY-1044](#) - Tables with non-hdfs locations breaks HMS startup
- [SENTRY-1169](#) - MetastorePlugin#renameAuthzObject log message prints oldpathname as newpathname
- [SENTRY-1184](#) - Clean up HMSPaths.renameAuthzObject
- [SOLR-6631](#) - DistributedQueue spinning on calling zookeeper getChildren()
- [SOLR-6820](#) - The sync on the VersionInfo bucket in DistributedUpdateProcessor#addDocument appears to be a large bottleneck when using replication
- [SOLR-7281](#) - Add an overseer action to publish an entire node as 'down'
- [SOLR-7332](#) - Seed version buckets with max version from index
- [SOLR-7493](#) - Requests aren't distributed evenly if the collection isn't present locally. Merges r1683946 and r1683948 from trunk
- [SOLR-7587](#) - TestSpellCheckResponse stalled and never timed out -- possible VersionBucket bug?
- [SOLR-7625](#) - Version bucket seed not updated after new index is installed on a replica
- [SOLR-8215](#) - Only active replicas should handle incoming requests against a collection
- [SOLR-8371](#) - Try and prevent too many recovery requests from stacking up and clean up some faulty cancel recovery logic
- [SOLR-8451](#) - We should not call method.abort in HttpSolrClient or HttpSolrCall#remoteQuery and HttpSolrCall#remoteQuery should not close streams
- [SOLR-8453](#) - Solr should attempt to consume the request inputStream on errors as we cannot count on the container to do it
- [SOLR-8575](#) - Fix HDFSLogReader replay status numbers and a performance bug where we can reopen FSDataInputStream too often
- [SOLR-8578](#) - Successful or not, requests are not always fully consumed by Solrj clients and we count on HttpClient or the JVM
- [SOLR-8615](#) - Just like creating cores, we should use multiple threads when closing cores
- [SOLR-8633](#) - DistributedUpdateProcess processCommit/deleteByQuery calls finish on DUP and SolrCmdDistributor, which violates the lifecycle and can cause bugs
- [SOLR-8683](#) - Always consume the full request on the server, not just in the case of an error, tune down stream closed logging
- [SOLR-8720](#) - ZkController#publishAndWaitForDownStates should use #publishNodeAsDown
- [SOLR-8771](#) - Multi-threaded core shutdown creates executor per core
- [SOLR-8855](#) - The HDFS BlockDirectory should not clean up it's cache on shutdown
- [SOLR-8856](#) - Do not cache merge or 'read once' contexts in the hdfs block cache
- [SOLR-8857](#) - HdfsUpdateLog does not use configured or new default number of version buckets and is hard coded to 256
- [SOLR-8869](#) - Optionally disable printing field cache entries in SolrFieldCacheMBean
- [SPARK-10859](#) - Predicates pushed to InmemoryColumnarTableScan are not evaluated correctly
- [SPARK-10914](#) - UnsafeRow serialization breaks when two machines have different Ooops size
- [SPARK-11009](#) - RowNumber in HiveContext returns negative values in cluster mode
- [SPARK-11442](#) - Reduce numSlices for local metrics test of SparkListenerSuite
- [SPARK-12617](#) - Socket descriptor leak killing streaming app
- [SPARK-14477](#) - Allow custom mirrors for downloading artifacts in build/mvn
- [SQOOP-2847](#) - Sqoop --incremental + missing parent --target-dir reports success with no data

Issues Fixed in CDH 5.6.0

Apache Avro

Concurrent schema parsing can result in processes hanging because of an unsafe shared cache

Bug: [AVRO-1781](#)

Cloudera Bug: CDH-36057

Severity: High

Workaround: Use a global lock around all calls to `Schema.parse` and `Schema.Parser#parse` to ensure only one thread is parsing at a time.

Apache HBase

Values of some metrics may appear to be negative.

Bug: [HBASE-12961](#)

Some metric value are stored in integers, and cannot accommodate real-world values. This causes metric values to appear to be negative.

Workaround: None.

The HBase Shell cannot handle Scan filters which contain non-UTF8 characters.

Bug: [HBASE-15032](#)

The HBase Shell incorrectly handles filter strings which contain non-UTF8 characters.

Workaround: None.

HDFS

Checkpointing can fail due to an InvalidSignatureException in a secure cluster

Bug: [HDFS-7798](#)

Cloudera Bug: CDH-33411

Severity: High

Workaround: This problem occurs occasionally due to race condition. The error is transient, and a subsequent checkpoint may still succeed.

Issues Fixed in CDH 5.5.x

The following topics describe issues fixed in CDH 5.5.x, from newest to oldest release. You can also review [What's New In CDH 5.5.x](#) on page 1834 or [Known Issues in CDH 5](#) on page 1944.

Issues Fixed in CDH 5.5.6

Upstream Issues Fixed

The following upstream issues are fixed in CDH 5.5.6:

- [FLUME-2797](#) - Use SourceCounter for SyslogTcpSource
- [FLUME-2844](#) - SpillableMemoryChannel must start ChannelCounter
- [HADOOP-10300](#) - Allow deferred sending of call responses
- [HADOOP-11031](#) - Design Document for Credential Provider API
- [HADOOP-12453](#) - Support decoding KMS Delegation Token with its own Identifier
- [HADOOP-12483](#) - Maintain wrapped SASL ordering for postponed IPC responses
- [HADOOP-12537](#) - S3A to support Amazon STS temporary credentials
- [HADOOP-12548](#) - Read s3a credentials from a Credential Provider
- [HADOOP-12609](#) - Fix intermittent failure of TestDecayRpcScheduler.
- [HADOOP-12723](#) - S3A: Add ability to plug in any AWSCredentialsProvider
- [HADOOP-12749](#) - Create a threadpoolexecutor that overrides afterExecute to log uncaught exceptions/errors
- [HADOOP-13034](#) - Log message about input options in distcp lacks some items
- [HADOOP-13317](#) - Add logs to KMS server-side to improve supportability
- [HADOOP-13353](#) - LdapGroupsMapping getPassword should not return null when IOException throws
- [HADOOP-13487](#) - Hadoop KMS should load old delegation tokens from ZooKeeper on startup
- [HADOOP-13526](#) - Add detailed logging in KMS for the authentication failure of proxy user
- [HADOOP-13558](#) - UserGroupInformation created from a Subject incorrectly tries to renew the Kerberos ticket
- [HADOOP-13638](#) - KMS should set UGI's Configuration object properly
- [HADOOP-13669](#) - KMS Server should log exceptions before throwing

- [HADOOP-13693](#) - Remove the message about HTTP OPTIONS in SPNEGO initialization message from kms audit log.
- [HDFS-4176](#) - EditLogTailer should call rollEdits with a timeout.
- [HDFS-6962](#) - ACLs inheritance conflict with umaskmode
- [HDFS-7210](#) - Avoid two separate RPC's namenode.append() and namenode.getFileInfo() for an append call from DFSClient
- [HDFS-7413](#) - Some unit tests should use NameNodeProtocols instead of FSNameSystem
- [HDFS-7415](#) - Move FSNameSystem.resolvePath() to FSDirectory
- [HDFS-7420](#) - Delegate permission checks to FSDirectory
- [HDFS-7463](#) - Simplify FSNamesystem#getBlockLocationsUpdateTimes
- [HDFS-7478](#) - Move org.apache.hadoop.hdfs.server.namenode.NNConf to FSNamesystem
- [HDFS-7517](#) - Remove redundant non-null checks in FSNamesystem#getBlockLocations
- [HDFS-7964](#) - Add support for async edit logging
- [HDFS-8224](#) - Schedule a block for scanning if its metadata file is corrupt
- [HDFS-8269](#) - getBlockLocations() does not resolve the .reserved path and generates incorrect edit logs when updating the atime
- [HDFS-8709](#) - Clarify automatic sync in FSEditLog#logEdit
- [HDFS-9106](#) - Transfer failure during pipeline recovery causes permanent write failures
- [HDFS-9290](#) - DFSClient#callAppend() is not backward compatible for slightly older NameNodes
- [HDFS-9428](#) - Fix intermittent failure of TestDNFencing.testQueueingWithAppend
- [HDFS-9549](#) - TestCacheDirectives#testExceedsCapacity is unreliable
- [HDFS-9630](#) - DistCp minor refactoring and clean up
- [HDFS-9638](#) - Improve DistCp Help and documentation
- [HDFS-9764](#) - DistCp does not print value for several arguments including -numListstatusThreads.
- [HDFS-9781](#) - FsDatasetImpl#getBlockReports can occasionally throw NullPointerException
- [HDFS-9820](#) - Improve distcp to support efficient restore to an earlier snapshot
- [HDFS-9906](#) - Remove excessive unnecessary log output when a DataNode is restarted
- [HDFS-9958](#) - BlockManager#createLocatedBlocks can throw NPE for corruptBlocks on failed storages
- [HDFS-10178](#) - Permanent write failures can happen if pipeline recoveries occur for the first packet
- [HDFS-10216](#) - Distcp -diff throws exception when handling relative path
- [HDFS-10270](#) - TestJMXGet:testNameNode() fails
- [HDFS-10271](#) - Extra bytes are getting released from reservedSpace for append
- [HDFS-10298](#) - Document the usage of distcp -diff option
- [HDFS-10313](#) - Distcp need to enforce the order of snapshot names passed to -diff
- [HDFS-10397](#) - Distcp should ignore -delete option if -diff option is provided instead of exiting
- [HDFS-10457](#) - DataNode should not auto-format block pool directory if VERSION is missing.
- [HDFS-10525](#) - Fix NPE in CacheReplicationMonitor#rescanCachedBlockMap
- [HDFS-10556](#) - DistCpOptions should be validated automatically
- [HDFS-10609](#) - Uncaught InvalidEncryptionKeyException during pipeline recovery can abort downstream applications
- [HDFS-10722](#) - Fix race condition in TestEditLog#testBatchedSyncWithClosedLogs
- [HDFS-10760](#) - DataXceiver#run() should not log InvalidToken exception as an error
- [HDFS-10822](#) - Log DataNodes in the write pipeline. John Zhuge via Lei Xu
- [HDFS-10879](#) - TestEncryptionZonesWithKMS#testReadWrite fails intermittently
- [HDFS-10962](#) - TestRequestHedgingProxyProvider is unreliable
- [HDFS-11012](#) - Unnecessary INFO logging on DFSClients for InvalidToken
- [HDFS-11040](#) - Add documentation for HDFS-9820 distcp improvement
- [HDFS-11056](#) - Concurrent append and read operations lead to checksum error
- [MAPREDUCE-6359](#) - In RM HA setup, Cluster tab links populated with AM hostname instead of RM
- [MAPREDUCE-6473](#) - Job submission can take a long time during Cluster initialization
- [MAPREDUCE-6635](#) - Unsafe long to int conversion in UncompressedSplitLineReader and IndexOutOfBoundsExcpetion

- [MAPREDUCE-6680](#) - JHS UserLogDir scan algorithm sometime could skip directory with update in CloudFS (Azure FileSystem, S3, etc)
- [MAPREDUCE-6684](#) - High contention on scanning of user directory under immediate_done in Job History Server
- [MAPREDUCE-6761](#) - Regression when handling providers - invalid configuration ServiceConfiguration causes Cluster initialization failure
- [MAPREDUCE-6771](#) - RMContainerAllocator sends container diagnostics event after corresponding completion event
- [YARN-3495](#) - Confusing log generated by FairScheduler
- [YARN-4004](#) - container-executor should print output of docker logs if the docker container exits with non-0 exit status
- [YARN-4017](#) - container-executor overuses PATH_MAX
- [YARN-4245](#) - Generalize config file handling in container-executor
- [YARN-4255](#) - container-executor does not clean up Docker operation command files
- [YARN-5608](#) - TestAMRMClient.setup() fails with ArrayOutOfBoundsException
- [YARN-5704](#) - Provide config knobs to control enabling/disabling new/work in progress features in container-executor
- [HBASE-13330](#) - Region left unassigned due to AM & SSH each thinking the assignment would be done by the other
- [HBASE-14241](#) - Fix deadlock during cluster shutdown due to concurrent connection close
- [HBASE-14313](#) - After a Connection sees ConnectionClosingException on a connection it never recovers
- [HBASE-14407](#) - NotServingRegion: hbase region closed forever
- [HBASE-14449](#) - Rewrite deadlock prevention for concurrent connection close
- [HBASE-14474](#) - Addendum closes connection in writeRequest() outside synchronized block
- [HBASE-14474](#) - DeadLock in RpcClientImpl.Connection.close()
- [HBASE-14578](#) - URISyntaxException during snapshot restore for table with user defined namespace
- [HBASE-14968](#) - ConcurrentModificationException in region close resulting in the region staying in closing state
- [HBASE-15430](#) - Failed taking snapshot - Manifest proto-message too large
- [HBASE-15856](#) - Addendum Fix UnknownHostException import in MetaTableLocator
- [HBASE-15856](#) - Do not cache unresolved addresses for connections
- [HBASE-16350](#) - Undo server abort from HBASE-14968
- [HBASE-16360](#) - TableMapReduceUtil addHBaseDependencyJars has the wrong class name for PrefixTreeCodec
- [HBASE-16767](#) - Mob compaction needs to clean up files in /hbase/mobdir/.tmp and /hbase/mobdir/.tmp/.bulkload when running into IO exceptions
- [HIVE-10384](#) - BackportRetryingMetaStoreClient does not retry wrapped TTransportExceptions
- [HIVE-10728](#) - Deprecate unix_timestamp(void) and make it deterministic
- [HIVE-11579](#) - Invoke the set command will close standard error output[beeline-cli]
- [HIVE-11768](#) - java.io.DeleteOnExitHook leaks memory on long running Hive Server2 Instances
- [HIVE-11901](#) - StorageBasedAuthorizationProvider requires write permission on table for SELECT statements
- [HIVE-12475](#) - Parquet schema evolution within array<struct<>> does not work
- [HIVE-12891](#) - Hive fails when java.io.tmpdir is set to a relative location
- [HIVE-13058](#) - Add session and operation_log directory deletion messages
- [HIVE-13090](#) - Hive metastore crashes on NPE with ZooKeeperTokenStore

Issues Fixed in CDH 5.5.5

CDH 5.5.5 fixes the following issues.

Apache Oozie

Oozie Web Console returns 500 error when Oozie server runs on JDK 8u75 or higher

Bug: [OOZIE-2533](#)

Cloudera Bug: CDH-40362

The Oozie Web Console returns a 500 error when the Oozie server is running on JDK 8u75 and higher. The Oozie server still functions, and you can use the Oozie command line, REST API, Java API, or the Hue Oozie Dashboard to review status of those jobs.

Upstream Issues Fixed

The following upstream issues are fixed in CDH 5.5.5:

- [FLUME-2821](#) - KafkaSourceUtil Can Log Passwords at Info remove logging of security related data in older releases
- [FLUME-2913](#) - Don't strip SLF4J from imported classpaths
- [FLUME-2918](#) - Speed up TaildirSource on directories with many files
- [HADOOP-8436](#) - NPE In getLocalPathForWrite (path, conf) when the required context item is not configured
- [HADOOP-8437](#) - getLocalPathForWrite should throw IOException for invalid paths
- [HADOOP-8751](#) - NPE in Token.toString() when Token is constructed using null identifier
- [HADOOP-8934](#) - Shell command ls should include sort options
- [HADOOP-10048](#) - LocalDirAllocator should avoid holding locks while accessing the filesystem
- [HADOOP-10971](#) - Add -C flag to make `hadoop fs -ls` print filenames only
- [HADOOP-11901](#) - BytesWritable fails to support 2G chunks due to integer overflow
- [HADOOP-11984](#) - Enable parallel JUnit tests in pre-commit
- [HADOOP-12252](#) - LocalDirAllocator should not throw NPE with empty string configuration
- [HADOOP-12259](#) - Utility to Dynamic port allocation
- [HADOOP-12659](#) - Incorrect usage of config parameters in token manager of KMS
- [HADOOP-12787](#) - KMS SPNEGO sequence does not work with WEBHDFS
- [HADOOP-12841](#) - Update s3-related properties in core-default.xml.
- [HADOOP-12901](#) - Add warning log when KMSClientProvider cannot create a connection to the KMS server.
- [HADOOP-12963](#) - Allow using path style addressing for accessing the s3 endpoint.
- [HADOOP-13079](#) - Add -q option to Ls to print ? instead of non-printable characters
- [HADOOP-13132](#) - Handle ClassCastException on AuthenticationException in LoadBalancingKMSClientProvider
- [HADOOP-13155](#) - Implement TokenRenewer to renew and cancel delegation tokens in KMS
- [HADOOP-13251](#) - Authenticate with Kerberos credentials when renewing KMS delegation token
- [HADOOP-13255](#) - KMSClientProvider should check and renew tgt when doing delegation token operations
- [HADOOP-13263](#) - Reload cached groups in background after expiry.
- [HADOOP-13457](#) - Remove hardcoded absolute path for shell executable.
- [HDFS-6434](#) - Default permission for creating file should be 644 for WebHdfs/HttpFS
- [HDFS-7597](#) - DelegationTokenIdentifier should cache the TokenIdentifier to UGI mapping
- [HDFS-8008](#) - Support client-side back off when the datanodes are congested
- [HDFS-8581](#) - ContentSummary on / skips further counts on yielding lock
- [HDFS-8829](#) - Make SO_RCVBUF and SO_SNDBUF size configurable for DataTransferProtocol sockets and allow configuring auto-tuning
- [HDFS-8897](#) - Balancer should handle fs.defaultFS trailing slash in HA

- [HDFS-9085](#) - Show renewer information in DelegationTokenIdentifier#toString
- [HDFS-9259](#) - Make SO_SNDBUF size configurable at DFSClient side for hdfs write scenario.
- [HDFS-9276](#) - Failed to Update HDFS Delegation Token for long running application in HA mode
- [HDFS-9365](#) - Balancer does not work with the HDFS-6376 HA setup.
- [HDFS-9405](#) - Warmup NameNode EDEK caches in background thread
- [HDFS-9466](#) - TestShortCircuitCache#testDataXceiverCleansUpSlotsOnFailure is flaky

Issues Fixed in CDH 5.5.4

CDH 5.5.4 fixes the following issues.

Apache Hadoop

FSImage may get corrupted after deleting snapshot

Bug: [HDFS-9406](#)

Cloudera Bug: CDH-33224

When deleting a snapshot that contains the last record of a given INode, the fsimage may become corrupt because the create list of the snapshot diff in the previous snapshot and the child list of the parent INodeDirectory are not cleaned.

Apache HBase

The ReplicationCleaner process can abort if its connection to ZooKeeper is inconsistent

Bug: [HBASE-15234](#)

If the connection with ZooKeeper is inconsistent, the ReplicationCleaner may abort, and the following event is logged by the HMaster:

```
WARN org.apache.hadoop.hbase.replication.master.ReplicationLogCleaner: Aborting
ReplicationLogCleaner
because Failed to get list of replicators
```

Unprocessed WALs accumulate.

The `seekBefore()` method calculates the size of the previous data block by assuming that data blocks are contiguous, and HFile v2 and higher store Bloom blocks and leaf-level INode blocks with the data. As a result, reverse scans do not work when Bloom blocks or leaf-level INode blocks are present when HFile v2 or higher is used.

Workaround: Restart the HMaster occasionally. The `ReplicationCleaner` restarts if necessary and process the unprocessed WALs.

Upstream Issues Fixed

The following upstream issues are fixed in CDH 5.5.4:

- [FLUME-2632](#) - High CPU on KafkaSink
- [FLUME-2712](#) - Optional channel errors slows down the Source to Main channel event rate
- [FLUME-2781](#) - Kafka Channel with `parseAsFlumeEvent=true` should write data as is, not as flume events
- [FLUME-2886](#) - Optional Channels can cause OOMs
- [FLUME-2891](#) - Revert FLUME-2712 and FLUME-2886
- [FLUME-2897](#) - AsyncHBase sink NPE when `Channel.getTransaction()` fails
- [HADOOP-7139](#) - Allow appending to existing SequenceFiles
- [HADOOP-7817](#) - `RawLocalFileSystem.append()` should give `FSDDataOutputStream` with accurate `.getPos()`
- [HADOOP-11321](#) - `copyToLocal` cannot save a file to an SMB share unless the user has Full Control permissions
- [HADOOP-11687](#) - Ignore `x-*` and response headers when copying an Amazon S3 object
- [HADOOP-11722](#) - Some Instances of Services using `ZKDelegationTokenSecretManager` go down when old token cannot be deleted
- [HADOOP-12240](#) - Fix tests requiring native library to be skipped in non-native profile
- [HADOOP-12280](#) - Skip unit tests based on maven profile rather than `NativeCodeLoader.isNativeCodeLoaded`
- [HADOOP-12559](#) - KMS connection failures should trigger TGT renewal
- [HADOOP-12605](#) - Fix intermittent failure of `TestIPC.testIpcWithReaderQueuing`
- [HADOOP-12668](#) - Support excluding weak Ciphers in `HttpServer2` through `ssl-server.conf`
- [HADOOP-12682](#) - Fix `TestKMS#testKMSRestart*` failure
- [HADOOP-12699](#) - `TestKMS#testKMSProvider` intermittently fails during 'test rollover draining'
- [HADOOP-12715](#) - `TestValueQueue#testgetAtMostPolicyALL` fails intermittently
- [HADOOP-12718](#) - Incorrect error message by `fs -put local dir without permission`
- [HADOOP-12736](#) - `TestTimedOutTestsListener#testThreadDumpAndDeadlocks` sometimes times out
- [HADOOP-12788](#) - `OpensslAesCtrCryptoCodec` should log which random number generator is used
- [HADOOP-12825](#) - Log slow name resolutions
- [HADOOP-12954](#) - Add a way to change `hadoop.security.token.service.use_ip`
- [HADOOP-12972](#) - `Lz4Compressor#getLibraryName` returns the wrong version number
- [HDFS-6520](#) - `hdfs fsck` passes invalid length value when creating `BlockReader`
- [HDFS-7373](#) - Clean up temporary files after `fsimage` transfer failures
- [HDFS-7758](#) - Retire `FsDatasetSpi#getVolumes()` and use `FsDatasetSpi#getVolumeRefs()` instead
- [HDFS-8211](#) - `DataNode` UUID is always null in the JMX counter
- [HDFS-8496](#) - Calling `stopWriter()` with `FSDatasetImpl` lock held may block other threads
- [HDFS-8576](#) - Lease recovery should return true if the lease can be released and the file can be closed
- [HDFS-8785](#) - `TestDistributedFileSystem` is failing in trunk

- [SPARK-12617](#) - [PYSOLR] Move Py4jCallbackConnectionCleaner to Streaming, clean up the leak sockets of Py4J

- [SPARK-14477](#) - [BUILD] Allow custom mirrors for downloading artifacts in build/mvn
- [SQOOP-2847](#) - Sqoop --incremental + missing parent --target-dir reports success with no data

Issues Fixed in CDH 5.5.2

Known Issues Fixed

The following topics describe known issues fixed in CDH 5.5.2.

Apache Spark

Spark SQL cannot retrieve data from a partitioned Hive table

When reading from a partitioned Hive table, Spark SQL is not able to identify the column delimiter used, and reads the full record as the first column entry.

Cloudera Bug: CDH-37189

Workaround: None.

When using Spark on YARN, the driver reports misleading error messages

The Spark driver reports misleading error messages such as:

```
ERROR ErrorMonitor: AssociationError [akka.tcp://sparkDriver@...] ->
[akka.tcp://sparkExecutor@...]: Error [Association failed with [akka.tcp://sparkE
xecutor@...]]
[akka.remote.EndpointAssociationException: Association failed with
[akka.tcp://sparkExecutor@...]]
```

Cloudera Bug: CDH-33949

Workaround: Add the following property to the Spark log4j configuration file:

```
log4j.logger.org.apache.spark.rpc.akka.ErrorMonitor=FATAL..
```

Spark does not support rolling upgrades

Spark does not support rolling upgrades. Submitted Spark jobs may fail during upgrade. Jobs requiring new configuration properties will fail.

Cloudera Bug: CDH-33655

Workaround: Finish the upgrade, and then relaunch the Spark jobs.

Hue

Cannot query the `customers` table in Hue

To query the `customers` table, you must re-create the Parquet data for compatibility.

Bug: [HUE-3040](#)

Cloudera Bug: CDH-33974

Workaround: Update the parquet file of the `customers` table (`/user/hive/warehouse/customers/customers`) with the one attached to [HUE-3040](#).

Upstream Issues Fixed

The following upstream issues are fixed in CDH 5.5.2:

- [AVRO-1781](#) - Remove LogicalTypes cache
- [HADOOP-7713](#) - `dfs -count -q` should label output column
- [HADOOP-10406](#) - `TestIPC.testIpcWithReaderQueuing` may fail
- [HADOOP-10668](#) - Addendum patch to fix `TestZKFailoverController`
- [HADOOP-10668](#) - `TestZKFailoverControllerStress#testExpireBackAndForth` occasionally fails
- [HADOOP-11171](#) - Enable using a proxy server to connect to S3a
- [HADOOP-11218](#) - Add TLS 1.1, TLS 1.2 to KMS, HttpFS, SSLFactory
- [HADOOP-12269](#) - Update aws-sdk dependency to 1.10.6

- [HADOOP-12417](#) - TestWebDelegationToken failing with port in use
- [HADOOP-12418](#) - TestRPC.testRPCInterruptedSimple fails intermittently
- [HADOOP-12464](#) - Interrupted client may try to fail-over and retry
- [HADOOP-12468](#) - Partial group resolution failure should not result in user lockout
- [HADOOP-12474](#) - MiniKMS should use random ports for Jetty server by default
- [HADOOP-12568](#) - Update core-default.xml to describe posixGroups support
- [HADOOP-12573](#) - TestRPC.testClientBackOff failing
- [HADOOP-12584](#) - Disable browsing the static directory in HttpServer2
- [HADOOP-12584](#) - Revert - Disable browsing the static directory in HttpServer2
- [HADOOP-12584](#) - Disable browsing the static directory in HttpServer2
- [HADOOP-12604](#) - Exception may be swallowed in KMSClientProvider
- [HADOOP-12625](#) - Add a config to disable the /logs endpoints
- [HDFS-6101](#) - TestReplaceDatanodeOnFailure fails occasionally
- [HDFS-6533](#) - TestBPOfferService#testBasicFunctionalitytest fails intermittently
- [HDFS-6694](#) - TestPipelinesFailover.testPipelineRecoveryStress tests fail intermittently with various symptoms - debugging patch
- [HDFS-7553](#) - Fix the TestDFSUpgradeWithHA due to BindException
- [HDFS-7798](#) - Checkpointing failure caused by shared KerberosAuthenticator
- [HDFS-8647](#) - Abstract BlockManager's rack policy into BlockPlacementPolicy
- [HDFS-8722](#) - Optimize DataNode writes for small writes and flushes
- [HDFS-8772](#) - Fix TestStandbyIsHot#testDatanodeRestarts which occasionally fails
- [HDFS-8805](#) - Archival Storage: getStoragePolicy should not need superuser privilege
- [HDFS-9083](#) - Replication violates block placement policy
- [HDFS-9123](#) - Copying from the root to a subdirectory should be forbidden
- [HDFS-9160](#) - [OIV-Doc] : Missing details of 'delimited' for processor options
- [HDFS-9220](#) - Reading small file (< 512 bytes) that is open for append fails due to incorrect checksum
- [HDFS-9249](#) - NPE is thrown if an IOException is thrown in NameNode constructor
- [HDFS-9250](#) - Add precondition check to LocatedBlock#addCachedLoc
- [HDFS-9268](#) - fuse_dfs chown crashes when uid is passed as -1
- [HDFS-9273](#) - ACLs on root directory may be lost after NameNode restart
- [HDFS-9286](#) - HttpFs does not parse ACL syntax correctly for operation REMOVEACLENTRIES
- [HDFS-9295](#) - Add a thorough test of the full KMS code path
- [HDFS-9313](#) - Possible NullPointerException in BlockManager if no excess replica can be chosen
- [HDFS-9332](#) - Fix Precondition failures from NameNodeEditLogRoller while saving namespace
- [HDFS-9339](#) - Extend full test of KMS ACLs
- [HDFS-9364](#) - Unnecessary DNS resolution attempts when creating NameNodeProxies
- [HDFS-9410](#) - Some tests should always reset sysout and syserr
- [HDFS-9429](#) - Tests in TestDFSAdminWithHA intermittently fail with EOFException
- [HDFS-9438](#) - Only collect HDFS-6694 debug data on Linux, Mac, and Solaris
- [HDFS-9445](#) - DataNode may deadlock while handling a bad volume
- [HDFS-9470](#) - Encryption zone on root not loaded from fsimage after NameNode restart
- [HDFS-9474](#) - TestPipelinesFailover should not fail when printing debug message
- [MAPREDUCE-6191](#) - Improve clearing stale state of Java serialization testcase
- [MAPREDUCE-6233](#) - org.apache.hadoop.mapreduce.TestLargeSort.testLargeSort failed in trunk
- [MAPREDUCE-6549](#) - Multibyte delimiters with LineRecordReader cause duplicate records
- [MAPREDUCE-6550](#) - archive-logs tool changes log ownership to the Yarn user when using DefaultContainerExecutor
- [YARN-3564](#) - Fix TestContainerAllocation.testAMContainerAllocationWhenDNSUnavailable fails randomly
- [YARN-3768](#) - ArrayIndexOutOfBoundsException with empty environment variables
- [YARN-4235](#) - FairScheduler PrimaryGroup does not handle empty groups returned for a user
- [YARN-4310](#) - FairScheduler: Log skipping reservation messages at DEBUG level

- [YARN-4347](#) - Resource manager fails with Null pointer exception
- [YARN-4408](#) - Fix issue that NodeManager still reports negative running containers
- [HBASE-6617](#) - ReplicationSourceManager should be able to track multiple WAL paths
- [HBASE-12961](#) - Fix negative values in read and write region server metrics
- [HBASE-13134](#) - mutateRow and checkAndMutate apis don't throw region level exceptions
- [HBASE-13703](#) - ReplicateContext should not be a member of ReplicationSource
- [HBASE-13746](#) - list_replicated_tables command is not listing table in HBase shell
- [HBASE-13833](#) - LoadIncrementalHFile.doBulkLoad(Path, HTable) does not handle unmanaged connections when using SecureBulkLoad
- [HBASE-14003](#) - Work around JDK-8044053
- [HBASE-14205](#) - RegionCoprocessorHost System.nanoTime() performance bottleneck
- [HBASE-14283](#) - Reverse scan doesn't work with HFile inline index/bloom blocks
- [HBASE-14501](#) - NPE in replication with TDE
- [HBASE-14533](#) - Connection Idle time 1 second is too short and the connection is closed too quickly by the ChoreService. Increase it to the default (10 minutes) for testAll(). The patch is not committed upstream yet.
- [HBASE-14541](#) - TestHFileOutputFormat.testMRIncrementalLoadWithSplit failed due to too many splits and few retries
- [HBASE-14547](#) - Add more debug/trace to zk-procedure
- [HBASE-14621](#) - ReplicationLogCleaner stuck on RS crash
- [HBASE-14731](#) - Add -DuseMob option to ITBLL
- [HBASE-14809](#) - Grant / revoke namespace admin permission to group
- [HBASE-14923](#) - VerifyReplication should not mask the exception during result comparison
- [HBASE-14926](#) - Hung ThriftServer; no timeout on read from client; if client crashes, worker thread gets stuck reading
- [HBASE-15031](#) - Fix merge of MVCC and SequenceID performance regression in branch-1.0
- [HBASE-15032](#) - HBase shell scan filter string assumes UTF-8 encoding
- [HBASE-15035](#) - Bulkloading HFiles with tags that require splits do not preserve tags
- [HBASE-15104](#) - Occasional failures due to NotServingRegionException in IT tests
- [HIVE-7575](#) - GetTables thrift call is very slow
- [HIVE-7653](#) - Hive AvroSerDe does not support circular references in Schema
- [HIVE-9507](#) - Make "LATERAL VIEW inline(expression) mytable" tolerant to nulls
- [HIVE-10027](#) - Use descriptions from Avro schema files in column comments
- [HIVE-10048](#) - JDBC - Support SSL encryption regardless of Authentication mechanism
- [HIVE-10083](#) - SMBJoin fails in case one table is uninitialized
- [HIVE-10265](#) - Hive CLI crashes on != inequality
- [HIVE-10514](#) - Fix MiniCliDriver tests failure
- [HIVE-10687](#) - AvroDeserializer fails to deserialize evolved union fields
- [HIVE-10697](#) - ObjectInspectorConvertors#UnionConvertor does a faulty conversion
- [HIVE-11149](#) - Fix issue with sometimes HashMap in PerfLogger.java hangs
- [HIVE-11288](#) - Backport:Avro SerDe InstanceCache returns incorrect schema
- [HIVE-11513](#) - AvroLazyObjectInspector could handle empty data better
- [HIVE-11616](#) - DelegationTokenSecretManager reuses the same objectstore, which has concurrency issues
- [HIVE-11785](#) - Revert - Support escaping carriage return and new line for LazySimpleSerDe
- [HIVE-11785](#) - Support escaping carriage return and new line for LazySimpleSerDe
- [HIVE-11826](#) - 'hadoop.proxyuser.hive.groups' configuration does not prevent unauthorized user to access metastore
- [HIVE-11977](#) - Hive should handle an external Avro table with zero length files present
- [HIVE-12008](#) - Hive queries failing when using count(*) on column in view
- [HIVE-12058](#) - Change Hive script to record errors when calling hbase fails
- [HIVE-12188](#) - DoAs does not work properly in non-Kerberos secured HiveServer2
- [HIVE-12189](#) - The list in pushdownPreds of ppd.ExprWalkerInfo should not be allowed to grow very large

- [HIVE-12218](#) - Unable to create a like table for an HBase-backed table
- [HIVE-12250](#) - Zookeeper connection leaks in Hive's HBaseHandler
- [HIVE-12265](#) - Generate lineage info only if requested
- [HIVE-12268](#) - Context leaks deleteOnExit paths
- [HIVE-12278](#) - Skip logging lineage for explain queries
- [HIVE-12287](#) - Lineage for lateral view shows wrong dependencies
- [HIVE-12330](#) - Fix precommit Spark test part2
- [HIVE-12365](#) - Added resource path is sent to cluster as an empty string when externally removed
- [HIVE-12378](#) - Exception on HBaseSerDe.serialize binary field
- [HIVE-12388](#) - GetTables cannot get external tables when TABLE type argument is given
- [HIVE-12406](#) - HIVE-9500 introduced incompatible change to LazySimpleSerDe public interface
- [HIVE-12418](#) - HiveHBaseTableInputFormat.getRecordReader() causes Zookeeper connection leak
- [HIVE-12505](#) - Backport: Insert overwrite in same encrypted zone silently fails to remove some existing files
- [HIVE-12566](#) - Incorrect result returns when using COALESCE in WHERE condition with LEFT JOIN

Issues Fixed in CDH 5.5.1

The following issues have been fixed in CDH 5.5.1:

Apache Commons Collections deserialization vulnerability

Cloudera has learned of a potential security vulnerability in a third-party library called the [Apache Commons Collections](#). This library is used in products distributed and supported by Cloudera (“Cloudera Products”), including core Apache Hadoop. The Apache Commons Collections library is also in widespread use beyond the Hadoop ecosystem. At this time, no specific attack vector for this vulnerability has been identified as present in Cloudera Products.

In an abundance of caution, we are currently in the process of incorporating a version of the Apache Commons Collections library with a fix into the Cloudera Products. In most cases, this will require coordination with the projects in the Apache community. One example of this is tracked by [HADOOP-12577](#).

The Apache Commons Collections potential security vulnerability is titled “Arbitrary remote code execution with InvokerTransformer” and is tracked by [COLLECTIONS-580](#). MITRE has not issued a CVE, but related [CVE-2015-4852](#) has been filed for the vulnerability. CERT has issued [Vulnerability Note #576313](#) for this issue.

Releases affected: CDH 5.5.0, CDH 5.4.8 and lower, CDH 5.3.8 and lower, CDH 5.2.8 and lower, CDH 5.1.7 and lower, Cloudera Manager 5.5.0, Cloudera Manager 5.4.8 and lower, Cloudera Manager 5.3.8 and lower, and Cloudera Manager 5.2.8 and lower, Cloudera Manager 5.1.6 and lower, Cloudera Manager 5.0.7 and lower, Cloudera Navigator 2.4.0, Cloudera Navigator 2.3.8 and lower.

Users affected: All

Impact: This potential vulnerability may enable an attacker to execute arbitrary code from a remote machine without requiring authentication.

Immediate action required: Upgrade to Cloudera Manager 5.5.1 and CDH 5.5.1, Cloudera Manager 5.4.9 and CDH 5.4.9, Cloudera Manager 5.3.9 and CDH 5.3.9, and Cloudera Manager 5.2.9 and CDH 5.2.9, and Cloudera Manager 5.1.7 and CDH 5.1.7, and Cloudera Manager 5.0.8 and CDH 5.0.8.

Apache HBase

Data may not be replicated to slave cluster if multiway multiplicity is set to greater than 1.

Bug: [HBASE-13703](#), [HBASE-6617](#), [HBASE-14501](#), CDH-30208.

Issues Fixed in CDH 5.5.0

The following topics describe known issues fixed in CDH 5.5.0.

Apache Flume

Fix FD leak in AsyncHBaseSink.

Bug: [FLUME-2738](#)

Fix for Kerberos configuration error when using short names.

Bug: [FLUME-2749](#)

Fix NullPointerException in KafkaSourceCounter.

Bug: [FLUME-2672](#)

Fix for Tail Directory Source FileNotFoundException.

Bug: [FLUME-2773](#)

Fix for Kafka Channel timeout property handling.

Bug: [FLUME-2734](#)

Apache Hadoop
YARN/MapReduce

Incorrect headroom leads to deadlock between mappers and reducers.

Bug: [MAPREDUCE-6302](#)

Blacklisting Support for Scheduling ApplicationMasters

When an ApplicationMaster fails, and the NodeManager on the same host has not yet been blacklisted, the framework should route the second ApplicationMaster attempt to a NodeManager on a different host.

Bug: [YARN-2005](#)

Cloudera Bug: CDH-25492

Apache HBase

HBase mlock agent is not included as part of CDH 5.x releases.

Starting in CDH 5.0, the native mlock daemons were not included in CDH HBase. CDH 5.5 restores the daemon in both parcels and packages.

Cloudera Bug: CDH-30196, CDH-30208

Apache Hive

Parquet Predicate pushdown for float types does not work

The Parquet predicate builder should use PrimitiveTypeName type to construct a predicate leaf instead of the type provided by PredicateLeaf.

Bug: [HIVE-11504](#)

Cloudera Bug: CDH-30495

LineageCtx should release all resources at clear()

Some maps are not released with the clear() method and can cause a memory leak.

Bug: [HIVE-12225](#)

Cloudera Bug: CDH-33265

LEFT JOIN query plan outputs wrong column when using subquery

Incorrect results may arise if a LEFT OUTER JOIN is combined with a subquery.

Bug: [HIVE-9613](#)

Cloudera Bug: CDH-28587

Map-side aggregation is extremely slow

Map-side aggregation on columns with double type is extremely slow due to [HIVE-7041](#).

Bug: [HIVE-11502](#)

Cloudera Bug: CDH-30387

Lineage does not work with dynamic partitioning query

An error message displays after running a dynamic partitioning query: ERROR : Result schema has 2 fields, but we don't get as many dependencies.

Bug: [HIVE-11834](#)

Cloudera Bug: CDH-31566

DROP PARTITION in encrypted zone does not remove data from HDFS

An ALTER TABLE query to DROP PARTITION removes the partition metadata from HDFS but not the data.

Bug: [HIVE-10910](#)

Cloudera Bug: CDH-29014*DROP TABLE with qualified table name ignores database name when checking partitions*

DDLTask.dropTable() uses an older version of Hive.getPartitionNames(), which takes in a single string for the table name, instead of the database and table names.

Bug: [HIVE-10421](#)**Cloudera Bug:** CDH-31183*INSERT INTO statement may expose data that should be encrypted*

INSERT INTO <table> VALUES() uses a temporary table; the data in temporary tables is stored under hive.exec.scratchdir which is not usually encrypted.

Bug: [HIVE-10658](#)**Cloudera Bug:** CDH-29235*Whitelist restrictions do not get initialized in new copy of HiveConf*

Whitelist restrictions use a regex pattern in HiveConf, but when a new HiveConf object copy is created, the regex pattern is not initialized in the new HiveConf copy.

Bug: [HIVE-10465](#)**Cloudera Bug:** CDH-31184*RuntimeException when vectorization is enabled with binary data*

A RuntimeException is thrown when vectorization is enabled and binary data is in the GROUP BY clause.

Bug: [HIVE-9908](#)**Cloudera Bug:** CDH-31182*Hive may return wrong results in some queries with PTF function*

The select statement has an extra column with a PTF operator that is skewing results.

Bug: [HIVE-11604](#)**Cloudera Bug:** CDH-30669*HiveServer2 leaks Hive Metastore Connections*

HiveServer2 uses threadlocal to cache Hive Metastore (HMS) Thrift client in class Hive. When the thread dies, the HMS client does not close. So the connection to the HMS client leaks.

Bug: [HIVE-10956](#)**Cloudera Bug:** CDH-28441*Remote Spark Client has a memory leak*

In Remote Spark Client (RSC), MapWork/ReduceWork tasks build up until an OutOfMemoryException is thrown.

Bug: [HIVE-10006](#)**Cloudera Bug:** CDH-26327*Replication factor is not properly set in SparkHashTableSinkOperator*

The default replication factors (3) affects the Map Join performance of small files.

Bug: [HIVE-11109](#)**Cloudera Bug:** CDH-28903

Hive LDAP Authenticator should allow users to set Domain without the base Distinguished Name

When the base distinguished name (DN) is not configured but only the Domain has been set in hive-site.xml, the LDAP authentication provider cannot locate the user in the directory. Authentication fails in such cases.

Bug: [HIVE-12007](#)

Cloudera Bug: CDH-23561

Hive should support additional LDAP authentication parameters

Currently, Hive only has the following authenticator parameters for LDAP authentication for HiveServer2:

```
<property>
  <name>hive.server2.authentication</name>
  <value>LDAP</value>
</property>
<property>
  <name>hive.server2.authentication.ldap.url</name>
  <value>ldap://our_ldap_address</value>
</property>
```

Other LDAP properties need to be included as part of Hive-LDAP authentication, for example:

```
group search base -> dc=domain,dc=com
group search filter -> member={0}
user search base -> dc=domain,dc=com
user search filter -> sAMAccountName={0}
list of valid user groups -> group1,group2,group3
```

Bug: [HIVE-7193](#)

Cloudera Bug: CDH-31454

Aggregate functions used as window functions can fail in various ways

- [HIVE-11817](#), CDH-28903: Window function `max()` fails with `NullPointerException`.
- [HIVE-10702](#), CDH-31128: `COUNT(*)` over windowing `x` preceding and `y` preceding returns unexpected results.
- [HIVE-10826](#), CDH-31958: Support `min()/max()` functions over `x` preceding and `y` preceding windowing.

Apache Spark

Attempts to access secure HBase from Spark executors fail when authenticating to the metastore.

An exception like the following occurs when you attempt to access kerberized HBase instance from a Spark executor.

```
GSSEException: No valid credentials provided
(Mechanism level: Failed to find any Kerberos tgt)
```

The root cause is that the HBase Kerberos authentication token is not sent to the Spark executor.

Bug: [SPARK-6918](#)

Workaround: None.

The shuffle service fails on NodeManager restarts and kills all running Spark applications

In CDH 5.4.0 through CDH 5.4.4, the shuffle service is on by default. Because it fails in NodeManager restarts, in CDH 5.4.5, and higher, the shuffle service is off by default. Dynamic allocation requires that the shuffle service be turned on.

Bug: [SPARK-9439](#)

Cloudera Bug: CDH-29772

Workaround: In CDH 5.4.5 and higher, enable the shuffle service when using dynamic allocation.

Spark not automatically picking up hive-site.xml

When you run Spark on YARN, the client `hive-site.xml` does not get picked up automatically by `spark-submit`.

Bug: [SPARK-2669](#)

Cloudera Bug: CDH-23780

Workaround: Do one of the following, depending on which deployment mode you are running in:

- Client - set `HADOOP_CONF_DIR` to `/etc/hive/conf/` (or the directory where `hive-site.xml` is located).
- Cluster - add `--files=/etc/hive/conf/hive-site.xml` (or the path for `hive-site.xml`) to the `spark-submit` script.

*Apache Sentry (incubating)**Synchronize calls in SentryClient and create Sentry client once per request in SimpleDBProvider*

Adds proper locking to the SentryClient and reduces the number of SentryClients created within a single request in the SimpleDbProvider (used by Hive). This fixes issues that may have caused transient permission failures and out of memory conditions.

Bug: [SENTRY-893](#)

Sentry-HDFS sync events should treat database and table names as case-insensitive

Sentry-HDFS Sync was treating database and table names as case-sensitive. This led to incorrect or missing ACLs being applied as part of the sync operation if the DDL operations used a different case for the catalog objects.

Bug: [SENTRY-885](#)

Hive drop database operation removes the Sentry privileges, even if drop operation fails

Even if the Hive drop database operation fails, the Sentry privileges on that database will be removed.

Bug: [SENTRY-669](#)

Nested queries in Hive on views incorrectly enforce base table privileges instead of view privileges

Nested queries in Hive on views incorrectly enforce base table privileges instead of view privileges. This leads to to Hive query failures due to insufficient privileges.

Bug: [SENTRY-619](#)

*Apache ZooKeeper**BinaryInputArchive readString should check length before allocating memory*

This fixed a possible OutOfMemoryError when malformed packets were sent to the ZooKeeper server.

Bug: [ZOOKEEPER-2146](#)

Cloudera Bug: CDH-25733

Workaround: Upgrade to CDH 5.5.

*Cloudera Search**The GoLive Function Does not Support Running As a Configurable User*

After using `--go-live` mode with the `MapReduceIndexerTool` and `HBaseMapReduceIndexerTool`, depending on group mappings and the configured HDFS umask, Solr may not have been able to read the results of the indexing job.

With Search for CDH 5.5 and later, the `MapReduceIndexerTool` and `HBaseMapReduceIndexerTool` includes updated `--go-live` functionality. The indexers now automatically update HDFS ACLs for the specified output directory, giving Solr permission to read the indexer results.

See [MapReduceIndexerTool](#) and [HBaseMapReduceIndexerTool](#) for more information.

Bug: None.

Workaround: Do not use the `--go-live` mode with `MapReduceIndexerTool` and `HBaseMapReduceIndexerTool` or use a less restrictive umask.

MapReduceIndexerTool fails to Index Documents When Sentry Is Enabled

Prior to CDH 5.5, when Sentry was enabled, the MapReduceIndexerTool was unable to index data even if the user was authorized to write to the collection according to Sentry permissions. This limitation occurred because, by default, the MapReduceIndexerTool used the underlying collection's `solrconfig.xml` from ZooKeeper to build the index using its EmbeddedSolrServers. But the embedded servers are not properly configured to use Sentry, so this process failed.

With Search for CDH 5.5, the MapReduceIndexerTool uses a default `solrconfig.xml` that is appropriate for the vast majority of collection configurations. With this configuration, the MapReduceIndexerTool is able to index data, even if Sentry is enabled. Note that this default configuration does not include any `updateRequestProcessorChains`; if your configuration requires an `updateRequestProcessorChain`, you can tell the MapReduceIndexerTool to use the configuration from ZooKeeper by specifying `--use-zk-solrconfig.xml` or from local disk by specifying `--solr-home-dir`.

Bug: None.

Workaround: To address this issue, configure the MapReduceIndexerTool to run without Sentry restrictions. This does not compromise security because this only affects the "embedded" Solr Servers in the job that are used to build the offline index; Solr's Sentry permissions are still checked when the data is merged into the cluster via `--go-live`.

Here are two ways to enable indexing:

1. If your environment uses the default configuration files, use `solrconfig.xml` for indexing jobs, rather than `solrconfig.xml.secure`. Use the `--solr-home-dir` option to specify the directory containing `solrconfig.xml`, causing the job to run with Sentry disabled.
2. Alternately, you can comment out the following line:

```
<str name="update.chain">updateIndexAuthorization</str>
```

This line must be commented out and the change saved in the `solrconfig` file used by the machine running the indexing job.

Issues Fixed in CDH 5.4.x

The following topics describe known issues fixed in CDH 5.4.x, from newest to oldest release.

Issues Fixed in CDH 5.4.11

CDH 5.4.11 fixes the following issues.

- [FLUME-2891](#) - Revert FLUME-2712 and FLUME-2886
- [FLUME-2908](#) - NetcatSource - SocketChannel not closed when session is broken
- [HADOOP-8436](#) - NPE In `getLocalPathForWrite (path, conf)` when the required context item is not configured
- [HADOOP-8437](#) - `getLocalPathForWrite` should throw `IOException` for invalid paths
- [HADOOP-8751](#) - NPE in `Token.toString()` when `Token` is constructed using null identifier
- [HADOOP-8934](#) - Shell command `ls` should include sort options
- [HADOOP-10048](#) - `LocalDirAllocator` should avoid holding locks while accessing the filesystem
- [HADOOP-10971](#) - Add `-C` flag to make ``hadoop fs -ls`` print filenames only
- [HADOOP-11901](#) - `BytesWritable` fails to support 2G chunks due to integer overflow
- [HADOOP-12252](#) - `LocalDirAllocator` should not throw NPE with empty string configuration
- [HADOOP-12269](#) - Update `aws-sdk` dependency to 1.10.6
- [HADOOP-12787](#) - KMS SPNEGO sequence does not work with WEBHDFS
- [HADOOP-12841](#) - Update `s3`-related properties in `core-default.xml`.
- [HADOOP-12901](#) - Add warning log when `KMSClientProvider` cannot create a connection to the KMS server.
- [HADOOP-12972](#) - `Lz4Compressor#getLibraryName` returns the wrong version number
- [HADOOP-13079](#) - Add `-q` option to `ls` to print `?` instead of non-printable characters
- [HADOOP-13132](#) - Handle `ClassCastException` on `AuthenticationException` in `LoadBalancingKMSClientProvider`
- [HADOOP-13155](#) - Implement `TokenRenewer` to renew and cancel delegation tokens in KMS
- [HADOOP-13251](#) - Authenticate with Kerberos credentials when renewing KMS delegation token

- [HADOOP-13255](#) - KMSSClientProvider should check and renew tgt when doing delegation token operations
- [HADOOP-13263](#) - Reload cached groups in background after expiry.
- [HADOOP-13457](#) - Remove hardcoded absolute path for shell executable.
- [HDFS-4660](#) - Block corruption can happen during pipeline recovery
- [HDFS-8211](#) - DataNode UUID is always null in the JMX counter.
- [HDFS-8451](#) - DFSClient probe for encryption testing interprets empty URI property for enabled
- [HDFS-8496](#) - Calling stopWriter() with FSDataSetImpl lock held may block other threads
- [HDFS-8576](#) - Lease recovery should return true if the lease can be released and the file can be closed
- [HDFS-8722](#) - Optimize datanode writes for small writes and flushes
- [HDFS-9085](#) - Show renewer information in DelegationTokenIdentifier#toString
- [HDFS-9220](#) - Reading small file (< 512 bytes) that is open for append fails due to incorrect checksum
- [HDFS-9276](#) - Failed to Update HDFS Delegation Token for long running application in HA mode
- [HDFS-9466](#) - TestShortCircuitCache#testDataXceiverCleansUpSlotsOnFailure is flaky
- [HDFS-9589](#) - Block files which have been hardlinked should be duplicated before the DataNode appends to the them
- [HDFS-9700](#) - DFSClient and DFSOutputStream should set TCP_NODELAY on sockets for DataTransferProtocol
- [HDFS-9732](#) - Improve DelegationTokenIdentifier.toString() for better logging
- [HDFS-9939](#) - Increase DecompressorStream skip buffer size
- [HDFS-9949](#) - Add a test case to ensure that the DataNode does not regenerate its UUID when a storage directory is cleared
- [HDFS-10267](#) - Extra "synchronized" on FsDataSetImpl#recoverAppend and FsDataSetImpl#recoverClose
- [HDFS-10360](#) - DataNode might format directory and lose blocks if current/VERSION is missing.
- [HDFS-10381](#) - , DataStreamer DataNode exclusion log message should be warning.
- [MAPREDUCE-4785](#) - TestMRApp occasionally fails
- [MAPREDUCE-6580](#) - Test failure: TestMRJobsWithProfiler
- [YARN-2871](#) - TestRMRestart#testRMRestartGetApplicationList sometimes fails in trunk
- [YARN-3727](#) - Check if the directory exists before using it for localization
- [YARN-4168](#) - Fixed a failing test TestLogAggregationService.testLocalFileDeletionOnDiskFull
- [YARN-4354](#) - Public resource localization fails with NPE
- [YARN-4717](#) - TestResourceLocalizationService.testPublicResourceInitializesLocalDir fails Intermittently due to IllegalArgumentException from cleanup
- [YARN-5048](#) - DelegationTokenRenewer#skipTokenRenewal might throw NPE
- [HBASE-6617](#) - ReplicationSourceManager should be able to track multiple WAL paths (ADDENDUM)
- [HBASE-11625](#) - Verifies data before building HFileBlock. - Adds HFileBlock.Header class which contains information about location of fields. Testing: Adds CorruptedFSReaderImpl to TestChecksum.
- [HBASE-11927](#) - Use Native Hadoop Library for HFile checksum.
- [HBASE-14155](#) - StackOverflowError in reverse scan
- [HBASE-14359](#) - HTable#close will hang forever if unchecked error/exception thrown in AsyncProcess#sendMultiAction
- [HBASE-14730](#) - region server needs to log warnings when there are attributes configured for cells with hfile v2
- [HBASE-14759](#) - Avoid using Math.abs when selecting SyncRunner in FSHLog
- [HBASE-15234](#) - Don't abort ReplicationLogCleaner on ZooKeeper errors
- [HBASE-15456](#) - CreateTableProcedure/ModifyTableProcedure needs to fail when there is no family in table descriptor
- [HBASE-15479](#) - No more garbage or beware of autoboxing
- [HBASE-15582](#) - SnapshotManifestV1 too verbose when there are no regions
- [HBASE-15707](#) - ImportTSV bulk output does not support tags with hfile.format.version=3
- [HBASE-15746](#) - Remove extra RegionCoprocesor preClose() in RSRpcServices#closeRegion
- [HBASE-15811](#) - Batch Get after batch Put does not fetch all Cells We were not waiting on all executors in a batch to complete. The test for no-more-executors was damaged by the 0.99/0.98.4 fix "HBASE-11403 Fix race conditions around Object#notify"

- [HBASE-15925](#) - provide default values for hadoop compat module related properties that match default hadoop profile.
- [HBASE-16207](#) - can't restore snapshot without "Admin" permission
- [HIVE-9499](#) - hive.limit.query.max.table.partition makes queries fail on non-partitioned tables
- [HIVE-10048](#) - JDBC - Support SSL encryption regardless of Authentication mechanism

- [SOLR-8855](#) - The HDFS BlockDirectory should not clean up its cache on shutdown.
- [SOLR-8856](#) - Do not cache merge or 'read once' contexts in the hdfs block cache.
- [SOLR-8857](#) - HdfsUpdateLog does not use configured or new default number of version buckets and is hard coded to 256.
- [SOLR-8869](#) - Optionally disable printing field cache entries in SolrFieldCacheMBean
- [SPARK-12087](#) - Create new JobConf for every batch in saveAsHadoopFiles

Issues Fixed in CDH 5.4.10

CDH 5.4.10 fixes the following issues.

Apache Hadoop

FSImage may get corrupted after deleting snapshot

Bug: [HDFS-9406](#)

Cloudera Bug: CDH-33224

When deleting a snapshot that contains the last record of a given INode, the fsimage may become corrupt because the create list of the snapshot diff in the previous snapshot and the child list of the parent INodeDirectory are not cleaned.

Upstream Issues Fixed

The following upstream issues are fixed in CDH 5.4.10:

- [FLUME-2712](#) - Optional channel errors slows down the Source to Main channel event rate
- [FLUME-2886](#) - Optional Channels can cause OOMs
- [HADOOP-10406](#) - TestIPC.testIpcWithReaderQueuing may fail
- [HADOOP-10668](#) - TestZKFailoverControllerStress#testExpireBackAndForth occasionally fails
- [HADOOP-11218](#) - Add TLSv1.1,TLSv1.2 to KMS, HttpFS, SSLFactory
- [HADOOP-12200](#) - TestCryptoStreamsWithOpensslAesCtrCryptoCodec should be skipped in non-native profile
- [HADOOP-12240](#) - Fix tests requiring native library to be skipped in non-native profile
- [HADOOP-12280](#) - Skip unit tests based on Maven profile rather than NativeCodeLoader.isNativeCodeLoaded

- [HADOOP-12417](#) - TestWebDelegationToken failing with port in use
- [HADOOP-12418](#) - TestRPC.testRPCInterruptedSimple fails intermittently
- [HADOOP-12464](#) - Interrupted client may try to fail-over and retry
- [HADOOP-12468](#) - Partial group resolution failure should not result in user lockout.
- [HADOOP-12474](#) - MiniKMS should use random ports for Jetty server by default
- [HADOOP-12559](#) - KMS connection failures should trigger TGT renewal
- [HADOOP-12604](#) - Exception may be swallowed in KMSClientProvider.
- [HADOOP-12605](#) - Fix intermittent failure of TestIPC.testIpcWithReaderQueuing
- [HADOOP-12668](#) - Support excluding weak Ciphers in HttpServer2 through ssl-server.conf
- [HADOOP-12682](#) - Fix TestKMS#testKMSRestart* failure
- [HADOOP-12699](#) - TestKMS#testKMSProvider intermittently fails during 'test rollover draining'

- [KITE-1114](#) - fix test
- [KITE-1114](#) - Fix missing license header
- [KITE-1114](#) - Kite CLI json-import HDFS temp file path not multiuser safe
- [OOZIE-2413](#) - Kerberos credentials can expire if the KDC is slow to respond
- [OOZIE-2428](#) - TestSLAService, TestSLAEventGeneration flaky tests
- [OOZIE-2432](#) - TestPurgeXCommand fails
- [OOZIE-2435](#) - TestCoordChangeXCommand is flaky
- [SENTRY-835](#) - Drop table leaves a connection open when using MetastoreListener
- [SENTRY-885](#) - DB name should be case insensitive in HDFS sync plugin
- [SENTRY-944](#) - Setting HDFS rules on Sentry managed hdfs paths should not affect original hdfs rules
- [SENTRY-953](#) - External Partitions which are referenced by more than one table can cause some unexpected behavior with Sentry HDFS sync
- [SENTRY-957](#) - Exceptions in MetastoreCacheInitializer should probably not prevent HMS from starting up
- [SENTRY-988](#) - It's better to let SentryAuthorization setter path always fall through and update HDFS
- [SENTRY-991](#) - backportRoles of Sentry Permission needs to be case insensitive
- [SENTRY-994](#) - SentryAuthorizationInfoX should override isSentryManaged

- [SENTRY-1002](#) - PathsUpdate.parsePath(path) will throw an NPE when parsing relative paths
- [SENTRY-1003](#) - backportSupport "reload" by updating the classpath of Sentry function aux jar path during run time
- [SENTRY-1008](#) - Path should be not be updated if the create/drop table/partition event fails
- [SENTRY-1044](#) - Tables with non-HDFS locations breaks HMS startup
- [SOLR-7281](#) - Add an overseer action to publish an entire node as 'down'
- [SOLR-8367](#) - Fix the LeaderInitiatedRecovery 'all replicas participate' fail-safe
- [SOLR-8371](#) - Try and prevent too many recovery requests from stacking up and clean up some faulty cancel recovery logic
- [SOLR-8372](#) - backportCanceled recovery can lead to data loss
- [SOLR-8575](#) - Addendum to Fix HDFSLogReader replay
- [SOLR-8575](#) - Fix HDFSLogReader replay status numbers and a performance bug where we can reopen FSDataInputStream too often
- [SOLR-8615](#) - Just like creating cores, we should use multiple threads when closing cores
- [SOLR-8720](#) - ZkController#publishAndWaitForDownStates should use #publishNodeAsDown
- [SOLR-8771](#) - Multithreaded core shutdown creates executor per core
- [SQOOP-2847](#) - Sqoop --incremental + missing parent --target-dir reports success with no data
- [SQOOP-2422](#) - Sqoop2: Test TestJSONIntermediateDataFormat is failing on JDK8
- [ZOOKEEPER-442](#) - Need a way to remove watches that are no longer of interest"

Issues Fixed in CDH 5.4.9

Known Issues Fixed

The following topics describe known issues fixed in CDH 5.4.9.

Apache Commons Collections deserialization vulnerability

Cloudera has learned of a potential security vulnerability in a third-party library called the [Apache Commons Collections](#). This library is used in products distributed and supported by Cloudera ("Cloudera Products"), including core Apache Hadoop. The Apache Commons Collections library is also in widespread use beyond the Hadoop ecosystem. At this time, no specific attack vector for this vulnerability has been identified as present in Cloudera Products.

In an abundance of caution, we are currently in the process of incorporating a version of the Apache Commons Collections library with a fix into the Cloudera Products. In most cases, this will require coordination with the projects in the Apache community. One example of this is tracked by [HADOOP-12577](#).

The Apache Commons Collections potential security vulnerability is titled "Arbitrary remote code execution with InvokerTransformer" and is tracked by [COLLECTIONS-580](#). MITRE has not issued a CVE, but related [CVE-2015-4852](#) has been filed for the vulnerability. CERT has issued [Vulnerability Note #576313](#) for this issue.

Releases affected: CDH 5.5.0, CDH 5.4.8 and lower, CDH 5.3.8 and lower, CDH 5.2.8 and lower, CDH 5.1.7 and lower, Cloudera Manager 5.5.0, Cloudera Manager 5.4.8 and lower, Cloudera Manager 5.3.8 and lower, and Cloudera Manager 5.2.8 and lower, Cloudera Manager 5.1.6 and lower, Cloudera Manager 5.0.7 and lower, Cloudera Navigator 2.4.0, Cloudera Navigator 2.3.8 and lower.

Users affected: All

Impact: This potential vulnerability may enable an attacker to execute arbitrary code from a remote machine without requiring authentication.

Immediate action required: Upgrade to Cloudera Manager 5.5.1 and CDH 5.5.1, Cloudera Manager 5.4.9 and CDH 5.4.9, Cloudera Manager 5.3.9 and CDH 5.3.9, and Cloudera Manager 5.2.9 and CDH 5.2.9, and Cloudera Manager 5.1.7 and CDH 5.1.7, and Cloudera Manager 5.0.8 and CDH 5.0.8.

Apache HBase

Data may not be replicated to worker cluster if multiwal multiplicity is set to greater than 1

Bug: [HBASE-13703](#), [HBASE-6617](#), [HBASE-14501](#).

Upstream Issues Fixed

The following upstream issues are fixed in CDH 5.4.9:

- [FLUME-2841](#) - Upgrade commons-collections to 3.2.2
- [HADOOP-7713](#) - dfs -count -q should label output column
- [HADOOP-11171](#) - Enable using a proxy server to connect to S3a
- [HADOOP-12568](#) - Update core-default.xml to describe posixGroups support
- [HADOOP-12577](#) - Bumped up commons-collections version to 3.2.2 to address a security flaw
- [HDFS-7785](#) - Improve diagnostics information for HttpPutFailedException
- [HDFS-7798](#) - Checkpointing failure caused by shared KerberosAuthenticator
- [HDFS-7871](#) - NameNodeEditLogRoller can keep printing 'Swallowing exception' message
- [HDFS-7990](#) - IBR delete ack should not be delayed
- [HDFS-8646](#) - Prune cached replicas from DatanodeDescriptor state on replica invalidation
- [HDFS-9123](#) - Copying from the root to a subdirectory should be forbidden
- [HDFS-9250](#) - Add Precondition check to LocatedBlock#addCachedLoc
- [HDFS-9273](#) - ACLs on root directory may be lost after NN restart
- [HDFS-9332](#) - Fix Precondition failures from NameNodeEditLogRoller while saving namespace
- [HDFS-9364](#) - Unnecessary DNS resolution attempts when creating NameNodeProxies
- [HDFS-9470](#) - Encryption zone on root not loaded from fsmage after NN restart
- [MAPREDUCE-6191](#) - Improve clearing stale state of Java serialization
- [MAPREDUCE-6549](#) - Multibyte delimiters with LineRecordReader cause duplicate records
- [YARN-4235](#) - FairScheduler PrimaryGroup does not handle empty groups returned for a user
- [HBASE-6617](#) - ReplicationSourceManager should be able to track multiple WAL paths
- [HBASE-12865](#) - WALs may be deleted before they are replicated to peers
- [HBASE-13134](#) - mutateRow and checkAndMutate APIs don't throw region level exceptions
- [HBASE-13618](#) - ReplicationSource is too eager to remove sinks
- [HBASE-13703](#) - ReplicateContext should not be a member of ReplicationSource
- [HBASE-14003](#) - Work around JDK-8044053
- [HBASE-14283](#) - Reverse scan doesn't work with HFile inline index/bloom blocks
- [HBASE-14374](#) - Backport parent 'HBASE-14317 Stuck FSHLog' issue to 1.1
- [HBASE-14501](#) - NPE in replication with TDE
- [HBASE-14533](#) - Connection Idle time 1 second is too short and the connection is closed too quickly by the ChoreService
- [HBASE-14547](#) - Add more debug/trace to zk-procedure
- [HBASE-14799](#) - Commons-collections object deserialization remote command execution vulnerability
- [HBASE-14809](#) - Grant / revoke Namespace admin permission to group
- [HIVE-10265](#) - Hive CLI crashes on != inequality
- [HIVE-11149](#) - Sometimes HashMap in PerfLogger.java hangs
- [HIVE-11616](#) - DelegationTokenSecretManager reuses the same objectstore, which has concurrency issues
- [HIVE-12058](#) - Change hive script to record errors when calling hbase fails
- [HIVE-12188](#) - DoAs does not work properly in non-Kerberos secured HS2
- [HIVE-12189](#) - The list in pushdownPreds of ppd.ExprWalkerInfo should not be allowed to grow very large
- [HIVE-12250](#) - ZooKeeper connection leaks in Hive's HBaseHandler
- [HIVE-12365](#) - Added resource path is sent to cluster as an empty string when externally removed
- [HIVE-12378](#) - Exception on HBaseSerDe.serialize binary field
- [HIVE-12406](#) - HIVE-9500 introduced incompatible change to LazySimpleSerDe public interface
- [HIVE-12418](#) - HiveHBaseTableInputFormat.getRecordReader() causes ZooKeeper connection leak
- [HUE-2941](#) - [hadoop] Cache the active RM HA
- [HUE-3035](#) - [beeswax] Optimize sample data query for partitioned tables
- [IMPALA-1459](#) - Fix migration/assignment of On-clause predicates inside inline views

- [IMPALA-1675](#) - Avoid overflow when adding large intervals to TIMESTAMPs
- [IMPALA-1746](#) - QueryExecState does not check for query cancellation or errors
- [IMPALA-1917](#) - Do not register aux equivalence predicates with NULL on either side
- [IMPALA-1949](#) - Analysis exception when a binary operator contain an IN operator with
- [IMPALA-2086/IMPALA-2090](#) - Avoid boost year/month interval logic
- [IMPALA-2141](#) - UnionNode::getNext() does not check for query errors
- [IMPALA-2252](#) - Crash (likely race) tearing down BufferedBlockMgr on query failure
- [IMPALA-2260](#) - Adding a large hour interval caused an interval overflow
- [IMPALA-2265](#) - Sorter was not checking the returned Status of PrepareRead
- [IMPALA-2273](#) - Make MAX_PAGE_HEADER_SIZE configurable
- [IMPALA-2286](#) - Fix race between ~BufferedBlockMgr() and BufferedBlockMgr::Create()
- [IMPALA-2344](#) - Work-around IMPALA-2344 Fail query with OOM in case block->Pin() fails
- [IMPALA-2357](#) - Fix spilling sorts with var-len slots that are NULL or empty
- [IMPALA-2446](#) - Fix wrong predicate assignment in outer joins
- [IMPALA-2533](#) - Impala throws IllegalStateException when inserting data into a partition
- [IMPALA-2559](#) - Fix check failed: sorter_runs_.back()->is_pinned_
- [IMPALA-2664](#) - Avoid sending large partition stats objects over thrift
- [IMPALA-2731](#) - Refactor MemPool usage in HBase scan node
- [KITE-1089](#) - readAvroContainer morphline command should work even if the Avro writer schema of each input file is different
- [PIG-3641](#) - Split "otherwise" producing incorrect output when combined with ColumnPruning
- [SENTRY-565](#) - Improve performance of filtering Hive SHOW commands
- [SENTRY-702](#) - Hive binding should support RELOAD command
- [SENTRY-936](#) - getGroup and getUser should always return original hdfs values for paths in prefixes which are not Sentry managed
- [SENTRY-960](#) - Blacklist reflect, java_method using hive.server2.builtin.udf.blacklist
- [SOLR-6443](#) - backportDisable test that fails on Jenkins with SolrCore.getOpenCount()==2
- [SOLR-7049](#) - LIST Collections API call should be processed directly by the CollectionsHandler instead of the OverseerCollectionProcessor
- [SOLR-7552](#) - Support using ZkCredentialsProvider/ZkACLProvider in custom filter
- [SOLR-7989](#) - After a new leader is elected, it should ensure it's state is ACTIVE if it has already registered with ZK
- [SOLR-8075](#) - Leader Initiated Recovery should not stop a leader that participated in an election with all of it's replicas from becoming a valid leader
- [SOLR-8223](#) - Avoid accidentally swallowing OutOfMemoryError
- [SOLR-8288](#) - DistributedUpdateProcessor#doFinish should explicitly check and ensure it does not try to put itself into LIR
- [SPARK-11484](#) - [WEBUI] Using proxyBase set by spark AM
- [SPARK-11652](#) - [CORE] Remote code execution with InvokerTransformer

Issues Fixed in CDH 5.4.8

Upstream Issues Fixed

The following upstream issues are fixed in CDH 5.4.8:

- [FLUME-2095](#) - JMS source with TIBCO
- [HADOOP-11261](#) - Set custom endpoint for S3A
- [HADOOP-12404](#) - Disable caching for JarURLConnection to avoid sharing JarFile with other users when loading resource from URL in Configuration class
- [HADOOP-12413](#) - AccessControlList should avoid calling getGroupNames in isUserInList with empty groups
- [HDFS-7916](#) - 'reportBadBlocks' from datanodes to standby Node BPSERVICEACTOR goes for infinite loop
- [HDFS-7978](#) - Add LOG.isDebugEnabled() guard for some LOG.debug()

- [HIVE-11712](#) - Duplicate groupby keys cause ClassCastException
- [HIVE-11737](#) - IndexOutOfBounds compiling query with duplicated groupby keys

- [HIVE-11745](#) - Alter table Exchange partition with multiple partition_spec is not working
- [HIVE-11816](#) - Upgrade groovy to 2.4.4
- [HIVE-11824](#) - Insert to local directory causes staging directory to be copied
- [HIVE-11843](#) - Add 'sort by c' to Parquet PPD q-tests to avoid different output issues with hadoop-1
- [HIVE-11891](#) - Add basic performance logging to metastore calls
- [HIVE-11926](#) - Backport:Stats annotation might not extract stats for varchar/decimal columns
- [HIVE-11982](#) - Some test cases for union all fail with recent changes
- [HIVE-11995](#) - Remove repetitively setting permissions in insert/load overwrite partition
- [HUE-2881](#) - [oozie] A fork can point to a deleted node
- [IMPALA-1136](#) - Support loading Avro tables without an explicit Avro schema
- [IMPALA-1899](#) - Cleanup handling of Hive's field schema3e0fee5 IMPALA-2369, IMPALA-2435: Impala crashes when the sorter hits an OOM error
- [IMPALA-2130](#) - Wrong verification of Parquet file version
- [IMPALA-2161](#) - Skip \u0000 characters when dealing Avro schemas
- [IMPALA-2165](#) - Avoid cardinality 0 in scan nodes of small tables and low selectivity
- [IMPALA-2168](#) - Do not try to access streams of repartitioned spilled partition in right-joins
- [IMPALA-2213](#) - Make Parquet scanner fail query if the file size metadata is stale
- [IMPALA-2249](#) - Avoid allocating StringBuffer > 1GB in ScannerContext::Stream::GetBytesInternal()
- [IMPALA-2256](#) - Handle joins with right side of high cardinality and zero materialized slots
- [IMPALA-2270](#) - Avoid FnvHash64to32 with empty inputs
- [IMPALA-2284](#) - Disallow long (1<<30) strings in group_concat()
- [IMPALA-2292](#) - Change the type of timestamp_col to string in the table no_avro_schema.
- [IMPALA-2314](#) - LargestSpilledPartition was not checking if partition is closed
- [IMPALA-2348](#) - The catalog does not close the connection to HMS during table invalidation
- [IMPALA-2364](#) - Wrong DCHECK in PHJ::ProcessProbeBatch
- [IMPALA-2366](#) - Check fread return code correctly
- [IMPALA-2440](#) - Fix old HJ full outer join with no rows
- [IMPALA-2477](#) - Parquet metadata randomly 'appears stale'
- [IMPALA-2514](#) - DCHECK on destroying an ExprContext
- [KITE-1069](#) - Make zkClientSessionTimeout and zkClientConnectTimeout configurable in SolrLocator
- [KITE-1074](#) - Partial updates aka Atomic updates with loadSolr aren't recognized with SolrCloud
- [MAHOUT-1771](#) - Cluster dumper omits indices and 0 elements for dense vector or sparse containing 0s
- [OOZIE-2376](#) - Default action configs not honored if no <configuration> section in workflow
- [SENTRY-878](#) - collect_list missing from HIVE_UDF_WHITE_LIST
- [SENTRY-884](#) - Give execute permission by default to paths managed by sentry
- [SENTRY-893](#) - Synchronize calls in SentryClient and create sentry client once per request in SimpleDBProvider
- [SOLR-5776](#) - Use less TLS/SSL in a test run
- [SOLR-7109](#) - Indexing threads stuck during network partition can put leader into down state
- [SOLR-7844](#) - Zookeeper session expiry during shard leader election can cause multiple leaders
- [SOLR-7956](#) - There are interrupts on shutdown in places that can cause ChannelAlreadyClosed exceptions which prevents proper closing of transaction logs and can poison the IndexWriter and interfere with the HDFS client
- [SOLR-8046](#) - HdfsCollectionsAPIDistributedZkTest checks that no transaction logs failed to be opened during the test but does not isolate this to the test and could fail due to other tests
- [SOLR-8069](#) - Ensure that only the valid ZooKeeper registered leader can put a replica into Leader Initiated Recovery
- [SOLR-8075](#) - Leader Initiated Recovery should not stop a leader that participated in an election with all of it's replicas from becoming a valid leader
- [SOLR-8077](#) - Replication can still cause index corruption
- [SOLR-8085](#) - Fix a variety of issues that can result in replicas getting out of sync
- [SOLR-8094](#) - HdfsUpdateLog should not replay buffered documents as a replacement to dropping them
- [SOLR-8095](#) - Add enable prop for HDFS Locality Metrics

- [SOLR-8121](#) - It looks like ChaosMonkeySafeLeader test can fail with replica inconsistency because `waitForThingsToLevelOut` can pass while state is still changing.
- [SPARK-6880](#) - Spark Shutdowns with `NoSuchElementException` when running parallel collect on `cachedRDD`
- [SQOOP-2597](#) - Missing method `AvroSchemaGenerator.generate()`

Published Known Issues Fixed

As a result of the above fixes, the following issues, previously published as [Known Issues in CDH 5](#) on page 1944, are also fixed.

Spurious warning in MRv1 jobs

The `mapreduce.client.genericoptionsparser.used` property is not correctly checked by `JobClient` and this leads to a spurious warning.

Cloudera Bug: CDH-9740

Workaround: MapReduce jobs using `GenericOptionsParser` or implementing `Tool` can remove the warning by setting this property to `true`.

Spark Sink requires spark-assembly.jar in Flume classpath

In CDH 5.4.0, Flume requires `spark-assembly.jar` in the Flume classpath to use the Spark Sink. Without this, the sink fails with a dependency issue.

Bug: [SPARK-7038](#)

Cloudera Bug: CDH-27210

Workaround: Use the Spark Sink from CDH 5.3 with Spark from CDH 5.4, or add `spark-assembly.jar` to the `FLUME_CLASSPATH`.

Streaming incompatibility between Spark 1.2 and 1.3

Applications built as a JAR with dependencies ("uber JAR") must be built for the specific version of Spark running on the cluster.

Cloudera Bug: CDH-26527

Workaround: Rebuild the JAR with the Spark dependencies in `pom.xml` pointing to the specific version of Spark running on the target cluster.

Configuring more than one NT domain does not work in CDH 5.4.0

Trying to add users and groups using the multi-NT domain feature (<http://gethue.com/hadoop-tutorial-make-hadoop-more-accessible-by-integrating-multiple-ldap-servers/>) produces an error.

Bug: [HUE-2665](#)

Cloudera Bug: CDH-26431

Workaround: None.

If Sentry is enabled, the `RELOAD` command cannot be executed in the Hive CLI or Beeline.

Bug: [SENTRY-702](#)

Cloudera Bug: CDH-25786

Workaround: None.

Issues Fixed in CDH 5.4.7

Upstream Issues Fixed

The following upstream issues are fixed in CDH 5.4.7:

- [CRUNCH-525](#) - Correct (more) accurate default scale factors for built-in MapFn implementations
- [CRUNCH-527](#) - Use hash smearing for partitioning

- [CRUNCH-528](#) - Improve Pair comparison
- [CRUNCH-531](#) - Fix split graph rendering typo.
- [CRUNCH-535](#) - call initCredentials on the job
- [CRUNCH-536](#) - Refactor CrunchControlledJob.Hook interface and make it client-accessible
- [CRUNCH-539](#) - Fix reading WritableComparables bimap
- [CRUNCH-540](#) - Make AvroReflectDeepCopier serializable
- [CRUNCH-543](#) - Have AvroPathPerKeyTarget handle child directories properly
- [CRUNCH-544](#) - Improve performance/serializability of materialized toMap.
- [CRUNCH-546](#) - Remove calls to CellUtil.cloneXXX
- [CRUNCH-547](#) - Properly handle nullability for Avro union types
- [CRUNCH-548](#) - Have the AvroReflectDeepCopier use the class of the source object when constructing new instances instead of the target class
- [CRUNCH-551](#) - Make the use of Configuration objects consistent in CrunchInputSplit and CrunchRecordReader
- [CRUNCH-553](#) - Fix record drop issue that can occur w/From.formattedFile TableSources
- [FLUME-1934](#) - Spooling Directory Source dies on encountering zero-byte files.
- [FLUME-2753](#) - Error when specifying empty replace string in Search and Replace Interceptor
- [HADOOP-12317](#) - Applications fail on NM restart on some linux distro because NM container recovery declares AM container as LOST
- [HDFS-8806](#) - Inconsistent metrics: number of missing blocks with replication factor 1 not properly cleared
- [HDFS-8850](#) - VolumeScanner thread exits with exception if there is no block pool to be scanned but there are suspicious blocks.
- [MAPREDUCE-5817](#) - Mappers get rescheduled on node transition even after all reducers are completed.
- [MAPREDUCE-6277](#) - Job can post multiple history files if attempt loses connection to the RM
- [MAPREDUCE-6439](#) - AM may fail instead of retrying if RM shuts down during the allocate call.
- [YARN-2921](#) - Fix MockRM/MockAM#waitForState sleep too long.
- [YARN-3823](#) - Fix mismatch in default values for yarn.scheduler.maximum-allocation-vcores property
- [YARN-3990](#) - AsyncDispatcher may overloaded with RMAppNodeUpdateEvent when Node is connected/disconnected
- [HBASE-13329](#) - ArrayIndexOutOfBoundsException in CellComparator#getMinimumMidpointArray.
- [HBASE-13437](#) - ThriftServer leaks ZooKeeper connections
- [HBASE-13471](#) - Fix a possible infinite loop in doMiniBatchMutation
- [HBASE-13684](#) - Allow mlockagent to be used when not starting as root
- [HBASE-14162](#) - Fixing maven target for regenerating thrift classes fails against 0.9.2
- [HBASE-14354](#) - Minor improvements for usage of the mlock agent
- [HIVE-7476](#) - CTAS does not work properly for s3
- [HIVE-9327](#) - CBO (Calcite Return Path): Removing Row Resolvers from ParseContext
- [HIVE-9512](#) - HIVE-9327 causing regression in stats annotation
- [HIVE-9580](#) - Server returns incorrect result from JOIN ON VARCHAR columns
- [HIVE-9613](#) - Left join query plan outputs wrong column when using subquery
- [HIVE-10085](#) - Lateral view on top of a view throws RuntimeException
- [HIVE-10140](#) - Window boundary is not compared correctly
- [HIVE-10288](#) - Cannot call permanent UDFs
- [HIVE-10319](#) - Hive CLI startup takes a long time with a large number of databases
- [HIVE-10719](#) - Hive metastore failure when alter table rename is attempted.
- [HIVE-10875](#) - Select query with view in subquery adds underlying table as direct input
- [HIVE-10906](#) - Value based UDAF function without orderby expression throws NPE
- [HIVE-10911](#) - Add support for date datatype in the value based windowing function
- [HIVE-10972](#) - DummyTxnManager always locks the current database in shared mode, which is incorrect
- [HIVE-10985](#) - Value based windowing on timestamp and double can't handle NULL value
- [HIVE-10996](#) - Aggregation / Projection over Multi-Join Inner Query producing incorrect results
- [HIVE-11139](#) - PROPOSEDQTest combine2_hadoop20.q fails when using -Phadoop-1 profile due to

- [HIVE-11172](#) - Vectorization wrong results for aggregate query with where clause without group by
- [HIVE-11203](#) - Beeline force option does not force execution when errors occurred in a script.
- [HIVE-11250](#) - Change in spark.executor.instances (and others) does not take effect after RSC is launched for HS2
- [HIVE-11255](#) - get_table_objects_by_name() in HiveMetaStore.java needs to retrieve table objects in multiple batches
- [HIVE-11258](#) - The function drop_database_core() of HiveMetaStore.java may not drop all the tables
- [HIVE-11271](#) - java.lang.IndexOutOfBoundsException when union all with if function
- [HIVE-11288](#) - Avro SerDe InstanceCache returns incorrect schema
- [HIVE-11333](#) - ColumnPruner prunes columns of UnionOperator that should be kept
- [HIVE-11502](#) - Map side aggregation is extremely slow
- [HIVE-11604](#) - HIVE return wrong results in some queries with PTF function
- [HIVE-11620](#) - Fix several qtest output order
- [HUE-2873](#) - [oozie] Handle TransactionManagementError on workflow dashboard
- [HUE-2877](#) - [desktop] Add pyasn1 and ndg_httpsclient to support SSL Server Name Indication
- [HUE-2880](#) - [hadoop] Fix uploading large files to a kerberized HTTPFS
- [HUE-2882](#) - [oozie] Fix parsing error when workflow job uses Australian timezone
- [HUE-2883](#) - [impala] Canceling a query shows an error message
- [HUE-2885](#) - [oozie] Java options java-opts not generated correctly in XML
- [HUE-2893](#) - [desktop] Backport CherryPy SSL file upload fix
- [HUE-2903](#) - [oozie] Fix error with Workflow parameter on rerun
- [IMPALA-1737](#) - Substitute an InsertStmt's partition key exprs with the root node's smap.
- [IMPALA-1756](#) - Constant filter expressions are not checked for errors and state cleanup is not done before throwing exception.
- [IMPALA-1898](#) - Explicit aliases + ordinals analysis bug
- [IMPALA-1983](#) - Warn if table stats are potentially corrupt.
- [IMPALA-1987](#) - Fix TupleIsNullPredicate to return false if no tuples are nullable.
- [IMPALA-2088](#) - Fix planning of empty union operands with analytics.
- [IMPALA-2089](#) - Retain eq predicates bound by grouping slots with complex grouping exprs.
- [IMPALA-2178](#) - fix Expr::ComputeResultsLayout() logic.
- [IMPALA-2199](#) - Row count not set for empty partition when spec is used with compute incremental stats
- [IMPALA-2201](#) - Unconditionally update the partition stats and row count.
- [IMPALA-2203](#) - Set an InsertStmt's result exprs from the source statement's result exprs.
- [IMPALA-2216](#) - Set the output smap of an EmptySetNode produced from an empty inline view.
- [IMPALA-2239](#) - update misc.test to match the new .test file format.
- [IMPALA-2266](#) - Pass correct child node in 2nd phase merge aggregation.
- [KITE-1053](#) - Fix int overflow bug in FS writer.
- [SENTRY-810](#) - CTAS without location is not verified properly
- [SOLR-7135](#) - Allow the server build.xml 'sync-hack' target to be skipped by specifying a system property.
- [SOLR-7999](#) - SolrRequetParserTest#testStreamURL started failing.
- [SPARK-8606](#) - Prevent exceptions in RDD.getPreferredLocations() from crashing DAGScheduler
- [ZOOKEEPER-442](#) - need a way to remove watches that are no longer of interest

Issues Fixed in CDH 5.4.5

Upstream Issues Fixed

The following upstream issues are fixed in CDH 5.4.5:

- [CRUNCH-508](#) - Improve performance of Scala Enumeration counters in Scrunch
- [CRUNCH-511](#) - Scrunch product type support should use derived() instead of derivedImmutable()
- [CRUNCH-514](#) - AvroDerivedDeepCopier should initialize delegate MapFns
- [CRUNCH-516](#) - Scrunch needs some additional null checks
- [CRUNCH-530](#) - Fix object reuse bug in GenericRecordToTuple

- [CRUNCH-542](#) - Wider tolerance for flaky scrunch PCollectionTest
- [FLUME-2215](#) - ResettableFileInputStream can't support ucs-4 character
- [FLUME-2732](#) - Make maximum tolerated failures before shutting down and recreating client in AsyncHbaseSink configurable
- [FLUME-2738](#) - Async HBase sink FD leak on client shutdown
- [FLUME-2749](#) - Kerberos configuration error when using short names in multiple HDFS Sinks
- [HADOOP-12017](#) - Hadoop archives command should use configurable replication factor when closing
- [HADOOP-12103](#) - Small refactoring of DelegationTokenAuthenticationFilter to allow code sharing
- [HADOOP-8151](#) - Error handling in snappy decompressor throws invalid exceptions
- [HDFS-7501](#) - TransactionsSinceLastCheckpoint can be negative on SBNS
- [HDFS-7546](#) - Document, and set an accepting default for dfs.namenode.kerberos.principal.pattern
- [HDFS-7890](#) - Improve information on Top users for metrics in RollingWindowsManager and lower log level
- [HDFS-7894](#) - Rolling upgrade readiness is not updated in jmx until query command is issued.
- [HDFS-8072](#) - Reserved RBW space is not released if client terminates while writing block
- [HDFS-8337](#) - Accessing httpfs via webhdfs doesn't work from a jar with kerberos
- [HDFS-8656](#) - Preserve compatibility of ClientProtocol#rollingUpgrade after finalization
- [HDFS-8681](#) - BlockScanner is incorrectly disabled by default
- [MAPREDUCE-5965](#) - Hadoop streaming throws error if list of input files is high.
- [YARN-3143](#) - RM Apps REST API can return NPE or entries missing id and other fields
- [YARN-3453](#) - Fair Scheduler: Parts of preemption logic uses DefaultResourceCalculator even in DRF mode causing thrashing
- [YARN-3535](#) - Scheduler must re-request container resources when RMContainer transitions from ALLOCATED to KILLED
- [YARN-3793](#) - Several NPEs when deleting local files on NM recovery
- [YARN-3842](#) - NMProxy should retry on NMNotYetReadyException
- [HBASE-13342](#) - Fix incorrect interface annotations
- [HBASE-13419](#) - Thrift gateway should propagate text from exception causes.
- [HBASE-13491](#) - Fix bug in FuzzyRowFilter#getNextForFuzzyRule
- [HBASE-13851](#) - RpcClientImpl.close() can hang with cancelled replica RPCs
- [HBASE-13885](#) - ZK watches leaks during snapshots
- [HBASE-13958](#) - RESTApiClusterManager calls kill() instead of suspend() and resume()
- [HBASE-13995](#) - ServerName is not fully case insensitive
- [HBASE-14027](#) - Clean up netty dependencies
- [HBASE-14045](#) - Bumping thrift version to 0.9.2.
- [HBASE-14076](#) - ResultSerialization and MutationSerialization can throw InvalidProtocolBufferException when serializing a cell larger than 64MB
- [HIVE-10252](#) - Make PPD work for Parquet in row group level
- [HIVE-10270](#) - Cannot use Decimal constants less than 0.1BD
- [HIVE-10553](#) - Remove hardcoded Parquet references from SearchArgumentImpl SearchArgumentImpl
- [HIVE-10706](#) - Make vectorized_timestamp_funcs test more stable
- [HIVE-10801](#) - 'drop view' fails throwing java.lang.NullPointerException
- [HIVE-10808](#) - Inner join on Null throwing Cast Exception
- [HIVE-11150](#) - Remove wrong warning message related to chgrp
- [HIVE-11174](#) - Hive does not treat floating point signed zeros as equal
- [HIVE-11216](#) - UDF GenericUDFMapKeys throws NPE when a null map value is passed in
- [HIVE-11401](#) - Predicate push down does not work with Parquet when partitions are in the expression expression
- [HIVE-6099](#) - Multi insert does not work properly with distinct count
- [HIVE-9500](#) - Support nested structs over 24 levels
- [HIVE-9665](#) - Parallel move task optimization causes race condition
- [HIVE-10427](#) - collect_list() and collect_set() should accept struct types as argument

- [HIVE-10437](#) - NullPointerException on queries where map/reduce is not involved on tables with partitions
- [HIVE-10895](#) - ObjectStore does not close Query objects in some calls, causing a potential leak in some metastore db resources
- [HIVE-10976](#) - Redundant HiveMetaStore connect check in HS2 CLIService start
- [HIVE-10977](#) - No need to instantiate MetaStoreDirectSql when HMS DirectSql is disabled
- [HIVE-11095](#) - Fix SerDeUtils bug when Text is reused
- [HIVE-11100](#) - Beeline should escape semi-colon in queries
- [HIVE-11112](#) - ISO-8859-1 text output has fragments of previous longer rows appended
- [HIVE-11157](#) - Hive.get(HiveConf) returns same Hive object to different user sessions
- [HIVE-11194](#) - Exchange partition on external tables should fail with error message when target folder already exists
- [HIVE-11433](#) - NPE for a multiple inner join query
- [HIVE-9767](#) - Fixes in Hive UDF to be usable in Pig
- [HIVE-10629](#) - Dropping table in an encrypted zone does not drop warehouse directory
- [HIVE-10630](#) - Renaming tables across encryption zones renames table even though the operation throws error
- [HIVE-10659](#) - Beeline command which contains semi-colon as a non-command terminator will fail
- [HIVE-10788](#) - Change sort_array to support non-primitive types
- [HIVE-10895](#) - ObjectStore does not close Query objects in some calls causing potential leak.
- [HIVE-11109](#) - Replication factor is not properly set in SparkHashTableSinkOperator [Spark Branch]
- [HIVE-10594](#) - Remote Spark client doesn't use Kerberos keytab to authenticate [Spark Branch]
- [HUE-2618](#) - [hive] Recent query results show character encoding in view
- [HUE-2767](#) - [impala] Issue showing sample data for a table
- [HUE-2796](#) - sync_groups_on_login doesn't work with posixGroups
- [HUE-2807](#) - [useradmin] Support deleting numeric groups
- [HUE-2808](#) - [dbquery] Add row numbers to support default order by
- [HUE-2813](#) - [hive] Report when Hue server is down when trying to execute a query
- [HUE-2814](#) - Revert pyopenssl 0.13.1
- [HUE-2835](#) - Fixed issue with DN's that have weird comma location
- [HUE-2840](#) - [useradmin] Fix create home directories for Add/Sync LDAP group
- [HUE-2849](#) - [useradmin] Fix exception in Add/Sync LDAP group for undefined group name
- [IMPALA-1929](#) - Avoiding a DCHECK of NULL hash table in spilled right joins
- [IMPALA-2136](#) - Bug in PrintTColumnValue caused wrong stats for TINYINT partition cols
- [IMPALA-2133](#) - Properly unescape string value for HBase filters
- [IMPALA-2018](#) - Where clause does not propagate to joins inside nested views
- [IMPALA-2064](#) - Add effective_user() builtin
- [IMPALA-2125](#) - Make UTC to local TimestampValue conversion faster.
- [IMPALA-2048](#) - Impala DML/DDDL operations corrupt table metadata leading to Hive query failures
- [KITE-1014](#) - Fix support for Hive datasets on Kerberos enabled clusters.
- [KITE-1015](#) - Add "replaceValues" morphline command that replaces all matching record field values with a given replacement string
- [KITE-462](#) - Oozie jobs do not pass credentials
- [KITE-976](#) - DatasetKeyInputFormat/DatasetKeyOutputFormat not setting job configuration before loading dataset

Issues Fixed in CDH 5.4.4

Upstream Issues Fixed

The following upstream issues are fixed in CDH 5.4.4:

- [HIVE-10572](#) - Improve Hive service test to check empty string
- [HIVE-9934](#) - Vulnerability in LdapAuthenticationProviderImpl enables HiveServer2 client to degrade the authentication mechanism to "none", allowing authentication without password
- [HIVE-10006](#) - RSC has memory leak while execute multi queries.
- [HUE-2814](#) - Revert pyopenssl 0.13.1

Published Known Issues Fixed

As a result of the above fixes, the following issues, previously published as [Known Issues in CDH 5](#) on page 1944, are also fixed.

Hue with TLS/SSL Fails to Start in CDH 5.4.3

In CDH 5.4.3, Hue with TLS/SSL fails to start because a pyOpenSSL package is missing in the parcel. This applies to both new installs and upgrades and is not operating-system specific.

Bug: CDH-29076

Release affected: CDH 5.4.3

Release containing the fix: CDH 5.4.4

Workaround:

1. Download the package:

a. `cd /tmp`

b. `curl -O https://pypi.python.org/packages/source/p/pyOpenSSL/pyOpenSSL-0.13.tar.gz`

2. Determine the Hue installation directory:

- Parcels:

```
export HUE_DIR=/opt/cloudera/parcels/CDH-5.4.3-1.cdh5.4.3.p0.6/lib/hue
```

- Packages:

```
export HUE_DIR=/usr/lib/hue
```

3. Change to the Hue installation directory:

```
cd $HUE_DIR
```

4. Do the following, depending on your OS:

- On CentOS/RedHat 6.x:
 1. `sudo yum install gcc python-devel openssl-devel`
 2. `sudo ./build/env/bin/python ./build/env/bin/pip -v install /tmp/pyOpenSSL-0.13.tar.gz`
- On Ubuntu 14.04:
 1. `sudo apt-get install gcc python-dev python-pip libssl-dev`
 2. `sudo pip install --target=`pwd`/`ls -d build/env/lib/python*/site-packages` /tmp/pyOpenSSL-0.13.tar.gz`
- On other platforms, [contact Support](#) for assistance.

Issues Fixed in CDH 5.4.3

Upgrades to CDH 5.4.1 from Releases Earlier than 5.4.0 May Fail

Problem: Because of a change in the implementation of the NameNode metadata upgrade mechanism, upgrading to CDH 5.4.1 from a version lower than 5.4.0 can take an inordinately long time. In a cluster with NameNode high availability (HA) configured and a large number of edit logs, the upgrade can fail, with errors indicating a timeout in the pre-upgrade step on JournalNodes.

What to do:

To avoid the problem: Do not upgrade to CDH 5.4.1; upgrade to CDH 5.4.2 instead.

If you experience the problem: If you have already started an upgrade and seen it fail, contact Cloudera Support. This problem involves no risk of data loss, and manual recovery is possible.

If you have already completed an upgrade to CDH 5.4.1, or are installing a new cluster: In this case you are not affected and can continue to run CDH 5.4.1.

Upstream Issues Fixed

The following upstream issues are fixed in CDH 5.4.3:

- [HADOOP-12043](#) - Display warning if defaultFs is not set when running fs commands.
- [HADOOP-11969](#) - ThreadLocal initialization in several classes is not thread safe
- [HADOOP-11402](#) - Negative user-to-group cache entries are never cleared for never-again-accessed users
- [HADOOP-11238](#) - Update the NameNode's Group Cache in the background when possible
- [HDFS-8535](#) - Clarify that dfs usage in dfsadmin -report output includes all block replicas.
- [HDFS-8486](#) - DN startup may cause severe data loss
- [HDFS-7917](#) - Use file to replace data dirs in test to simulate a disk failure.
- [HDFS-7833](#) - DataNode reconfiguration does not recalculate valid volumes required, based on configured failed volumes tolerated.
- [HDFS-7604](#) - Track and display failed DataNode storage locations in NameNode.
- [HDFS-8380](#) - Always call addStoredBlock on blocks which have been shifted from one storage to another
- [HDFS-7980](#) - Incremental BlockReport will dramatically slow down the startup of a namenode

Migrations to MySQL fail if multiple Hue users have the same name but different upper/lower case letters

Bug: CDH-24213

Workaround: None.

Issues Fixed in CDH 5.4.2

Upgrades to CDH 5.4.1 from Releases Earlier than 5.4.0 May Fail

Problem: Because of a change in the implementation of the NameNode metadata upgrade mechanism, upgrading to CDH 5.4.1 from a version lower than 5.4.0 can take an inordinately long time. In a cluster with NameNode high availability (HA) configured and a large number of edit logs, the upgrade can fail, with errors indicating a timeout in the pre-upgrade step on JournalNodes.

What to do:

To avoid the problem: Do not upgrade to CDH 5.4.1; upgrade to CDH 5.4.2 instead.

If you experience the problem: If you have already started an upgrade and seen it fail, contact Cloudera Support. This problem involves no risk of data loss, and manual recovery is possible.

If you have already completed an upgrade to CDH 5.4.1, or are installing a new cluster: In this case you are not affected and can continue to run CDH 5.4.1.

Issues Fixed in CDH 5.4.1

Upstream Issues Fixed

The following upstream issues are fixed in CDH 5.4.1:

- [HADOOP-11891](#) - OsSecureRandom should lazily fill its reservoir to avoid open too many file descriptors.
- [HADOOP-11802](#) - DomainSocketWatcher thread terminates sometimes after there is an I/O error during requestShortCircuitShm
- [HADOOP-11724](#) - DistCp throws NPE when the target directory is root.
- [HDFS-7645](#) - Rolling upgrade is restoring blocks from trash multiple times which could cause significant and unnecessary block churn.
- [HDFS-7869](#) - Inconsistency in the return information while performing rolling upgrade
- [HDFS-8127](#) - NameNode Failover during HA upgrade can cause DataNode to finalize upgrade
- [HDFS-3443](#) - Fix NPE when NameNode transition to active during startup.

- [HDFS-7312](#) - Update DistCp v1 to optionally not use tmp location
- [HDFS-8292](#) - Move conditional in fmt_time from dfs-dust.js to status.html
- [HDFS-6673](#) - Add delimited format support to PB OIV tool
- [HDFS-8214](#) - Secondary NN Web UI shows wrong date for Last Checkpoint
- [HDFS-7884](#) - Fix NullPointerException in BlockSender when the generation stamp provided by the client is larger than the one stored in the DataNode
- [HDFS-4448](#) - Allow HA NN to start in secure mode with wildcard address configured
- [HDFS-8070](#) - Fix issue that Pre-HDFS-7915 DFSClient cannot use short circuit on post-HDFS-7915 DataNode
- [HDFS-7915](#) - The DataNode can sometimes allocate a ShortCircuitShm slot and fail to tell the DFSClient about it because of a network error
- [HDFS-7931](#) - DistributedFileSystem should not look for keyProvider in cache if Encryption is disabled
- [HDFS-7916](#) - 'reportBadBlocks' from DataNodes to standby Node BPSERVICEActor goes for infinite loop
- [HDFS-8099](#) - Change "DFSInputStream has been closed already" message to debug log level
- [HDFS-7996](#) - After swapping a volume, BlockReceiver reports ReplicaNotFoundException
- [HDFS-7587](#) - Edit log corruption can happen if append fails with a quota violation
- [HDFS-7881](#) - TestHftpFileSystem#testSeek fails
- [HDFS-7929](#) - inotify is unable to fetch pre-upgrade edit log segments once upgrade starts
- [YARN-3363](#) - Add localization and container launch time to ContainerMetrics at NM to show these timing information for each active container.
- [YARN-3485](#) - FairScheduler headroom calculation doesn't consider maxResources for Fifo and FairShare policies
- [YARN-3464](#) - Race condition in LocalizerRunner kills localizer before localizing all resources
- [YARN-3516](#) - Killing ContainerLocalizer action doesn't take effect when private localizer receives FETCH_FAILURE status.
- [YARN-3021](#) - YARN's delegation-token handling disallows certain trust setups to operate properly over DistCp
- [YARN-3241](#) - FairScheduler handles invalid queue names inconsistently.
- [YARN-2868](#) - FairScheduler: Add a metric for measuring latency of allocating first container for an application
- [YARN-3428](#) - Add debug logs to capture the resources being localized for a container.
- [MAPREDUCE-6339](#) - Job history file is not flushed correctly because isTimerActive flag is not set true when flushTimerTask is scheduled.
- [MAPREDUCE-5710](#) - Running distcp with -delete incurs avoidable penalties
- [MAPREDUCE-6343](#) - JobConf.parseMaximumHeapSizeMB() fails to parse value greater than 2GB expressed in bytes
- [MAPREDUCE-6238](#) - MR2 can't run local jobs with -libjars command options which is a regression from MR1
- [MAPREDUCE-6076](#) - Zero map split input length combined with none zero map split input length may cause MR1 job hung sometimes.
- [HBASE-13374](#) - Small scanners (with particular configurations) do not return all rows

- [SENTRY-703](#) - Calls to add_partition fail when passed a Partition object with a null location
- [SENTRY-696](#) - Improve Metastoreplugin Cache Initialization time
- [SENTRY-683](#) - HDFS service client should ensure the kerberos ticket is valid before new service connection
- [SOLR-7478](#) - UpdateLog#close shuts down it's executor with interrupts before running close, possibly preventing a clean close.
- [SOLR-7437](#) - Make HDFS transaction log replication factor configurable.
- [SOLR-7338/SOLR-6583](#) - A reloaded core will never register itself as active after a ZK session expiration.
- [SPARK-7281](#) - No option for AM native library path in yarn-client mode.
- [SPARK-6087](#) - Provide actionable exception if Kryo buffer is not large enough
- [SPARK-6868](#) - Container link broken on Spark UI Executors page when YARN is set to HTTPS_ONLY
- [SPARK-6506](#) - python support in yarn cluster mode requires SPARK_HOME to be set
- [SPARK-6650](#) - ExecutorAllocationManager never stops

- [SPARK-6578](#) - Outbound channel in network library is not thread-safe, can lead to fetch failures
- [SQOOP-2343](#) - AsyncSqlRecordWriter stuck if any exception is thrown out in its close method
- [SQOOP-2286](#) - Ensure Sqoop generates valid avro column names
- [SQOOP-2283](#) - Support usage of --exec and --password-alias
- [SQOOP-2281](#) - Set overwrite on kite dataset
- [SQOOP-2282](#) - Add validation check for --hive-import and --append
- [SQOOP-2257](#) - Import Parquet data into a hive table with --hive-overwrite option does not work
- [ZOOKEEPER-2146](#) - BinaryInputArchive readString should check length before allocating memory
- [ZOOKEEPER-2149](#) - Log client address when socket connection established

Published Known Issues Fixed

As a result of the above fixes, the following issues, previously published as [Known Issues in CDH 5](#) on page 1944, are also fixed.

Apache Hadoop

NameNode cannot use wildcard address in a secure cluster

In a secure cluster, you cannot use a wildcard for the NameNode's RPC or HTTP bind address. For example, `dfs.namenode.http-address` must be a real, routable address and port, not `0.0.0.0.<port>`. This should affect you only if you are running a secure cluster *and* your NameNode needs to bind to multiple local addresses.

Bug: [HDFS-4448](#)

Cloudera Bug: CDH-9991

Workaround: None

Offline Image Viewer (OIV) tool regression: missing Delimited outputs.

Bugs: [HDFS-6673](#), [HDFS-5952](#)

Cloudera Bug: CDH-20259

Severity: Medium

Workaround: Set up `dfs.namenode.legacy-oiv-image.dir` to an appropriate directory on the secondary NameNode (or standby NameNode in an HA configuration), and use `hdfs oiv_legacy` to process the legacy format of the OIV `fsimage`.

Apache HBase

Setting `maxResultSize` Incorrectly On a Scan May Cause Client Data Loss

Scanners may not return all the results from a region if a scan is configured with a `maxResultSize` limit that could be reached before the caching limit. Results are missed because the scanner jumps to the next region preemptively.

The default value for `maxResultSize` is `Long.MAX_VALUE` and the default value of caching is 100, so with the default configuration, the caching limit will always be reached before the `maxResultSize` and the issue will not appear. If the `maxResultSize` is configured to any limit that may be reached before the caching limit, the issue may occur.

Bug: [HBASE-13262](#)

Severity: Low

Workaround: Never configure a scan with a `maxResultSize` other than `Long.MAX_VALUE` (never change it from its default value) because that will ensure that the `maxResultSize` limit is never reached before the caching limit.

Apache Hive

Hive metatool does not fix Avro schema URL setting in an HDFS HA upgrade

When you upgrade Hive in an HDFS HA configuration, and the `avro.schema.url` is set in an Avro table's properties instead of the SerDe properties, the metatool will not correct the problem.

Bug: [HIVE-10324](#)

Cloudera Bug: CDH-26976

Workaround: Use `alter table.. set tblproperties` to fix the `avro.schema.url`.

Hive metastore `getIndexTableName` returns qualified table name

In CDH 5.4.0, `getIndexTableName` returns a qualified table name such as

```
database_name
.
index_table_name
```

whereas in previous releases it returns an unqualified table name, such as

```
index_table_name
```

Bug: [HIVE-10108](#)

Cloudera Bug: CDH-26508

Workaround: None

HiveServer2 has an unexpected Derby metastore directory in secure clusters

Bug: [HIVE-10093](#)

Cloudera Bug: CDH-26453

Workaround: None. Ignore the Derby database.

Apache Oozie

Spark jobs run from the Spark action don't show up in the Spark History Server or properly link to it from the Spark AM

Bug: [OOZIE-2170](#)

Cloudera Bug: CDH-25513

Severity: Low

Workaround: Specify these configuration properties in the `spark-opts` element of your Spark action in the `workflow.xml` file:

```
--conf spark.yarn.historyServer.address=http://SPH:18088 --conf
spark.eventLog.dir=hdfs://NN:8020/user/spark/applicationHistory --conf
spark.eventLog.enabled=true
```

where *SPH* is the hostname of the Spark History Server and *NN* is the hostname of the NameNode. You can also find these values in `/etc/spark/conf/spark-defaults.conf` on the gateway host when Spark is installed from Cloudera Manager.

Apache Sentry

Hive binding should support enforcing URI privilege for transforms

Bug: [SENTRY-598](#)

Severity: Medium

Workaround: None.

Issues Fixed in CDH 5.4.0

The following topics describe known issues fixed in CDH 5.4.0.

For the latest Impala fixed issues, see [Issues Fixed in CDH 5.4 / Impala 2.2](#) on page 2436.

Apache Hadoop

HDFS

After upgrade from a release earlier than CDH 5.2.0, storage IDs may no longer be unique

As of CDH 5.2, each storage volume on a DataNode should have its own unique `storageID`, but in clusters upgraded from CDH 4, or CDH 5 releases earlier than CDH 5.2.0, each volume on a given DataNode shares the same `storageID`, because the HDFS upgrade does not properly update the IDs to reflect the new naming scheme. This causes problems with load balancing. The problem affects only clusters upgraded from CDH 5.1.x and earlier to CDH 5.2 or later. Clusters that are new as of CDH 5.2.0 or later do not have the problem.

Bug: [HDFS-7575](#)

Cloudera Bug: CDH-24155

Severity: Medium

Workaround: Upgrade to a later or patched version of CDH.

Apache Hive

UDF infile() does not accept arguments of type CHAR or VARCHAR

Bug: [HIVE-6637](#)

Severity: Low

Workaround: Cast the argument to type String.

Hive's Decimal type cannot be stored in Parquet and Avro

Tables containing decimal columns cannot use Parquet or the Avro storage engine.

Bug: [HIVE-6367](#) and [HIVE-5823](#)

Severity: Low

Workaround: Use a different file format.

Apache Oozie

Executing oozie job -config properties file -dryrun fails because of a code defect in argument parsing

Bug: [OOZIE-1878](#)

Cloudera Bug: CDH-25537

Severity: Low

Workaround: None.

When you use Hive Server 2 from Oozie, Oozie won't collect or print out the Hadoop Job IDs of any jobs launched by Hive Server 2

Cloudera Bug: CDH-12777, CDH-12891

Severity: Low

Workaround: You can get the Hadoop IDs from the Resource Manager or JobTracker.

Cloudera Search

Spark indexer failed if configured to use security.

Spark indexing jobs failed when Kerberos authentication was enabled.

With Search for CDH 5.4 and later, Spark indexing jobs succeed, even when Kerberos authentication is required.

Bug: None.

Severity: Medium.

Workaround: Disable Kerberos authentication or use another indexer.

Mapper-only HBase batch indexer failed if configured to use security.

Attempts to complete an HBase batch indexing job failed when Kerberos authentication was enabled and reducers were set to 0.

With Search for CDH 5.4 and later, mapper-only HBase batch indexer succeeds, even when Kerberos authentication is required.

Bug: None.

Severity: Medium.

Workaround: Either disable Kerberos authentication or use one or more reducers.

Shard splitting support is experimental.

Cloudera anticipated shard splitting to function as expected with Cloudera Search, but this interaction had not been thoroughly tested.

As of the release of Search for CDH 5.4, additional testing of shard splitting has been completed, so this functionality can be safely used.

Cloudera Bug: CDH-11024

Severity: Low

Workaround: Use shard splitting for test and development purposes, but be aware of the risks of using shard splitting in production environments. To avoid using shard splitting, use the source data to create a new index with a new sharding count by re-indexing the data to a new collection. You can enable this using the MapReduceIndexerTool.

TrieDateField defaulted OMIT_NORMS to True.

All primitive field types were intended to omit norms by default with schema version 1.5 or higher. This change was not applied to `TrieDateField`.

With Search for CDH 5.4, `TrieDateField` is set to omit norms by default.

Bug: SOLR-6211

Severity: Low

Fields or Types outside <field> or <types> tags are silently ignored.

In previous releases, Solr silently ignored definitions such as `<fieldType>`, `<field>`, and `<copyField>` if those definitions were not contained in `<fields>` or `<types>` tags.

With Search 5.4 for CDH, these tags are no longer required for definitions to be included. These tags are supported so either style may be implemented.

Bug: SOLR-5228

Apache Sentry (incubating)

INSERT OVERWRITE LOCAL fails if you use only the Linux pathname

Cloudera Bug: CDH-13732

Severity: Low

Workaround: Prefix the path of the local file with `file://` when using `INSERT OVERWRITE LOCAL`.

INSERT OVERWRITE and CREATE EXTERNAL commands fail because of HDFS URI permissions

When you use Sentry to secure Hive, and use HDFS URIs in a HiveQL statement, the query will fail with an HDFS permissions error unless you specify the NameNode and port.

Cloudera Bug: CDH-13728

Severity: Low

Workaround: Specify the NameNode and port, where applicable, in the URI; for example specify `hdfs://nn-uri:port/user/warehouse/hive/tab` rather than simply `/user/warehouse/hive/tab`. In a high-availability deployment, specify the value of `FS.defaultFS`.

Issues Fixed in CDH 5.3.x

The following topics describe issues fixed in CDH 5.3.x, from newest to oldest release. You can also review [What's New In CDH 5.3.x](#) on page 1845 or [Known Issues in CDH 5](#) on page 1944.

Issues Fixed in CDH 5.3.10

CDH 5.3.10 fixes the following issues.

Apache Hadoop

FSImage may get corrupted after deleting snapshot

Bug: [HDFS-9406](#)

Cloudera Bug: CDH-33224

When deleting a snapshot that contains the last record of a given INode, the fsmage may become corrupt because the create list of the snapshot diff in the previous snapshot and the child list of the parent INodeDirectory are not cleaned.

Apache HBase

The ReplicationCleaner process can abort if its connection to ZooKeeper is inconsistent

Bug: [HBASE-15234](#)

If the connection with ZooKeeper is inconsistent, the ReplicationCleaner may abort, and the following event is logged by the HMaster:

```
WARN org.apache.hadoop.hbase.replication.master.ReplicationLogCleaner: Aborting
ReplicationLogCleaner
because Failed to get list of replicators
```

Unprocessed WALs accumulate.

The `seekBefore()` method calculates the size of the previous data block by assuming that data blocks are contiguous, and HFile v2 and higher store Bloom blocks and leaf-level INode blocks with the data. As a result, reverse scans do not work when Bloom blocks or leaf-level INode blocks are present when HFile v2 or higher is used.

Workaround: Restart the HMaster occasionally. The ReplicationCleaner restarts if necessary and process the unprocessed WALs.

Upstream Issues Fixed

The following upstream issues are fixed in CDH 5.3.10:

- [HADOOP-7713](#) - dfs -count -q should label output column
- [HADOOP-8944](#) - Shell command fs -count should include human readable option
- [HADOOP-10406](#) - TestIPC.testIpcWithReaderQueuing may fail
- [HADOOP-12200](#) - TestCryptoStreamsWithOpensslAesCtrCryptoCodec should be skipped in non-native profile
- [HADOOP-12240](#) - Fix tests requiring native library to be skipped in non-native profile
- [HADOOP-12280](#) - Skip unit tests based on maven profile rather than NativeCodeLoader.isNativeCodeLoaded
- [HADOOP-12418](#) - TestRPC.testRPCInterruptedSimple fails intermittently
- [HADOOP-12464](#) - Interrupted client may try to fail over and retry
- [HADOOP-12468](#) - Partial group resolution failure should not result in user lockout
- [HADOOP-12559](#) - KMS connection failures should trigger TGT renewal
- [HADOOP-12604](#) - Exception may be swallowed in KMSClientProvider
- [HADOOP-12605](#) - Fix intermittent failure of TestIPC.testIpcWithReaderQueuing
- [HADOOP-12682](#) - Fix TestKMS#testKMSRestart* failure
- [HADOOP-12699](#) - TestKMS#testKMSPProvider intermittently fails during 'test rollover draining'
- [HADOOP-12715](#) - TestValueQueue#testgetAtMostPolicyALL fails intermittently
- [HADOOP-12736](#) - TestTimedOutTestsListener#testThreadDumpAndDeadlocks sometimes times out
- [HADOOP-12788](#) - OpensslAesCtrCryptoCodec should log which random number generator is used

- [HDFS-6533](#) - TestBPOfferService#testBasicFunctionalitytest fails intermittently
- [HDFS-6673](#) - Add delimited format support to PB OIV tool
- [HDFS-6799](#) - The invalidate method in SimulatedFSDataset failed to remove (invalidate) blocks from the file system
- [HDFS-7423](#) - Various typos and message formatting fixes in nfs daemon and doc
- [HDFS-7553](#) - Fix the TestDFSUpgradeWithHA due to BindException
- [HDFS-7990](#) - IBR delete ack should not be delayed
- [HDFS-8211](#) - DataNode UUID is always null in the JMX counter
- [HDFS-8646](#) - Prune cached replicas from DatanodeDescriptor state on replica invalidation
- [HDFS-9092](#) - NFS silently drops overlapping write requests and causes data copying to fail
- [HDFS-9250](#) - Add Precondition check to LocatedBlock#addCachedLoc
- [HDFS-9347](#) - Invariant assumption in TestQuorumJournalManager.shutdown() is wrong
- [HDFS-9358](#) - TestNodeCount#testNodeCount timed out
- [HDFS-9364](#) - Unnecessary DNS resolution attempts when creating NameNodeProxies
- [HDFS-9406](#) - FSImage may get corrupted after deleting snapshot
- [HDFS-9949](#) - Add a test case to ensure that the DataNode does not regenerate its UUID when a storage directory is cleared
- [MAPREDUCE-6302](#) - Incorrect headroom can lead to a deadlock between map and reduce allocations
- [MAPREDUCE-6387](#) - Serialize the recently added Task#encryptedSpillKey field at the end
- [MAPREDUCE-6460](#) - TestRMContainerAllocator.testAttemptNotFoundCausesRMCommunicatorException fails
- [YARN-2377](#) - Localization exception stack traces are not passed as diagnostic info
- [YARN-2785](#) - Fixed intermittent TestContainerResourceUsage failure
- [YARN-3024](#) - LocalizerRunner should give DIE action when all resources are localized
- [YARN-3074](#) - Nodemanager dies when localizer runner tries to write to a full disk
- [YARN-3464](#) - Race condition in LocalizerRunner kills localizer before localizing all resources.
- [YARN-3516](#) - Killing ContainerLocalizer action does not take effect when private localizer receives FETCH_FAILURE status
- [YARN-3727](#) - For better error recovery, check if the directory exists before using it for localization
- [YARN-3762](#) - FairScheduler: CME on FSParentQueue#getQueueUserAclInfo
- [YARN-4204](#) - ConcurrentModificationException in FairSchedulerQueueInfo
- [YARN-4235](#) - FairScheduler PrimaryGroup does not handle empty groups returned for a user
- [YARN-4354](#) - Public resource localization fails with NPE
- [YARN-4380](#) - TestResourceLocalizationService.testDownloadingResourcesOnContainerKill fails intermittently
- [YARN-4393](#) - Fix intermittent test failure for TestResourceLocalizationService#testFailedDirsResourceRelease
- [YARN-4613](#) - Fix test failure in TestClientRMService#testGetClusterNodes
- [YARN-4717](#) - TestResourceLocalizationService.testPublicResourceInitializesLocalDir fails Intermittently due to IllegalArgumentException from cleanup
- [HBASE-10153](#) - Improve VerifyReplication to compute BADROWS more accurately
- [HBASE-11394](#) - AmendReplication can have data loss if peer id contains hyphen
- [HBASE-11394](#) - Replication can have data loss if peer id contains hyphen "-"
- [HBASE-11992](#) - Backport HBASE-11367 (Pluggable replication endpoint) to 0.98
- [HBASE-12136](#) - Race condition between client adding tableCF replication znode and server triggering TableCFsTracker
- [HBASE-12150](#) - Backport replication changes from HBASE-12145
- [HBASE-12336](#) - RegionServer failed to shutdown for NodeFailoverWorker thread
- [HBASE-12631](#) - Backport HBASE-12576 (Add metrics for rolling the HLog if there are too few DNs in the write pipeline) to 0.98
- [HBASE-12658](#) - Backport HBASE-12574 (Update replication metrics to not do so many map look ups) to 0.98
- [HBASE-12865](#) - WALs may be deleted before they are replicated to peers
- [HBASE-13035](#) - Backport HBASE-12867 Shell does not support custom replication endpoint specification
- [HBASE-13084](#) - Add labels to VisibilityLabelsCache asynchronously causes TestShell flakey
- [HBASE-13437](#) - ThriftServer leaks ZooKeeper connections

- [HBASE-13703](#) - ReplicateContext should not be a member of ReplicationSource
- [HBASE-13746](#) - list_replicated_tables command is not listing table in hbase shell
- [HBASE-14146](#) - Fix Once replication sees an error it slows down forever
- [HBASE-14501](#) - NPE in replication with TDE
- [HBASE-14621](#) - ReplicationLogCleaner gets stuck when a regionserver crashes
- [HBASE-14923](#) - VerifyReplication should not mask the exception during result comparison
- [HBASE-15019](#) - Replication stuck when HDFS is restarted
- [HBASE-15032](#) - hbase shell scan filter string assumes UTF-8 encoding
- [HBASE-15035](#) - bulkloading hfiles with tags that require splits do not preserve tags
- [HBASE-15052](#) - Use EnvironmentEdgeManager in ReplicationSource
- [HIVE-7524](#) - Enable auto conversion of SMBjoin in presence of constant propagate optimization
- [HIVE-7575](#) - GetTables thrift call is very slow
- [HIVE-8115](#) - Fixing text failures caused in CDH
- [HIVE-8115](#) - Hive select query hang when fields contain map
- [HIVE-8184](#) - Inconsistency between colList and columnExprMap when ConstantPropagate is applied to subquery
- [HIVE-9112](#) - Query may generate different results depending on the number of reducers
- [HIVE-9500](#) - Support nested structs over 24 levels
- [HIVE-9860](#) - MapredLocalTask/SecureCmdDoAs leaks local files
- [HIVE-10956](#) - Fallout fix from backport to CDH 5.3.x
- [HIVE-11977](#) - Hive should handle an external avro table with zero length files present
- [HIVE-12388](#) - GetTables cannot get external tables when TABLE type argument is given
- [HIVE-12406](#) - HIVE-9500 introduced incompatible change to LazySimpleSerDe public interface
- [HIVE-12713](#) - Miscellaneous improvements in driver compile and execute logging
- [HIVE-12790](#) - Metastore connection leaks in HiveServer2
- [HIVE-12946](#) - alter table should also add default scheme and authority for the location similar to create table
- [HUE-2767](#) - [impala] Issue showing sample data for a table
- [HUE-2941](#) - [hadoop] Cache the active RM HA
- [IMPALA-1702](#) - "invalidate metadata" can cause duplicate TableIds (issue not entirely fixed, but now fails gracefully)
- [IMPALA-2125](#) - Improve perf when reading timestamps from parquet files written by hive
- [IMPALA-2565](#) - Planner tests are flaky due to file size mismatches
- [IMPALA-3095](#) - Allow additional Kerberos users to be authorized to access internal APIs
- [OOZIE-2432](#) - TestPurgeXCommand fails
- [SENTRY-565](#) - Improve performance of filtering Hive SHOW commands
- [SENTRY-780](#) - HDFS Plugin should not execute path callbacks for views
- [SENTRY-835](#) - Drop table leaves a connection open when using metastorelistener
- [SENTRY-885](#) - DB name should be case insensitive in HDFS sync plugin.
- [SENTRY-936](#) - getGroup and getUser should always return original hdfs values for paths in prefix which are not sentry managed
- [SENTRY-944](#) - Setting HDFS rules on Sentry managed hdfs paths should not affect original hdfs rules
- [SENTRY-957](#) - Exceptions in MetastoreCacheInitializer should probably not prevent HMS from starting up
- [SENTRY-988](#) - It is better to let SentryAuthorization setter path always fall through and update HDFS
- [SENTRY-994](#) - SentryAuthorizationInfoX should override isSentryManaged
- [SENTRY-1002](#) - PathsUpdate.parsePath(path) will throw an NPE when parsing relative paths
- [SENTRY-1044](#) - Tables with non-hdfs locations break HMS startup
- [SPARK-12617](#) - [PYSPARK] Move Py4jCallbackConnectionCleaner to Streaming

Issues Fixed in CDH 5.3.9

Apache Commons Collections deserialization vulnerability

Cloudera has learned of a potential security vulnerability in a third-party library called the [Apache Commons Collections](#). This library is used in products distributed and supported by Cloudera ("Cloudera Products"), including core Apache

Hadoop. The Apache Commons Collections library is also in widespread use beyond the Hadoop ecosystem. At this time, no specific attack vector for this vulnerability has been identified as present in Cloudera Products.

In an abundance of caution, we are currently in the process of incorporating a version of the Apache Commons Collections library with a fix into the Cloudera Products. In most cases, this will require coordination with the projects in the Apache community. One example of this is tracked by [HADOOP-12577](#).

The Apache Commons Collections potential security vulnerability is titled “Arbitrary remote code execution with InvokerTransformer” and is tracked by [COLLECTIONS-580](#). MITRE has not issued a CVE, but related [CVE-2015-4852](#) has been filed for the vulnerability. CERT has issued [Vulnerability Note #576313](#) for this issue.

Releases affected: CDH 5.5.0, CDH 5.4.8 and lower, CDH 5.3.8 and lower, CDH 5.2.8 and lower, CDH 5.1.7 and lower, Cloudera Manager 5.5.0, Cloudera Manager 5.4.8 and lower, Cloudera Manager 5.3.8 and lower, and Cloudera Manager 5.2.8 and lower, Cloudera Manager 5.1.6 and lower, Cloudera Manager 5.0.7 and lower, Cloudera Navigator 2.4.0, Cloudera Navigator 2.3.8 and lower.

Users affected: All

Impact: This potential vulnerability may enable an attacker to execute arbitrary code from a remote machine without requiring authentication.

Immediate action required: Upgrade to Cloudera Manager 5.5.1 and CDH 5.5.1, Cloudera Manager 5.4.9 and CDH 5.4.9, Cloudera Manager 5.3.9 and CDH 5.3.9, and Cloudera Manager 5.2.9 and CDH 5.2.9, and Cloudera Manager 5.1.7 and CDH 5.1.7, and Cloudera Manager 5.0.8 and CDH 5.0.8.

Upstream Issues Fixed

The following upstream issues are fixed in CDH 5.3.9:

- [FLUME-2841](#) - Upgrade commons-collections to 3.2.2
- [HADOOP-12577](#) - Bumped up commons-collections version to 3.2.2 to address a security flaw
- [HDFS-7785](#) - Improve diagnostics information for HttpPutFailedException
- [HDFS-7798](#) - Checkpointing failure caused by shared KerberosAuthenticator
- [HDFS-7871](#) - NameNodeEditLogRoller can keep printing 'Swallowing exception' message
- [HDFS-9123](#) - Copying from the root to a subdirectory should be forbidden
- [HDFS-9273](#) - ACLs on root directory may be lost after NN restart
- [HDFS-9332](#) - Fix Precondition failures from NameNodeEditLogRoller while saving namespace
- [HDFS-9470](#) - Encryption zone on root not loaded from fsimage after NN restart
- [MAPREDUCE-6191](#) - Improve clearing stale state of Java serialization testcase
- [MAPREDUCE-6233](#) - org.apache.hadoop.mapreduce.TestLargeSort.testLargeSort failed in trunk
- [MAPREDUCE-6549](#) - Multibyte delimiters with LineRecordReader cause duplicate records
- [YARN-3564](#) - Fix TestContainerAllocation.testAMContainerAllocationWhenDNSUnavailable fails randomly
- [YARN-3602](#) - TestResourceLocalizationService.testPublicResourceInitializesLocalDir fails Intermittently due to IOException from cleanup
- [YARN-3675](#) - FairScheduler: RM quits when node removal races with continuous-scheduling on the same node
- [HBASE-13134](#) - mutateRow and checkAndMutate APIs do not throw region level exceptions
- [HBASE-14196](#) - Thrift server idle connection timeout issue
- [HBASE-14283](#) - Reverse scan does not work with HFile inline index/bloom blocks
- [HBASE-14533](#) - Thrift client gets "AsyncProcess: Failed to get region location closed"
- [HBASE-14799](#) - Commons-collections object deserialization remote command execution vulnerability
- [HIVE-6099](#) - Multi insert does not work properly with distinct count
- [HIVE-7146](#) - posexplode() UDTF fails with a NullPointerException on NULL columns
- [HIVE-8612](#) - Support metadata result filter hooks
- [HIVE-9475](#) - HiveMetastoreClient.tableExists does not work
- [HIVE-10895](#) - ObjectStore does not close Query objects in some calls, causing a potential leak in some metastore db resources

- [HIVE-11255](#) - `get_table_objects_by_name()` in `HiveMetaStore.java` needs to retrieve table objects in multiple batches
- [HIVE-12378](#) - Exception on `HBaseSerDe.serialize` binary field
- [HUE-3035](#) - [beeswax] Optimize sample data query for partitioned tables
- [IMPALA-1746](#) - `QueryExecState` does not check for query cancellation or errors
- [IMPALA-1756](#) - Constant filter expressions are not checked for errors and state cleanup not done before throwing exception
- [IMPALA-1917](#) - DCHECK on destroying an `ExprContext`
- [IMPALA-2141](#) - `UnionNode::getNext()` does not check for query errors
- [IMPALA-2264](#) - Fix edge cases for decimal/integer cast
- [IMPALA-2514](#) - DCHECK on destroying an `ExprContext`
- [OOZIE-2413](#) - Kerberos credentials can expire if the KDC is slow to respond
- [PIG-3641](#) - Split "otherwise" producing incorrect output when combined with `ColumnPruning`
- [SPARK-11484](#) - [WEBUI] Using `proxyBase` set by spark instead of env
- [SPARK-11652](#) - [CORE] Remote code execution with `InvokerTransformer`

Issues Fixed in CDH 5.3.8

Upstream Issues Fixed

The following upstream issues are fixed in CDH 5.3.8:

- [CRUNCH-525](#) - Correct (more) accurate default scale factors for built-in `MapFn` implementations
- [CRUNCH-527](#) - Use hash smearing for partitioning
- [CRUNCH-528](#) - Improve Pair comparison
- [CRUNCH-535](#) - call `initCredentials` on the job
- [CRUNCH-536](#) - Refactor `CrunchControlledJob.Hook` interface and make it client-accessible
- [CRUNCH-539](#) - Fix reading `WritableComparables` bimap
- [CRUNCH-540](#) - Make `AvroReflectDeepCopier` serializable
- [CRUNCH-542](#) - Eliminate flaky `Scrunch` sampling test.
- [CRUNCH-543](#) - Have `AvroPathPerKeyTarget` handle child directories properly
- [CRUNCH-544](#) - Improve performance/serializability of materialized `toMap`.
- [CRUNCH-547](#) - Properly handle nullability for Avro union types
- [CRUNCH-548](#) - Have the `AvroReflectDeepCopier` use the class of the source object when constructing new instances instead of the target class
- [CRUNCH-551](#) - Make the use of Configuration objects consistent in `CrunchInputSplit` and `CrunchRecordReader`
- [CRUNCH-553](#) - Fix record drop issue that can occur w/`From.formattedFile` `TableSources`
- [FLUME-1934](#) - Spooling Directory Source dies on encountering zero-byte files.
- [FLUME-2095](#) - JMS source with TIBCO
- [FLUME-2385](#) - Remove incorrect log message at INFO level in Spool Directory Source.
- [FLUME-2753](#) - Error when specifying empty replace string in Search and Replace Interceptor
- [HADOOP-11105](#) - `MetricsSystemImpl` could leak memory in registered callbacks
- [HADOOP-11446](#) - `S3AOutputStream` should use shared thread pool to avoid `OutOfMemoryError`
- [HADOOP-11463](#) - Replace method-local `TransferManager` object with `S3AFileSystem#transfers`.
- [HADOOP-11584](#) - s3a file block size set to 0 in `getFileStatus`.
- [HADOOP-11607](#) - Reduce log spew in `S3AFileSystem`.
- [HADOOP-12317](#) - Applications fail on NM restart on some linux distro because NM container recovery declares AM container as LOST
- [HADOOP-12404](#) - Disable caching for `JarURLConnection` to avoid sharing `JarFile` with other users when loading resource from URL in Configuration class
- [HADOOP-12413](#) - `AccessControlList` should avoid calling `getGroupNames` in `isUserInList` with empty groups
- [HDFS-7978](#) - Add `LOG.isDebugEnabled()` guard for some `LOG.debug(..)`
- [HDFS-8384](#) - Allow NN to startup if there are files having a lease but are not under construction

- [HDFS-8964](#) - When validating the edit log, do not read at or beyond the file offset that is being written
- [HDFS-8965](#) - Harden edit log reading code against out of memory errors
- [MAPREDUCE-5918](#) - LineRecordReader can return the same decompressor to CodecPool multiple times
- [MAPREDUCE-5948](#) - org.apache.hadoop.mapred.LineRecordReader does not handle multibyte record delimiters well
- [MAPREDUCE-6277](#) - Job can post multiple history files if attempt loses connection to the RM
- [MAPREDUCE-6439](#) - AM may fail instead of retrying if RM shuts down during the allocate call.
- [MAPREDUCE-6481](#) - LineRecordReader may give incomplete record and wrong position/key information for uncompressed input sometimes
- [MAPREDUCE-6484](#) - Yarn Client uses local address instead of RM address as token renewer in a secure cluster when RM HA is enabled
- [YARN-3385](#) - Fixed a race-condition in ResourceManager's ZooKeeper based state-store to avoid crashing on duplicate deletes
- [YARN-3469](#) - ZKRMStateStore: Avoid setting watches that are not required.
- [YARN-3990](#) - AsyncDispatcher may overloaded with RMAppNodeUpdateEvent when Node is connected/disconnected
- [HBASE-12639](#) - Backport HBASE-12565 Race condition in HRegion.batchMutate() causes partial data to be written when region closes
- [HBASE-13217](#) - Procedure fails due to ZK issue
- [HBASE-13388](#) - Handling NullPointerException in ZKProcedureMemberRpcs while getting ZNode data
- [HBASE-13437](#) - ThriftServer leaks ZooKeeper connections
- [HBASE-13471](#) - Fix a possible infinite loop in doMiniBatchMutation
- [HBASE-13684](#) - Allow mlockagent to be used when not starting as root
- [HBASE-13885](#) - ZK watches leaks during snapshots.
- [HBASE-14045](#) - Bumping thrift version to 0.9.2.
- [HBASE-14302](#) - TableSnapshotInputFormat should not create back references when restoring snapshot
- [HBASE-14354](#) - Minor improvements for usage of the mlock agent
- [HIVE-4867](#) - Deduplicate columns appearing in both the key list and value list of ReduceSinkOperator
- [HIVE-7012](#) - Wrong RS de-duplication in the ReduceSinkDeDuplication Optimizer
- [HIVE-8162](#) - Dynamic sort optimization propagates additional columns even in the absence of order by
- [HIVE-8398](#) - ExprNodeColumnDesc cannot be cast to ExprNodeConstantDesc
- [HIVE-8404](#) - ColumnPruner doesnt prune columns from limit operator
- [HIVE-8560](#) - SerDes that do not inherit AbstractSerDe do not get table properties during initialize()
- [HIVE-9195](#) - CBO changes constant to column type
- [HIVE-9450](#) - Merge[Parquet] Check all data types work for Parquet in Group
- [HIVE-9613](#) - Left join query plan outputs wrong column when using subquery
- [HIVE-9984](#) - JoinReorder's getOutputSize is exponential
- [HIVE-10319](#) - Hive CLI startup takes a long time with a large number of databases
- [HIVE-10572](#) - Improve Hive service test to check empty string

- [PIG-4053](#) - TestMRCompiler succeeded with sun jdk 1.6 while failed with sun jdk 1.7
- [SENTRY-721](#) - HDFS Cascading permissions not applied to child file ACLs if a direct grant exists
- [SENTRY-699](#) - Memory leak when running Sentry w/ HiveServer2
- [SOLR-6146](#) - Leak in CloudSolrServer causing "Too many open files"
- [SOLR-7503](#) - Recovery after ZK session expiration happens in a single thread for all cores in a node

Issues Fixed in CDH 5.3.5

Potential job failures during YARN rolling upgrades to CDH 5.3.4

Problem: A MapReduce security fix introduced a compatibility issue that results in job failures during YARN rolling upgrades from CDH 5.3.3 to CDH 5.3.4.

Cloudera Bug: CDH-28680

Release affected: CDH 5.3.4

Release containing the fix: CDH 5.3.5

Workarounds: You can use any one of the following workarounds for this issue:

- Upgrade to CDH 5.3.5.
- Restart any jobs that might have failed during the upgrade.
- Explicitly set the version of MapReduce to be used so it is picked on a per-job basis.
 1. Update the YARN property, **MR Application Classpath** (`mapreduce.application.classpath`), either in Cloudera Manager or in the `mapred-site.xml` file. Remove all existing values and add a new entry: `<parcel-path>/lib/hadoop-mapreduce/*`, where `<parcel-path>` is the absolute path to the parcel installation. For example, the default installation path for the CDH 5.3.3 parcel would be: `/opt/cloudera/parcels/CDH-5.3.3-1.cdh5.3.3.p0.5/lib/hadoop-mapreduce/*`.
 2. Wait until jobs submitted with the above client configuration change have run to completion.
 3. Upgrade to CDH 5.3.4.
 4. Update the **MR Application Classpath** (`mapreduce.application.classpath`) property to point to the new CDH 5.3.4 parcel.

Do *not* delete the old parcel until after all jobs submitted prior to the upgrade have finished running.

Upstream Issues Fixed

The following upstream issue has been fixed in CDH 5.3.5:

- [YARN-3811](#) - NodeManager restarts could lead to application failures

Issues Fixed in CDH 5.3.4

Upstream Issues Fixed

The following upstream issues are fixed in CDH 5.3.4:

- [HDFS-7980](#) - Incremental BlockReport will dramatically slow down the startup of a namenode
- [HDFS-8380](#) - Always call addStoredBlock on blocks which have been shifted from one storage to another
- [HDFS-7645](#) - Rolling upgrade is restoring blocks from trash multiple times
- [HDFS-7869](#) - Inconsistency in the return information while performing rolling upgrade
- [HDFS-7340](#) - make rollingUpgrade start/finalize idempotent
- [HDFS-7312](#) - Update DistCp v1 to optionally not use tmp location (branch-1 only)

- [HDFS-7530](#) - Allow renaming of encryption zone roots
- [HDFS-7587](#) - Edit log corruption can happen if append fails with a quota violation
- [YARN-3485](#) - FairScheduler headroom calculation doesn't consider maxResources for Fifo and FairShare policies
- [YARN-3491](#) - PublicLocalizer#addResource is too slow.
- [YARN-3021](#) - YARN's delegation-token handling disallows certain trust setups to operate properly over DistCp
- [YARN-3241](#) - FairScheduler handles "invalid" queue names inconsistently
- [YARN-3022](#) - Expose Container resource information from NodeManager for monitoring
- [YARN-2984](#) - Metrics for container's actual memory usage
- [YARN-3465](#) - Use LinkedHashMap to preserve order of resource requests
- [MAPREDUCE-6339](#) - Job history file is not flushed correctly because isTimerActive flag is not set true when flushTimerTask is scheduled.
- [MAPREDUCE-5710](#) - Backport MAPREDUCE-1305 to branch-1
- [MAPREDUCE-6238](#) - MR2 can't run local jobs with -libjars command options which is a regression from MR1
- [MAPREDUCE-6076](#) - Zero map split input length combine with none zero map split input length may cause MR1 job hung sometimes.
- [HBASE-13374](#) - Small scanners (with particular configurations) do not return all rows
- [HBASE-13269](#) - Limit result array preallocation to avoid OOME with large scan caching values
- [HBASE-13422](#) - remove use of StandardCharsets in 0.98
- [HBASE-13335](#) - Update ClientSmallScanner and ClientSmallReversedScanner
- [HBASE-13262](#) - ResultScanner doesn't return all rows in Scan
- [HIVE-10646](#) - ColumnValue does not handle NULL_TYPE
- [HIVE-10453](#) - HS2 leaking open file descriptors when using UDFs
- [HIVE-9655](#) - Dynamic partition table insertion error
- [HIVE-10452](#) - Followup fix for HIVE-10202 to restrict it for script mode.
- [HIVE-10312](#) - SASL.QOP in JDBC URL is ignored for Delegation token Authentication
- [HIVE-10202](#) - Beeline outputs prompt+query on standard output when used in non-interactive mode
- [HIVE-10087](#) - Beeline's --silent option should suppress query from being echoed when running with -f option
- [HIVE-10085](#) - Lateral view on top of a view throws RuntimeException
- [HIVE-2828](#) - make timestamp accessible in the hbase KeyValue
- [HUE-2741](#) - [home] Hide the document move dialog
- [HUE-2732](#) - Hue isn't correctly doing add_column migrations with non-blank defaults
- [HUE-2513](#) - [fb] File list column sorting is broken
- [IMPALA-1519](#) - Fix wrapping of exprs via a TupleIsNullPredicate with analytics
- [IMPALA-1952](#) - Expand parsing of decimals to include scientific notation
- [IMPALA-1860](#) - INSERT/CTAS evaluates and applies constant predicates.
- [IMPALA-1900](#) - Assign predicates below analytic functions with a compatible partition by clause
- [IMPALA-1376](#) - Split up Planner into multiple classes.
- [IMPALA-1888](#) - FIRST_VALUE may produce incorrect results with preceding windows
- [IMPALA-1559](#) - FIRST_VALUE rewrite fn type might not match slot type
- [IMPALA-1808](#) - AnalyticEvalNode cannot handle partition/order by exprs with NaN
- [IMPALA-1562](#) - AnalyticEvalNode not properly handling nullable tuples
- [OOZIE-2063](#) - Cron syntax creates duplicate actions
- [OOZIE-2218](#) - META-INF directories in the war file have 777 permissions
- [OOZIE-1878](#) - Can't execute dryrun on the CLI
- [SENTRY-696](#) - Improve Metastoreplugin Cache Initialization time
- [SENTRY-703](#) - Calls to add_partition fail when passed a Partition object with a null location
- [SENTRY-408](#) - The URI permission should support more filesystem prefixes
- [SOLR-7478](#) - UpdateLog#close shutdown it's executor with interrupts before running close, preventing a clean close.
- [SOLR-7437](#) - Make HDFS transaction log replication factor configurable.

- [SOLR-7338](#) - A reloaded core will never register itself as active after a ZK session expiration
- [SOLR-7370](#) - FSHDFSUtils#recoverFileLease tries to recover the lease every one second after the first four second wait.
- [SPARK-6578](#) - Outbound channel in network library is not thread-safe, can lead to fetch failures
- [SQOOP-2343](#) - AsyncSqlRecordWriter stucks if any exception is thrown out in its close method
- [SQOOP-2286](#) - Ensure Sqoop generates valid avro column names
- [SQOOP-2283](#) - Support usage of --exec and --password-alias
- [SQOOP-2281](#) - Set overwrite on kite dataset
- [SQOOP-2282](#) - Add validation check for --hive-import and --append
- [SQOOP-2257](#) - Parquet target for imports with Hive overwrite option does not work
- [ZOOKEEPER-2146](#) - BinaryInputArchive readString should check length before allocating memory
- [ZOOKEEPER-2149](#) - Logging of client address when socket connection established

Published Known Issues Fixed

As a result of the above fixes, the following issues, previously published as [Known Issues in CDH 5](#) on page 1944, are also fixed.

Executing oozie job -config properties file -dryrun fails because of a code defect in argument parsing

Bug: [OOZIE-1878](#)

Severity: Low

Workaround: None.

Issues Fixed in CDH 5.3.3

Upstream Issues Fixed

The following upstream issues are fixed in CDH 5.3.3:

- [HADOOP-11722](#) - Some Instances of Services using ZKDelegationTokenSecretManager go down when old token cannot be deleted
- [HADOOP-11469](#) - KMS should skip default.key.acl and whitelist.key.acl when loading key acl
- [HADOOP-11710](#) - Make CryptoOutputStream behave like DFSOutputStream wrt synchronization
- [HADOOP-11674](#) - oneByteBuf in CryptoInputStream and CryptoOutputStream should be non static
- [HADOOP-11445](#) - Bzip2Codec: Data block is skipped when position of newly created stream is equal to start of split
- [HADOOP-11620](#) - Add support for load balancing across a group of KMS for HA
- [HDFS-6830](#) - BlockInfo.addStorage fails when DN changes the storage for a block replica
- [HDFS-7961](#) - Trigger full block report after hot swapping disk
- [HDFS-7960](#) - The full block report should prune zombie storages even if they're not empty
- [HDFS-7575](#) - Upgrade should generate a unique storage ID for each volume
- [HDFS-7596](#) - NameNode should prune dead storages from storageMap
- [HDFS-7579](#) - Improve log reporting during block report rpc failure
- [HDFS-7208](#) - NN doesn't schedule replication when a DN storage fails
- [HDFS-6899](#) - Allow changing MiniDFScluster volumes per DN and capacity per volume
- [HDFS-6878](#) - Change MiniDFScluster to support StorageType configuration for individual directories
- [HDFS-6678](#) - MiniDFScluster may still be partially running after initialization fails.
- [YARN-3351](#) - AppMaster tracking URL is broken in HA
- [YARN-3242](#) - Asynchrony in ZK-close can lead to ZKRMStateStore watcher receiving events for old client
- [YARN-2865](#) - Application recovery continuously fails with "Application with id already present. Cannot duplicate"
- [MAPREDUCE-6275](#) - Race condition in FileOutputCommitter v2 for user-specified task output subdirs
- [MAPREDUCE-4815](#) - Speed up FileOutputCommitter#commitJob for many output files
- [HBASE-13131](#) - ReplicationAdmin leaks connections if there's an error in the constructor
- [HIVE-10086](#) - Hive throws error when accessing Parquet file schema using field name match

- [HIVE-10098](#) - HS2 local task for map join fails in KMS encrypted cluster
- [HIVE-7426](#) - ClassCastException: ...IntWritable cannot be cast to ...Text involving ql.udf.generic.GenericUDFBasePad.evaluate
- [HIVE-7737](#) - Hive logs full exception for table not found
- [HIVE-9749](#) - ObjectStore schema verification logic is incorrect
- [HIVE-9788](#) - Make double quote optional in tsv/csv/dsv output
- [HIVE-9755](#) - Hive built-in "ngram" UDAF fails when a mapper has no matches.
- [HIVE-9770](#) - Beeline ignores --showHeader for non-tabular output formats i.e csv,tsv,dsv
- [HIVE-8688](#) - serialized plan OutputStream is not being closed
- [HIVE-9716](#) - Map job fails when table's LOCATION does not have scheme
- [HIVE-5857](#) - Reduce tasks do not work in uber mode in YARN
- [HIVE-8938](#) - Compiler should save the transform URI as input entity
- [HUE-2569](#) - [home] Delete project is broken
- [HUE-2529](#) - Increase the character limit of 'Name' Textfield in Useradmin Ldap Sync Groups
- [HUE-2506](#) - [search] Marker map does not display with HTML widget
- [HUE-1663](#) - [core] Option to either follow or not LDAP referrals for auth
- [HUE-2198](#) - [core] Reduce noise such as "handle_other(): Mutual authentication unavailable on 200 response"
- [SENTRY-683](#) - HDFS service client should ensure the kerberos ticket validity before new service connection
- [SENTRY-654](#) - Calls to append_partition fail when Sentry is enabled
- [SENTRY-664](#) - After Namenode is restarted, Path updates remain unsynched
- [SENTRY-665](#) - PathsUpdate.parsePath needs to handle special characters
- [SENTRY-652](#) - Sentry fails to parse spaces when HDFS ACL sync enabled
- [SOLR-7092](#) - Stop the HDFS lease recovery retries on HdfsTransactionLog on close and try to avoid lease recovery on closed files.
- [SOLR-7141](#) - RecoveryStrategy: Raise time that we wait for any updates from the leader before they saw the recovery state to have finished.
- [SOLR-7113](#) - Multiple calls to UpdateLog#init is not thread safe with respect to the HDFS FileSystem client object usage.
- [SOLR-7134](#) - Replication can still cause index corruption.
- [SQOOP-1764](#) - Numeric Overflow when getting extent map
- [IMPALA-1658](#) - Add compatibility flag for Hive-Parquet-Timestamps
- [IMPALA-1820](#) - Start with small pages for hash tables during repartitioning
- [IMPALA-1897](#) - Fixes for old hash join and agg
- [IMPALA-1894](#) - Fix old aggregation node hash table cleanup
- [IMPALA-1863](#) - Avoid deadlock across fragment instances
- [IMPALA-1915](#) - Fix query hang in BufferedBlockMgr:FindBlock()
- [IMPALA-1890](#) - Fixing a race between ~BufferedBlockMgr() and the WriteComplete() call
- [IMPALA-1738](#) - Use sprintf() instead of lexical_cast() in float-to-string casts
- [IMPALA-1865](#) - Fix partition spilling cleanup when new stream OOMs
- [IMPALA-1835](#) - Keep the fragment alive for TransmitData()
- [IMPALA-1805](#) - Impala's ACLs check do not consider all group ACLs, only checked first one.
- [IMPALA-1794](#) - Fix infinite loop opening or closing file with invalid metadata
- [IMPALA-1801](#) - external-data-source-executor leaking global jni refs
- [IMPALA-1712](#) - Unexpected remote bytes read counter was not being reset properly
- [IMPALA-1636](#) - Generalize index-based partition pruning to allow constant expressions

Published Known Issues Fixed

As a result of the above fixes, the following issues, previously published as [Known Issues in CDH 5](#) on page 1944, are also fixed.

After upgrade from a release earlier than CDH 5.2.0, storage IDs may no longer be unique

As of CDH 5.2, each storage volume on a DataNode should have its own unique `storageID`, but in clusters upgraded from CDH 4, or CDH 5 releases earlier than CDH 5.2.0, each volume on a given DataNode shares the same `storageID`, because the HDFS upgrade does not properly update the IDs to reflect the new naming scheme. This causes problems with load balancing. The problem affects only clusters upgraded from CDH 5.1.x and earlier to CDH 5.2 or later. Clusters that are new as of CDH 5.2.0 or later do not have the problem.

Bug: [HDFS-7575](#)

Cloudera Bug: CDH-24155

Severity: Medium

Workaround: Upgrade to a later or patched version of CDH.

Issues Fixed in CDH 5.3.2

Upstream Issues Fixed

The following upstream issues are fixed in CDH 5.3.2:

- [AVRO-1630](#) - Creating Builder from instance loses data
- [AVRO-1628](#) - Add Schema.createUnion(Schema... type)
- [AVRO-1539](#) - Add FileSystem-based FsInput Constructor
- [AVRO-1623](#) - GenericData#validate() of enum: IndexOutOfBoundsException
- [AVRO-1614](#) - Always getting a value...
- [AVRO-1592](#) - Java keyword as an enum constant in Avro schema file causes deserialization to fail.
- [AVRO-1619](#) - Generate better JavaDoc
- [AVRO-1622](#) - Add missing license headers
- [AVRO-1604](#) - ReflectData.AllowNull fails to generate schemas when @Nullable is present.
- [AVRO-1407](#) - NettyTransceiver can cause a infinite loop when slow to connect
- [AVRO-834](#) - Data File corruption recovery tool
- [AVRO-1596](#) - Cannot read past corrupted block in Avro data file
- [HADOOP-11350](#) - The size of header buffer of HttpServer is too small when HTTPS is enabled
- [HDFS-7707](#) - Edit log corruption due to delayed block removal again
- [HDFS-7718](#) - Store KeyProvider in ClientContext to avoid leaking key provider threads when using FileContext
- [HDFS-6425](#) - Large postponedMisreplicatedBlocks has impact on blockReport latency
- [HDFS-7560](#) - ACLs removed by removeDefaultAcl() will be back after NameNode restart/failover
- [HDFS-7513](#) - HDFS inotify: add defaultBlockSize to CreateEvent
- [HDFS-7158](#) - Reduce the memory usage of WebImageViewer
- [HDFS-7497](#) - Inconsistent report of decommissioning DataNodes between dfsadmin and NameNode webui
- [HDFS-6917](#) - Add an hdfs debug command to validate blocks, call recoverlease, etc.
- [HDFS-6779](#) - Add missing version subcommand for hdfs
- [YARN-2697](#) - RMAuthenticationHandler is no longer useful
- [YARN-2656](#) - RM web services authentication filter should add support for proxy user
- [YARN-3082](#) - Non thread safe access to systemCredentials in NodeHeartbeatResponse processing
- [YARN-3079](#) - Scheduler should also update maximumAllocation when updateNodeResource.
- [YARN-2992](#) - ZKRMStateStore crashes due to session expiry
- [YARN-2675](#) - containersKilled metrics is not updated when the container is killed during localization
- [YARN-2715](#) - Proxy user is problem for RPC interface if yarn.resourcemanager.webapp.proxyuser is not set

- [IMPALA-1535](#) - Partition pruning with NULL
- [IMPALA-1606](#) - Impala does not always give short name to Llama
- [IMPALA-1120](#) - Fetch column statistics using Hive 0.13 bulk API

In addition, CDH 5.3.2 reverts [YARN-2713](#), which has caused problems since its inclusion in CDH 5.3.0.

Published Known Issues Fixed

As a result of the above fixes, the following issues, previously published as [Known Issues in CDH 5](#) on page 1944, are also fixed.

Hive does not support Parquet schema evolution

Adding a new column to a Parquet table causes queries on that table to fail with a `column not found` error.

Bug: [HIVE-7800](#)

Cloudera Bug: CDH-24123

Severity: Medium

Workaround: Use Impala instead; Impala handles Parquet schema evolution correctly.

Issues Fixed in CDH 5.3.1

Upstream Issues Fixed

The following upstream issues are fixed in CDH 5.3.1:

- [YARN-2975](#) - FSLeafQueue app lists are accessed without required locks
- [YARN-2010](#) - Handle app-recovery failures gracefully
- [YARN-3027](#) - Scheduler should use totalAvailable resource from node instead of availableResource for maxAllocation
- [HIVE-9445](#) - Revert HIVE-5700 - enforce single date format for partition column storage
- [IMPALA-1668](#) - TSaslServerTransport::Factory::getTransport() leaks transport map entries
- [IMPALA-1674](#) - IMPALA-1556 causes memory leak with secure connections

Published Known Issues Fixed

As a result of the above fixes, the following issues, previously published as [Known Issues in CDH 5](#) on page 1944, are also fixed.

Upgrading a PostgreSQL Hive Metastore from Hive 0.12 to Hive 0.13 may result in a corrupt metastore

[HIVE-5700](#) introduced a serious bug into the Hive Metastore upgrade scripts. This bug affects users who have a PostgreSQL Hive Metastore and have *at least one table* which is partitioned by date and the value is stored as a date type (not string).

Bug: [HIVE-5700](#)

Cloudera Bug: CDH-24531

Severity: High

Workaround: None. Do not upgrade your PostgreSQL metastore to version 0.13 if you satisfy the condition stated above.

Issues Fixed in CDH 5.3.0

The following topics describe known issues fixed in CDH 5.3.0.

Apache Hadoop

HDFS

Kerberos re-login attempts fail when using JDK 1.7.0_80

On clusters using JDK 1.7.0_80, long running HDFS clients are unable to re-authenticate using Kerberos once their ticket expires. Due to this authentication failure, any jobs triggered from these clients will fail.

Releases Affected: CDH 5.1, 5.2

Bug: [HADOOP-10786](#)

Cloudera Bug: CDH-27714

Workaround: Upgrade to CDH 5.3.2 (or higher).

NameNode - KMS communication fails after long periods of inactivity

Encrypted files and encryption zones cannot be created if a long period of time (by default, 20 hours) has passed since the last time the KMS and NameNode communicated.

Bug: [HADOOP-11187](#)

Cloudera Bug: CDH-22217

Workaround: There are two possible workarounds to this issue:

- You can increase the KMS authentication token validity period to a very high number. Since the default value is 10 hours, this bug will only be encountered after 20 hours of no communication between the NameNode and the KMS. Add the following property to the `kms-site.xml` Safety Valve:

```
<property>
<name>hadoop.kms.authentication.token.validity</name>
<value>SOME VERY HIGH NUMBER</value>
</property>
```

- You can switch the KMS signature secret provider to the string secret provider by adding the following property to the `kms-site.xml` Safety Valve:

```
<property>
<name>hadoop.kms.authentication.signature.secret</name>
<value>SOME VERY SECRET STRING</value>
</property>
```

DataNodes may become unresponsive to block creation requests

In releases earlier than CDH 5.2.3, DataNodes may become unresponsive to block creation requests from clients when the directory scanner is running.

Bug: [HDFS-7489](#)

Cloudera Bug: CDH-23732

Workaround: Upgrade to CDH 5.2.3 or later.

Apache Hive

UDF translate() does not accept arguments of type CHAR or VARCHAR

Bug: [HIVE-6622](#)

Workaround: Cast the argument to type String.

Hive's Timestamp type cannot be stored in Parquet

Tables containing timestamp columns cannot use Parquet as the storage engine.

Bug: [HIVE-6394](#)

Workaround: Use a different file format.

Apache Spark

Spark sort-based shuffle is affected by a kernel bug

Spark sort-based shuffle is affected by a kernel bug

(<http://git.kernel.org/cgit/linux/kernel/git/torvalds/linux.git/commit/?id=2cb4b05e7647891b46b91c07c9a60304803d1688>).

The kernel bug was fixed in RHEL/CentOS 6.2.

Note: Previously CDH defaulted to hash-based shuffle. It now defaults to sort-based shuffle.

Bug: [SPARK-3948](#)

Cloudera Bug: CDH-23577

Issues Fixed in CDH 5.2.x

The following topics describe known issues fixed in CDH 5.2.x, from newest to oldest release.

CDH 5.2.6

Upstream Issues Fixed

The following upstream issues are fixed in CDH 5.2.6:

- [CRUNCH-516](#) - Scrunch needs some additional null checks
- [CRUNCH-508](#) - Improve performance of Scala Enumeration counters in Scrunch
- [CRUNCH-514](#) - AvroDerivedDeepCopier should initialize delegate MapFns
- [CRUNCH-530](#) - Fix object reuse bug in GenericRecordToTuple
- [HADOOP-12103](#) - Small refactoring of DelegationTokenAuthenticationFilter to allow code sharing
- [HADOOP-10839](#) - Add unregisterSource() to MetricsSystem API
- [HDFS-8337](#) - Accessing httpfs via webhdfs doesn't work from a jar with kerberos
- [HDFS-7546](#) - Document, and set an accepting default for dfs.namenode.kerberos.principal.pattern
- [HDFS-6997](#) - Archival Storage: add more tests for data migration and replicaion
- [HDFS-7980](#) - Incremental BlockReport will dramatically slow down the startup of a namenode
- [HDFS-8380](#) - Always call addStoredBlock on blocks which have been shifted from one storage to another
- [HDFS-7312](#) - Update DistCp v1 to optionally not use tmp location (branch-1 only)
- [YARN-3485](#) - FairScheduler headroom calculation doesn't consider maxResources for Fifo and FairShare policies
- [YARN-3241](#) - FairScheduler handles "invalid" queue names inconsistently
- [YARN-2669](#) - FairScheduler: queue names shouldn't allow periods
- [YARN-3022](#) - Expose Container resource information from NodeManager for monitoring
- [YARN-2984](#) - Metrics for container's actual memory usage
- [YARN-3465](#) - Use LinkedHashMap to preserve order of resource requests
- [MAPREDUCE-6387](#) - Serialize the recently added Task#encryptedSpillKey field at the end
- [MAPREDUCE-6339](#) - Job history file is not flushed correctly because isTimerActive flag is not set true when flushTimerTask is scheduled.
- [MAPREDUCE-5710](#) - Backport MAPREDUCE-1305 to branch-1
- [MAPREDUCE-6238](#) - MR2 can't run local jobs with -libjars command options which is a regression from MR1
- [HBASE-13826](#) - Unable to create table when group acls are appropriately set.
- [HBASE-13241](#) - Add tests for group level grants
- [HBASE-13239](#) - HBase grant at specific column level does not work for Groups

- [HBASE-13768](#) - ZooKeeper znodes are bootstrapped with insecure ACLs in a secure configuration
- [HBASE-13789](#) - ForeignException should not be sent to the client
- [HBASE-13779](#) - Calling table.exists() before table.get() end up with an empty Result
- [HBASE-13780](#) - Default to 700 for HDFS root dir permissions for secure deployments
- [HBASE-13768](#) - ZooKeeper znodes are bootstrapped with insecure ACLs in a secure configuration
- [HBASE-13767](#) - Allow ZKAcIReset to set and not just clear ZK ACLs
- [HBASE-13086](#) - Show ZK root node on Master WebUI
- [HBASE-13342](#) - Fix incorrect interface annotations
- [HBASE-13162](#) - Add capability for cleaning hbase acls to hbase cleanup script.
- [HBASE-12641](#) - Grant all permissions of hbase zookeeper node to hbase superuser in a secure cluster
- [HBASE-13374](#) - Small scanners (with particular configurations) do not return all rows
- [HBASE-13269](#) - Limit result array preallocation to avoid OOME with large scan caching values
- [HBASE-13422](#) - remove use of StandardCharsets in 0.98
- [HBASE-13335](#) - Update ClientSmallScanner and ClientSmallReversedScanner
- [HBASE-13262](#) - ResultScanner doesn't return all rows in Scan
- [HIVE-10841](#) - [WHERE col is not null] does not work sometimes for queries with many JOIN statements
- [HIVE-9620](#) - Cannot retrieve column statistics using HMS API if column name contains uppercase characters
- [HIVE-8863](#) - Cannot drop table with uppercase name after "compute statistics for columns"
- [HIVE-6679](#) - HiveServer2 should support configurable the server side socket timeout and keepalive for various transports types where applicable
- [OOZIE-1944](#) - Recursive variable resolution broken when same parameter name in config-default and action conf
- [OOZIE-2218](#) - META-INF directories in the war file have 777 permissions
- [SENTRY-540](#) - Fix Sentry test validating special chars in username due to HIVE-8916
- [SENTRY-227](#) - Fix for "Unsupported entity type DUMMYPARTITION"
- [SOLR-7478](#) - UpdateLog#close shutdown it's executor with interrupts before running close, preventing a clean close.
- [SOLR-7338](#) - A reloaded core will never register itself as active after a ZK session expiration
- [SOLR-7370](#) - FSHDFSUtils#recoverFileLease tries to recover the lease every one second after the first four second wait.
- [ZOOKEEPER-2146](#) - BinaryInputArchive readString should check length before allocating memory
- [ZOOKEEPER-2149](#) - Logging of client address when socket connection established
- [IMPALA-1726](#): Move JNI / Thrift utilities to separate header
- [IMPALA-2002](#): Provide way to cache ext data source classes

CDH 5.2.5

Upstream Issues Fixed

The following upstream issues are fixed in CDH 5.2.5:

- [HADOOP-11350](#) - The size of header buffer of HttpServer is too small when HTTPS is enabled
- [HADOOP-11710](#) - Make CryptoOutputStream behave like DFSOutputStream wrt synchronization
- [HADOOP-11674](#) - oneByteBuf in CryptoInputStream and CryptoOutputStream should be non static
- [HDFS-6830](#) - BlockInfo.addStorage fails when DN changes the storage for a block replica
- [HDFS-7960](#) - The full block report should prune zombie storages even if they're not empty
- [HDFS-6425](#) - Large postponedMisreplicatedBlocks has impact on blockReport latency
- [HDFS-7575](#) - Upgrade should generate a unique storage ID for each volume
- [HDFS-7596](#) - NameNode should prune dead storages from storageMap
- [HDFS-7579](#) - Improve log reporting during block report rpc failure
- [HDFS-7208](#) - NN doesn't schedule replication when a DN storage fails
- [HDFS-6899](#) - Allow changing MiniDFScluster volumes per DN and capacity per volume
- [HDFS-6878](#) - Change MiniDFScluster to support StorageType configuration for individual directories
- [HDFS-6678](#) - MiniDFScluster may still be partially running after initialization fails.

- [HDFS-7575](#) - Upgrade should generate a unique storage ID for each volume
- [HDFS-7960](#) - The full block report should prune zombie storages even if they're not empty
- [YARN-570](#) - Time strings are formatted in different timezone
- [YARN-2251](#) - Avoid negative elapsed time in JHS/MRAM web UI and services
- [YARN-3242](#) - Asynchrony in ZK-close can lead to ZKRMStateStore watcher receiving events for old client
- [MAPREDUCE-5957](#) - AM throws ClassNotFoundException with job classloader enabled if custom output format/committer is used
- [MAPREDUCE-6076](#) - Zero map split input length combine with none zero map split input length may cause MR1 job hung sometimes.
- [MAPREDUCE-6275](#) - Race condition in FileOutputCommitter v2 for user-specified task output subdirs
- [MAPREDUCE-4815](#) - Speed up FileOutputCommitter#commitJob for many output files
- [HIVE-2828](#) - make timestamp accessible in the hbase KeyValue
- [HIVE-2828](#) - make timestamp accessible in the hbase KeyValue
- [HIVE-7433](#) - ColumnMappers.ColumnMapping should expose public accessors for its fields
- [HIVE-6148](#) - Support arbitrary structs stored in HBase
- [HIVE-6147](#) - Support avro data stored in HBase columns
- [HIVE-6584](#) - Add HiveHBaseTableSnapshotInputFormat
- [HIVE-6411](#) - Support more generic way of using composite key for HBaseHandler
- [HIVE-6677](#) - HBaseSerDe needs to be refactored
- [HIVE-9934](#) - Vulnerability in LdapAuthenticationProviderImpl enables HiveServer2 client to degrade the authentication mechanism to "none", allowing authentication without password
- [HIVE-7737](#) - Hive logs full exception for table not found
- [HIVE-9716](#) - Map job fails when table's LOCATION does not have scheme
- [HIVE-8688](#) - serialized plan OutputStream is not being closed
- [HIVE-5857](#) - Reduce tasks do not work in uber mode in YARN
- [HUE-2446](#) - Migrating from CDH 4.7 to CDH 5.0.1+/Hue 3.5+ will fail
- [HUE-2371](#) - [sentry] Sentry URI should be created only with a ALL permission
- [HUE-1663](#) - [core] Option to either follow or not LDAP referrals for auth
- [SENTRY-654](#) - Calls to append_partition fail when Sentry is enabled
- [SOLR-7092](#) - Stop the HDFS lease recovery retries on HdfsTransactionLog on close and try to avoid lease recovery on closed files.
- [SOLR-7134](#) - Replication can still cause index corruption.
- [SOLR-7113](#) - Multiple calls to UpdateLog#init is not thread safe with respect to the HDFS FileSystem client object usage.
- [SOLR-7141](#) - RecoveryStrategy: Raise time that we wait for any updates from the leader before they saw the recovery state to have finished.
- [SQOOP-1764](#) - Numeric Overflow when getting extent map
- [IMPALA-1658](#): Add compatibility flag for Hive-Parquet-Timestamps
- [IMPALA-1794](#): Fix infinite loop opening/closing file w/ invalid metadata
- [IMPALA-1801](#): external-data-source-executor leaking global jni refs

CDH 5.2.4

Upstream Issues Fixed

The following upstream issues are fixed in CDH 5.2.4:

- [HDFS-7707](#) - Edit log corruption due to delayed block removal again
- [YARN-2846](#) - Incorrect persist exit code for running containers in reacquireContainer() that interrupted by NodeManager restart.
- [HIVE-7733](#) - Ambiguous column reference error on query
- [HIVE-8444](#) - update pom to junit 4.11
- [HIVE-9474](#) - truncate table changes permissions on the target

- [HIVE-6308](#) - COLUMNS_V2 Metastore table not populated for tables created without an explicit column list.
- [HIVE-9445](#) - Revert HIVE-5700 - enforce single date format for partition column storage
- [HIVE-7800](#) - Parquet Column Index Access Schema Size Checking Checking
- [HIVE-9393](#) - reduce noisy log level of ColumnarSerDe.java:116 from INFO to DEBUG
- [HUE-2501](#) - [metastore] Creating a table with header files bigger than 64MB truncates it
- [SOLR-7033](#) - [RecoveryStrategy should not publish any state when closed / cancelled.
- [SOLR-5961](#) - Solr gets crazy on /overseer/queue state change
- [SOLR-6640](#) - Replication can cause index corruption
- [SOLR-6920](#) - During replication use checksums to verify if files are the same
- [SOLR-5875](#) - QueryComponent.mergelds() unmarshals all docs' sort field values once per doc instead of once per shard
- [SOLR-6919](#) - Log REST info before executing
- [SOLR-6969](#) - When opening an HDFSTransactionLog for append we must first attempt to recover its lease to prevent data loss
- [IMPALA-1471](#): Bug in spilling of PHJ that was affecting left anti and outer joins.
- [IMPALA-1451](#): Empty Row in HBase triggers NPE in Planner
- [IMPALA-1535](#): Partition pruning with NULL
- [IMPALA-1483](#): Substitute TuplelsNullPredicates to refer to physical analytic output.
- [IMPALA-1674](#): Fix serious memory leak in TSaslTransport
- [IMPALA-1668](#): Fix leak of transport objects in TSaslServerTransport::Factory
- [IMPALA-1565](#): Python sasl client transport perf issue
- [IMPALA-1556](#): Kerberos fetches 3x slower
- [IMPALA-1120](#): Fetch column statistics using Hive 0.13 bulk API

Published Known Issues Fixed

As a result of the above fixes, the following issues, previously published as [Known Issues in CDH 5](#) on page 1944, are also fixed:

Hive does not support Parquet schema evolution

Adding a new column to a Parquet table causes queries on that table to fail with a `column not found` error.

Bug: [HIVE-7800](#)

Cloudera Bug: CDH-24123

Workaround: Use Impala instead; Impala handles Parquet schema evolution correctly.

CDH 5.2.3

Upstream Issues Fixed

The following upstream issues are fixed in CDH 5.2.3:

- [AVRO-1623](#) - GenericData#validate() of enum: IndexOutOfBoundsException
- [AVRO-1622](#) - Add missing license headers
- [AVRO-1604](#) - ReflectData.AllowNull fails to generate schemas when @Nullable is present.
- [AVRO-1407](#) - NettyTransceiver can cause a infinite loop when slow to connect
- [AVRO-834](#) - Data File corruption recovery tool
- [AVRO-1596](#) - Cannot read past corrupted block in Avro data file
- [CRUNCH-480](#) - AvroParquetFileSource does not properly configure user-supplied read schema
- [CRUNCH-479](#) - Writing to target with WriteMode.APPEND merges values into PCollection
- [CRUNCH-477](#) - Fix HFileTargetIT failures on hadoop1 under Java 1.7/1.8
- [CRUNCH-473](#) - Use specific class type for case class serialization
- [CRUNCH-473](#) - Use specific class type for case class serialization
- [CRUNCH-472](#) - Add Scrunch serialization support for Java Enums
- [HADOOP-11068](#) - Match hadoop.auth cookie format to jetty output

- [HADOOP-11343](#) - Overflow is not properly handled in calculating final iv for AES CTR
- [HADOOP-11301](#) - [optionally] update jmx cache to drop old metrics
- [HADOOP-11085](#) - Excessive logging by org.apache.hadoop.util.Progress when value is NaN
- [HADOOP-11247](#) - Fix a couple javac warnings in NFS
- [HADOOP-11195](#) - Move Id-Name mapping in NFS to the hadoop-common area for better maintenance
- [HADOOP-11130](#) - NFS updateMaps OS check is reversed
- [HADOOP-10990](#) - Add missed NFSv3 request and response classes
- [HADOOP-11323](#) - WritableComparator#compare keeps reference to byte array
- [HDFS-7560](#) - ACLs removed by removeDefaultAcl() will be back after NameNode restart/failover
- [HDFS-7367](#) - HDFS short-circuit read cannot negotiate shared memory slot and file descriptors when SASL is enabled on DataTransferProtocol.
- [HDFS-7489](#) - Incorrect locking in FsVolumeList#checkDirs can hang datanodes
- [HDFS-7158](#) - Reduce the memory usage of WebImageViewer
- [HDFS-7497](#) - Inconsistent report of decommissioning DataNodes between dfsadmin and NameNode webui
- [HDFS-7146](#) - NFS ID/Group lookup requires SSSD enumeration on the server
- [HDFS-7387](#) - NFS may only do partial commit due to a race between COMMIT and write
- [HDFS-7356](#) - Use DirectoryListing.hasMore() directly in nfs
- [HDFS-7180](#) - NFSv3 gateway frequently gets stuck due to GC
- [HDFS-7259](#) - Unresponsive NFS mount point due to deferred COMMIT response
- [HDFS-6894](#) - Add XDR parser method for each NFS response
- [HDFS-6850](#) - Move NFS out of order write unit tests into TestWrites class
- [HDFS-7385](#) - ThreadLocal used in FSEditLog class causes FSImage permission mess up
- [HDFS-7409](#) - Allow dead nodes to finish decommissioning if all files are fully replicated
- [HDFS-7373](#) - Clean up temporary files after fsimage transfer failures
- [HDFS-7225](#) - Remove stale block invalidation work when DN re-registers with different UUID
- [YARN-2721](#) - Race condition: ZKRMStateStore retry logic may throw NodeExist exception
- [YARN-2975](#) - FSLeafQueue app lists are accessed without required locks
- [YARN-2992](#) - ZKRMStateStore crashes due to session expiry
- [YARN-2910](#) - FSLeafQueue can throw ConcurrentModificationException
- [YARN-2816](#) - NM fail to start with NPE during container recovery
- [MAPREDUCE-6198](#) - NPE from JobTracker#resolveAndAddToTopology in MR1 cause initJob and heartbeat failure.
- [MAPREDUCE-6169](#) - MergeQueue should release reference to the current item from key and value at the end of the iteration to save memory.
- [HBASE-11794](#) - StripeStoreFlusher causes NullPointerException
- [HBASE-12077](#) - FilterLists create many ArrayList\$Itr objects per row.
- [HBASE-12386](#) - Replication gets stuck following a transient zookeeper error to remote peer cluster
- [HBASE-11979](#) - Compaction progress reporting is wrong

Published Known Issues Fixed

As a result of the above fixes, the following issues, previously published as [Known Issues in CDH 5](#) on page 1944, are also fixed.

Upgrading a PostgreSQL Hive Metastore from Hive 0.12 to Hive 0.13 may result in a corrupt metastore

[HIVE-5700](#) introduced a serious bug into the Hive Metastore upgrade scripts. This bug affects users who have a PostgreSQL Hive Metastore and have *at least one table* which is partitioned by date and the value is stored as a date type (not string).

Bug: [HIVE-5700](#)

Cloudera Bug: CDH-24531

Workaround: None. Do not upgrade your PostgreSQL metastore to version 0.13 if you satisfy the condition stated above.

DataNodes may become unresponsive to block creation requests

DataNodes may become unresponsive to block creation requests from clients when the directory scanner is running.

Bug: [HDFS-7489](#)

Cloudera Bug: CDH-23732

Workaround: Disable the directory scanner by setting `dfs.datanode.directoryscan.interval` to `-1`.

CDH 5.2.2

There is no CDH 5.2.2 release.

CDH 5.2.1

Apache Hadoop

Files inside encryption zones cannot be read in Hue

Hue uses either WebHDFS or HttpFS to access files. Both are proxy user clients of KMS and the KMS client library does not currently handle proxy users correctly.

Bug: [HADOOP-11176](#)

Cloudera Bug: CDH-22276

Workaround: None

Both ResourceManagers can end up in Standby mode

After a restart, if an application fails to recover, both Resource Managers could end up in Standby mode.

Bug: [YARN-2588](#), [YARN-2010](#)

Cloudera Bug: CDH-22337

Workarounds:

- Stop the RM. Format the state store using `yarn resourcemanager -format-state-store`. Applications that were running before the ResourceManager went down will not be recovered.
- You can limit the number of completed applications the RM state-store stores (`yarn.resourcemanager.state-store.max-completed-applications`) to reduce the chances of running into this problem.

Apache Oozie

Using cron-like syntax for Coordinator frequencies can result in duplicate actions

Every `throttle` number of actions will be a duplicate. For example, if the throttle is set to 5, every fifth action will be a duplicate.

Bug: [OOZIE-2063](#)

Cloudera Bug: CDH-23137

Workaround: If possible, use the older syntax to specify an equivalent frequency.

Upstream Fixes

CDH 5.2.1 also fixes the following issues:

- [HADOOP-11243](#) - SSLFactory shouldn't allow SSLv3
- [HADOOP-11217](#) - Disable SSLv3 in KMS
- [HADOOP-11156](#) - DelegateToFileSystem should implement `getFsStatus(final Path f)`.
- [HADOOP-11176](#) - KMSSClientProvider authentication fails when both `currentUgi` and `loginUgi` are a proxied user
- [HDFS-7235](#) - `DataNode#transferBlock` should report blocks that don't exist using `reportBadBlock`
- [HDFS-7274](#) - Disable SSLv3 in HttpFS
- [HDFS-7391](#) - Reenable `SSLv2Hello` in HttpFS
- [HDFS-6781](#) - Separate HDFS commands from `CommandsManual.apptm`
- [HDFS-6831](#) - Inconsistency between `'hdfs dfsadmin'` and `'hdfs dfsadmin -help'`
- [HDFS-7278](#) - Add a command that allows sysadmins to manually trigger full block reports from a DN
- [YARN-2010](#) - Handle app-recovery failures gracefully
- [YARN-2588](#) - Standby RM does not `transitionToActive` if previous `transitionToActive` is failed with ZK exception.
- [YARN-2566](#) - `DefaultContainerExecutor` should pick a working directory randomly
- [YARN-2641](#) - Decommission nodes on `-refreshNodes` instead of next NM-RM heartbeat
- [MAPREDUCE-6147](#) - Support `mapreduce.input.fileinputformat.split.maxsize`

- [HBASE-12376](#) - HBaseAdmin leaks ZK connections if failure starting watchers (ConnectionLossException)
- [HBASE-12201](#) - Close the writers in the MOB sweep tool
- [HBASE-12220](#) - Add hedgedReads and hedgedReadWins metrics
- [HIVE-8693](#) - Separate out fair scheduler dependency from hadoop 0.23 shim
- [HIVE-8634](#) - HiveServer2 fair scheduler queue mapping does not handle the secondary groups rules correctly
- [HIVE-8675](#) - Increase thrift server protocol test coverage
- [HIVE-8827](#) - Remove SSLv2Hello from list of disabled protocols protocols
- [HIVE-8615](#) - beeline csv,tsv outputformat needs backward compatibility mode
- [HIVE-8627](#) - Compute stats on a table from impala caused the table to be corrupted
- [HIVE-7764](#) - Support all JDBC-HiveServer2 authentication modes on a secure cluster cluster
- [HIVE-8182](#) - beeline fails when executing multiple-line queries with trailing spaces
- [HUE-2438](#) - [core] Disable SSLv3 for Poodle vulnerability
- [IMPALA-1361](#): FE Exceptions with BETWEEN predicates
- [IMPALA-1397](#): free local expr allocations in scanner threads
- [IMPALA-1400](#): Window function insert issue (LAG() + OVER)
- [IMPALA-1401](#): raise MAX_PAGE_HEADER_SIZE and use scanner context to stitch together header buffer
- [IMPALA-1410](#): accept "single character" character classes in regex functions
- [IMPALA-1411](#): Create table as select produces incorrect results
- [IMPALA-1416](#) - Queries fail with metastore exception after upgrade and compute stats
- [OOZIE-2034](#) - Disable SSLv3 (POODLEbleed vulnerability)
- [OOZIE-2063](#) - Cron syntax creates duplicate actions
- [PARQUET-107](#) - Add option to disable summary metadata aggregation after MR jobs
- [SPARK-3788](#) - Yarn dist cache code is not friendly to HDFS HA, Federation
- [SPARK-3661](#) - spark.*.memory is ignored in cluster mode
- [SPARK-3979](#) - Yarn backend's default file replication should match HDFS' default one
- [SPARK-1720](#) - use LD_LIBRARY_PATH instead of -Djava.library.path

CDH 5.2.0

Apache HBase

hbase.zookeeper.useMulti set to false by default

The default value of `hbase.zookeeper.useMulti` was changed from `true` to `false` in CDH 5. In CDH 5.2, the default is changed back to `true`. This affects environments with HBase replication enabled and large replication queues.

Cloudera Bug: CDH-22716

Workaround: Enable `hbase.zookeeper.useMulti` by setting the value to `true` in `hbase-site.xml`.

Apache Hadoop

Hadoop shell commands which reference the root directory ("/") do not work

Bug: [HDFS-5888](#)

Workaround: None

ResourceManager High Availability with manual failover does not work on secure clusters

Bug: [YARN-1640](#)

Workaround: Enable automatic failover; this requires ZooKeeper.

Apache Hive

*Select * fails on Parquet tables with the map data type*

Bug: [HIVE-6575](#)

Severity: Low

Workaround: Use the map's column name in the `SELECT` statement.

Cloudera Search

Malicious users could update information by circumventing Sentry checks

A sophisticated malicious user could update restricted content by setting the `update.distrib` parameter to bypass Sentry's index-level checks.

With Search for CDH 5.2 and later, Sentry always checks for index-level access control settings, preventing unauthorized updates.

Bug: None.

Severity: Medium.

Workaround: None.

Kerberos name rules were not followed

`SOLR_AUTHENTICATION_KERBEROS_NAME_RULES`, which is specified in `/etc/default/solr` or `/opt/cloudera/parcels/CDH-*/etc/default/solr` would sometimes not be respected, even if those rules were also specified using the `hadoop.security.auth_to_local` property in `SOLR_HDFS_CONFIG/core-site.xml`.

With Search for CDH 5.2 and later, Kerberos name rules are followed.

Bug: None.

Workaround: None.

Issues Fixed in CDH 5.1.x

The following topics describe issues fixed in CDH 5.1.x, from newest to oldest release. You can also review [What's New in CDH 5.1.x](#) on page 1854 or [Known Issues in CDH 5](#) on page 1944.

Issues Fixed in CDH 5.1.7

Upstream Issues Fixed

CDH 5.1.7 includes the following issues fixed upstream:

- [HDFS-7960](#) - The full block report should prune zombie storages even if they're not empty
- [HDFS-7278](#) - Add a command that allows sysadmins to manually trigger full block reports from a DN
- [HDFS-6831](#) - Inconsistency between 'hdfs dfsadmin' and 'hdfs dfsadmin -help'
- [HDFS-7596](#) - NameNode should prune dead storages from storageMap
- [HDFS-7208](#) - NN doesn't schedule replication when a DN storage fails
- [HDFS-7575](#) - Upgrade should generate a unique storage ID for each volume
- [HDFS-6529](#) - Trace logging for RemoteBlockReader2 to identify remote datanode and file being read
- [YARN-570](#) - Time strings are formatted in different timezone
- [YARN-2251](#) - Avoid negative elapsed time in JHS/MRAM web UI and services
- [YARN-2588](#) - Standby RM does not transitionToActive if previous transitionToActive is failed with ZK exception.
- [HIVE-8634](#) - HiveServer2 fair scheduler queue mapping doesn't handle the secondary groups rules correctly
- [HIVE-8634](#) - HiveServer2 fair scheduler queue mapping doesn't handle the secondary groups rules correctly
- [HIVE-6403](#) - uncorrelated subquery is failing with `auto.convert.join=true`
- [HIVE-5945](#) - `ql.plan.ConditionalResolverCommonJoin.resolveMapJoinTask` also sums those tables which are not used in the child of this conditional task.
- [HIVE-8916](#) - Handle `user@domain` username under LDAP authentication
- [HIVE-8874](#) - Error Accessing HBase from Hive via Oozie on Kerberos 5.0.1 cluster
- [HIVE-9716](#) - Map job fails when table's LOCATION does not have scheme
- [HIVE-8784](#) - Querying partition does not work with JDO enabled against PostgreSQL
- [HUE-2484](#) - [beeswax] Configure support for Hive Server2 LDAP authentication
- [HUE-2446](#) - Migrating from CDH 4.7 to CDH 5.0.1+/Hue 3.5+ will fail
- [PARQUET-107](#) - Add option to disable summary metadata aggregation after MR jobs

- [SOLR-6268](#) - HdfsUpdateLog has a race condition that can expose a closed HDFS FileSystem instance and should close it's FileSystem instance if either inherited close method is called.
- [SOLR-6393](#) - Improve transaction log replay speed on HDFS.
- [SOLR-6403](#) - TransactionLog replay status logging.
- [IMPALA-1801](#) - external-data-source-executor leaking global jni refs
- [IMPALA-1794](#) - Fix infinite loop opening/closing file w/ invalid metadata
- [IMPALA-1674](#) - Fix serious memory leak in TSaslTransport
- [IMPALA-1668](#) - Fix leak of transport objects in TSaslServerTransport::Factory
- [IMPALA-1556](#) - TSaslTransport.read() should return available data before next frame
- [IMPALA-1565](#) - Python sasl client transport perf issue
- [IMPALA-1556](#) - Sasl transport should be wrapped with buffered transport
- [IMPALA-1442](#) - Better fix for non-buffered SASL transports The Thrift SASL implementation relies on the

Apache Commons Collections deserialization vulnerability

Cloudera has learned of a potential security vulnerability in a third-party library called the [Apache Commons Collections](#). This library is used in products distributed and supported by Cloudera (“Cloudera Products”), including core Apache Hadoop. The Apache Commons Collections library is also in widespread use beyond the Hadoop ecosystem. At this time, no specific attack vector for this vulnerability has been identified as present in Cloudera Products.

In an abundance of caution, we are currently in the process of incorporating a version of the Apache Commons Collections library with a fix into the Cloudera Products. In most cases, this will require coordination with the projects in the Apache community. One example of this is tracked by [HADOOP-12577](#).

The Apache Commons Collections potential security vulnerability is titled “Arbitrary remote code execution with InvokerTransformer” and is tracked by [COLLECTIONS-580](#). MITRE has not issued a CVE, but related [CVE-2015-4852](#) has been filed for the vulnerability. CERT has issued [Vulnerability Note #576313](#) for this issue.

Releases affected: CDH 5.5.0, CDH 5.4.8 and lower, CDH 5.3.8 and lower, CDH 5.2.8 and lower, CDH 5.1.7 and lower, Cloudera Manager 5.5.0, Cloudera Manager 5.4.8 and lower, Cloudera Manager 5.3.8 and lower, and Cloudera Manager 5.2.8 and lower, Cloudera Manager 5.1.6 and lower, Cloudera Manager 5.0.7 and lower, Cloudera Navigator 2.4.0, Cloudera Navigator 2.3.8 and lower.

Users affected: All

Impact: This potential vulnerability may enable an attacker to execute arbitrary code from a remote machine without requiring authentication.

Immediate action required: Upgrade to Cloudera Manager 5.5.1 and CDH 5.5.1, Cloudera Manager 5.4.9 and CDH 5.4.9, Cloudera Manager 5.3.9 and CDH 5.3.9, and Cloudera Manager 5.2.9 and CDH 5.2.9, and Cloudera Manager 5.1.7 and CDH 5.1.7, and Cloudera Manager 5.0.8 and CDH 5.0.8.

Issues Fixed in CDH 5.1.5

This is a maintenance release that fixes the following issues:

- [HDFS-7960](#) - The full block report should prune zombie storages even if they're not empty
- [HDFS-7278](#) - Add a command that allows sysadmins to manually trigger full block reports from a DN
- [HDFS-6831](#) - Inconsistency between 'hdfs dfsadmin' and 'hdfs dfsadmin -help'
- [HDFS-7596](#) - NameNode should prune dead storages from storageMap
- [HDFS-7208](#) - NN doesn't schedule replication when a DN storage fails
- [HDFS-7575](#) - Upgrade should generate a unique storage ID for each volume
- [HDFS-6529](#) - Trace logging for RemoteBlockReader2 to identify remote datanode and file being read
- [YARN-570](#) - Time strings are formatted in different timezone
- [YARN-2251](#) - Avoid negative elapsed time in JHS/MRAM web UI and services
- [YARN-2588](#) - Standby RM does not transitionToActive if previous transitionToActive is failed with ZK exception.
- [HIVE-8634](#) - HiveServer2 fair scheduler queue mapping doesn't handle the secondary groups rules correctly
- [HIVE-8634](#) - HiveServer2 fair scheduler queue mapping doesn't handle the secondary groups rules correctly

- [HIVE-6403](#) - uncorrelated subquery is failing with auto.convert.join=true
- [HIVE-5945](#) - ql.plan.ConditionalResolverCommonJoin.resolveMapJoinTask also sums those tables which are not used in the child of this conditional task.
- [HIVE-8916](#) - Handle user@domain username under LDAP authentication

- [IMPALA-1442](#) - Better fix for non-buffered SASL transports The Thrift SASL implementation relies on the

Issues Fixed in CDH 5.1.4

CDH 5.1.4 fixes the following issues, organized by component. See [What's New in CDH 5.1.x](#) on page 1854 for a list of the most important upstream problems fixed in this release.

HTTPS does not work on the HTTPS configured port

If you enable HTTPS (TLS/SSL) for YARN services, these services (including ResourceManager, NodeManager, and Job History Server) will not continue to use non-secure HTTP, but HTTPS does not work on the HTTPS configured port.

Bug: [YARN-1553](#)

Workaround: None.

Upstream Issues Fixed

In addition to the above, CDH 5.1.4 includes the following issues fixed upstream:

- [DATAFU-68](#) - SampleByKey can throw NullPointerException
- [HADOOP-11243](#) - SSLFactory shouldn't allow SSLv3
- [HADOOP-11156](#) - DelegateToFileSystem should implement getFsStatus(final Path f).
- [HDFS-7391](#) - Reenable SSLv2Hello in HttpFS
- [HDFS-7235](#) - DataNode#transferBlock should report blocks that don't exist using reportBadBlock
- [HDFS-7274](#) - Disable SSLv3 in HttpFS
- [HDFS-7005](#) - DFS input streams do not timeout
- [HDFS-6376](#) - Distcp data between two HA clusters requires another configuration
- [HDFS-6621](#) - Hadoop Balancer prematurely exits iterations
- [YARN-2273](#) - NPE in ContinuousScheduling thread when we lose a node
- [YARN-2566](#) - DefaultContainerExecutor should pick a working directory randomly
- [YARN-2588](#) - Standby RM does not transitionToActive if previous transitionToActive is failed with ZK exception.
- [YARN-2641](#) - Decommission nodes on -refreshNodes instead of next NM-RM heartbeat
- [YARN-2608](#) - FairScheduler: Potential deadlocks in loading alloc files and clock access
- [HBASE-12376](#) - HBaseAdmin leaks ZK connections if failure starting watchers (ConnectionLossException)

- [HBASE-12366](#) - Add login code to HBase Canary tool
- [HBASE-12098](#) - User granted namespace table create permissions can't create a table
- [HBASE-12087](#) - [0.98] Changing the default setting of hbase.security.access.early_out to true
- [HBASE-11896](#) - LoadIncrementalHFiles fails in secure mode if the namespace is specified
- [HBASE-12054](#) - bad state after NamespaceUpgrade with reserved table names
- [HBASE-12460](#) - Moving Chore to hbase-common module
- [HIVE-5643](#) - ZooKeeperHiveLockManager.getQuorumServers incorrectly appends the custom zk port to quorum hosts
- [HIVE-8675](#) - Increase thrift server protocol test coverage
- [HIVE-8827](#) - Remove SSLv2Hello from list of disabled protocols
- [HIVE-8182](#) - beeline fails when executing multiple-line queries with trailing spaces
- [HIVE-8330](#) - HiveResultSet.findColumn() parameters are case sensitive
- [HIVE-5994](#) - ORC RLEv2 encodes wrongly for large negative BIGINTs (64 bits)
- [HIVE-7629](#) - Problem in SMB Joins between two Parquet tables
- [HIVE-6670](#) - ClassNotFoundException with Serde
- [HIVE-6409](#) - FileOutputCommitterContainer::commitJob() cancels delegation tokens too early.
- [HIVE-7647](#) - Beeline does not honor --headerInterval and --color when executing with \
- [HIVE-7441](#) - Custom partition scheme gets rewritten with hive scheme upon concatenate
- [HIVE-5871](#) - Use multiple-characters as field delimiter
- [HIVE-1363](#) - SHOW TABLE EXTENDED LIKE command does not strip single/double quotes
- [HIVE-5989](#) - Hive metastore authorization check is not threadsafe
- [HUE-2438](#) - [core] Disable SSLv3 for Poodle vulnerability
- [HUE-2291](#) - [oozie] Faster dashboard display
- [IMPALA-1334](#) - Impala does not map principals to lowercase, affecting Sentry authorisation
- [IMPALA-1251](#) - High-offset queries hang
- [IMPALA-1338](#) - HDFS does not return all ACLs in getAclStatus()
- [IMPALA-1279](#) - Impala does not employ ACLs when checking path permissions for LOAD and INSERT
- [OOZIE-2034](#) - Disable SSLv3 (POODLEbleed vulnerability)
- [OOZIE-2063](#) - Cron syntax creates duplicate actions
- [SENTRY-428](#) - Sentry service should periodically renew the server kerberos ticket
- [SENTRY-431](#) - Sentry db provider client should attempt to refresh kerberos ticket before connection
- [SPARK-3606](#) - Spark-on-Yarn AmlpFilter does not work with Yarn HA

Issues Fixed in CDH 5.1.3

CDH 5.1.3 fixes the following issues, organized by component. See [New Features and Changes in CDH 5](#) on page 1812 for a list of the most important upstream problems fixed in this release.

Apache Hadoop

The default setting of `dfs.client.block.write.replace-datanode-on-failure.policy` can cause an unrecoverable error in small clusters

The default setting of `dfs.client.block.write.replace-datanode-on-failure.policy` (DEFAULT) can cause an unrecoverable error in a small cluster during HBase rolling restart.

Bug: [HDFS-4257](#)

Workaround: Set `dfs.client.block.write.replace-datanode-on-failure.policy` to NEVER for 1- 2- or 3-node clusters, and leave it as DEFAULT for all other clusters. Leave `dfs.client.block.write.replace-datanode-on-failure.enable` set to true.

Upstream Issues Fixed

In addition to the above, CDH 5.1.3 includes the following issues fixed upstream.

- [HADOOP-11035](#) - distcp on mr1(branch-1) fails with NPE using a short relative source path.

- [HBASE-10188](#) - Hide ServerName constructor
- [HBASE-10012](#) - Hide ServerName constructor
- [HBASE-11349](#) - [Thrift] support authentication/impersonation
- [HBASE-11446](#) - Reduce the frequency of RNG calls in SecureWALCellCodec#EncryptedKvEncoder
- [HBASE-11457](#) - Increment HFile block encoding IVs accounting for cipher's internal use
- [HBASE-11474](#) - [Thrift2] support authentication/impersonation
- [HBASE-11565](#) - Stale connection could stay for a while
- [HBASE-11627](#) - RegionSplitter's rollingSplit terminated with "/ by zero", and the `_balancedSplit` file was not deleted properly
- [HBASE-11788](#) - hbase is not deleting the cell when a Put with a KeyValue, KeyValue.Type.Delete is submitted
- [HBASE-11828](#) - Callers of ServerName.valueOf should use equals and not ==
- [HDFS-4257](#) - The ReplaceDatanodeOnFailure policies could have a forgiving option
- [HDFS-6776](#) - Using distcp to copy data between insecure and secure cluster via webhdfs does not work
- [HDFS-6908](#) - Incorrect snapshot directory diff generated by snapshot deletion
- [HUE-2247](#) - [Impala] Support pass-through LDAP authentication
- [HUE-2295](#) - [librdbs] External oracle DB connection is broken due to a typo
- [HUE-2273](#) - [desktop] Blacklisting apps with existing document will break home page
- [HUE-2318](#) - [desktop] Documents shared with write group permissions are not editable
- [HIVE-5087](#) - Rename npath UDF to matchpath
- [HIVE-6820](#) - HiveServer(2) ignores HIVE_OPTS
- [HIVE-7635](#) - Query having same aggregate functions but different case throws IndexOutOfBoundsException
- [IMPALA-958](#) - Excessively long query plan serialization time in FE when querying huge tables
- [IMPALA-1091](#) - Improve TScanRangeLocation struct and associated code
- [OOZIE-1989](#) - NPE during a rerun with forks
- [YARN-1458](#) - FairScheduler: Zero weight can lead to livelock

Issues Fixed in CDH 5.1.2

CDH 5.1.2 fixes the following issues, organized by component. See [What's New in CDH 5.1.x](#) on page 1854 for a list of the most important upstream problems fixed in this release.

Apache Hadoop

Jobs can hang on NodeManager decommission owing to a race condition when continuous scheduling is enabled.

Bug: [YARN-2273](#)

Workaround: Disable continuous scheduling by setting `yarn.scheduler.fair.continuous-scheduling-enabled` to false

Apache HBase

Sending a large amount of invalid data to the Thrift service can cause it to crash

Bug: [HBASE-11052](#).

Workaround: None. This is a longstanding problem, not a new issue in CDH 5.1.

The metric `ageOfLastShippedOp` never decreases

This can cause it to appear as though the cluster is in an inconsistent state even when there is no problem.

Bug: [HBASE-11143](#).

Workaround: None.

Upstream Issues Fixed

In addition to the above, CDH 5.1.2 includes the following issues fixed upstream.

- [FLUME-2438](#)
- [HBASE-11052](#)

- [HBASE-11143](#)
- [HBASE-11609](#)
- [HDFS-6114](#)
- [HDFS-6640](#)
- [HDFS-6703](#)
- [HDFS-6788](#)
- [HDFS-6825](#)

- [MAPREDUCE-6012](#)
- [OOZIE-1920](#)
- [PARQUET-19](#)
- [SENTRY-363](#)
- [YARN-2273](#)
- [YARN-2274](#)
- [YARN-2313](#)
- [YARN-2352](#)
- [YARN-2359](#)

Issues Fixed in CDH 5.1.0

Apache Hadoop

HDFS

The same DataNodes may appear in the NameNode web UI in both the live and dead node lists

Bug: [HDFS-6180](#)

Workaround: None

MapReduce

YARN Fair Scheduler's Cluster Utilization Threshold check is broken

Bug: [YARN-1640](#)

Workaround: Set the `yarn.scheduler.fair.preemption.cluster-utilization-threshold` property in `yarn-site.xml` to -1.

ResourceManager High Availability with manual failover does not work on secure clusters

Bug: [YARN-2155](#)

Workaround: Enable automatic failover; this requires ZooKeeper.

Apache HBase

MapReduce over HBase Snapshot bypasses HBase-level security

The MapReduce over HBase Snapshot bypasses HBase-level security completely since the files are read from the HDFS directly. The user who is running the scan/job has to have read permissions to the data and snapshot files.

Bug: [HBASE-8369](#)

Workaround: MapReduce users must be trusted to process/view all data in HBase.

HBase snapshots now saved to the /<hbase>/hbase-snapshot directory

HBase snapshots are now saved to the /<hbase>/hbase-snapshot directory instead of the /hbase/.snapshot directory. This was a conflict introduced by the HDFS snapshot feature in Hadoop 2.2/CDH 5 HDFS.

Bug: [HBASE-8352](#)

Workaround: This should be handled in the upgrade process.

Hue

Oozie jobs don't support ResourceManager HA in YARN

If the ResourceManager fails, the workflow will fail.

Bug: None

Severity: Medium

Workaround: None

Apache Oozie

Oozie HA does not work properly with HCatalog integration or SLA notifications

This issue appears when you are using HCatalog as a data dependency in a coordinator; using HCatalog from an action (for example, Pig) works correctly.

Bug: [OOZIE-1492](#)

Workaround: None

Issues Fixed in CDH 5.0.x

The following topics describe issues fixed in CDH 5.0.x, from newest to oldest release. You can also review [What's New in CDH 5.0.x](#) on page 1858 or [Known Issues in CDH 5](#) on page 1944.

Issues Fixed in CDH 5.0.6

Upstream Issues Fixed

The following upstream issues are fixed in CDH 5.0.6:

- [HDFS-7960](#) - The full block report should prune zombie storages even if they're not empty
- [HDFS-7278](#) - Add a command that allows sysadmins to manually trigger full block reports from a DN
- [HDFS-6831](#) - Inconsistency between `hdfs dfsadmin` and `hdfs dfsadmin -help`
- [HDFS-7596](#) - NameNode should prune dead storages from `storageMap`
- [HDFS-7208](#) - NN does not schedule replication when a DN storage fails
- [HDFS-7575](#) - Upgrade should generate a unique storage ID for each volume
- [YARN-570](#) - Time strings are formatted in different timezone
- [YARN-2251](#) - Avoid negative elapsed time in JHS/MRAM web UI and services
- [HIVE-8874](#) - Error Accessing HBase from Hive via Oozie on Kerberos 5.0.1 cluster
- [SOLR-6268](#) - `HdfsUpdateLog` has a race condition that can expose a closed HDFS `FileSystem` instance and should close its `FileSystem` instance if either inherited close method is called.
- [SOLR-6393](#) - Improve transaction log replay speed on HDFS.
- [SOLR-6403](#) - `TransactionLog` replay status logging.

Issues Fixed in CDH 5.0.5

"POODLE" Vulnerability on TLS/SSL enabled ports

The POODLE (Padding Oracle On Downgraded Legacy Encryption) attack takes advantage of a cryptographic flaw in the obsolete SSLv3 protocol, after first forcing the use of that protocol. The only solution is to disable SSLv3 entirely.

This requires changes across a wide variety of components of CDH and Cloudera Manager in all current versions. CDH 5.0.5 provides these changes for CDH 5.0.x deployments.

For more information, see the [Cloudera Security Bulletin](#).

Apache Hadoop Distributed Cache Vulnerability

The Distributed Cache Vulnerability allows a malicious cluster user to expose private files owned by the user running the YARN NodeManager process. For more information, see the [Cloudera Security Bulletin](#).

Upstream Issues Fixed

CDH 5.0.4 includes the following issues fixed upstream.

- [HADOOP-11243](#) - SSLFactory shouldn't allow SSLv3
- [HDFS-7274](#) - Disable SSLv3 in HttpFS
- [HDFS-7391](#) - Reenable SSLv2Hello in HttpFS
- [HBASE-12376](#) - HBaseAdmin leaks ZK connections if failure starting watchers (ConnectionLossException)
- [HIVE-8675](#) - Increase thrift server protocol test coverage
- [HIVE-8827](#) - Remove SSLv2Hello from list of disabled protocols protocols
- [HUE-2438](#) - [core] Disable SSLv3 for Poodle vulnerability
- [OOZIE-2034](#) - Disable SSLv3 (POODLEbleed vulnerability)
- [OOZIE-2063](#) - Cron syntax creates duplicate actions

Issues Fixed in CDH 5.0.4

Upstream Issues Fixed

CDH 5.0.4 includes the following issues fixed upstream.

- [FLUME-2438](#)
- [HBASE-11609](#)
- [HDFS-6044](#)
- [HDFS-6529](#)

Issues Fixed in CDH 5.0.3

The following topics describe known issues fixed in CDH 5.0.3. See [What's New in CDH 5.0.x](#) on page 1858 for a list of the most important upstream problems fixed in this release.

CDH 5 Release Notes

Apache Hadoop

MapReduce

YARN Fair Scheduler's Cluster Utilization Threshold check is broken

Bug: [YARN-2155](#)

Workaround: Set the `yarn.scheduler.fair.preemption.cluster-utilization-threshold` property in `yarn-site.xml` to -1.

Apache Oozie

When Oozie is configured to use MRv1 and TLS/SSL, YARN / MRv2 libraries are erroneously included in the classpath instead

This problem causes much of the configured Oozie functionality to be unusable.

Bug: None

Workaround: Use a different configuration (non-TLS/SSL or YARN), if possible.

Upstream Issues Fixed

In addition to the above, CDH 5.0.2 includes the following issues fixed upstream.

- [FLUME-2245](#)
- [FLUME-2416](#)
- [HBASE-10871](#)
- [HDFS-5891](#)
- [HDFS-6021](#)

- [HDFS-6475](#)
- [HDFS-6510](#)
- [HDFS-6527](#)
- [HDFS-6563](#)
- [HUE-1928](#)
- [HUE-2184](#)
- [HUE-2085](#)
- [HUE-2192](#)
- [HUE-2193](#)
- [OOZIE-1621](#)
- [OOZIE-1890](#)
- [OOZIE-1907](#)
- [SOLR-5593](#)
- [SOLR-5915](#)
- [SOLR-6161](#)
- [YARN-1550](#)
- [YARN-2155](#)

Issues Fixed in CDH 5.0.2

The following topics describe known issues fixed in CDH 5.0.2. See [What's New in CDH 5.0.x](#) on page 1858 for a list of the most important upstream problems fixed in this release.

Apache Hadoop

CDH 5 clients running releases 5.0.1 and earlier cannot use WebHDFS to connect to a CDH 4 cluster

For example, a `hadoop fs -ls webhdfs` command run from the CDH 5 client to the CDH 4 cluster produces an error such as the following:

```
Found 21 items
ls: Invalid value for webhdfs parameter "op": No enum const class
org.apache.hadoop.hdfs.web.resources.GetOpParam.Op.GETACLSTATUS
```

Bug: [HDFS-6326](#)

Workaround: None; note that this is fixed as of CDH 5.0.2.

Apache HBase

Endless Compaction Loop

If an empty HFile whose max timestamp is past its TTL (time-to-live) is selected for compaction, it is compacted into another empty HFile, which is selected for compaction, creating an endless compaction loop.

Bug: [HBASE-10371](#)

Workaround: None

Upstream Issues Fixed

In addition to the above, CDH 5.0.2 includes the following issues fixed upstream.

- [HADOOP-10556](#)
- [HADOOP-10638](#)
- [HADOOP-10639](#)
- [HADOOP-10658](#)
- [HBASE-6690](#)
- [HBASE-10312](#)
- [HBASE-10371](#)
- [HDFS-6326](#)
- [HIVE-5380](#)
- [HIVE-6913](#)
- [PIG-3677](#)
- [YARN-2073](#)

Issues Fixed in CDH 5.0.1

Apache Hadoop

HDFS

NameNode LeaseManager may crash

Bug: [HDFS-6148](#)/[HDFS-6094](#)

Workaround: Restart the NameNode.

Some group mapping providers can cause the NameNode to crash

In certain environments, some group mapping providers can cause the NameNode to segfault and crash.

Bug: [HADOOP-10442](#)

Workaround: Configure either `ShellBasedUnixGroupsMapping` in Hadoop or configure SSSD in the operating system on the NameNode.

Apache Hive

CREATE TABLE AS SELECT (CTAS) does not work with Parquet files

Since CTAS does not work with Parquet files, the following example will return null values.

```
CREATE TABLE test_data(column1 string);
LOAD DATA LOCAL INPATH './data.txt' OVERWRITE INTO TABLE test_data;

CREATE TABLE parquet_test
ROW FORMAT SERDE 'parquet.hive.serde.ParquetHiveSerDe'
  STORED AS
  INPUTFORMAT 'parquet.hive.DeprecatedParquetInputFormat'
  OUTPUTFORMAT 'parquet.hive.DeprecatedParquetOutputFormat'
AS
  SELECT column1 FROM test_data;

SELECT * FROM parquet_test;
SELECT column1 FROM parquet_test;
```

Bug: [HIVE-6375](#)

Workaround: A workaround for this is to follow up a CREATE TABLE query with an INSERT OVERWRITE TABLE SELECT * as in the example below.

```
CREATE TABLE parquet_test (column1 string)
ROW FORMAT SERDE 'parquet.hive.serde.ParquetHiveSerDe'
  STORED AS
  INPUTFORMAT 'parquet.hive.DeprecatedParquetInputFormat'
  OUTPUTFORMAT 'parquet.hive.DeprecatedParquetOutputFormat';
INSERT OVERWRITE TABLE parquet_test SELECT * from test_data;
```

Apache Oozie

The oozie-workflow-0.4.5 schema has been removed

Workflows using schema 0.4.5 will no longer be accepted by Oozie because this schema definition version has been removed.

Bug: [OOZIE-1768](#)

Workaround: Use schema 0.5. It's backwards compatible with 0.4.5, so updating the workflow is as simple as changing the schema version number.

Upstream Issues Fixed

In addition to the above, CDH 5.0.1 includes the following issues fixed upstream.

- [HADOOP-10442](#) - Group look-up can cause segmentation fault when a certain JNI-based mapping module is used.
- [HADOOP-10456](#) - Bug in Configuration.java exposed by Spark (ConcurrentModificationException)
- [HDFS-5064](#) - Standby checkpoints should not block concurrent readers
- [HDFS-6039](#) - Uploading a File under a Dir with default ACLs throws "Duplicated ACLFeature"
- [HDFS-6094](#) - The same block can be counted twice towards safe mode threshold
- [HDFS-6231](#) - DFSClient hangs infinitely if using hedged reads and all eligible DataNodes die
- [HIVE-6495](#) - TableDesc.getDeserializer() should use correct classloader when calling Class.forName()
- [HIVE-6575](#) - select * fails on parquet table with map data type
- [HIVE-6648](#) - Fixed permission inheritance for multi-partitioned tables
- [HIVE-6740](#) - Fixed addition of Avro JARs to classpath
- [HUE-2061](#) - Task logs are not retrieved if containers not on the same host
- [OOZIE-1794](#) - java-opts and java-opt in the Java action don't always work properly in YARN
- [SOLR-5608](#) - Frequently reproducible failures in CollectionsAPIDistributedZkTest#testDistribSearch
- [YARN-1924](#) - STATE_STORE_OP_FAILED happens when ZKRMStateStore tries to update app(attempt) before storing it

Issues Fixed in CDH 5.0.0

Apache Flume

AsyncHBaseSink does not work in CDH 5 Beta 1 and CDH 5 Beta 2

Bug: None

Workaround: Use the HBASE sink (`org.apache.flume.sink.hbase.HBaseSink`) to write to HBase in CDH 5 Beta releases.

Apache Hadoop

HDFS

DataNode can consume 100 percent of one CPU

A narrow race condition can cause one of the threads in the DataNode process to get stuck in a tight loop and consume 100 percent of one CPU.

Bug: [HDFS-5922](#)

Workaround: Restart the DataNode process.

HDFS NFS gateway does not work with Kerberos-enabled clusters

Bug: [HDFS-5898](#)

Workaround: None.

Cannot browse filesystem via NameNode Web UI if any directory has the sticky bit set

When listing any directory which contains an entry that has the sticky bit permission set, for example `/tmp` is often set this way, nothing will appear where the list of files or directories should be.

Bug: [HDFS-5921](#)

Workaround: Use the Hue File Browser.

Appending to a file that has been snapshotted previously will append to the snapshotted file as well

If you append content to a file that exists in snapshot, the file in snapshot will have the same content appended to it, invalidating the original snapshot.

Bug: See also [HDFS-5343](#)

Workaround: None

MapReduce

In MRv2 (YARN), the JobHistory Server has no information about a job if the ApplicationMasters fails while the job is running

Bug: None

Workaround: None.

Apache HBase

An empty rowkey is treated as the first row of a table

An empty rowkey is allowed in HBase, but it was treated as the first row of the table, even if it was not in fact the first row. Also, multiple rows with empty rowkeys caused issues.

Bug: [HBASE-3170](#)

Workaround: Do not use empty rowkeys.

Apache Hive

Hive queries that combine multiple splits and query large tables fail on YARN

Hive queries that scan large tables, or perform map side joins may fail with the following exception when the query is run using YARN:

```
java.io.IOException: Max block location exceeded for split:
InputFormatClass: org.apache.hadoop.mapred.TextInputFormat
```

```
splitsize: 21 maxsize: 10

at org.apache.hadoop.hive.ql.exec.Task.executeTask(Task.java:151)
at org.apache.hadoop.hive.ql.exec.TaskRunner.runSequential(TaskRunner.java:65)
```

Bug: [MAPREDUCE-5186](#)

Workaround: Set `mapreduce.job.max.split.locations` to a high value such as 100.

Files in Avro tables no longer have .avro extension

As of CDH 4.3.0 Hive no longer creates files in Avro tables with the `.avro` extension by default. This does not cause any problems in Hive, but could affect downstream components such as Pig, MapReduce, or Sqoop 1 that expect files with the `.avro` extension.

Bug: None

Workaround: Manually set the extension to `.avro` before using a query that inserts data into your Avro table. Use the following `set` statement:

```
set hive.output.file.extension=".avro";
```

Apache Oozie

Oozie does not work seamlessly with ResourceManager HA

Oozie workflows are not recovered on ResourceManager failover when ResourceManager HA is enabled. Further, users cannot specify the `clusterId` for JobTracker to work against either ResourceManager.

Bug: None

Workaround: On non-secure clusters, users are required to specify either of the ResourceManagers' `host:port`. For secure clusters, users are required to specify the Active ResourceManager's `host:port`.

When using Oozie HA with security enabled, some znodes have world ACLs

Oozie High Availability with security enabled will still work, but a malicious user or program can alter znodes used by Oozie for locking, possibly causing Oozie to be unable to finish processing certain jobs.

Bug: [OOZIE-1608](#)

Workaround: None

Oozie and Sqoop 2 may need additional configuration to work with YARN

In CDH 5, MRv2 (YARN) MapReduce 2.0 is recommended over the Hadoop 0.20-based MRv1. The default configuration may not reflect this in Oozie and Sqoop 2 in CDH 5 Beta 2, however, unless you are using Cloudera Manager.

Bug: None

Workaround: Check the value of `CATALINA_BASE` in `/etc/oozie/conf/oozie-env.sh` (if you are running an Oozie server) and `/etc/default/sqoop2-server` (if you are using a Sqoop 2 server). You should also ensure that `CATALINA_BASE` is correctly set in your environment if you are invoking `/usr/bin/sqoop2-server` directly instead of using the service `init` scripts. For Oozie, `CATALINA_BASE` should be set to `/usr/lib/oozie/oozie-server` for YARN, or `/usr/lib/oozie/oozie-server-0.20` for MRv1. For Sqoop 2, `CATALINA_BASE` should be set to `/usr/lib/sqoop2/sqoop-server` for YARN, or `/usr/lib/sqoop2/sqoop-server-0.20` on MRv1.

Cloudera Search

Creating cores using the web UI with default values causes the system to become unresponsive

You can use the Solr Server web UI to create new cores. If you click **Create Core** without making any changes to the default attributes, the server may become unresponsive. Checking the log for the server shows a repeated error that begins:

```
ERROR org.apache.solr.cloud.Overseer: Exception in Overseer main queue loop
java.lang.IllegalArgumentException: Path must not end with / character
```

Bug: Solr-5813

Workaround: To avoid this issue, do not create cores without first updating values for the new core in the web UI. For example, you might enter a new name for the core to be created.

If you created a core with default settings and are seeing this error, you can address the problem by finding which node is having problems and removing that node. Find the problematic node by using a tool that can inspect ZooKeeper, such as the Solr Admin UI. Using such a tool, examine items in the ZooKeeper queue, reviewing the properties for the item. The problematic node will have an item in its queue with the property `collection=""`.

Remove the node with the item with the `collection=""` property using a ZooKeeper management tool. For example, you can remove nodes using the ZooKeeper command line tool or recent versions of HUE.

Issues Fixed in CDH 5 Beta Releases

The following topics describe issues fixed in CDH 5 Beta 2, after being discovered in CDH 5 Beta 1. You can also review [What's New In CDH 5 Beta Releases](#) on page 1861 or [Known Issues in CDH 5](#) on page 1944.

Issues Fixed in CDH 5 Beta 2

Apache Hadoop

MapReduce

ResourceManager High Availability does not work on secure clusters

If JobTrackers in an High Availability configuration are shut down, migrated to new hosts, then restarted, no JobTracker becomes active. The logs show a `Mismatched address` exception.

Bug: None

Workaround: None.

Default port conflicts

By default, the Shuffle Handler (which runs inside the YARN NodeManager), the REST server, and many third-party applications, all use port 8080. This will result in conflicts if you deploy more than one of them without reconfiguring the default port.

Bug: None

Workaround: Make sure at most one service uses port 8080. To reconfigure the REST server, follow [these instructions](#). To change the default port for the Shuffle Handler, set the value of `mapreduce.shuffle.port` in `mapred-site.xml` to an unused port.

JobTracker memory leak

The JobTracker has a memory leak caused by subtleties in the way `UserGroupInformation` interacts with the file-system cache. The number of cached file system objects can grow without bound.

Bug: [MAPREDUCE-5508](#)

Workaround: Set `keep.failed.task.files` to true, which will sidestep the memory leak but require job staging directories to be cleaned out manually.

Hue

Running a Hive Beeswax metastore on the same host as the Hue server will result in Simple Authentication and Security Layer (SASL) authentication failures on a Kerberos-enabled cluster

Bug: None

Workaround: The simple workaround is to run the metastore server remotely on a different host and make sure all Hive and Hue configurations properly refer to it. A more complex workaround is to adjust network configurations to ensure that reverse DNS properly resolves the host's address to its fully qualified-domain name (FQDN) rather than `localhost`.

The Pig shell does not work when NameNode uses a wildcard address

The Pig shell does not work from Hue if you use a wildcard for the NameNode's RPC or HTTP bind address. For example, `dfs.namenode.http-address` must be a real, routable address and port, not `0.0.0.0.<port>`.

Bug: [HUE-1060](#)

Workaround: Use a real, routable address and port, not `0.0.0.0.<port>`, for the NameNode; or use the Pig application directly, rather than from Hue.

Apache Sqoop

Oozie and Sqoop 2 may need additional configuration to work with YARN

In CDH 5, MRv2 (YARN) MapReduce 2.0 is recommended over the Hadoop 0.20-based MRv1. The default configuration may not reflect this in Oozie and Sqoop 2 in CDH 5 Beta 2, however, unless you are using Cloudera Manager.

Bug: None

Workaround: Check the value of `CATALINA_BASE` in `/etc/oozie/conf/oozie-env.sh` (if you are running an Oozie server) and `/etc/default/sqoop2-server` (if you are using a Sqoop 2 server). You should also ensure that `CATALINA_BASE` is correctly set in your environment if you are invoking `/usr/bin/sqoop2-server` directly instead of using the service `init` scripts. For Oozie, `CATALINA_BASE` should be set to `/usr/lib/oozie/oozie-server` for YARN, or `/usr/lib/oozie/oozie-server-0.20` for MRv1. For Sqoop 2, `CATALINA_BASE` should be set to `/usr/lib/sqoop2/sqoop-server` for YARN, or `/usr/lib/sqoop2/sqoop-server-0.20` on MRv1.

Apache Sentry (incubating)

Sentry allows unauthorized access to a directory whose name includes the scratch directory name as a prefix

As an example, if the scratch directory path is `/tmp/hive`, and you create a directory `/tmp/hive-data`, Sentry allows unauthorized read/write access to `/tmp/hive-data`.

Bug: None

Workaround: For external tables or data export location, do not use a pathname that includes the scratch directory name as a prefix. For example, if the scratch directory is `/tmp/hive`, do not locate external tables or exported data in `/tmp/hive-data` or any directory whose path uses `"/tmp/hive-"` as a prefix.

Apache Oozie

Oozie Hive action against HiveServer2 fails on a secure cluster

Workaround: None

Fixed Issues in Apache Impala

The following sections describe the major issues fixed in each Impala release.

For known issues that are currently unresolved, see [Apache Impala Known Issues](#) on page 1995.

Issues Fixed in Impala for CDH 5.16.2

For the full list of fixed issues for all CDH components in CDH 5.16.2, see [Issues Fixed in CDH 5.16.x](#) on page 2054. The following list represents the subset of fixed Impala JIRAs from the CDH fixed issues.

- [IMPALA-6323](#) - Impala now supports a constant in the window specifications.
- [IMPALA-7960](#) - Impala now returns a correct result when comparing `TIMESTAMP` to a string literal in a binary predicate where the `TIMESTAMP` is casted to `VARCHAR` of smaller length.
- [IMPALA-7961](#) - Fixed an issue where queries running with the `SYNC_DDL` query option can fail when the Catalog Server is under a heavy load with concurrent catalog operations of long-running DDLs.
- [IMPALA-8058](#) - Fixed cardinality estimates for HBase queries, which could sometimes yield hugely high numbers.
- [IMPALA-8109](#) - Impala can now read the gzip files bigger than 2 GB.
- [IMPALA-8212](#) - Fixed a race condition in the Kerberos authentication code.

Issues Fixed in Impala for CDH 5.16.1

For the full list of fixed issues for all CDH components in CDH 5.16.1, see [Issues Fixed in CDH 5.16.x](#) on page 2054. The following list represents the subset of fixed Impala JIRAs from the CDH fixed issues.

- [IMPALA-6086](#) - Require the `SELECT` privilege on the database for built-in function calls.
- [IMPALA-6451](#) - Fixed the `AuthorizationException` in CTAS for Kudu tables.
- [IMPALA-6479](#) - `DESCRIBE` now respects column level privileges and only shows the columns that the user has the privilege to view.
- [IMPALA-6571](#) - Fixed the `NullPointerException` in `SHOW CREATE TABLE` for HBase tables.
- [IMPALA-7225](#) - `REFRESH..PARTITION` no longer reset the number of rows in a partition.
- [IMPALA-7272](#) - Fixed the crash in `StringMinMaxFilter`.
- [IMPALA-7360](#) - Fixed an issue where Avro scanner sometimes skipped blocks when skip marker was on HDFS block boundary.
- [IMPALA-7419](#) - Fixed the `NullPointerException` in `SimplifyConditionalsRule`.
- [IMPALA-7483](#) - `impalad/catalogd` on JVM deadlock now get aborted.
- [IMPALA-7520](#) - Fixed the `NullPointerException` in `SentryProxy`.

Issues Fixed in Impala for CDH 5.15.2

For the full list of fixed issues for all CDH components in CDH 5.15.2, see [Issues Fixed in CDH 5.15.x](#) on page 2063. The following list represents the subset of fixed Impala JIRAs from the CDH fixed issues.

- [IMPALA-6907](#) - Now Impala correctly closes all stale connections to removed impala cluster members.
- [IMPALA-7225](#) - Fixed an issue where the `REFRESH...PARTITION` statement caused statistics for the refreshed partition to be automatically reset to `-1 (unknown)`. With the fix, statistics will be changed only if an explicit `COMPUTE STATS` statement is issued for an object.
- [IMPALA-7272](#) - Fixed a crash caused by a memory management problem when the query execution requires finding strings inside a range defined by the lesser-than and greater-than comparisons.
- [IMPALA-7360](#) - Fixed an issue where Impala could incorrectly skip data if a record separator in a sequence-based file (Avro, RC or sequence file) straddled an HDFS block boundary.
- [IMPALA-7537](#) - Fixed a security issue where `REVOKE ALL ON SERVER` did not have a permanent effect if the `ALL` permission was granted using the `WITH GRANT` option. Running `INVALIDATE METADATA` no longer causes the permission to reappear.
- [IMPALA-7585](#) - Fixed an issue in KRPC, which can cause slow or hung queries on non-secured clusters.

Issues Fixed in Impala for CDH 5.15.1

For the full list of fixed issues for all CDH components in CDH 5.15.1, see [Issues Fixed in CDH 5.15.x](#) on page 2063. The following list represents the subset of fixed Impala JIRAs from the CDH fixed issues.

- [IMPALA-6687](#) - Fixed `INSERT` with mixed case in partition column names.
- [IMPALA-6822](#) - Added a query option to control shuffling by distinct expressions.
- [IMPALA-6847](#) - Added a work around high memory estimates for admission control.
- [IMPALA-6908](#) - `IsConnResetTEException()` should include `ECONNRESET`.
- [IMPALA-6934](#) - Corrected the wrong results with `EXISTS` subqueries that contain `ORDER BY`, `LIMIT`, and `OFFSET`.
- [IMPALA-7014](#) - Disabled the stacktrace symbolisation by default.

- [IMPALA-7078](#) - Reduced the queue size based on num_scanner_threads.
- [IMPALA-7078](#) - Improved memory consumption of wide Avro scans.
- [IMPALA-7288](#) - Fixed the Codegen crash in FinalizeModule.
- [IMPALA-7298](#) - Impala no longer passes IP address as hostname in Kerberos principal.

Issues Fixed in Impala for CDH 5.15.0

For the full list of fixed issues for all CDH components in CDH 5.15.0, see [Issues Fixed in CDH 5.15.x](#) on page 2063. The following list represents the subset of fixed Impala JIRAs from the CDH fixed issues.

- [IMPALA-4315](#) - Allow `USE` and `SHOW TABLES` if there is at least one table in a database where the user has table or column privileges.
- [IMPALA-4323](#) - The `SET ROW FORMAT` clause was added to the `ALTER TABLE` statement for the `TEXT` or `SEQUENCE` file formats.
- [IMPALA-4886](#) - Table metrics are available in the catalog web UI.
- [IMPALA-5654](#) - Disallows explicitly setting the Kudu table name property for managed Kudu tables in a `CREATE TABLE` and `ALTER TABLE` statements, e.g. `CREATE TABLE t (i INT) STORED AS KUDU TBLPROPERTIES('kudu.table_name' = 'some_name')`.
- [IMPALA-6549](#) - The file handle cache, controlled by the `max_cached_file_handles` flag, is enabled by default.

Issues Fixed in Impala for CDH 5.14.4

For the full list of fixed issues for all CDH components in CDH 5.14.4, see [Issues Fixed in CDH 5.14.x](#) on page 2076. The following list represents the subset of fixed Impala JIRAs from the CDH fixed issues.

- [IMPALA-4315](#) - Users with the column-level privileges can run the `USE` and `SHOW TABLES` statements.
- [IMPALA-5270](#) - Impala now passes fully resolved sort expressions to prevent crashes with inline view and analytic functions.
- [IMPALA-6500](#) - Fixed an issue where Impala crashed under certain hypervisors that returned out-of-range CPU IDs.
- [IMPALA-6687](#) - The `INSERT` statements with mixed case partition column name no longer fails.
- [IMPALA-6822](#) - A new query option, `SHUFFLE_DISTINCT_EXPRS`, is available for disabling shuffling by distinct expressions.
- [IMPALA-6908](#) - The `ECONNRESET` error code handling was added to the `IsConnReset` function that checks if a given exception is due to a stale connection.
- [IMPALA-6934](#) - Correct results returns from the `EXISTS` subquery containing `ORDER BY`, `LIMIT`, and `OFFSET`
- [IMPALA-6954](#) - Fixed a problem with expression rewrites that caused losses of partitions with CTAS into Kudu.
- [IMPALA-7032](#) - Codegen for `CHAR` type null literals are disabled to prevent a crash.

Issues Fixed in Impala for CDH 5.14.2

For the full list of fixed issues for all CDH components in CDH 5.14.2, see [Issues Fixed in CDH 5.14.x](#) on page 2076. The following list represents the subset of fixed Impala JIRAs from the CDH fixed issues.

- [IMPALA-3942](#) - Fixed incorrectly escaped string literal in front-end.
- [IMPALA-4664](#) - Fixed an unexpected string conversion in Shell.
- [IMPALA-5139](#) - Updated `mvn-quiet.sh` to print execution content to log file.
- [IMPALA-5269](#) - Fix the issue with final line of query followed by a comment.
- [IMPALA-5936](#) - The `'%'` operator no longer overflows on large decimals.
- [IMPALA-5940](#) - Impala no longer shows stack tracing with `Status::Expected()`.
- [IMPALA-6008](#) - Creating a UDF from a shared library with a `.ll` extension does not crash Impala.
- [IMPALA-6114](#) - Require type equality for `NumericLiteral::localEquals()`.
- [IMPALA-6284](#) - Mark the intermediate decimal avg struct as packed.
- [IMPALA-6295](#) - Fix mix/max handling of `'nan'` and `'inf'`.
- [IMPALA-6307](#) - CTAS statement fails with duplicate column exception.
- [IMPALA-6348](#) - Redact only sensitive fields in runtime profiles.

- [IMPALA-6353](#) - Impala no longer crashes in snappy decompressor.
- [IMPALA-6384](#) - RequestPoolService should honor custom group mapping config.
- [IMPALA-6388](#) - Fix the Union node number of hosts estimation
- [IMPALA-6418](#) - Find a reliable way to detect supported TLS versions.
- [IMPALA-6435](#) - Disabled codegen for CHAR literals.
- [IMPALA-6454](#) - CTAS into Kudu fails with mixed-case partition or primary key column names.
- [IMPALA-6473](#) - An analytic sorts with the same expression in PARTITION BY and ORDER BY does not return an error.
- [IMPALA-6489](#) - Impala now uses the correct template tuple size.
- [IMPALA-6530](#) - Impala now tracks time spent opening HDFS file handles.
- [IMPALA-6538](#) - Fixed read path when Parquet min/max statistics contain NaN.
- [IMPALA-6542](#) - Fixed inconsistent write path of Parquet min/max statistics.
- [IMPALA-6570](#) - Support KUDU on SLES12.
- [IMPALA-6577](#) - Avoid slow Status constructor on expiration thread.

Issues Fixed in Impala for CDH 5.14.0

For the full list of fixed issues for all CDH components in CDH 5.14, see [Issues Fixed in CDH 5.14.x](#) on page 2076. The following list represents the subset of fixed Impala JIRAs from the CDH fixed issues.

- [IMPALA-467](#) - enable disabled metric verification
- [IMPALA-992](#) - [DOCS] Document impala-shell 'rerun' command
- [IMPALA-1291](#) - Parquet read fails if io buffer size is less than the footer size
- [IMPALA-1575](#) - part 2: yield admission control resources
- [IMPALA-1575](#) - part 2: yield admission control resources
- [IMPALA-1575](#) - Part 1: eagerly release query exec resources
- [IMPALA-1767](#) - Adds predicate to test boolean values true, false, unknown.
- [IMPALA-2107](#) - [DOCS] Document base64*code() functions
- [IMPALA-2181](#) - Add query option levels for display
- [IMPALA-2190](#) - [DOCS] from_timestamp() and to_timestamp()
- [IMPALA-2234](#) - remove workaround from stress test
- [IMPALA-2235](#) - Fix current db when shell auto-reconnects
- [IMPALA-2250](#) - Make multiple COUNT(DISTINCT) message state workarounds
- [IMPALA-2281](#) - Replace FNV with FastHash in exchange nodes
- [IMPALA-2494](#) - Support for byte array encoded decimals in Parquet scanner
- [IMPALA-2636](#) - HS2 GetTables() returns TABLE_TYPE as TABLE for VIEW
- [IMPALA-2758](#) - Remove BufferedTupleStream::GetRows
- [IMPALA-2810](#) - Remove column stats restoration when altering table
- [IMPALA-3200](#) - [DOCS] Document user-facing aspects of new buffer pool
- [IMPALA-3360](#) - Codegen inserting into runtime filters
- [IMPALA-3437](#) - DECIMAL_V2: avoid implicit decimal->double conversion
- [IMPALA-3504](#) - [DOCS] Document utc_timestamp()
- [IMPALA-3516](#) - Avoid writing to /tmp in testing
- [IMPALA-3548](#) - Prune runtime filters based on query options in the FE
- [IMPALA-3613](#) - Avoid topic updates to unregistered subscriber instances
- [IMPALA-3642](#) - Adding backend addresses to error statuses for some scratch failures.
- [IMPALA-3877](#) - support unpatched LLVM
- [IMPALA-3897](#) - Codegen null-aware constant in PHJ::ProcessBuildBatch()
- [IMPALA-3998](#) - deprecate --refresh_after_connect
- [IMPALA-4082](#) - Remove todo item in getRegionsInRange
- [IMPALA-4177](#) - IMPALA-6039: batched bit reading and rle decoding
- [IMPALA-4236](#) - Codegen CopyRows() for select nodes

- [IMPALA-4252](#) - Min-max runtime filters for Kudu
- [IMPALA-4252](#) - Move runtime filters to ScanNode
- [IMPALA-4513](#) - Promote integer types for ABS()
- [IMPALA-4524](#) - Batch ALTER TABLE...ADD PARTITION calls.
- [IMPALA-4591](#) - Bound Kudu client error mem usage
- [IMPALA-4620](#) - Refactor evalcost computation in query analysis
- [IMPALA-4622](#) - [DOCS] New Kudu ALTER TABLE syntax
- [IMPALA-4623](#) - [DOCS] Document file handle caching
- [IMPALA-4669](#) - [KRPC] Add kudu_rpc library to build
- [IMPALA-4670](#) - Introduces RpcMgr class
- [IMPALA-4704](#) - Turns on client connections when local catalog initialized.
- [IMPALA-4736](#) - Add SIGUSR1 behavior to help string for 'minidump_path' flag
- [IMPALA-4786](#) - Clean up how ImpalaServers are created
- [IMPALA-4847](#) - Simplify HdfsTable block metadata loading code
- [IMPALA-4856](#) - Port data stream service to KRPC
- [IMPALA-4856](#) - IMPALA-4872: Include KRPC services in plan fragment's destinations
- [IMPALA-4856](#) - Rename thrift-deps to gen-deps
- [IMPALA-4863](#) - IMPALA-5311: Correctly account the file type and compression codec
- [IMPALA-4918](#) - Support getting column comments via HS2
- [IMPALA-4927](#) - Impala should handle invalid input from Sentry
- [IMPALA-4939](#) - IMPALA-4940: Decimal V2 multiplication
- [IMPALA-4964](#) - Fix Decimal modulo overflow
- [IMPALA-4985](#) - use parquet stats of nested types for dynamic pruning
- [IMPALA-5018](#) - Error on decimal modulo or divide by zero
- [IMPALA-5019](#) - Decimal V2 addition
- [IMPALA-5129](#) - Use Kudu's Kinit code to avoid expensive fork
- [IMPALA-5142](#) - EventSequence displays negative elapsed time.
- [IMPALA-5174](#) - Suppress kudu flags that aren't relevant to Impala
- [IMPALA-5199](#) - prevent hang on empty row batch exchange
- [IMPALA-5210](#) - Count rows and collection items in parquet scanner separately
- [IMPALA-5211](#) - Simplifying nullif conditional.
- [IMPALA-5211](#) - Simplifying ifnull/isnull/nvl where conditional is a literal.
- [IMPALA-5243](#) - Speed up code gen for wide Avro tables.
- [IMPALA-5250](#) - Unify decompressor output_length semantics
- [IMPALA-5307](#) - Part 4: copy out uncompressed text and seq
- [IMPALA-5307](#) - Part 2: copy out strings in uncompressed Avro
- [IMPALA-5307](#) - part 1: don't transfer disk I/O buffers out of parquet
- [IMPALA-5307](#) - Part 3: remove TODO from RCFile
- [IMPALA-5317](#) - add DATE_TRUNC() function
- [IMPALA-5341](#) - Avoid unintended filter out in fe test
- [IMPALA-5376](#) - Implement all TPCDS test cases or alternates for Impala.
- [IMPALA-5383](#) - [DOCS] Document unpartitioned Kudu tables
- [IMPALA-5394](#) - Change ThriftServer() to always use TAcceptQueueServer
- [IMPALA-5416](#) - Fix an impala-shell command recursion bug
- [IMPALA-5417](#) - make I/O buffer queue fixed-size
- [IMPALA-5425](#) - Add test for validating input when setting query options
- [IMPALA-5429](#) - Multi threaded block metadata loading
- [IMPALA-5448](#) - fix invalid number of splits reported in Parquet scan node
- [IMPALA-5501](#) - [DOCS] Clarify 'binaries' w.r.t. installation procedure
- [IMPALA-5525](#) - Extend TestScannersFuzzing to test uncompressed parquet

- [IMPALA-5529](#) - [DOCS] New trunc() signatures
- [IMPALA-5538](#) - Revert "Use explicit catalog versions for deleted objects"
- [IMPALA-5538](#) - Use explicit catalog versions for deleted objects
- [IMPALA-5541](#) - Reject BATCH_SIZE greater than 65536
- [IMPALA-5589](#) - Re-apply:change "set" in impala-shell to show empty string for unset query options
- [IMPALA-5589](#) - Revert "change "set" in impala-shell to show empty string for unset query options"
- [IMPALA-5589](#) - change "set" in impala-shell to show empty string for unset query options
- [IMPALA-5599](#) - Clean up references to TimestampValue in be/src.
- [IMPALA-5599](#) - Fix for mis-use of TimestampValue
- [IMPALA-5624](#) - Replace "ls -l" with opendir() in ProcessStateInfo
- [IMPALA-5638](#) - [DOCS] Add known issue for Impala-Kudu-Sentry issue
- [IMPALA-5653](#) - Remove "unlimited" process mem_limit option
- [IMPALA-5664](#) - Unix time to timestamp conversions may crash Impala
- [IMPALA-5668](#) - Fix cast(X as timestamp) for negative subsecond Decimals
- [IMPALA-5736](#) - Add impala-shell argument to set default query options
- [IMPALA-5789](#) - Add always_false flag in bloom filter
- [IMPALA-5836](#) - Improvements to Eclipse frontend configuration.
- [IMPALA-5844](#) - use a MemPool for expr result allocations
- [IMPALA-5846](#) - Fix output path for kudu libraries
- [IMPALA-5854](#) - Revert "Update external hadoop versions"
- [IMPALA-5854](#) - Update external hadoop versions
- [IMPALA-5860](#) - upgrade to LLVM 3.9.1
- [IMPALA-5870](#) - Improve runtime profile for partial sort
- [IMPALA-5873](#) - Check for existence of sync_file_range()
- [IMPALA-5894](#) - [DOCS] Clarify placement of STRAIGHT_JOIN hint
- [IMPALA-5895](#) - clean up runtime profile lifecycle
- [IMPALA-5902](#) - add ThreadSanitizer build
- [IMPALA-5905](#) - build-all-flag-combinations addendum
- [IMPALA-5905](#) - add script for all-build-options job
- [IMPALA-5908](#) - Allow SET to unset modified query options.
- [IMPALA-5912](#) - fix crash in trunc(..., "WW") in release build
- [IMPALA-5920](#) - addendum - add missing RAT check
- [IMPALA-5920](#) - Remove admission control dependency on YARN RM jar
- [IMPALA-5926](#) - Avoid printing expensive stack when closing a session
- [IMPALA-5927](#) - Fix enable_distcc for zsh
- [IMPALA-5932](#) - Improve transitive closure computation performance in FE
- [IMPALA-5940](#) - Avoid log spew by using Status::Expected()
- [IMPALA-5940](#) - Avoid log spew by using Status::Expected.
- [IMPALA-5941](#) - Fix Metastore schema creation in create-test-configuration.sh
- [IMPALA-5957](#) - print memory address, not memory
- [IMPALA-5965](#) - avoid per-value switch on NeedsConversionInline() in parquet
- [IMPALA-5966](#) - Fix the result file location of PlannerTest
- [IMPALA-5975](#) - Work around broken beeline clients
- [IMPALA-5976](#) - Remove equivalence class computation in FE
- [IMPALA-5986](#) - Correct set-option logic to recognize digits in names.
- [IMPALA-5987](#) - LZ4 Codec silently produces bogus compressed data for large inputs
- [IMPALA-5988](#) - optimise MemPool::TryAllocate()
- [IMPALA-5999](#) - Fix LLVM linkage errors due LibCache sync issues
- [IMPALA-6001](#) - Part 1: Increase log level during catalog update processing
- [IMPALA-6002](#) - Add a LLVM diagnostic handler for LLVM linker errors

- [IMPALA-6004](#) - Fix test_row_filters failure on ASAN
- [IMPALA-6009](#) - Upgrade Guava to 14.0.1
- [IMPALA-6012](#) - workaround - downgrade hive temporarily
- [IMPALA-6016](#) - Fix logging in TableLoadingMgr class
- [IMPALA-6019](#) - Remove dead code parallel-executor*
- [IMPALA-6021](#) - Revert "IMPALA-6009: Upgrade Guava to 14.0.1"
- [IMPALA-6027](#) - Retry downloading toolchain components.
- [IMPALA-6030](#) - Don't start coordinator specific thread pools if a node isn't a coordinator node
- [IMPALA-6040](#) - skip test_multi_compression_types where Hive isn't supported
- [IMPALA-6053](#) - Fix exception when storadelds don't match hosts
- [IMPALA-6054](#) - Parquet dictionary pages should be freed on dictionary construction
- [IMPALA-6055](#) - Fix hdfs encryption test for Hadoop 2.8+
- [IMPALA-6060](#) - Check the return value of JNI exception handling functions
- [IMPALA-6067](#) - Enable S3 access via IAM roles for EC2 VMs
- [IMPALA-6068](#) - Revert "Fix dataload for complextypes_fileformat"
- [IMPALA-6068](#) - Fix dataload for complextypes_fileformat
- [IMPALA-6069](#) - Fix CodegenAnyVal's handling of 'nan'
- [IMPALA-6076](#) - Parquet BIT_PACKED deprecation warning
- [IMPALA-6080](#) - clean up table descriptor handling
- [IMPALA-6081](#) - Fix test_basic_filters runtime profile failure
- [IMPALA-6084](#) - Avoid using of global namespace for llvm
- [IMPALA-6099](#) - Fix crash in CheckForAlwaysFalse()
- [IMPALA-6100](#) - increase test_exchange_delays timeout on slow builds
- [IMPALA-6105](#) - Clarify argument order in single_node_perf_run
- [IMPALA-6106](#) - handle comments before set in test parser
- [IMPALA-6108](#) - IMPALA-6070: Parallel data load (re-instated).
- [IMPALA-6108](#) - Revert "IMPALA-6070: Parallel data load."
- [IMPALA-6109](#) - xfail TestHdfsUnknownErrors::test_hdfs_safe_mode_error_255
- [IMPALA-6118](#) - Fix assertion failure in coordinator bloom filter updating
- [IMPALA-6121](#) - remove I/O mgr request context cache
- [IMPALA-6123](#) - Fix column order of a query test in test_inline_view_limit
- [IMPALA-6124](#) - Fix alter table ddl updates and test
- [IMPALA-6126](#) - ASAN detects heap-use-after-free in thrift-server-test
- [IMPALA-6127](#) - Fix timeout in TestRuntimeFilter.test_wait_time
- [IMPALA-6128](#) - Spill-to-disk Encryption(AES-CFB + SHA256) is slow
- [IMPALA-6134](#) - Update code base to use impala::ConditionVariable
- [IMPALA-6136](#) - Part 1: Query duration should not be normally negative.
- [IMPALA-6137](#) - fix text scanner split delim mem mgmt
- [IMPALA-6144](#) - PublishFilter() continues to run after query failure/cancellation
- [IMPALA-6148](#) - Specifying thirdparty deps as URLs
- [IMPALA-6151](#) - add query-level fragment/backend counters
- [IMPALA-6155](#) - Allow tests to pass when ORDER BY does not cover the query.
- [IMPALA-6164](#) - Fix stale query profile in TestAlwaysFalseFilter
- [IMPALA-6171](#) - Revert "IMPALA-1575: part 2: yield admission control resources"
- [IMPALA-6173](#) - Fix SHOW CREATE TABLE for unpartitioned Kudu tables
- [IMPALA-6183](#) - Fix Decimal to Double conversion
- [IMPALA-6184](#) - Clean up after ScalarExprEvaluator::Clone() fails
- [IMPALA-6187](#) - Fix missing conjuncts evaluation with empty projection
- [IMPALA-6188](#) - make test_top_n_reclaim less flaky
- [IMPALA-6198](#) - marks a test as debug-only

- [IMPALA-6201](#) - Fix test_basic_filters on ASAN
- [IMPALA-6206](#) - Fix data load failure with -notests
- [IMPALA-6217](#) - fix DCHECK in Parquet fuzz test
- [IMPALA-6220](#) - Revert "IMPALA-6128: Spill-to-disk Encryption(AES-CFB + SHA256) is slow"
- [IMPALA-6225](#) - Part 1: Query profile date-time strings should have ns precision.
- [IMPALA-6232](#) - Disable file handle cache by default
- [IMPALA-6241](#) - timeout in admission control test under ASAN
- [IMPALA-6256](#) - Incorrect principal will be used for internal connections if FLAGS_be_principal is set
- [IMPALA-6262](#) - Always initialize runtime profile for DataSink
- [IMPALA-6280](#) - Materialize TupleIsNullPredicate for insert sorts
- [IMPALA-6281](#) - Fix use-after-free in InitAuth()
- [IMPALA-6285](#) - Don't print stack trace on RPC errors.
- [IMPALA-6286](#) - Remove invalid runtime filter targets.
- [IMPALA-6291](#) - disable AVX512 codegen in LLVM
- [IMPALA-6292](#) - addendum: Fix failing test
- [IMPALA-6292](#) - Fix incorrect DCHECK in decimal subtraction
- [IMPALA-6298](#) - Skip test_profile_fragment_instances on local filesystem
- [IMPALA-6308](#) - Fix bad Status() usage in data-stream-sender.cc
- [IMPALA-5307](#) - ScannerContext API change
- [IMPALA-5493](#) - Add Protobuf to CMakeLists.txt

Issues Fixed in Impala for CDH 5.13.3

For the full list of fixed issues for all CDH components in CDH 5.13.3, see [Issues Fixed in CDH 5.13.x](#) on page 2106. The following list represents the subset of fixed Impala JIRAs from the CDH fixed issues.

- [IMPALA-6353](#) - Fixed the crash in snappy decompressor.
- [IMPALA-6473](#) - Error in analytic sort with same expr in 'partition by' and 'order by'.
- [IMPALA-6500](#) - Impala crashes randomly on different queries with GROUP BY.

Issues Fixed in Impala for CDH 5.13.2

For the full list of fixed issues for all CDH components in CDH 5.13.2, see [Issues Fixed in CDH 5.13.x](#) on page 2106. The following list represents the subset of fixed Impala JIRAs from the CDH fixed issues.

- [IMPALA-2810](#) - Remove column stats restoration when altering table.
- [IMPALA-4664](#) - Unexpected string conversion in Shell.
- [IMPALA-5167](#) - Revert "Reduce the number of Kudu clients created (FE)".
- [IMPALA-5664](#) - Unix time to timestamp conversions may crash Impala
- [IMPALA-5926](#) - Avoid printing expensive stack when closing a session.
- [IMPALA-5936](#) - Operator '%' overflows on large decimals.
- [IMPALA-5940](#) - Avoid log spew by using Status::Expected.
- [IMPALA-5951](#) - Remove flaky test_catalogd_timeout.
- [IMPALA-5987](#) - LZ4 Codec silently produces bogus compressed data for large inputs.
- [IMPALA-6004](#) - Fix the test_row_filters failure on ASAN.
- [IMPALA-6053](#) - Fix the exception when storadelds don't match hosts.
- [IMPALA-6060](#) - Check the return value of JNI exception handling functions.
- [IMPALA-6067](#) - Enable S3 access via IAM roles for EC2 VMs.
- [IMPALA-6069](#) - Fix CodegenAnyVal's handling of 'nan'.
- [IMPALA-6100](#) - Increase test_exchange_delays timeout on slow builds.
- [IMPALA-6106](#) - Handle comments before set in test parser.
- [IMPALA-6114](#) - Require type equality for NumericLiteral::localEquals().
- [IMPALA-6137](#) - Fix text scanner split delim mem mgmt.
- [IMPALA-6183](#) - Fix Decimal to Double conversion.

- [IMPALA-6184](#) - Clean up after ScalarExprEvaluator::Clone() fails.
- [IMPALA-6280](#) - Materialize TupleIsNullPredicate for insert sorts.
- [IMPALA-6284](#) - Mark the intermediate decimal avg struct as packed.
- [IMPALA-6286](#) - Remove invalid runtime filter targets.
- [IMPALA-6291](#) - Disable AVX512 codegen in LLVM.
- [IMPALA-6295](#) - Fix mix/max handling of 'nan' and 'inf'.
- [IMPALA-6307](#) - CTAS statement fails with duplicate column exception.
- [IMPALA-6308](#) - Fix bad Status() usage in data-stream-sender.cc.
- [IMPALA-6348](#) - Redact only sensitive fields in runtime profiles.
- [IMPALA-6364](#) - Bypass file handle cache for ineligible files.
- [IMPALA-6381](#) - Increase test_exchange_delays timeout for isilon.
- [IMPALA-6384](#) - RequestPoolService should honor custom group mapping config.
- [IMPALA-6388](#) - Fix the Union node number of hosts estimation.
- [IMPALA-6418](#) - Find a reliable way to detect supported TLS versions.
- [IMPALA-6435](#) - Disable codegen for CHAR literals.

Issues Fixed in Impala for CDH 5.13.1

For the full list of fixed issues for all CDH components in CDH 5.13.1, see [Issues Fixed in CDH 5.13.x](#) on page 2106. The following list represents the subset of fixed Impala JIRAs from the CDH fixed issues.

- [IMPALA-4682](#) - Remove Preconditions check from analyzeAggregation().
- [IMPALA-4951](#) - Fix database visibility for user with only column privilege
- [IMPALA-5597](#) - Try casting targetExpr when building runtime filter plan
- [IMPALA-5856](#) - Fix outer join predicate assignment.
- [IMPALA-5923](#) - Print binary ID as hex in ChildQuery::Cancel()
- [IMPALA-5954](#) - Set DO_NOT_UPDATE_STATS in alterTable() RPCs to HMS.
- [IMPALA-5955](#) - Use totalSize tblproperty instead of rawDataSize.
- [IMPALA-5983](#) - Fix crash in to/from_utc_timestamp

Issues Fixed in Impala for CDH 5.13.0

For the full list of fixed issues for all CDH components in CDH 5.13, see [Issues Fixed in CDH 5.13.x](#) on page 2106. The following list represents the subset of fixed Impala JIRAs from the CDH fixed issues.

- [IMPALA-992](#) - Rerun past queries from history in shell
- [IMPALA-1470](#) - Fix error message with catalog down
- [IMPALA-1478](#) - Improve error message when subquery is used in the ON clause
- [IMPALA-1882](#) - Remove ORDER BY restriction from first_value()/last_value()
- [IMPALA-1891](#) - Statestore won't send deletions in initial non-delta topic
- [IMPALA-2373](#) - Extrapolate row counts for HDFS tables.
- [IMPALA-2525](#) - Treat parquet ENUMs as STRINGs when creating impala tables.
- [IMPALA-2615](#) - support [[nodiscard]] on Status
- [IMPALA-3040](#) - addendum: use specific_build_type_timeout for slow builds
- [IMPALA-3208](#) - max_row_size option
- [IMPALA-3504](#) - UDF for current timestamp in UTC
- [IMPALA-3894](#) - Change the behavior parsing date "YY"
- [IMPALA-3905](#) - HdfsScanner::GetNext() for Avro, RC, and Seq scans.
- [IMPALA-3931](#) - arbitrary fixed-size uda intermediate types
- [IMPALA-3937](#) - Deprecate --be_service_threads
- [IMPALA-4039](#) - Increase width of Operator column in runtime profile
- [IMPALA-4086](#) - Add benchmark for simple scheduler
- [IMPALA-4164](#) - Avoid overly aggressive inlining in LLVM IR
- [IMPALA-4192](#) - Disentangle Expr and ExprContext

- [IMPALA-4276](#) - Profile displays non-default query options set by planner
- [IMPALA-4418](#) - Fixes extra blank lines in query result
- [IMPALA-4622](#) - Add ALTER COLUMN statement.
- [IMPALA-4623](#) - Enable file handle cache
- [IMPALA-4669](#) - Add Kudu's RPC, util, and security libraries
- [IMPALA-4674](#) - Port spilling ExecNodes to new buffer pool
- [IMPALA-4687](#) - Get Impala working against HBase 2.0
- [IMPALA-4703](#) - reservation denial debug action
- [IMPALA-4737](#) - Prevent SIGUSR1 from killing daemons when minidumps are disabled
- [IMPALA-4794](#) - Grouping distinct agg plan robust to data skew
- [IMPALA-4795](#) - Allow fetching function obj from catalog using signature
- [IMPALA-4826](#) - Fix error during a scan on repeated root schema in Parquet.
- [IMPALA-4833](#) - Use scheduling information to make per-node memory reservation tight
- [IMPALA-4861](#) - READ_WRITE warning on CREATE TABLE LIKE PARQUET.
- [IMPALA-4862](#) - make resource profile consistent with backend behaviour
- [IMPALA-4866](#) - Hash join node does not apply limits correctly
- [IMPALA-4905](#) - Don't send empty insert status to coordinator
- [IMPALA-4925](#) - Cancel finstance if query has finished
- [IMPALA-5016](#) - Simplify COALESCE() in SimplifyConditionalsRule.
- [IMPALA-5031](#) - UBSAN clean and method for testing UBSAN cleanliness
- [IMPALA-5036](#) - Parquet count star optimization
- [IMPALA-5061](#) - Populate null_count in parquet::statistics
- [IMPALA-5085](#) - large rows in BufferedTupleStreamV2
- [IMPALA-5104](#) - Admit queries with mem equal to proc mem_limit
- [IMPALA-5108](#) - idle_session_timeout kicks in later than expected
- [IMPALA-5109](#) - Increase range of backend latency histogram
- [IMPALA-5116](#) - Remove deprecated hash_* types in gutil
- [IMPALA-5158](#) - Account for difference between process memory consumption and memory used by queries
- [IMPALA-5160](#) - adjust spill buffer size based on planner estimates
- [IMPALA-5167](#) - Reduce the number of Kudu clients created
- [IMPALA-5240](#) - Allow config of number of disk I/O threads per disk type
- [IMPALA-5275](#) - Avoid printing status stack trace on hot paths
- [IMPALA-5280](#) - Coalesce chains of OR conditions to an IN predicate
- [IMPALA-5286](#) - Query with Kudu col name w/ different casing from 'order by' fails
- [IMPALA-5316](#) - Adds last_day() function
- [IMPALA-5327](#) - Handle return of JNI GetStringUTFChar
- [IMPALA-5336](#) - Fix partition pruning when column is cast
- [IMPALA-5347](#) - reduce codegen overhead of timestamp trunc()
- [IMPALA-5350](#) - Tidy up thread groups for first exec threads
- [IMPALA-5352](#) - Age out unused file handles from the cache
- [IMPALA-5354](#) - INSERT hints for Kudu tables
- [IMPALA-5376](#) - Loads all TPC-DS tables
- [IMPALA-5386](#) - Fix ReopenCachedHdfsFileHandle failure case
- [IMPALA-5389](#) - simplify BufferDescriptor lifetime
- [IMPALA-5407](#) - Fix crash in HdfsSequenceTableWriter
- [IMPALA-5412](#) - Fix scan result with partitions on same file
- [IMPALA-5420](#) - Skip ACL fetch if the acl bit is not set.
- [IMPALA-5427](#) - Fix race between CRS::UpdateQueryStatus() and beeswax RPCs
- [IMPALA-5431](#) - Remove redundant path exists checks during table load
- [IMPALA-5433](#) - Mark single-argument Status c'tors as explicit

- [IMPALA-5446](#) - dropped Sorter::Reset() status
- [IMPALA-5477](#) - Fix minidump-2-core tool
- [IMPALA-5479](#) - Propagate the argument type in RawValue::Compare()
- [IMPALA-5480](#) - Improve missing filters message
- [IMPALA-5481](#) - Clarify RowDescriptor ownership
- [IMPALA-5482](#) - fix git checkout when workloads are modified
- [IMPALA-5483](#) - Automatically disable codegen for small queries
- [IMPALA-5484](#) - Fix LICENSE issues discovered by IPMC in 2.9 vote
- [IMPALA-5488](#) - Fix handling of exclusive HDFS file handles
- [IMPALA-5489](#) - Improve Sentry authorization for Kudu tables
- [IMPALA-5492](#) - Fix incorrect newline character in the LDAP message
- [IMPALA-5494](#) - Fixes the selectivity of NOT IN predicates
- [IMPALA-5495](#) - Improve error message if no impalad role is configured
- [IMPALA-5497](#) - spilling hash joins that output build rows hit OOM
- [IMPALA-5498](#) - Support for partial sorts in Kudu INSERTS
- [IMPALA-5499](#) - avoid ephemeral port conflicts
- [IMPALA-5500](#) - Reduce catalog update topic size
- [IMPALA-5504](#) - Fix TupleIsNullPredicate evaluation.
- [IMPALA-5506](#) - Add stdin description to help information of query_file option
- [IMPALA-5507](#) - Add clear description to help information of KEYVAL option
- [IMPALA-5511](#) - Add process start time to debug web page
- [IMPALA-5513](#) - Fix display message exception when using invalid KEYVAL
- [IMPALA-5514](#) - Throw an error when --ldap_password_cmd is used without LDAP auth
- [IMPALA-5517](#) - Allow IMPALA_LOGS_DIR to be overridden
- [IMPALA-5520](#) - TopN node periodically reclaims old allocations
- [IMPALA-5524](#) - Fixes NPE during planning with DISABLE_UNSAFE_SPILLS=1
- [IMPALA-5529](#) - Add additional function signatures for TRUNC()
- [IMPALA-5531](#) - Fix correctness issue in correlated aggregate subqueries
- [IMPALA-5532](#) - Stack-allocate compressors in RowBatch (de)serialization
- [IMPALA-5536](#) - Fix TCLIService thrift compilation on Hive 2
- [IMPALA-5539](#) - Fix Kudu timestamp with -use_local_tz_for_unix_ts
- [IMPALA-5540](#) - Revert Sentry version back to 5.13
- [IMPALA-5546](#) - Allow creating unpartitioned Kudu tables
- [IMPALA-5547](#) - Rework FK/PK join detection.
- [IMPALA-5548](#) - Fix some minor nits with HDFS parquet column readers
- [IMPALA-5549](#) - Remove deprecated fields from CatalogService API
- [IMPALA-5551](#) - Fix AggregationNode::Close() when Prepare() fails
- [IMPALA-5554](#) - sorter DCHECK on null column
- [IMPALA-5560](#) - always store CHAR(N) inline in tuple
- [IMPALA-5567](#) - race in fragment instance teardown
- [IMPALA-5570](#) - fix spilling null-aware anti join
- [IMPALA-5572](#) - Timestamp codegen for text scanner
- [IMPALA-5573](#) - Add decimal codegen in text scanner
- [IMPALA-5579](#) - Fix IndexOutOfBoundsException in GetTables metadata request
- [IMPALA-5580](#) - fix Java UDFs that return NULL strings
- [IMPALA-5582](#) - Store sentry privileges in lower case
- [IMPALA-5586](#) - Null-aware anti-join can take a long time to cancel
- [IMPALA-5588](#) - Reduce the frequency of fault injection
- [IMPALA-5591](#) - set should handle negative values
- [IMPALA-5594](#) - don't import shaded classes

- [IMPALA-5595](#) - Only set KuduScanner timestamp feature flag if necessary
- [IMPALA-5598](#) - Fix excessive dumping in MemLimitExceeded
- [IMPALA-5602](#) - Fix query optimization for kudu and datasource tables
- [IMPALA-5611](#) - KuduPartitionExpr holds onto memory unnecessarily
- [IMPALA-5612](#) - join inversion should factor in parallelism
- [IMPALA-5615](#) - Fix compute incremental stats for general partition exprs
- [IMPALA-5616](#) - Add --enable_minidumps startup flag
- [IMPALA-5617](#) - Include full workload name in tpch_nested query filenames
- [IMPALA-5618](#) - buffered-tuple-stream-v2 fixes
- [IMPALA-5623](#) - Fix lag() on STRING cols to release UDF mem
- [IMPALA-5627](#) - fix dropped statuses in HDFS writers
- [IMPALA-5629](#) - avoid expensive list::size() call
- [IMPALA-5630](#) - Add Kudu client version as a common metric
- [IMPALA-5636](#) - Change the metadata in parquet
- [IMPALA-5638](#) - Fix Kudu table set tblproperties inconsistencies
- [IMPALA-5641](#) - mem-estimate should never be less than mem-reservation
- [IMPALA-5643](#) - Add total number of threads created per group to /threadz
- [IMPALA-5644](#) - Fail queries early when their minimum reservation is too high to execute within the given mem_limit
- [IMPALA-5648](#) - fix count(*) mem estimate regression
- [IMPALA-5650](#) - Make sum_init_zero a SUM function
- [IMPALA-5652](#) - deprecate unlimited process mem_limit
- [IMPALA-5657](#) - FunctionCallExpr.toSql() and clone() ignore 'IGNORE NULLS' case
- [IMPALA-5658](#) - addtl. process/system-wide memory metrics
- [IMPALA-5659](#) - Begin standardizing treatment of thirdparty libraries
- [IMPALA-5659](#) - glog/gflags should be dynamically linked
- [IMPALA-5661](#) - buffer pool limit
- [IMPALA-5666](#) - ASAN poisoning for MemPool and BufferPool
- [IMPALA-5670](#) - Misc. tidying of ExecEnv
- [IMPALA-5676](#) - avoid expensive consistency checks in BTSv2
- [IMPALA-5677](#) - limit clean page memory consumption
- [IMPALA-5679](#) - Fix Parquet count(*) with group by string
- [IMPALA-5681](#) - release reservation from blocking operators
- [IMPALA-5686](#) - Update a mini cluster Sentry property
- [IMPALA-5689](#) - Avoid inverting non-equi left joins
- [IMPALA-5691](#) - recalibrate mem limit for Q18
- [IMPALA-5696](#) - Enable cipher configuration when using TLS / Thrift
- [IMPALA-5709](#) - Remove mini-impala-cluster
- [IMPALA-5713](#) - always reserve memory for preaggs
- [IMPALA-5714](#) - Add OpenSSL to bootstrap_toolchain.py
- [IMPALA-5715](#) - (mitigation only) defer destruction of MemTrackers
- [IMPALA-5716](#) - Don't delete cmake_modules/* when enabling distcc
- [IMPALA-5722](#) - Fix string to decimal cast
- [IMPALA-5725](#) - coalesce() with outer join incorrectly rewritten
- [IMPALA-5739](#) - Correctly handle sles12 SP2
- [IMPALA-5742](#) - De-allocate buffer in parquet-reader on exit
- [IMPALA-5743](#) - Support TLS version configuration for Thrift servers
- [IMPALA-5744](#) - Add 'use_krpc' flag and create DataStream interface
- [IMPALA-5745](#) - Bump Breakpad version
- [IMPALA-5749](#) - coordinator race hits DCHECK 'num_remaining_backends_ > 0'
- [IMPALA-5750](#) - Catch exceptions from boost thread creation

- [IMPALA-5756](#) - start memory maintenance thread after metric creation
- [IMPALA-5757](#) - Make tbl property toSql deterministic
- [IMPALA-5769](#) - Add periodic minidump cleanup
- [IMPALA-5773](#) - Correctly account for memory used in data stream receiver queue
- [IMPALA-5774](#) - Prevent FindInSet() from reading off end of string
- [IMPALA-5775](#) - Allow shell to support TLSv1, v1.1 and v1.2
- [IMPALA-5776](#) - HdfsTextScanner::WritePartialTuple() writes the varlen data to an incorrect memory pool
- [IMPALA-5778](#) - Clarify logging around and usage of read_size startup option
- [IMPALA-5784](#) - Separate planner and user set query options in profile
- [IMPALA-5787](#) - Dropped status in KuduTableSink::Send()
- [IMPALA-5788](#) - Fix agg node crash when grouping by nondeterministic exprs
- [IMPALA-5791](#) - Make bootstrap_development.sh survive apt-get failure
- [IMPALA-5796](#) - CTAS for Kudu fails with expr rewrite
- [IMPALA-5798](#) - ASAN use-after-poison in Parquet decoder
- [IMPALA-5799](#) - Kudu DML can crash if schema has changed
- [IMPALA-5800](#) - Configure Squeasel's cipher suite and TLS version
- [IMPALA-5811](#) - Add 'backends' tab to query details pages
- [IMPALA-5812](#) - Fix NPE when joining on empty const select
- [IMPALA-5815](#) - right outer join returns invalid memory
- [IMPALA-5819](#) - DCHECK in HdfsTextScanner::Close()
- [IMPALA-5823](#) - fix SET_DENY_RESERVATION_PROBABILITY
- [IMPALA-5825](#) - Catch exceptions thrown by TSSLocketFactory c'tor
- [IMPALA-5838](#) - Improve errors on AC buffer mem rejection
- [IMPALA-5840](#) - Don't write page-level statistics in Parquet files.
- [IMPALA-5849](#) - Remove compile-time checks for OpenSSL > 1.0.0
- [IMPALA-5850](#) - Cast sender partition exprs under unions.
- [IMPALA-5852](#) - improve MINIMUM_RESERVATION_UNAVAILABLE error
- [IMPALA-5853](#) - fix GetResultSetMetadata() error message for invalid query id
- [IMPALA-5855](#) - Preaggregation crashes - unable to initialize hash table
- [IMPALA-5857](#) - avoid invalid free of hedged read metrics
- [IMPALA-5867](#) - Fix bugs parsing 2-digit year
- [IMPALA-5871](#) - KuduPartitionExpr incorrectly handles its child types
- [IMPALA-5885](#) - free runtime filter allocations in Parquet
- [IMPALA-5888](#) - free other local allocations in Parquet
- [IMPALA-5890](#) - Abort queries if scanner hits IO errors
- [IMPALA-5891](#) - fix PeriodicCounterUpdater initialization
- [IMPALA-5892](#) - Allow reporting status independent of fragment instance
- [IMPALA-2615](#) - annotate Status with [[nodiscard]]
- [IMPALA-5412](#) - Fix scan result with partitions on same file

Issues Fixed in Impala for CDH 5.12.2

For the full list of fixed issues for all CDH components in CDH 5.12, see [Issues Fixed in CDH 5.12.x](#) on page 2134. The following list represents the subset of fixed Impala JIRAs from the CDH fixed issues.

- [IMPALA-4682](#) - Remove Preconditions check from analyzeAggregation().
- [IMPALA-4737](#) - Prevent SIGUSR1 from killing daemons when minidumps are disabled
- [IMPALA-4826](#) - Fix error during a scan on repeated root schema in Parquet.
- [IMPALA-4951](#) - Fix database visibility for user with only column privilege
- [IMPALA-5327](#) - Handle return of JNI GetStringUTFChar
- [IMPALA-5336](#) - Fix partition pruning when column is cast
- [IMPALA-5446](#) - dropped Sorter::Reset() status

- [IMPALA-5495](#) - Improve error message if no impalad role is configured
- [IMPALA-5504](#) - Fix TupleIsNullPredicate evaluation.
- [IMPALA-5531](#) - Fix correctness issue in correlated aggregate subqueries
- [IMPALA-5595](#) - Only set KuduScanner timestamp feature flag if necessary
- [IMPALA-5597](#) - Try casting targetExpr when building runtime filter plan
- [IMPALA-5598](#) - Fix excessive dumping in MemLimitExceeded
- [IMPALA-5689](#) - Avoid inverting non-equi left joins
- [IMPALA-5750](#) - Catch exceptions from boost thread creation
- [IMPALA-5776](#) - Write partial tuple to the correct mempool
- [IMPALA-5784](#) - Separate planner and user set query options in profile
- [IMPALA-5796](#) - CTAS for Kudu fails with expr rewrite
- [IMPALA-5815](#) - right outer join returns invalid memory
- [IMPALA-5819](#) - DCHECK in HdfsTextScanner::Close()
- [IMPALA-5820](#) - Fix string format() syntax in test_scanners_fuzz.py
- [IMPALA-5840](#) - Don't write page-level statistics in Parquet files.
- [IMPALA-5850](#) - Cast sender partition exprs under unions.
- [IMPALA-5856](#) - Fix outer join predicate assignment.
- [IMPALA-5871](#) - KuduPartitionExpr incorrectly handles its child types
- [IMPALA-5885](#) - free runtime filter allocations in Parquet
- [IMPALA-5892](#) - Allow reporting status independent of fragment instance
- [IMPALA-5923](#) - Print binary ID as hex in ChildQuery::Cancel()
- [IMPALA-5954](#) - Set DO_NOT_UPDATE_STATS in alterTable() RPCs to HMS.
- [IMPALA-5983](#) - Fix crash in to/from_utc_timestamp
- [IMPALA-5994](#) - Lower case struct-field names
- [IMPALA-6060](#) - Check the return value of JNI exception handling functions

Issues Fixed in Impala for CDH 5.12.1

For the full list of fixed issues for all CDH components in CDH 5.12, see [Issues Fixed in CDH 5.12.x](#) on page 2134. The following list represents the subset of fixed Impala JIRAs from the CDH fixed issues.

- [IMPALA-4276](#) - Profile displays non-default query options set by planner
- [IMPALA-4866](#) - Hash join node does not apply limits correctly
- [IMPALA-5354](#) - INSERT hints for Kudu tables
- [IMPALA-5427](#) - Fix race between CRS::UpdateQueryStatus() and beeswax RPCs
- [IMPALA-5500](#) - Reduce catalog update topic size
- [IMPALA-5524](#) - Fixes NPE during planning with DISABLE_UNSAFE_SPILLS=1
- [IMPALA-5539](#) - Fix Kudu timestamp with -use_local_tz_for_unix_ts
- [IMPALA-5554](#) - sorter DCHECK on null column
- [IMPALA-5567](#) - race in fragment instance teardown
- [IMPALA-5579](#) - Fix IndexOutOfBoundsException in GetTables metadata request
- [IMPALA-5580](#) - fix Java UDFs that return NULL strings
- [IMPALA-5582](#) - Store sentry privileges in lower case
- [IMPALA-5586](#) - Null-aware anti-join can take a long time to cancel
- [IMPALA-5588](#) - Reduce the frequency of fault injection
- [IMPALA-5611](#) - KuduPartitionExpr holds onto memory unnecessarily
- [IMPALA-5615](#) - Fix compute incremental stats for general partition exprs
- [IMPALA-5616](#) - Add --enable_minidumps startup flag
- [IMPALA-5623](#) - Fix lag() on STRING cols to release UDF mem
- [IMPALA-5627](#) - fix dropped statuses in HDFS writers
- [IMPALA-5638](#) - Fix Kudu table set tblproperties inconsistencies
- [IMPALA-5657](#) - Fix a couple of bugs with FunctionCallExpr and IGNORE NULLS

- [IMPALA-5686](#) - Update a mini cluster Sentry property
- [IMPALA-5691](#) - recalibrate mem limit for Q18

Issues Fixed in Impala for CDH 5.12.0

For the full list of fixed issues for all CDH components in CDH 5.12, see [Issues Fixed in CDH 5.12.x](#) on page 2134. The following list represents the subset of fixed Impala JIRAs from the CDH fixed issues.

- [IMPALA-278](#) - Mention DIV arithmetic operator.
- [IMPALA-1427](#) - Improvements to "Unknown disk-ID" warning
- [IMPALA-1670](#), [IMPALA-4141](#) - Support multiple partitions in ALTER TABLE ADD PARTITION
- [IMPALA-1861](#) - Simplify conditionals with constant conditions
- [IMPALA-1972](#), [IMPALA-3882](#) - Fix client_request_state_map_lock_contention
- [IMPALA-2020](#) - Inline big number strings
- [IMPALA-2079](#) - Don't fail when write to scratch dir results in error.
- [IMPALA-2328](#) - Read support for min/max Parquet statistics
- [IMPALA-2518](#) - DROP DATABASE CASCADE removes cache directives of tables
- [IMPALA-2522](#) - Improve the reliability and effectiveness of ETL.
- [IMPALA-2550](#) - Switch to per-query exec rpc
- [IMPALA-2615](#) - warn if Status is ignored
- [IMPALA-3079](#) - Fix sequence file writer
- [IMPALA-3200](#) - Implement suballocator for splitting buffers
- [IMPALA-3202](#) - implement spill-to-disk in new buffer pool
- [IMPALA-3203](#) - Implement scalable buffer recycling in buffer pool.
- [IMPALA-3524](#) - Don't process spilled partitions with 0 probe rows
- [IMPALA-3586](#) - Implement union passthrough
- [IMPALA-3654](#) - Parquet stats filtering for IN predicate
- [IMPALA-3671](#) - Add SCRATCH_LIMIT query option.
- [IMPALA-3742](#) - Partitions and sort INSERTs for Kudu tables
- [IMPALA-3748](#) - minimum buffer requirements in planner
- [IMPALA-3748](#) - add query-wide resource acquisition step
- [IMPALA-3785](#) - Record query handle for invalid handle
- [IMPALA-3794](#) - Workaround for Breakpad ID conflicts
- [IMPALA-3905](#) - Implements HdfsScanner::GetNext() for text scans.
- [IMPALA-3909](#) - Populate min/max statistics in Parquet writer
- [IMPALA-3989](#) - Display skew warning for poorly formatted Parquet files
- [IMPALA-4008](#) - Don't bake fields into generated IR functions of OldHashTable
- [IMPALA-4014](#) - Introduce query-wide execution state.
- [IMPALA-4029](#) - Reduce memory requirements for storing file metadata
- [IMPALA-4036](#) - invalid SQL generated for partitioned table with comment
- [IMPALA-4041](#) - Limit catalog and admission control updates to coordinators
- [IMPALA-4163](#) - Add sortby() query hint
- [IMPALA-4166](#) - Add SORT BY sql clause
- [IMPALA-4341](#) - Add metadata load to planner timeline
- [IMPALA-4351](#), [IMPALA-4353](#) - query generator random profile options for INSERT.
- [IMPALA-4355](#) - random query generator: modify statement execution flow to support DML
- [IMPALA-4359](#) - qgen: add UPSERT support
- [IMPALA-4390](#) - Separate ADD and DROP PARTITION syntax
- [IMPALA-4431](#) - Add audit event log control mechanism to prevent disk overflow
- [IMPALA-4477](#) - Update Kudu to latest commit on master
- [IMPALA-4499](#) - Table name missing from exec summary
- [IMPALA-4546](#) - Fix Moscow timezone conversion after 2014

- [IMPALA-4548](#) - BlockingJoinNode should wait for async build thread
- [IMPALA-4549](#) - consistently treat 9999 as upper bound for timestamp year
- [IMPALA-4588](#) - Enable starting the minicluster when offline
- [IMPALA-4611](#) - Checking perms on S3 files is a very expensive no-op
- [IMPALA-4616](#) - Add missing Kudu column options
- [IMPALA-4617](#) - remove IsConstant() analysis from backend
- [IMPALA-4624](#) - Implement Parquet dictionary filtering
- [IMPALA-4631](#) - avoid DCHECK in PlanFragementExecutor::Close().
- [IMPALA-4640](#) - Fix number of rows displayed by parquet-reader tool
- [IMPALA-4647](#) - fix full data load with ninja
- [IMPALA-4648](#) - remove build_thirdparty.sh
- [IMPALA-4649](#) - add a mechanism to pass flags into make
- [IMPALA-4650](#) - Add Protobuf 2.6.1 to toolchain and as a build dependency
- [IMPALA-4651](#) - Add LibEv to build
- [IMPALA-4652](#) - Add crcutil to build
- [IMPALA-4653](#) - fix sticky config variable problem
- [IMPALA-4662](#) - Fix NULL literal handling in Kudu IN list predicates
- [IMPALA-4673](#) - Use --local_library_dir for tzdb startup scratch space
- [IMPALA-4674](#) - port BufferedTupleStream to BufferPool
- [IMPALA-4676](#) - remove vestigial references to getBlockStorageLocations() API
- [IMPALA-4678](#) - move query MemTracker into QueryState
- [IMPALA-4684](#) - check-hbase-nodes.py: Build failing on RHEL7 when trying to start HBase.
- [IMPALA-4686](#) - Fix schema output for INT96 columns in parquet-reader tool
- [IMPALA-4689](#) - Fix computation of last active time
- [IMPALA-4701](#) - make distcc work reliably with clang
- [IMPALA-4707](#) - fix use-after-free in QueryExecMgr
- [IMPALA-4710](#) - There is an error in control audit log file size number
- [IMPALA-4711](#) - clarify is_null semantics in udf.h
- [IMPALA-4716](#) - Expr rewrite causes IllegalStateException
- [IMPALA-4731](#), [IMPALA-397](#), [IMPALA-4728](#) - Sorter crash Impalad instance.
- [IMPALA-4734](#) - Set parquet::RowGroup::sorting_columns
- [IMPALA-4738](#) - STDDEV_SAMP should return NULL for single record input
- [IMPALA-4740](#) - Add option to use hdfsPread() for HDFS hedged reads
- [IMPALA-4747](#) - macros should only evaluate their arguments once
- [IMPALA-4748](#) - crash in TmpFileMgr when hitting process mem limit
- [IMPALA-4752](#) - make ObjectPool more efficient
- [IMPALA-4757](#) - addendum: avoid double underscore in name
- [IMPALA-4758](#) - Upgrade gutil to recent Kudu version.
- [IMPALA-4762](#) - RECOVER PARTITIONS should batch partition updates
- [IMPALA-4764](#) - Add Hedged read metrics
- [IMPALA-4788](#) - Use HashSet in RECOVER PARTITIONS duplicate checks
- [IMPALA-4789](#) - Fix slow metadata loading due to inconsistent paths.
- [IMPALA-4792](#) - Fix number of distinct values for a CASE with constant outputs
- [IMPALA-4801](#) - fix heap use after free for MemTracker
- [IMPALA-4815](#) -, [IMPALA-4817](#), [IMPALA-4819](#): Write and Read Parquet Statistics for remaining types
- [IMPALA-4820](#) - avoid writing unencrypted data during write cancellation
- [IMPALA-4828](#) - Add "Known Issues" item for
- [IMPALA-4831](#) - enforce BufferPool reservation invariants
- [IMPALA-4839](#) - Remove implicit 'localhost' for KUDU_MASTER_HOSTS
- [IMPALA-4840](#) - Fix REFRESH performance regression.

- [IMPALA-4846](#) - Upgrade Snappy to 1.1.4
- [IMPALA-4849](#) - IllegalStateException from rewritten CASE expr
- [IMPALA-4858](#) - add more info to MemLimitExceeded errors
- [IMPALA-4859](#) - Push down IS NULL / IS NOT NULL to Kudu
- [IMPALA-4877](#) - fix precedence of unary -/+
- [IMPALA-4880](#) - Clarify synchronization policy for 'done_' in KuduScanNode
- [IMPALA-4883](#) - Union Codegen
- [IMPALA-4884](#) - Add JVM heap and non-heap usage in metrics and UI
- [IMPALA-4885](#) - Expose Jvm thread info in web UI
- [IMPALA-4890](#) - /5143: Coordinator race involving TearDown()
- [IMPALA-4892](#) - Session ID included in error message
- [IMPALA-4893](#) - Efficiently update the rows read counter for sequence file
- [IMPALA-4897](#) - AnalysisException: specified cache pool does not exist
- [IMPALA-4923](#) - reduce memory transfer for selective scans
- [IMPALA-4926](#) - Upgrade LZ4 to 1.7.5
- [IMPALA-4937](#) - Remove unused kudu scanner keep alive variable
- [IMPALA-4943](#) - Speed up block md loading for add/recover partition calls.
- [IMPALA-4946](#) - fix hang in BufferPool
- [IMPALA-4955](#) - Fix integer overflow in hdfs table size accounting
- [IMPALA-4959](#) - Avoid picking up the system's boost cmake module
- [IMPALA-4962](#) - Fix SHOW COLUMN STATS for HS2
- [IMPALA-4965](#) - Authorize access to runtime profile and exec summary
- [IMPALA-4966](#) - Add flatbuffers to build
- [IMPALA-4983](#) - Set toolchain version to include LZ4 build flags
- [IMPALA-4988](#) - Add query option read_parquet_statistics
- [IMPALA-4996](#) - Single-threaded KuduScanNode
- [IMPALA-5003](#) - Constant propagation in scan conjuncts
- [IMPALA-5008](#) - Fix reading stats for TINYINT and SMALLINT
- [IMPALA-5021](#) - Fix count(*) remaining rows overflow in Parquet.
- [IMPALA-5027](#) - addendum - remove unneeded #define
- [IMPALA-5030](#) - Adds support for NVL2() function
- [IMPALA-5034](#) - Update Breakpad to newer version
- [IMPALA-5038](#) - Fix file size regex to include bytes
- [IMPALA-5041](#) - Allow AuthManager::Init() to be called more than once
- [IMPALA-5042](#) - Use a HashSet instead of ArrayList for O(1) look ups
- [IMPALA-5056](#) - Ensure analysis uses 'fresh' catalog after metadata loading
- [IMPALA-5057](#) - Upgrade glog (0.3.4-p2) and gflags
- [IMPALA-5073](#) - Part 1: add option to use mmap() for buffer pool
- [IMPALA-5077](#) - add NUMA and current cpu to CpuInfo
- [IMPALA-5080](#) - OutOfMemory PermGen space
- [IMPALA-5110](#) - Add deb support to dump_breakpad_symbols.py
- [IMPALA-5111](#) - Fix check when creating NOT NULL PK col in Kudu
- [IMPALA-5113](#) - fix dirty unpinned invariant
- [IMPALA-5120](#) - Default to partitioned join when stats are missing
- [IMPALA-5123](#) - Fix ASAN use after free in timezone_db
- [IMPALA-5125](#) - SimplifyConditionalsRule incorrectly handles aggregates
- [IMPALA-5127](#) - Add history_max option
- [IMPALA-5130](#) - fix race in MemTracker::EnableReservationReporting()
- [IMPALA-5137](#) - Support Kudu UNIXTIME_MICROS as Impala TIMESTAMP.
- [IMPALA-5140](#) - improve docs building guidelines

- [IMPALA-5144](#) - Remove sortBy() hint
- [IMPALA-5147](#) - Add the ability to exclude hosts from query execution
- [IMPALA-5154](#) - Handle 'unpartitioned' Kudu tables
- [IMPALA-5158](#) - Part 1: include untracked memory in MemTracker dumps
- [IMPALA-5166](#) - clean up BufferPool counters
- [IMPALA-5167](#) - Reduce the number of Kudu clients created
- [IMPALA-5169](#) - Add support for async pins in buffer pool
- [IMPALA-5171](#) - update RAT excluded files list
- [IMPALA-5172](#) - crash in tcmmalloc::CentralFreeList::FetchFromOneSpans
- [IMPALA-5173](#) - crash with hash join feeding directly into nlj
- [IMPALA-5174](#) - Bump gflags to 2.2.0-p1
- [IMPALA-5180](#) - Don't use non-deterministic exprs in partition pruning
- [IMPALA-5181](#) - Extract PYPI metadata from a webpage
- [IMPALA-5182](#) - Explicitly close connection to impalad on error from shell
- [IMPALA-5184](#) - build fe against both Hive 1 & 2 APIs
- [IMPALA-5187](#) - , IMPALA-5208: Bump Breakpad Version, undo IMPALA-3794
- [IMPALA-5188](#) - Add slot sorting in TupleDescriptor::LayoutEquals()
- [IMPALA-5189](#) - Pin version of setuptools-scm
- [IMPALA-5192](#) - Don't bake MemPool* into IR
- [IMPALA-5197](#) - Erroneous corrupted Parquet file message
- [IMPALA-5198](#) - Error messages are sometimes dropped before reaching client
- [IMPALA-5207](#) - ,IMPALA-5214: distcc fixes
- [IMPALA-5217](#) - KuduTableSink checks null constraints incorrectly
- [IMPALA-5220](#) - memory maintenance cleanup
- [IMPALA-5221](#) - Avoid re-use of stale SASL contexts.
- [IMPALA-5222](#) - don't call Bits::Log2*() functions
- [IMPALA-5223](#) - Add waiting for HBase Zookeeper nodes to retry loop
- [IMPALA-5224](#) - remove defunct codehaus repository
- [IMPALA-5229](#) - huge page-backed buffers with TCMalloc
- [IMPALA-5230](#) - fix non-functional impalad under ASAN
- [IMPALA-5232](#) - Parquet reader error message prints memory address instead of value
- [IMPALA-5235](#) - Initialize resourceProfile_ with a dummy value
- [IMPALA-5238](#) - transfer reservations between trackers
- [IMPALA-5258](#) - Pass CMAKE_BUILD_TYPE to Impala-izo
- [IMPALA-5259](#) - Add REFRESH FUNCTIONS <db> statement
- [IMPALA-5261](#) - Heap use-after-free in HdfsSequenceTableWriter
- [IMPALA-5273](#) - Replace StringCompare with glibc memcmp
- [IMPALA-5282](#) - Handle overflows in computeResourceProfile().
- [IMPALA-5294](#) - Kudu INSERT partitioning fails with constants
- [IMPALA-5301](#) - Set Kudu minicluster memory limit
- [IMPALA-5304](#) - reduce transfer of Parquet decompression buffers
- [IMPALA-5309](#) - Adds TABLESAMPLE clause for HDFS table refs.
- [IMPALA-5318](#) - Generate access events with fully qualified table names
- [IMPALA-5324](#) - Fix version check in EvalDictionaryFilters
- [IMPALA-5325](#) - Do not update totalHdfsBytes_/numHdfsFiles_ on Catalogd
- [IMPALA-5331](#) - Use new libHDFS API to address "Unknown Error 255"
- [IMPALA-5333](#) - Add support for Impala to work with ADLS
- [IMPALA-5338](#) - Fix Kudu timestamp column default values
- [IMPALA-5339](#) - Fix analysis with sort.columns and expr rewrites
- [IMPALA-5340](#) - Query profile displays stale query state

- [IMPALA-5342](#) - Add comments of loaded tables in the response of GetTables
- [IMPALA-5347](#) - Parquet scanner microoptimizations
- [IMPALA-5355](#) - Fix the order of Sentry roles and privileges
- [IMPALA-5357](#) - Fix unixtime to UTC TimestampValue perf
- [IMPALA-5358](#) - Fix repeatable table sample.
- [IMPALA-5363](#) - Reset probe_batch_ after reaching limit
- [IMPALA-5364](#) - Correct title of query locations table
- [IMPALA-5375](#) - Builds on CentOS 6.4 failing with broken python dependencies
- [IMPALA-5377](#) - Impala may crash if given a fragment instance while restarting
- [IMPALA-5378](#) - Disk IO manager needs to understand ADLS
- [IMPALA-5381](#) - Adds DEFAULT_JOIN_DISTRIBUTION_MODE query option.
- [IMPALA-5383](#) - Fix PARQUET_FILE_SIZE option for ADLS
- [IMPALA-5388](#) - Only retry RPC on lost connection in send call
- [IMPALA-5391](#) - remove C++11 from UDF header
- [IMPALA-5411](#) - Avoid log spew from GetRuntimeProfileStr
- [IMPALA-5419](#) - Check for cancellation when building hash tables
- [IMPALA-5424](#) - Ignore errors when removing minidumps folder
- [IMPALA-5426](#) - Update Hive schema script to 1.1.0
- [IMPALA-5432](#) - Remove invalid DCHECK from SetMemLimitExceeded
- [IMPALA-5438](#) - Always eval union const exprs in subplan.
- [IMPALA-5454](#) - Work around template rendering bug in /memz
- [IMPALA-5469](#) - Fix exception when processing catalog update
- [IMPALA-5487](#) - Fix race in RuntimeProfile::toThrift()
- [IMPALA-5537](#) - Retry RPC on some exceptions with SSL connection
- [IMPALA-5558](#) - /IMPALA-5576: Reopen stale client connection
- [IMPALA-5562](#) - Only recomputeMemLayout() if tuple has a layout.
- [IMPALA-3905](#) - Implements HdfsScanner::GetNext() for LZO text scans.
- [IMPALA-5172](#) - fix incorrect cast in call to LZO decompress

Issues Fixed in Impala for CDH 5.11.2

For the full list of fixed issues for all CDH components in CDH 5.11.2, see [Issues Fixed in CDH 5.11.x](#) on page 2151. The following list represents the subset of fixed Impala JIRAs from the CDH fixed issues.

- [IMPALA-4276](#) - Profile displays non-default query options set by planner
- [IMPALA-4546](#) - Fix Moscow timezone conversion after 2014
- [IMPALA-4631](#) - don't use floating point operations for time unit conversions
- [IMPALA-4716](#) - Expr rewrite causes IllegalStateException
- [IMPALA-4738](#) - STDDEV_SAMP should return NULL for single record input
- [IMPALA-4962](#) - Fix SHOW COLUMN STATS for HS2
- [IMPALA-5021](#) - Fix count(*) remaining rows overflow in Parquet.
- [IMPALA-5056](#) - Ensure analysis uses 'fresh' catalog after metadata loading
- [IMPALA-5154](#) - Handle 'unpartitioned' Kudu tables
- [IMPALA-5172](#) - Buffer overrun for Snappy decompression
- [IMPALA-5187](#) - Bump breakpad version to include the fix for Breakpad #681, re-enable the strict check that was disabled in IMPALA-3794.
- [IMPALA-5189](#) - Pin version of setuptools-scm
- [IMPALA-5197](#) - Erroneous corrupted Parquet file message
- [IMPALA-5198](#) - Error messages are sometimes dropped before reaching client
- [IMPALA-5217](#) - KuduTableSink checks null constraints incorrectly
- [IMPALA-5223](#) - Add waiting for HBase Zookeeper nodes to retry loop
- [IMPALA-5301](#) - Set Kudu minicluster memory limit

- [IMPALA-5318](#) - Generate access events with fully qualified table names
- [IMPALA-5355](#) - Fix the order of Sentry roles and privileges
- [IMPALA-5363](#) - Reset probe_batch_ after reaching limit
- [IMPALA-5419](#) - Check for cancellation when building hash tables
- [IMPALA-5469](#) - Fix exception when processing catalog update
- [IMPALA-5487](#) - Fix race in RuntimeProfile::toThrift()
- [IMPALA-5524](#) - Fixes NPE during planning with DISABLE_UNSAFE_SPILLS=1
- [IMPALA-5554](#) - sorter DCHECK on null column
- [IMPALA-5580](#) - fix Java UDFs that return NULL strings
- [IMPALA-5615](#) - Fix compute incremental stats for general partition exprs
- [IMPALA-5623](#) - Fix lag() on STRING cols to release UDF mem
- [IMPALA-5638](#) - Fix Kudu table set tblproperties inconsistencies
- [IMPALA-5657](#) - Fix a couple of bugs with FunctionCallExpr and IGNORE NULLS
- [IMPALA-5172](#) - fix incorrect cast in call to LZO decompress

Issues Fixed in Impala for CDH 5.11.1

For the full list of fixed issues for all CDH components in CDH 5.11.1, see [Issues Fixed in CDH 5.11.x](#) on page 2151. The following list represents the subset of fixed Impala JIRAs from the CDH fixed issues.

- [IMPALA-3641](#) - Fix catalogd RPC responses to DROP IF EXISTS.
- [IMPALA-4088](#) - Assign fix values to the minicluster server ports
- [IMPALA-4293](#) - query profile should include error log
- [IMPALA-4544](#) - ASAN should ignore SEGV and leaks
- [IMPALA-4615](#) - Fix create_table.sql command order
- [IMPALA-4733](#) - Change HBase ports to non-ephemeral
- [IMPALA-4787](#) - Optimize APPX_MEDIAN() memory usage
- [IMPALA-4822](#) - Implement dynamic log level changes
- [IMPALA-4899](#) - Fix parquet table writer dictionary leak
- [IMPALA-4902](#) - Copy parameters map in HdfsPartition.toThrift().
- [IMPALA-4998](#) - Fix missing table lock acquisition.
- [IMPALA-5028](#) - Lock table in /catalog_objects endpoint.
- [IMPALA-5055](#) - Fix DCHECK in parquet-column-readers.cc ReadPageHeader()
- [IMPALA-5088](#) - Fix heap buffer overflow
- [IMPALA-5115](#) - Handle status from HdfsTableSink::WriteClusteredRowBatch
- [IMPALA-5145](#) - Do not constant fold null in CastExprs
- [IMPALA-5156](#) - Drop VLOG level passed into Kudu client
- [IMPALA-5186](#) - Handle failed CreateAndOpenScanner() in MT scan.
- [IMPALA-5193](#) - Initialize decompressor before finding first tuple
- [IMPALA-5251](#) - Fix propagation of input exprs' types in 2-phase agg
- [IMPALA-5252](#) - Fix crash in HiveUdfCall::GetStringVal() when mem_limit exceeded
- [IMPALA-5253](#) - Use appropriate transport for StatestoreSubscriber
- [IMPALA-5322](#) - Fix a potential crash in Frontend & Catalog JNI startup

Issues Fixed in Impala for CDH 5.11.0

For the full list of fixed issues for all CDH components in CDH 5.11.0, see [Issues Fixed in CDH 5.11.x](#) on page 2151. The following list represents the subset of fixed Impala JIRAs from the CDH fixed issues.

- [IMPALA-1430](#) - IMPALA-4878,IMPALA-4879: codegen native UDAs
- [IMPALA-2020](#) - 4915, 4936: Add rounding for decimal casts
- [IMPALA-2020](#) - IMPALA-4809: Codegen support for DECIMAL_V2
- [IMPALA-2605](#) - Omit the sort and mini stress tests
- [IMPALA-4055](#) - Speed up to_date() with custom implementation.

- [IMPALA-4263](#) - Fix wrong omission of agg/analytic hash exchanges.
- [IMPALA-4282](#) - Remove max length check for type strings.
- [IMPALA-4370](#) - Divide and modulo result types for DECIMAL version V2
- [IMPALA-4449](#) - Revisit table locking pattern in the catalog
- [IMPALA-4675](#) - Case-insensitive matching of Parquet fields.
- [IMPALA-4702](#) - Fix command line help for `webserver_private_key_file`
- [IMPALA-4705](#) - IMPALA-4779, IMPALA-4780: Fix some Expr bugs with codegen
- [IMPALA-4725](#) - Query option to control Parquet array resolution.
- [IMPALA-4729](#) - Implement REPLACE()
- [IMPALA-4742](#) - Change `"{}".format()` to `"{0}".format()` for Py 2.6
- [IMPALA-4749](#) - hit DCHECK in sorter with scratch limit
- [IMPALA-4767](#) - Workaround for HIVE-15653 to preserve table stats.
- [IMPALA-4808](#) - old hash join can reference invalid memory
- [IMPALA-4809](#) - Enable support for DECIMAL_V2 in `decimal_casting.py`
- [IMPALA-4810](#) - fix incorrect expr-test decimal types
- [IMPALA-4810](#) - Make DECIMAL expr-test cases table driven
- [IMPALA-4810](#) - Add DECIMAL_V2 query option
- [IMPALA-4813](#) - Round on divide and multiply
- [IMPALA-4821](#) - Update AVG() for DECIMAL_V2
- [IMPALA-4828](#) - Alter Kudu schema outside Impala may crash on read
- [IMPALA-4854](#) - Fix incremental stats with complex types.
- [IMPALA-4916](#) - Fix maintenance of set of item sets in DisjointSet.
- [IMPALA-4929](#) - Safe concurrent access to IR function call graph
- [IMPALA-4933](#) - IMPALA-4931: Simplify SSL initialization on startup
- [IMPALA-4934](#) - Disable Kudu OpenSSL initialization
- [IMPALA-4981](#) - Re-enable spilling with MT_DOP.
- [IMPALA-4995](#) - Fix integer overflow in `TopNNNode::PrepareForOutput`
- [IMPALA-4997](#) - Fix overflows in `Sorter::TupletIterator`
- [IMPALA-5005](#) - Don't allow server to send SASL COMPLETE msg out of order
- [IMPALA-5025](#) - Update binutils to 2.26.1
- [IMPALA-5027](#) - make udf headers buildable externally

Issues Fixed in Impala for CDH 5.10.2

For the full list of fixed issues for all CDH components in CDH 5.10.2, see [Issues Fixed in CDH 5.10.x](#) on page 2168. The following list represents the subset of fixed Impala JIRAs from the CDH fixed issues.

- [IMPALA-3641](#) - Fix catalogd RPC responses to DROP IF EXISTS.
- [IMPALA-4088](#) - Assign fix values to the minicluster server ports
- [IMPALA-4293](#) - query profile should include error log
- [IMPALA-4544](#) - ASAN should ignore SEGV and leaks
- [IMPALA-4546](#) - Fix Moscow timezone conversion after 2014
- [IMPALA-4615](#) - Fix `create_table.sql` command order
- [IMPALA-4631](#) - avoid DCHECK in `PlanFragementExecutor::Close()`.
- [IMPALA-4716](#) - Expr rewrite causes `IllegalStateException`
- [IMPALA-4722](#) - Disable log caching in `test_scratch_disk`
- [IMPALA-4725](#) - Query option to control Parquet array resolution.
- [IMPALA-4733](#) - Change HBase ports to non-ephemeral
- [IMPALA-4738](#) - `STDDEV_SAMP` should return NULL for single record input
- [IMPALA-4787](#) - Optimize `APPX_MEDIAN()` memory usage
- [IMPALA-4822](#) - Implement dynamic log level changes
- [IMPALA-4899](#) - Fix parquet table writer dictionary leak

- [IMPALA-4902](#) - Copy parameters map in HdfsPartition.toThrift().
- [IMPALA-4920](#) - custom cluster tests: fix generation of py.test options
- [IMPALA-4998](#) - Fix missing table lock acquisition.
- [IMPALA-5021](#) - Fix count(*) remaining rows overflow in Parquet.
- [IMPALA-5028](#) - Lock table in /catalog_objects endpoint.
- [IMPALA-5055](#) - Fix DCHECK in parquet-column-readers.cc ReadPageHeader()
- [IMPALA-5088](#) - Fix heap buffer overflow
- [IMPALA-5115](#) - Handle status from HdfsTableSink::WriteClusteredRowBatch
- [IMPALA-5145](#) - Do not constant fold null in CastExprs
- [IMPALA-5154](#) - Handle 'unpartitioned' Kudu tables
- [IMPALA-5156](#) - Drop VLOG level passed into Kudu client
- [IMPALA-5172](#) - Buffer overrun for Snappy decompression
- [IMPALA-5183](#) - increase write wait timeout in BufferedBlockMgrTest
- [IMPALA-5186](#) - Handle failed CreateAndOpenScanner() in MT scan.
- [IMPALA-5189](#) - Pin version of setuptools-scm
- [IMPALA-5193](#) - Initialize decompressor before finding first tuple
- [IMPALA-5197](#) - Erroneous corrupted Parquet file message
- [IMPALA-5198](#) - Error messages are sometimes dropped before reaching client
- [IMPALA-5208](#) - Bump toolchain to include fixes for and IMPALA-5187
- [IMPALA-5217](#) - KuduTableSink checks null constraints incorrectly
- [IMPALA-5244](#) - test_hdfs_file_open_fail fails on local filesystem build
- [IMPALA-5252](#) - Fix crash in HiveUdfCall::GetStringVal() when mem_limit exceeded
- [IMPALA-5253](#) - Use appropriate transport for StatestoreSubscriber
- [IMPALA-5287](#) - Test skip.header.line.count on gzip
- [IMPALA-5297](#) - Reduce free-pool-test mem requirement to avoid OOM
- [IMPALA-5301](#) - Set Kudu minicluster memory limit
- [IMPALA-5318](#) - Generate access events with fully qualified table names
- [IMPALA-5322](#) - Fix a potential crash in Frontend & Catalog JNI startup
- [IMPALA-5487](#) - Race in runtime-profile.cc::toThrift() can lead to corrupt profiles being generated while query is running
- [IMPALA-5172](#) - fix incorrect cast in call to LZO decompress

Issues Fixed in Impala for CDH 5.10.1

For the full list of fixed issues for all CDH components in CDH 5.10.1, see [Issues Fixed in CDH 5.10.x](#) on page 2168. The following list represents the subset of fixed Impala JIRAs from the CDH fixed issues.

- [IMPALA-2605](#) - Omit the sort and mini stress tests.
- [IMPALA-4055](#) - Speed up to_date() with custom implementation.
- [IMPALA-4263](#) - Fix wrong omission of agg/analytic hash exchanges.
- [IMPALA-4282](#) - Remove max length check for type strings.
- [IMPALA-4449](#) - Revisit table locking pattern in the catalog.
- [IMPALA-4675](#) - Case-insensitive matching of Parquet fields.
- [IMPALA-4702](#) - Fix command line help for webserver_private_key_file.
- [IMPALA-4705](#), [IMPALA-4779](#), [IMPALA-4780](#) - Fix some Expr bugs with codegen.
- [IMPALA-4742](#) - Change "{}".format() to "{0}".format() for Py 2.6.
- [IMPALA-4749](#) - hit DCHECK in sorter with scratch limit.
- [IMPALA-4767](#) - Workaround for HIVE-15653 to preserve table stats.
- [IMPALA-4808](#) - old hash join can reference invalid memory.
- [IMPALA-4828](#) - Alter Kudu schema outside Impala may crash on read.
- [IMPALA-4854](#) - Fix incremental stats with complex types.
- [IMPALA-4916](#) - Fix maintenance of set of item sets in DisjointSet.

- [IMPALA-4981](#) - Re-enable spilling with MT_DOP.
- [IMPALA-4995](#) - Fix integer overflow in TopNNNode::PrepareForOutput.
- [IMPALA-4997](#) - Fix overflows in Sorter::TupletIterator.

Issues Fixed in Impala for CDH 5.10.0

For the full list of Impala fixed issues in CDH 5.10 / Impala 2.8, see [this report in the Impala JIRA tracker](#).

For the full list of fixed issues for all CDH components in CDH 5.10.0, see [Issues Fixed in CDH 5.10.x](#) on page 2168. The following list represents the subset of fixed Impala JIRAs from the CDH fixed issues.

- [IMPALA-1169](#) - Admission control info on the queries debug webpage
- [IMPALA-1286](#) - Extract common conjuncts from disjunctions.
- [IMPALA-1430](#) - IMPALA-4108: codegen all builtin aggregate functions
- [IMPALA-1616](#) - Improve the Memory Limit Exceeded error report
- [IMPALA-1654](#) - General partition exprs in DDL operations.
- [IMPALA-1702](#) - Enforce single-table consistency in query analysis
- [IMPALA-1788](#) - Fold constant expressions
- [IMPALA-2013](#) - Reintroduce steps for checking HBase health in run-hbase.sh
- [IMPALA-2057](#) - Better error message for incorrect avro decimal column declaration
- [IMPALA-2521](#) - Add clustered hint to insert statements
- [IMPALA-2523](#) - Make HdfsTableSink aware of clustered input
- [IMPALA-2789](#) - More compact mem layout with null bits at the end.
- [IMPALA-2864](#) - Ensure that client connections are closed after a failed Open()
- [IMPALA-2890](#) - Support ALTER TABLE statements for Kudu tables
- [IMPALA-2905](#) - Move QueryResultSet implementations into separate module
- [IMPALA-2905](#) - Handle coordinator fragment lifecycle like all others
- [IMPALA-2916](#) - Add warning to query profile if debug build
- [IMPALA-2925](#) - Mark test_alloc_update as xfail.
- [IMPALA-3002](#) - IMPALA-1473: Cardinality observability cleanup
- [IMPALA-3125](#) - Fix assignment of equality predicates from an outer-join On-clause
- [IMPALA-3126](#) - Conservative assignment of inner-join On-clause predicates
- [IMPALA-3167](#) - Fix assignment of WHERE conjunct through grouping agg + OJ
- [IMPALA-3200](#) - move bufferpool under runtime
- [IMPALA-3201](#) - in-memory buffer pool implementation
- [IMPALA-3201](#) - reservation implementation for new buffer pool
- [IMPALA-3202](#) - refactor scratch file management into TmpFileMgr
- [IMPALA-3202](#) - DiskIoMgr improvements for new buffer pool
- [IMPALA-3211](#) - provide toolchain build id for bootstrapping
- [IMPALA-3221](#) - Copyright / license audit
- [IMPALA-3229](#) - Don't assume that AUX exists just because of shell env
- [IMPALA-3308](#) - Get expr-test passing on PPC64LE
- [IMPALA-3314](#) - Fix Avro schema loading for partitioned tables
- [IMPALA-3342](#) - Add thread counters to monitor plan fragment execution
- [IMPALA-3346](#) - DeepCopy() Kudu rows into Impala tuples
- [IMPALA-3348](#) - Avoid per-slot check vector size in KuduScanner
- [IMPALA-3398](#) - Add docs to main Impala branch
- [IMPALA-3420](#) - use gold by default
- [IMPALA-3481](#) - Use Kudu ScanToken API for scan ranges
- [IMPALA-3491](#) - Use unique db in test_scanners.py and test_aggregation.py
- [IMPALA-3491](#) - Use unique database fixture in test_partitioning.py
- [IMPALA-3491](#) - Use unique database fixture in test_insert_parquet.py

- [IMPALA-3491](#) - Use unique database fixture in test_nested_types.py
- [IMPALA-3491](#) - Use unique database fixture in test_ddl.py
- [IMPALA-3552](#) - Make incremental stats max serialized size configurable
- [IMPALA-3567](#) - Part 2, IMPALA-3899: factor out PHJ builder
- [IMPALA-3567](#) - move ExecOption profile helpers to RuntimeProfile
- [IMPALA-3586](#) - Clean up union-node.h/cc to enable improvements.
- [IMPALA-3644](#) - Make predicate order deterministic
- [IMPALA-3671](#) - Add query option to limit scratch space usage
- [IMPALA-3676](#) - Use clang as a static analysis tool
- [IMPALA-3710](#) - Kudu DML should ignore conflicts, pt2
- [IMPALA-3710](#) - Kudu DML should ignore conflicts by default
- [IMPALA-3713](#) - ,IMPALA-4439: Fix Kudu DML shell reporting
- [IMPALA-3718](#) - Add test_cancellation tests for Kudu
- [IMPALA-3718](#) - Support subset of functional-query for Kudu
- [IMPALA-3719](#) - Simplify CREATE TABLE statements with Kudu tables
- [IMPALA-3724](#) - Support Kudu non-covering range partitions
- [IMPALA-3725](#) - Support Kudu UPSERT in Impala
- [IMPALA-3726](#) - Add support for Kudu-specific column options
- [IMPALA-3739](#) - Enable stress tests on Kudu
- [IMPALA-3771](#) - Expose kudu client timeout and set default
- [IMPALA-3786](#) - Replace "cloudera" with "apache"
- [IMPALA-3786](#) - Replace "cloudera" with "apache"
- [IMPALA-3788](#) - Fix Kudu ReadMode flag checking
- [IMPALA-3788](#) - Add flag for Kudu read-your-writes
- [IMPALA-3788](#) - Support for Kudu 'read-your-writes' consistency
- [IMPALA-3808](#) - Add incubating DISCLAIMER from the Incubator Branding Guide
- [IMPALA-3809](#) - Show Kudu-specific column metadata in DESCRIBE.
- [IMPALA-3812](#) - Fix error message for unsupported types
- [IMPALA-3815](#) - clean up cross-compiled comparator
- [IMPALA-3823](#) - Add timer to measure Parquet footer reads
- [IMPALA-3838](#) - IMPALA-4495: Codegen EvalRuntimeFilters() and fixes filter stats updates
- [IMPALA-3853](#) - More RAT cleaning.
- [IMPALA-3853](#) - squeasel is MIT (and dual copyright) not Apache
- [IMPALA-3872](#) - allow providing PyPi mirror for python packages
- [IMPALA-3875](#) - Thrift threaded server hang in some cases
- [IMPALA-3884](#) - Support TYPE_TIMESTAMP for HashTableCtx::CodegenAssignNullValue()
- [IMPALA-3902](#) - Scheduler improvements for running multiple fragment instances on a single backend
- [IMPALA-3905](#) - Add single-threaded scan node.
- [IMPALA-3912](#) - test_random_rpc_timeout is flaky.
- [IMPALA-3918](#) - Fix straggler Cloudera -> ASF license headers
- [IMPALA-3920](#) - TotalStorageWaitTime counter not populated for fragments with Kudu scan node
- [IMPALA-3943](#) - Address post-merge comments.
- [IMPALA-3971](#) - IMPALA-3229: Bootstrap an Impala dev environment
- [IMPALA-3973](#) - add position and occurrence to instr()
- [IMPALA-3980](#) - qgen: re-enable Hive as a target database
- [IMPALA-3983](#) - /IMPALA-3974: Delete function jar resources after load
- [IMPALA-4000](#) - Restricted Sentry authorization for Kudu Tables
- [IMPALA-4006](#) - Fix typo in buildall.sh introduced in
- [IMPALA-4006](#) - dangerous rm -rf statements in scripts
- [IMPALA-4008](#) - Don't bake ExprContext pointers into IR code

- [IMPALA-4008](#) - don't bake in hash table and hash join pointers
- [IMPALA-4011](#) - Remove / reword messages when statestore messages are late
- [IMPALA-4020](#) - Handle external conflicting changes to HMS gracefully
- [IMPALA-4023](#) - don't attach buffered tuple streams to batches
- [IMPALA-4026](#) - Implement double-buffering for BlockingQueue
- [IMPALA-4028](#) - Improve message for improper Sentry config to make extra spaces visible
- [IMPALA-4037](#) - IMPALA-4038: fix locking during query cancellation
- [IMPALA-4042](#) - Preserve root types when substituting grouping exprs
- [IMPALA-4047](#) - Remove occurrences of 'CDH'/'cdh' from repo
- [IMPALA-4048](#) - Misc. improvements to /sessions
- [IMPALA-4054](#) - Remove serial test workarounds for IMPALA-2479.
- [IMPALA-4056](#) - Fix toSql() of DistributeParam
- [IMPALA-4058](#) - benchmark byteswap on misaligned memory
- [IMPALA-4074](#) - Configuration items duplicate in template of YARN
- [IMPALA-4080](#) - IMPALA-3638: Introduce ExecNode::Codegen()
- [IMPALA-4087](#) - TestFragmentLifecycle.test_failure_in_prepare
- [IMPALA-4091](#) - Fix backend unit to log in logs/be_tests.
- [IMPALA-4096](#) - Allow clean.sh to work from snapshots
- [IMPALA-4097](#) - Crash in kudu-scan-node-test
- [IMPALA-4098](#) - Open()/Close() partition exprs once per fragment instance.
- [IMPALA-4100](#) - 4112: Qgen: Replace EXTRACT UDF + IS [NOT] DISTINCT FROM in HiveSqlWriter
- [IMPALA-4101](#) - qgen: Hive join predicates should only contains equality functions
- [IMPALA-4102](#) - Remote Kudu reads should be reported
- [IMPALA-4104](#) - add DCHECK to ConsumeLocal() and fix tests
- [IMPALA-4110](#) - IMPALA-3853: npm.js uses Artistic License 2
- [IMPALA-4110](#) - Clean up issues found by Apache RAT
- [IMPALA-4110](#) - Apache RAT script on Impala tarballs
- [IMPALA-4111](#) - backend death tests should not produce minidumps
- [IMPALA-4116](#) - Remove 'cdh' from version string again
- [IMPALA-4116](#) - Remove 'cdh' from version string
- [IMPALA-4117](#) - Factor simple scheduler test code into own files
- [IMPALA-4118](#) - extract encryption utils from BufferedBlockMgr
- [IMPALA-4122](#) - qgen: fix bitrotted cluster unit tests
- [IMPALA-4123](#) - Fast bit unpacking
- [IMPALA-4134](#) - IMPALA-3704: Kudu INSERT improvements
- [IMPALA-4136](#) - testKudu planner test hangs if Kudu is not supported
- [IMPALA-4138](#) - Fix AcquireState() for batches that change capacity
- [IMPALA-4142](#) - qgen: Hive does not support CTEs inside sub-query blocks
- [IMPALA-4155](#) - Update default partition when table is altered
- [IMPALA-4160](#) - Remove some leftover Llama references
- [IMPALA-4160](#) - Remove Llama support.
- [IMPALA-4171](#) - Remove JAR from repo.
- [IMPALA-4180](#) - Synchronize accesses to RuntimeState::reader_contexts_
- [IMPALA-4187](#) - Switch RPC latency metrics to histograms
- [IMPALA-4188](#) - Leopard: support external Docker volumes
- [IMPALA-4193](#) - Warn when benchmarks run with sub-optimal CPU settings
- [IMPALA-4194](#) - Bump version to 2.8.0
- [IMPALA-4199](#) - Add 'SNAPSHOT' to Impala version
- [IMPALA-4204](#) - Remove KuduScanNodeTest
- [IMPALA-4205](#) - fix tmp-file-mgr-test under ASAN

- [IMPALA-4206](#) - Add column lineage regression test.
- [IMPALA-4207](#) - test infra: move Hive options from connection to cluster options
- [IMPALA-4213](#) - Fix Kudu predicates that need constant folding
- [IMPALA-4230](#) - ASF policy issues from 2.7.0 rc3.
- [IMPALA-4231](#) - fix codegen time regression
- [IMPALA-4232](#) - qgen: Hive does not support aggregates inside specific analytic clauses
- [IMPALA-4234](#) - Remove astyle config file, looks outdated.
- [IMPALA-4239](#) - fix buffer pool test failures in release build
- [IMPALA-4240](#) - qgen: Add "ParseException line missing)" to Known Errors for Hive
- [IMPALA-4241](#) - remove spurious child queries event
- [IMPALA-4253](#) - impala-server.backends.client-cache.total-clients shows negative value
- [IMPALA-4258](#) - Remove duplicated and unused test macros
- [IMPALA-4259](#) - build Impala without any test cluster setup
- [IMPALA-4260](#) - Alter table add column drops all the column stats
- [IMPALA-4266](#) - Java udf returning string can give incorrect results
- [IMPALA-4269](#) - Codegen merging exchange node
- [IMPALA-4270](#) - Gracefully fail unsupported queries with mt_dop > 0.
- [IMPALA-4274](#) - hang in buffered-block-mgr-test
- [IMPALA-4277](#) - remove unneeded LegacyTCLIService
- [IMPALA-4277](#) - remove references for unsupported s3/s3n connectors
- [IMPALA-4277](#) - allow overriding of Hive/Hadoop versions/locations
- [IMPALA-4278](#) - Don't abort Catalog startup quickly if HMS is not present
- [IMPALA-4283](#) - Ensure Kudu-specific lineage and audit behavior
- [IMPALA-4285](#) - /IMPALA-4286: Fixes for Parquet scanner with MT_DOP > 0.
- [IMPALA-4287](#) - EE tests fail to run when KUDU_IS_SUPPORTED=false
- [IMPALA-4289](#) - Mark agg slots of NDV() functions as non-nullable
- [IMPALA-4291](#) - Reduce LLVM module's preparation time
- [IMPALA-4294](#) - Make check-schema-diff.sh executable from anywhere.
- [IMPALA-4295](#) - XFAIL wildcard SSL test
- [IMPALA-4299](#) - add buildall.sh option to start test cluster
- [IMPALA-4300](#) - Speed up BloomFilter::Or with SIMD
- [IMPALA-4302](#) - ,IMPALA-2379: constant expr arg fixes
- [IMPALA-4303](#) - Do not reset() qualifier of union operands.
- [IMPALA-4309](#) - Introduce Expr rewrite phase and supporting classes
- [IMPALA-4310](#) - Make push_to_asf.py respect --apache_remote
- [IMPALA-4314](#) - Standardize on MT-related data structures
- [IMPALA-4325](#) - StmtRewrite lost parentheses of CompoundPredicate
- [IMPALA-4330](#) - Fix JSON syntax in generate_metrics.py
- [IMPALA-4335](#) - Don't send 0-row batches to clients
- [IMPALA-4338](#) - test infra data migrator: include tables' primary keys in PostgreSQL
- [IMPALA-4339](#) - ensure coredumps end up in IMPALA_HOME
- [IMPALA-4340](#) - explain how to install postgresql-9.5 or higher
- [IMPALA-4343](#) - IMPALA-4354: qgen: model INSERTs; write INSERTs from query model
- [IMPALA-4348](#) - / IMPALA-4333: Improve coordinator fragment cancellation
- [IMPALA-4350](#) - Crash with vlog level 2 in hash join node
- [IMPALA-4352](#) - test infra: store Impala/Kudu primary keys in object model
- [IMPALA-4357](#) - Fix DROP TABLE to pass analysis if the table fails to load
- [IMPALA-4362](#) - Misc. fixes for PFE counters
- [IMPALA-4363](#) - Add Parquet timestamp validation
- [IMPALA-4365](#) - Enabling end-to-end tests on a remote cluster

- [IMPALA-4369](#) - Avoid DCHECK in Parquet scanner with MT_DOP > 0
- [IMPALA-4371](#) - Incorrect DCHECK-s in hdfs-parquet-table-writer
- [IMPALA-4372](#) - 'Describe formatted' returns types in upper case
- [IMPALA-4374](#) - Use new syntax for creating TPC-DS/H tables in Kudu stress test
- [IMPALA-4377](#) - Fix Java UDF-arg buffer use-after-free in UdfExecutorTest.
- [IMPALA-4379](#) - Fix and test Kudu table type checking, follow up
- [IMPALA-4379](#) - Fix and test Kudu table type checking
- [IMPALA-4380](#) - Remove 'cloudera' from hostnames in bin/generate_minidump_collection_testdata.py
- [IMPALA-4381](#) - Incorrect AVX version of BloomFilter::Or
- [IMPALA-4383](#) - Ensure plan fragment report thread is always started
- [IMPALA-4384](#) - NPE when cols list has trailing comma
- [IMPALA-4388](#) - Fix query option reset in tests
- [IMPALA-4391](#) - fix dropped statuses in scanners
- [IMPALA-4392](#) - restore PeakMemoryUsage to DataSink profiles
- [IMPALA-4397](#) - addendum: remove stray semicolon
- [IMPALA-4397](#) - IMPALA-3259: reduce codegen time and memory
- [IMPALA-4403](#) - Implement SHOW RANGE PARTITIONS for Kudu tables
- [IMPALA-4406](#) - Add cryptography export control notice
- [IMPALA-4408](#) - Omit null bytes for Kudu scans with no nullable slots.
- [IMPALA-4409](#) - respect lock order in QueryExecState::CancelInternal()
- [IMPALA-4410](#) - Safer tear-down of RuntimeState
- [IMPALA-4411](#) - Kudu inserts violate lock ordering and could deadlock
- [IMPALA-4412](#) - Per operator timing in profile summary is incorrect when mt_dop > 0
- [IMPALA-4415](#) - Fix unassigned scan range of size 1
- [IMPALA-4421](#) - Send custom cluster & process failure test results to logs/
- [IMPALA-4427](#) - leopard: make DOCKER_IMAGE_NAME required
- [IMPALA-4432](#) - Handle internal codegen disabling properly
- [IMPALA-4433](#) - Always generate testdata using the same time zone setting
- [IMPALA-4434](#) - In Python, ".split('\n') is [''], which has length 1
- [IMPALA-4435](#) - Fix in-predicate-benchmark linking by moving templates
- [IMPALA-4436](#) - StringValue::StringCompare() should match strncmp()
- [IMPALA-4437](#) - fix crash in disk-io-mgr
- [IMPALA-4437](#) - hit DCHECK in buffered-block-mgr-test
- [IMPALA-4438](#) - Serialize test_failpoints.py to reduce memory pressure
- [IMPALA-4440](#) - lineage timestamps can go backwards across daylight savings transitions
- [IMPALA-4441](#) - Divide-by-zero in RuntimeProfile::SummaryStatsCounter::SetStats
- [IMPALA-4442](#) - Fix FE ParserTests UnsatisfiedLinkError
- [IMPALA-4444](#) - Transfer row group resources to row batch on scan failure
- [IMPALA-4446](#) - expr-test fails under ASAN
- [IMPALA-4447](#) - Rein in overly broad sed that dirties the tree
- [IMPALA-4450](#) - qgen: use string concatenation operator for postgres queries
- [IMPALA-4452](#) - Always call AggFnEvaluator::Open() before AggFnEvaluator::Init()
- [IMPALA-4454](#) - test_kudu.TestShowCreateTable flaky
- [IMPALA-4455](#) - MemPoolTest.TryAllocateAligned failure: sizeof v. alignof
- [IMPALA-4458](#) - Fix resource cleanup of cancelled mt scan nodes.
- [IMPALA-4461](#) - Make sure data gets loaded for wide hbase tables.
- [IMPALA-4465](#) - Don't hold process wide lock while serializing Runtime Profile in GetRuntimeProfileStr()
- [IMPALA-4466](#) - Improve Kudu CRUD test coverage
- [IMPALA-4470](#) - Avoid creating a NumericLiteral from NaN/infinity/-0
- [IMPALA-4476](#) - Use unique_database to stop races in test_udfs.py

- [IMPALA-4477](#) - Bump Kudu version to latest master
- [IMPALA-4477](#) - Upgrade Kudu version to latest master
- [IMPALA-4477](#) - Upgrade Kudu version to latest master
- [IMPALA-4477](#) - Upgrade Kudu version to latest master
- [IMPALA-4478](#) - Initial Kudu client mem tracking for sink
- [IMPALA-4479](#) - Use correct isSet() thrift function when evaluating constant bool exprs
- [IMPALA-4480](#) - zero_length_region_ must be as aligned as max_align_t
- [IMPALA-4488](#) - HS2 GetOperationStatus() should keep session alive
- [IMPALA-4490](#) - Only generate runtime filters for hash join nodes.
- [IMPALA-4493](#) - fix string-compare-test when using clang
- [IMPALA-4494](#) - Fix crash in SimpleScheduler
- [IMPALA-4497](#) - Fix Kudu client crash w/ SASL initialization
- [IMPALA-4498](#) - crash in to_utc_timestamp/from_utc_timestamp
- [IMPALA-4502](#) - test_partition_ddl_predicates breaks on non-HDFS filesystems
- [IMPALA-4504](#) - fix races in PlanFragmentExecutor regarding status reporting
- [IMPALA-4509](#) - Initialise Sasl-specific mutex
- [IMPALA-4510](#) - Selectively filter args for metric verification tests
- [IMPALA-4511](#) - Add missing total_time_counter() to PFE::Exec()
- [IMPALA-4512](#) - Add a script that builds Impala on stock Ubuntu 14.04
- [IMPALA-4514](#) - Fix broken exhaustive builds caused by non-nullable columns
- [IMPALA-4516](#) - Don't hold process wide lock connection_to_sessions_map_lock_ while cancelling queries
- [IMPALA-4518](#) - CopyStringVal() doesn't copy null string
- [IMPALA-4519](#) - increase timeout in TestFragmentLifecycle
- [IMPALA-4522](#) - Bound Kudu client threads to avoid stress crash
- [IMPALA-4523](#) - Correct max VARCHAR size to 65535 (2¹⁶ - 1).
- [IMPALA-4525](#) - follow-on: cleanup error handling
- [IMPALA-4525](#) - fix crash when codegen mem limit exceeded
- [IMPALA-4527](#) - Columns in Kudu tables created from Impala default to "NULL"
- [IMPALA-4529](#) - speed up parsing of identifiers
- [IMPALA-4532](#) - Fix use-after-free in ProcessBuildInputAsync()
- [IMPALA-4535](#) - Remove 'auto' from parameter list
- [IMPALA-4539](#) - fix bug when scratch batch references I/O buffers
- [IMPALA-4540](#) - Function call in DCHECK crashes scheduler
- [IMPALA-4541](#) - fix test dimensions for test_codegen_mem_limit
- [IMPALA-4542](#) - Fix use-after-free in some BE tests
- [IMPALA-4550](#) - Fix CastExpr analysis for substituted slots
- [IMPALA-4553](#) - ntpd must be synchronized for kudu to start.
- [IMPALA-4554](#) - fix projection of nested collections with mt_dop > 0
- [IMPALA-4557](#) - Fix flakiness with FLAGS_stress_free_pool_alloc
- [IMPALA-4561](#) - Replace DISTRIBUTE BY with PARTITION BY in CREATE TABLE
- [IMPALA-4562](#) - Fix for crash on kerberized clusters w/o Kudu support
- [IMPALA-4564](#) - ,IMPALA-4565: mt_dop fixes for old aggs and joins
- [IMPALA-4566](#) - Kudu client glog contention can cause timeouts
- [IMPALA-4567](#) - Fix test_kudu_alter_table exhaustive failures
- [IMPALA-4570](#) - shell tarball breaks with certain setuptools versions
- [IMPALA-4571](#) - Push IN predicates to Kudu
- [IMPALA-4572](#) - Run COMPUTE STATS on Parquet tables with MT_DOP=4
- [IMPALA-4574](#) - Do not treat UUID() like a constant expr
- [IMPALA-4577](#) - Adjust maximum size of row batch queue with MT_DOP
- [IMPALA-4578](#) - Pick up bound predicates for Kudu scan nodes.

- [IMPALA-4579](#) - SHOW CREATE VIEW fails for view containing a subquery
- [IMPALA-4580](#) - Fix crash with FETCH_FIRST when #rows < result cache size
- [IMPALA-4584](#) - Make alter table operations on Kudu tables synchronous
- [IMPALA-4585](#) - Allow the \$DATABASE template in the CATCH section
- [IMPALA-4586](#) - don't constant fold in backend
- [IMPALA-4592](#) - Improve error msg for non-deterministic predicates
- [IMPALA-4594](#) - WriteSlot and CodegenWriteSlot handle escaped NULL slots differently
- [IMPALA-4595](#) - Ignore discarded functions after linking
- [IMPALA-4608](#) - Fix fragment completion times for INSERTs
- [IMPALA-4609](#) - prefix thread counters in fragment profile
- [IMPALA-4613](#) - Make sure timers are finished before sending report profile
- [IMPALA-4614](#) - Set eval cost of timestamp literals.
- [IMPALA-4619](#) - Allow NULL as default value in Kudu tables
- [IMPALA-4628](#) - Disable broken kudu test to unblock GVOs
- [IMPALA-4630](#) - remove debug webpage easter egg
- [IMPALA-4633](#) - Change broken gflag default for Kudu client mem
- [IMPALA-4636](#) - Correct Suse Linux distro string
- [IMPALA-4636](#) - Add support for SLES12 for Kudu integration
- [IMPALA-4638](#) - Run queries with MT_DOP through admission control
- [IMPALA-4642](#) - Fix TestFragmentLifecycle failures; kudu test must wait
- [IMPALA-4654](#) - KuduScanner must return when ReachedLimit()
- [IMPALA-4659](#) - fuzz test fixes
- [IMPALA-4739](#) - ExprRewriter fails on HAVING clauses
- [IMPALA-4765](#) - Avoid using several loading threads on one table
- [IMPALA-4768](#) - Improve logging of table loading
- [IMPALA-3905](#) - Add single-threaded scan node
- [IMPALA-4262](#) - LZO-scanner fails when reading large index files from S3
- [IMPALA-4277](#) - Merge "build against hadoop components in different location" into cdh5-trunk
- [IMPALA-4277](#) - build against hadoop components in different location
- [IMPALA-4322](#) - test_scanners_fuzz.py hits a DCHECK
- [IMPALA-4391](#) - fix dropped status in scanners

Issues Fixed in Impala for CDH 5.9.3

For the full list of fixed issues for all CDH components, see [Upstream Issues Fixed](#) on page 2194.

- [IMPALA-3794](#) - Workaround for Breakpad ID conflicts
- [IMPALA-4293](#) - query profile should include error log
- [IMPALA-4383](#) - Ensure plan fragment report thread is always started
- [IMPALA-4409](#) - respect lock order in QueryExecState::CancelInternal()
- [IMPALA-4615](#) - Fix create_table.sql command order
- [IMPALA-4787](#) - Optimize APPX_MEDIAN() memory usage
- [IMPALA-5088](#) - Fix heap buffer overflow
- [IMPALA-5193](#) - Initialize decompressor before finding first tuple
- [IMPALA-5197](#) - Erroneous corrupted Parquet file message
- [IMPALA-5252](#) - Fix crash in HiveUdfCall::GetStringVal() when mem_limit exceeded
- [IMPALA-5253](#) - Use appropriate transport for StatestoreSubscriber
- [IMPALA-5355](#) - Fix the order of Sentry roles and privileges
- [IMPALA-5469](#) - Fix exception when processing catalog update

Issues Fixed in Impala for CDH 5.9.2

For the full list of fixed issues for all CDH components, see [Upstream Issues Fixed](#) on page 2197.

- [IMPALA-1702](#) - Enforce single-table consistency in query analysis.
- [IMPALA-2864](#) - Ensure that client connections are closed after a failed Open()
- [IMPALA-3167](#) - Fix assignment of WHERE conjunct through grouping agg + OJ.
- [IMPALA-3314](#) - Fix Avro schema loading for partitioned tables.
- [IMPALA-3552](#) - Make incremental stats max serialized size configurable
- [IMPALA-3875](#) - Thrift threaded server hang in some cases
- [IMPALA-3884](#) - Support TYPE_TIMESTAMP for HashTableCtx::CodegenAssignNullValue()
- [IMPALA-3983](#) - [IMPALA-3974](#): Delete function jar resources after load
- [IMPALA-4020](#) - Handle external conflicting changes to HMS gracefully
- [IMPALA-4037](#) - [IMPALA-4038](#): fix locking during query cancellation
- [IMPALA-4180](#) - Synchronize accesses to RuntimeState::reader_contexts_
- [IMPALA-4260](#) - Alter table add column drops all the column stats
- [IMPALA-4263](#) - Fix wrong omission of agg/analytic hash exchanges.
- [IMPALA-4266](#) - Java udf returning string can give incorrect results
- [IMPALA-4282](#) - Remove max length check for type strings.
- [IMPALA-4291](#) - Reduce LLVM module's preparation time
- [IMPALA-4363](#) - [IMPALA-4585](#): Add Parquet timestamp validation
- [IMPALA-4391](#) - fix dropped statuses in scanners
- [IMPALA-4433](#) - Always generate testdata using the same time zone setting
- [IMPALA-4449](#) - Revisit table locking pattern in the catalog
- [IMPALA-4488](#) - HS2 GetOperationStatus() should keep session alive
- [IMPALA-4494](#) - [IMPALA-4540](#): Fix crash in SimpleScheduler
- [IMPALA-4516](#) - Don't hold process wide lock connection_to_sessions_map_lock_ while cancelling queries
- [IMPALA-4518](#) - CopyStringVal() doesn't copy null string
- [IMPALA-4539](#) - fix bug when scratch batch references I/O buffers
- [IMPALA-4550](#) - Fix CastExpr analysis for substituted slots
- [IMPALA-4579](#) - SHOW CREATE VIEW fails for view containing a subquery
- [IMPALA-4705](#) - [IMPALA-4779](#), [IMPALA-4780](#): Fix some Expr bugs with codegen
- [IMPALA-4765](#) - Avoid using several loading threads on one table.
- [IMPALA-4767](#) - Workaround for HIVE-15653 to preserve table stats.
- [IMPALA-4916](#) - Fix maintenance of set of item sets in DisjointSet.
- [IMPALA-4929](#) - Safe concurrent access to IR function call graph
- [IMPALA-4995](#) - Fix integer overflow in TopNNode::PrepareForOutput
- [IMPALA-4997](#) - Fix overflows in Sorter::TupleIterator
- [IMPALA-5005](#) - Don't allow server to send SASL COMPLETE msg out of order
- [IMPALA-4391](#) - fix dropped status in scanners

Issues Fixed in Impala for CDH 5.9.1

For the full list of fixed issues for all CDH components, see [Upstream Issues Fixed](#) on page 2203.

- [IMPALA-3949](#) - Log error message in FileSystemUtil.copyToLocal()
- [IMPALA-4076](#) - Fix runtime filter sort compare method
- [IMPALA-4099](#) - Fix the error message while loading UDFs with no JARs
- [IMPALA-4120](#) - Incorrect results with LEAD() analytic function
- [IMPALA-4135](#) - Thrift threaded server times out connections during high load
- [IMPALA-4153](#) - Fix count(*) on all blank("") columns - test
- [IMPALA-4170](#) - Fix identifier quoting in COMPUTE INCREMENTAL STATS
- [IMPALA-4196](#) - Cross compile bit-byte-functions
- [IMPALA-4223](#) - Handle truncated file read from HDFS cache
- [IMPALA-4237](#) - Fix materialization of 4-byte decimals in data source scan node
- [IMPALA-4246](#) - SleepForMs() utility function has undefined behavior for > 1s

- [IMPALA-4301](#) - Fix IGNORE NULLS with subquery rewriting
- [IMPALA-4336](#) - Cast exprs after unnesting union operands
- [IMPALA-4387](#) - Validate decimal type in Avro file schema
- [IMPALA-4751](#) - For unknown query IDs, /query_profile_encoded?query_id=123 starts with an empty line.
- [IMPALA-4423](#) - Correct but conservative implementation of Subquery.equals().

Issues Fixed in Impala for CDH 5.9.0

For the full list of Impala fixed issues in CDH 5.9.0 / Impala 2.7.0, see [this report in the Impala JIRA tracker](#).

For the full list of fixed issues for all CDH components in CDH 5.9.0, see [Issues Fixed in CDH 5.9.x](#) on page 2194.

- [IMPALA-1112](#) - Remove some unnecessary code from cross-compilation
- [IMPALA-1240](#) - add back spilling sort now that sorter is not flaky
- [IMPALA-1440](#) - test for insert mem limit
- [IMPALA-3018](#) - Address various small memory allocation related bugs
- [IMPALA-1619](#) - Support 64-bit allocations
- [IMPALA-1633](#) - GetOperationStatus should set errorMessage and sqlState
- [IMPALA-1671](#) - Print time and link to coordinator web UI once query is submitted in shell
- [IMPALA-1683](#) - Allow REFRESH on a single partition
- [IMPALA-2347](#) - Reuse metastore client connections in Catalog
- [IMPALA-2459](#) - Implement next_day date/time UDF
- [IMPALA-2700](#) - ASCII NUL characters are doubled on insert into text tables
- [IMPALA-2767](#) - Web UI call to force expire sessions
- [IMPALA-2878](#) - Fix Base64Decode error and remove duplicate codes
- [IMPALA-2885](#) - ScannerContext::Stream objects should be owned by ScannerContext
- [IMPALA-2979](#) - Fix scheduling on remote hosts
- [IMPALA-3018](#) - Don't return NULL on zero length allocations
- [IMPALA-3063](#) - Separate join inversion from join ordering
- [IMPALA-3084](#) - Cache the sequence of table ref and materialized tuple ids during analysis
- [IMPALA-3181](#) - Add noexcept to some functions
- [IMPALA-3201](#) - buffer pool header only
- [IMPALA-3206](#) - Enable codegen for AVRO_DECIMAL
- [IMPALA-3210](#) - last/first_value() support for IGNORE NULLS
- [IMPALA-3223](#) - Remove boost multiprecision in thirdparty
- [IMPALA-3225](#) - Add script to push from gerrit to ASF
- [IMPALA-3227](#) - generate test TPC data sets during data load
- [IMPALA-3253](#) - Modify gen_build_version.sh to always output the right version
- [IMPALA-3336](#) - qgen: do not randomly generate query options
- [IMPALA-3376](#) - Extra definition level when writing Parquet files
- [IMPALA-3418](#) - The Impala FE project relies on Z-tools snapshot builds
- [IMPALA-3442](#) - Replace '>>' with '>>' in template decls
- [IMPALA-3449](#) - Kudu deploy.py should find clusters by displayName
- [IMPALA-3454](#) - Kudu deletes may fail if subqueries are used
- [IMPALA-3470](#) - DecompressorTest is flaky
- [IMPALA-3491](#) - Merge test_hbase_metadata.py into compute_stats.py. Use unique db fixture
- [IMPALA-3501](#) - ee tests: detect build type and support different timeouts based on the same
- [IMPALA-3507](#) - update binutils version to fix slow linking
- [IMPALA-3521](#) - Impalad should communicate with the statestore after binding to the hs2 and besswax ports
- [IMPALA-3530](#) - Clean up test_ddl.py. Part 1
- [IMPALA-3567](#) - Part 1: groundwork to make Join build sides DataSinks
- [IMPALA-3575](#) - Add retry to backend connection request and rpc timeout

- [IMPALA-3587](#) - Get rid of not_default_fs skip marker
- [IMPALA-3600](#) - Add missing admission control tests
- [IMPALA-3606](#) - Fix Java NPE when trying to add an existing partition
- [IMPALA-3611](#) - track unused Disk IO buffer memory
- [IMPALA-3627](#) - Clean up RPC structures in ImpalaInternalService
- [IMPALA-3632](#) - Add script for running cppclean over the BE code
- [IMPALA-3647](#) - track runtime filter memory in separate tracker
- [IMPALA-3656](#) - Hitting DCHECK/CHECK does not write minidumps
- [IMPALA-3664](#) - S3A test_keys_do_not_work fails
- [IMPALA-3674](#) - Lazy materialization of LLVM module bitcode
- [IMPALA-3677](#) - Write minidump on SIGUSR1
- [IMPALA-3682](#) - Don't retry unrecoverable socket creation errors
- [IMPALA-3687](#) - Prefer Avro field name during schema reconciliation
- [IMPALA-3715](#) - Include total usage of JVM memory
- [IMPALA-3715](#) - Include more info by default in Impala debug memz webpage
- [IMPALA-3716](#) - Add Memory Tab in query's Details page
- [IMPALA-3727](#) - Change microbenchmarks to use percentile-based reporting
- [IMPALA-3729](#) - batch_size=1 coverage for avro scanner
- [IMPALA-3734](#) - C++11 - Replace boost:shared_ptr with std:: equivalent
- [IMPALA-3736](#) - Move Impala HTTP handlers to a separate class
- [IMPALA-3737](#) - Local filesystem build failed loading custom schemas
- [IMPALA-3751](#) - fix clang build errors and warnings
- [IMPALA-3753](#) - Disable create table test for old aggs and joins
- [IMPALA-3756](#) - Fix wrong argument type in HiveStringsTest
- [IMPALA-3757](#) - Add missing lock in RuntimeProfile::ComputeTimeInProfile
- [IMPALA-3762](#) - Download Python requirements before they are needed
- [IMPALA-3763](#) - download_requirements fixes
- [IMPALA-3764](#) - fuzz test HDFS scanners and fix parquet bugs found
- [IMPALA-3767](#) - bootstrap_virtualenv fails to find cython distribution
- [IMPALA-3774](#) - fix download_requirements for older Python versions
- [IMPALA-3778](#) - Fix ASF packaging build
- [IMPALA-3779](#) - Disable cache pool reader thread when HDFS isn't running
- [IMPALA-3780](#) - avoid many small reads past end of block
- [IMPALA-3786](#) - Remove "Cloudera" from impalad webpage title
- [IMPALA-3790](#) - AC tests timeout in codecoverage builds
- [IMPALA-3799](#) - Make MAX_SCAN_RANGE_LENGTH accept formatted quantities
- [IMPALA-3806](#) - remove a few modern shell idioms to improve RHEL5 support
- [IMPALA-3817](#) - Ensure filter hash function is the same on all hardware
- [IMPALA-3839](#) - Fix race condition in impala_cluster.py
- [IMPALA-3843](#) - Update warning for non-SSSE3 CPUs
- [IMPALA-3845](#) - Split up hdfs-parquet-scanner.cc into more files/components
- [IMPALA-3852](#) - Remove Derby and Shiro FE dependencies
- [IMPALA-3854](#) - Fix use-after-free in HdfsTextScanner::Close()
- [IMPALA-3856](#) - Fix BinaryPredicate normalization for Kudu
- [IMPALA-3857](#) - KuduScanNode race on returning "optional" threads
- [IMPALA-3864](#) - qgen: reduce likelihood of create_query() exceptions
- [IMPALA-3866](#) - consistent user-facing terminology for scratch dirs
- [IMPALA-3881](#) - Add DataTables 1.10.12 to www/
- [IMPALA-3886](#) - Improve log of pip_download.py
- [IMPALA-3892](#) - qgen: always run Impala with -convert_legacy_hive_parquet_utc_timestamps=true

- [IMPALA-3905](#) - Add HdfsScanner::GetNext() interface and implementation for Parquet
- [IMPALA-3906](#) - Materialize implicitly referenced IR functions
- [IMPALA-3914](#) - SKIP_TOOLCHAIN_BOOTSTRAP skips Python package downloads
- [IMPALA-3918](#) - Remove Cloudera copyrights and add ASF license header
- [IMPALA-3923](#) - fix overflow in BufferedTupleStream::GetRows()
- [IMPALA-3924](#) - Ubuntu16 support
- [IMPALA-3936](#) - BufferedBlockMgr fixes for Pin() while write in flight
- [IMPALA-3939](#) - Data loading may fail on tpch kudu
- [IMPALA-3943](#) - Do not throw scan errors for empty Parquet files
- [IMPALA-3946](#) - fix MemPool integrity issues with empty chunks
- [IMPALA-3952](#) - Clear scratch batch mem pool if Open() failed
- [IMPALA-3953](#) - Fixes for KuduScanNode BE test failure
- [IMPALA-3954](#) - Add unique_database to scanner test
- [IMPALA-3957](#) - Test failure in S3 build: TestLoadData.test_load
- [IMPALA-3964](#) - Fix crash when a count(*) is performed on a nested collection
- [IMPALA-3969](#) - stress test: add option to set common query options
- [IMPALA-3972](#) - Improve display of /varz page
- [IMPALA-3992](#) - bad shell error message when running nonexistent file

Issues Fixed in Impala for CDH 5.8.5

For the full list of fixed issues for all CDH components, see [Upstream Issues Fixed](#) on page 2232.

- [IMPALA-1346](#) - /1590/2344: fix sorter buffer mgmt when spilling
- [IMPALA-1619](#), [IMPALA-3018](#): Address various small memory allocation related bugs
- [IMPALA-1619](#) - Support 64-bit allocations.
- [IMPALA-1657](#) - Rework detection and reporting of corrupt table stats.
- [IMPALA-2864](#) - Ensure that client connections are closed after a failed Open()
- [IMPALA-3018](#) - Don't return NULL on zero length allocations.
- [IMPALA-3159](#) - impala-shell does not accept wildcard or SAN certificates
- [IMPALA-3167](#) - Fix assignment of WHERE conjunct through grouping agg + OJ.
- [IMPALA-3314](#) - Fix Avro schema loading for partitioned tables.
- [IMPALA-3344](#) - Simplify sorter and document/enforce invariants.
- [IMPALA-3441](#), [IMPALA-3659](#): check for malformed Avro data
- [IMPALA-3499](#) - Split catalog update
- [IMPALA-3552](#) - Make incremental stats max serialized size configurable
- [IMPALA-3575](#) - Add retry to backend connection request and rpc timeout
- [IMPALA-3628](#) - Fix cancellation from shell when security is enabled
- [IMPALA-3633](#) - cancel fragment if coordinator is gone
- [IMPALA-3646](#) - Handle corrupt RLE literal or repeat counts of 0.
- [IMPALA-3670](#) - fix sorter buffer mgmt bugs
- [IMPALA-3678](#) - Fix migration of predicates into union operands with an order by + limit.
- [IMPALA-3680](#) - Cleanup the scan range state after failed hdfs cache reads
- [IMPALA-3682](#) - Don't retry unrecoverable socket creation errors
- [IMPALA-3687](#) - Prefer Avro field name during schema reconciliation
- [IMPALA-3711](#) - Remove unnecessary privilege checks in getDbsMetadata()
- [IMPALA-3732](#) - handle string length overflow in avro files
- [IMPALA-3745](#) - parquet invalid data handling
- [IMPALA-3751](#) - fix clang build errors and warnings
- [IMPALA-3754](#) - fix TestParquet.test_corrupt_rle_counts flakiness
- [IMPALA-3776](#) - fix 'describe formatted' for Avro tables
- [IMPALA-3820](#) - Handle linkage errors while loading Java UDFs in Catalog

- [IMPALA-3861](#) - Replace BetweenPredicates with their equivalent CompoundPredicate.
- [IMPALA-3875](#) - Thrift threaded server hang in some cases
- [IMPALA-3884](#) - Support TYPE_TIMESTAMP for HashTableCtx::CodegenAssignNullValue()
- [IMPALA-3915](#) - Register privilege and audit requests when analyzing resolved table refs.
- [IMPALA-3930](#), [IMPALA-2570](#): Fix shuffle insert hint with constant partition exprs.
- [IMPALA-3940](#) - Fix getting column stats through views.
- [IMPALA-3949](#) - Log the error message in FileSystemUtil.copyToLocal()
- [IMPALA-3964](#) - Fix crash when a count(*) is performed on a nested collection.
- [IMPALA-3965](#) - TSSLSocketWithWildcardSAN.py not exported as part of impala-shell build lib
- [IMPALA-3983](#), [IMPALA-3974](#): Delete function jar resources after load
- [IMPALA-4019](#) - initialize member variables in HdfsTableSink
- [IMPALA-4020](#) - Handle external conflicting changes to HMS gracefully
- [IMPALA-4037](#), [IMPALA-4038](#): fix locking during query cancellation
- [IMPALA-4049](#) - fix empty batch handling NLJ build side
- [IMPALA-4076](#) - Fix runtime filter sort compare method
- [IMPALA-4099](#) - Fix the error message while loading UDFs with no JARs
- [IMPALA-4120](#) - Incorrect results with LEAD() analytic function
- [IMPALA-4135](#) - Thrift threaded server times-out connections during high load
- [IMPALA-4153](#) - Fix count(*) on all blank("") columns - test
- [IMPALA-4170](#) - Fix identifier quoting in COMPUTE INCREMENTAL STATS.
- [IMPALA-4180](#) - Synchronize accesses to RuntimeState::reader_contexts_
- [IMPALA-4196](#) - Cross compile bit-byte-functions
- [IMPALA-4223](#) - Handle truncated file read from HDFS cache
- [IMPALA-4237](#) - Fix materialization of 4 byte decimals in data source scan node.
- [IMPALA-4246](#) - SleepForMs() utility function has undefined behavior for > 1s
- [IMPALA-4260](#) - Alter table add column drops all the column stats
- [IMPALA-4263](#) - Fix wrong omission of agg/analytic hash exchanges.
- [IMPALA-4266](#) - Java udf returning string can give incorrect results
- [IMPALA-4282](#) - Remove max length check for type strings.
- [IMPALA-4293](#) - query profile should include error log
- [IMPALA-4295](#) - XFAIL wildcard SSL test
- [IMPALA-4336](#) - Cast exprs after unnesting union operands.
- [IMPALA-4363](#) - Add Parquet timestamp validation
- [IMPALA-4383](#) - Ensure plan fragment report thread is always started
- [IMPALA-4391](#) - fix dropped statuses in scanners
- [IMPALA-4423](#) - Correct but conservative implementation of Subquery.equals().
- [IMPALA-4433](#) - Always generate testdata using the same time zone setting
- [IMPALA-4449](#) - Revisit table locking pattern in the catalog This commit fixes an issue where multiple long-running operations on the same catalog object (e.g. table) can block other catalog operations from making progress.
- [IMPALA-4488](#) - HS2 GetOperationStatus() should keep session alive
- [IMPALA-4518](#) - CopyStringVal() doesn't copy null string
- [IMPALA-4539](#) - fix bug when scratch batch references I/O buffers
- [IMPALA-4550](#) - Fix CastExpr analysis for substituted slots
- [IMPALA-4579](#) - SHOW CREATE VIEW fails for view containing a subquery
- [IMPALA-4765](#) - Avoid using several loading threads on one table.
- [IMPALA-4767](#) - Workaround for HIVE-15653 to preserve table stats.
- [IMPALA-4779](#), [IMPALA-4780](#): Fix conditional functions built-in and Timestamp bounds
- [IMPALA-4787](#) - Optimize APPX_MEDIAN() memory usage
- [IMPALA-4916](#) - Fix maintenance of set of item sets in DisjointSet.
- [IMPALA-4995](#) - Fix integer overflow in TopNNNode::PrepareForOutput

- [IMPALA-4997](#) - Fix overflows in Sorter::TupletIterator
- [IMPALA-5005](#) - Don't allow server to send SASL COMPLETE msg out of order
- [IMPALA-5088](#) - Fix heap buffer overflow
- [IMPALA-5253](#) - Use appropriate transport for StatestoreSubscriber

Issues Fixed in Impala for CDH 5.8.4

For the full list of fixed issues for all CDH components, see [Upstream Issues Fixed](#) on page 2247.

- [IMPALA-1702](#) - "invalidate metadata" can cause duplicate TableIds
- [IMPALA-3167](#) - Fix assignment of WHERE clause predicate through grouping aggregate and outer join
- [IMPALA-3314](#) - Fix Avro schema loading for partitioned tables
- [IMPALA-3552](#) - Make incremental stats max serialized size configurable
- [IMPALA-3575](#) - Add retry to backend connection request and rpc timeout
- [IMPALA-3682](#) - Don't retry unrecoverable socket creation errors
- [IMPALA-3875](#) - Thrift threaded server hang in some cases
- [IMPALA-3884](#) - Support TYPE_TIMESTAMP for HashTableCtx::CodegenAssignNullValue()
- [IMPALA-3949](#) - Log the error message in FileSystemUtil.copyToLocal()
- [IMPALA-3964](#) - Fix crash when a count(*) is performed on a nested collection.
- [IMPALA-3983](#) - Delete function jar resources after load
- [IMPALA-4037](#) - ChildQuery::Cancel() appears to violate lock ordering
- [IMPALA-4038](#) - Fix locking during query cancellation
- [IMPALA-4076](#) - Fix runtime filter sort compare method
- [IMPALA-4099](#) - Fix the error message while loading UDFs with no JARs
- [IMPALA-4120](#) - Incorrect results with LEAD() analytic function
- [IMPALA-4153](#) - Fix count(*) on all blank("") columns - test
- [IMPALA-4223](#) - Handle truncated file read from HDFS cache
- [IMPALA-4246](#) - SleepForMs() utility function has undefined behavior for > 1s
- [IMPALA-4336](#) - Cast expressions after unnesting union operands
- [IMPALA-4363](#) - Add Parquet timestamp validation
- [IMPALA-4391](#) - Fix dropped statuses in scanners
- [IMPALA-4423](#) - Correct but conservative implementation of Subquery.equals()
- [IMPALA-4433](#) - Always generate test data using the same time zone setting
- [IMPALA-4449](#) - Revisit table locking pattern in the catalog. Fixes an issue where multiple long-running operations on the same catalog object (for example, a table) can block other catalog operations from making progress
- [IMPALA-4550](#) - Fix CastExpr analysis for substituted slots
- [IMPALA-4391](#) - Fix dropped status in scanners

Issues Fixed in Impala for CDH 5.8.3

For the full list of fixed issues for all CDH components, see [Upstream Issues Fixed](#) on page 2251.

- [IMPALA-1619](#) - Support 64-bit allocations
- [IMPALA-3687](#) - Prefer Avro field name during schema reconciliation
- [IMPALA-3751](#) - Fix clang build errors and warnings
- [IMPALA-4135](#) - Thrift threaded server times-out connections during high load
- [IMPALA-4170](#) - Fix identifier quoting in COMPUTE INCREMENTAL STATS
- [IMPALA-4180](#) - Synchronize accesses to RuntimeState::reader_contexts_
- [IMPALA-4196](#) - Cross compile bit-byte-functions
- [IMPALA-4237](#) - Fix materialization of 4-byte decimals in data source scan node

Issues Fixed in Impala for CDH 5.8.2

For the full list of fixed issues for all CDH components, see [Upstream Issues Fixed](#) on page 2253.

- [IMPALA-1346](#) - /1590/2344: fix sorter buffer mgmt when spilling
- [IMPALA-3159](#) - impala-shell does not accept wildcard or SAN certificates
- [IMPALA-3344](#) - Simplify sorter and document/enforce invariants.
- [IMPALA-3441](#) - , IMPALA-3659: check for malformed Avro data
- [IMPALA-3499](#) - Split catalog update.
- [IMPALA-3628](#) - Fix cancellation from shell when security is enabled
- [IMPALA-3633](#) - cancel fragment if coordinator is gone
- [IMPALA-3646](#) - Handle corrupt RLE literal or repeat counts of 0.
- [IMPALA-3670](#) - fix sorter buffer mgmt bugs
- [IMPALA-3678](#) - Fix migration of predicates into union operands with an order by + limit.
- [IMPALA-3680](#) - Cleanup the scan range state after failed hdfs cache reads
- [IMPALA-3711](#) - Remove unnecessary privilege checks in getDbsMetadata().
- [IMPALA-3732](#) - handle string length overflow in avro files
- [IMPALA-3745](#) - parquet invalid data handling
- [IMPALA-3754](#) - fix TestParquet.test_corrupt_rle_counts flakiness
- [IMPALA-3772](#) - Fix admission control stress test.
- [IMPALA-3776](#) - fix 'describe formatted' for Avro tables
- [IMPALA-3820](#) - Handle linkage errors while loading Java UDFs in Catalog
- [IMPALA-3861](#) - Replace BetweenPredicates with their equivalent CompoundPredicate.
- [IMPALA-3915](#) - Register privilege and audit requests when analyzing resolved table refs.
- [IMPALA-3930](#) - Fix shuffle insert hint with constant partition exprs.
- [IMPALA-3940](#) - Fix getting column stats through views.
- [IMPALA-3965](#) - TSSLSocketWithWildcardSAN.py not exported as part of impala-shell build lib
- [IMPALA-4020](#) - Handle external conflicting changes to HMS gracefully
- [IMPALA-4049](#) - fix empty batch handling NLJ build side

Issues Fixed in Impala for CDH 5.8.0

The following list contains the most critical fixed issues (`priority='Blocker'`) from the JIRA system. For the full list of fixed issues in CDH 5.8.0 / Impala 2.6.0, see [this report in the Impala JIRA tracker](#).

RuntimeState::error_log_ crashes

A crash could occur, with stack trace pointing to `impala::RuntimeState::ErrorLog`.

Bug: [IMPALA-3385](#)

Severity: High

`HiveUdfCall::Open()` produces unsynchronized access to `JniUtil::global_refs_vector`

A crash could occur because of contention between multiple calls to Java UDFs.

Bug: [IMPALA-3378](#)

Severity: High

`HBaseTableWriter::CreatePutList()` produces unsynchronized access to `JniUtil::global_refs_vector`

A crash could occur because of contention between multiple concurrent statements writing to HBase.

Bug: [IMPALA-3379](#)

Severity: High

Stress test failure: `sorter.cc:745] Check failed: i == 0 (1 vs. 0)`

A crash or wrong results could occur if the spill-to-disk mechanism encountered a zero-length string at the very end of a data block.

Bug: [IMPALA-3317](#)

Severity: High

String data coming out of agg can be corrupted by blocking operators

If a query plan contains an aggregation node producing string values anywhere within a subplan (that is, if in the SQL statement, the aggregate function appears within an inline view over a collection column), the results of the aggregation may be incorrect.

Bug: [IMPALA-3311](#)

Severity: High

CTAS with subquery throws AuthzException

A `CREATE TABLE AS SELECT` operation could fail with an authorization error, due to a slight difference in the privilege checking for the CTAS operation.

Bug: [IMPALA-3269](#)

Severity: High

Crash on inserting into table with binary and parquet

Impala incorrectly allowed `BINARY` to be specified as a column type, resulting in a crash during a write to a Parquet table with a column of that type.

Bug: [IMPALA-3237](#)

Severity: High

RowBatch::MaxTupleBufferSize() calculation incorrect, may lead to memory corruption

A crash could occur while querying tables with very large rows, for example wide tables with many columns or very large string values. This problem was identified in Impala 2.3, but had low reproducibility in subsequent releases. The fix ensures the memory allocation size is correct.

Bug: [IMPALA-3105](#)

Severity: High

Thrift buffer overflows when serialize more than 3355443200 bytes in impala

A very large memory allocation within the `catalogd` daemon could exceed an internal Thrift limit, causing a crash.

Bug: [IMPALA-3494](#)

Severity: High

Altering table partition's storage format is not working and crashing the daemon

If a partitioned table used a file format other than Avro, and the file format of an individual partition was changed to Avro, subsequent queries could encounter a crash.

Bug: [IMPALA-3314](#)

Severity: High

Race condition may cause scanners to spin with runtime filters on Avro or Sequence files

A timing problem during runtime filter processing could cause queries against Avro or SequenceFile tables to hang.

Bug: [IMPALA-3798](#)

Severity: High

Issues Fixed in Impala for CDH 5.7.6

For the full list of fixed issues for all CDH components, see [Upstream Issues Fixed](#) on page 2264.

- [IMPALA-2864](#) - Ensure that client connections are closed after a failed `Open()`
- [IMPALA-3167](#) - Fix assignment of WHERE conjunct through grouping agg + OJ.

- [IMPALA-3552](#) - Make incremental stats max serialized size configurable
- [IMPALA-3698](#) - Fix Isilon permissions test
- [IMPALA-3861](#) - Replace BetweenPredicates with their equivalent CompoundPredicate.
- [IMPALA-3875](#) - Thrift threaded server hang in some cases
- [IMPALA-3983](#) - /IMPALA-3974: Delete function jar resources after load
- [IMPALA-4153](#) - Return valid non-NULL pointer for 0-byte allocations
- [IMPALA-4223](#) - Handle truncated file read from HDFS cache
- [IMPALA-4336](#) - Cast exprs after unnesting union operands.
- [IMPALA-4363](#) - Add Parquet timestamp validation
- [IMPALA-4423](#) - Correct but conservative implementation of Subquery.equals().
- [IMPALA-4433](#) - Always generate testdata using the same time zone setting
- [IMPALA-4449](#) - Revisit table locking pattern in the catalog
- [IMPALA-4488](#) - HS2 GetOperationStatus() should keep session alive
- [IMPALA-4550](#) - Fix CastExpr analysis for substituted slots
- [IMPALA-4579](#) - SHOW CREATE VIEW fails for view containing a subquery
- [IMPALA-4765](#) - Avoid using several loading threads on one table.

Issues Fixed in Impala for CDH 5.7.5

For the full list of fixed issues for all CDH components, see [Upstream Issues Fixed](#) on page 2267.

- [IMPALA-1619](#) - Support 64-bit allocations
- [IMPALA-1740](#) - Add support for skip.header.line.count
- [IMPALA-3458](#) - Fix table creation to test insert with header lines
- [IMPALA-3949](#) - Log the error message in FileSystemUtil.copyToLocal()
- [IMPALA-4037](#) - Fix locking during query cancellation
- [IMPALA-4076](#) - Fix runtime filter sort compare method
- [IMPALA-4099](#) - Fix the error message while loading UDFs with no JARs
- [IMPALA-4120](#) - Incorrect results with LEAD() analytic function
- [IMPALA-4135](#) - Thrift threaded server times-out connections during high load
- [IMPALA-4170](#) - Fix identifier quoting in COMPUTE INCREMENTAL STATS
- [IMPALA-4196](#) - Cross compile bit-byte functions
- [IMPALA-4237](#) - Fix materialization of 4 byte decimals in data source scan node
- [IMPALA-4246](#) - SleepForMs() utility function has undefined behavior for > 1s

Issues Fixed in Impala for CDH 5.7.4

For the full list of fixed issues for all CDH components, see [Upstream Issues Fixed](#) on page 2269.

- [IMPALA-3081](#) - Increase memory limit for TestWideRow
- [IMPALA-3311](#) - Fix string data coming out of aggs in subplans
- [IMPALA-3575](#) - Add retry to back end connection request and rpc timeout
- [IMPALA-3678](#) - Fix migration of predicates into union operands with an order by + limit.
- [IMPALA-3682](#) - Do not retry unrecoverable socket creation errors
- [IMPALA-3687](#) - Fix test failure introduced by backporting
- [IMPALA-3687](#) - Prefer Avro field name during schema reconciliation
- [IMPALA-3820](#) - Handle linkage errors while loading Java UDFs in Catalog
- [IMPALA-3930](#) - Fix shuffle insert hint with constant partition exprs
- [IMPALA-3940](#) - Fix getting column stats through views
- [IMPALA-4020](#) - Handle external conflicting changes to HMS gracefully
- [IMPALA-4049](#) - Fix empty batch handling NLJ build side

Issues Fixed in Impala for CDH 5.7.2

For the full list of fixed issues for all CDH components, see [Upstream Issues Fixed](#) on page 2274.

- [IMPALA-1928](#) - Fix Thrift client transport wrapping order
- [IMPALA-2660](#) - Respect auth_to_local configs from hdfs configs
- [IMPALA-3276](#) - Consistently handle pin failure in BTS::PrepareForRead()
- [IMPALA-3369](#) - Add ALTER TABLE SET COLUMN STATS statement.
- [IMPALA-3441](#) - Impala should not crash for invalid avro serialized data
- [IMPALA-3499](#) - Split catalog update
- [IMPALA-3502](#) - Fix race in the coordinator while updating filter routing table
- [IMPALA-3633](#) - Cancel fragment if coordinator is gone
- [IMPALA-3732](#) - Handle string length overflow in Avro files
- [IMPALA-3745](#) - Corrupt encoded values in parquet files can cause crashes
- [IMPALA-3751](#) - Fix clang build errors and warnings
- [IMPALA-3754](#) - Fix TestParquet.test_corrupt_rle_counts flakiness

Issues Fixed in Impala for CDH 5.7.1

For the full list of fixed issues for all CDH components, see [Upstream Issues Fixed](#) on page 2277.

- [IMPALA-2076](#) - Correct execution time tracking for DataStreamSender
- [IMPALA-2502](#) - Don't redundantly repartition grouping aggregations
- [IMPALA-2892](#) - Buffered-tuple-stream-ir.cc is not cross-compiled
- [IMPALA-3133](#) - Wrong privileges after a REVOKE ALL ON SERVER statement
- [IMPALA-3139](#) - Fix drop table statement to not drop views and vice versa
- [IMPALA-3141](#) - Send dummy filters when filter production is disabled
- [IMPALA-3194](#) - Allow queries materializing scalar type columns in RC/sequence files
- [IMPALA-3220](#) - Skip logging empty ScannerContext's stream in parse error
- [IMPALA-3236](#) - Increase timeout for runtime filter tests
- [IMPALA-3238](#) - Avoid log spam for very large hash tables
- [IMPALA-3245](#), [IMPALA-3305](#): Fix crash with global filters when NUM_NODES=1
- [IMPALA-3269](#) - Remove authz checks on default table location in CTAS queries
- [IMPALA-3285](#) - Fix ASAN failure in webserver-test
- [IMPALA-3317](#) - Fix crash in sorter when spilling zero-length strings
- [IMPALA-3334](#) - Fix some bugs in query options' parsing.
- [IMPALA-3367](#) - Ensure runtime filters tests run on 3 nodes
- [IMPALA-3378](#), [IMPALA-3379](#): fix various JNI issues
- [IMPALA-3385](#) - Fix crashes on accessing error_log
- [IMPALA-3395](#) - Old HT filter code uses wrong expr type
- [IMPALA-3396](#) - Fix ConcurrentTimerCounter unit test "TimerCounterTest" failure.
- [IMPALA-3412](#) - Fix CHAR codegen crash in tuple comparator
- [IMPALA-3420](#) - Set IMPALA_THRIFT_VERSION patch level to +4

Issues Fixed in Impala for CDH 5.7.0

The following list contains the most critical issues (`priority='Blocker'`) from the JIRA system. For the full list of fixed issues in CDH 5.7.0 / Impala 2.5.0, see [this report in the Impala JIRA tracker](#).

Stress test hit assert in LLVM: external function could not be resolved

Bug: [IMPALA-2683](#)

The stress test was running a build with the TPC-H, TPC-DS, and TPC-H nested queries with scale factor 3.

Impalad is crashing if udf jar is not available in hdfs location for first time

Bug: [IMPALA-2365](#)

If a UDF JAR was not available in the HDFS location specified in the `CREATE FUNCTION` statement, the `impalad` daemon could crash.

PAGG hits `mem_limit` when switching to I/O buffers

Bug: [IMPALA-2535](#)

A join query could fail with an out-of-memory error despite the apparent presence of sufficient memory. The cause was the internal ordering of operations that could cause a later phase of the query to allocate memory required by an earlier phase of the query. The workaround was to either increase or decrease the `MEM_LIMIT` query option, because the issue would only occur for a specific combination of memory limit and data volume.

Prevent migrating incorrectly inferred identity predicates into inline views

Bug: [IMPALA-2643](#)

Referring to the same column twice in a view definition could cause the view to omit rows where that column contained a `NULL` value. This could cause incorrect results due to an inaccurate `COUNT(*)` value or rows missing from the result set.

Fix migration/assignment of `ON`-clause predicates inside inline views

Bug: [IMPALA-1459](#)

Some combinations of `ON` clauses in join queries could result in comparisons being applied at the wrong stage of query processing, leading to incorrect results. Wrong predicate assignment could happen under the following conditions:

- The query includes an inline view that contains an outer join.
- That inline view is joined with another table in the enclosing query block.
- That join has an `ON` clause containing a predicate that only references columns originating from the outer-joined tables inside the inline view.

Wrong plan of `NOT IN` aggregate subquery when a constant is used in subquery predicate

Bug: [IMPALA-2093](#)

`IN` subqueries might return wrong results if the left-hand side of the `IN` is a constant. For example:

```
select * from alltypestiny t1
  where 10 not in (select sum(int_col) from alltypestiny);
```

Parquet DictDecoders accumulate throughout query

Bug: [IMPALA-2940](#)

Parquet dictionary decoders can accumulate throughout query execution, leading to excessive memory usage. One decoder is created per-column per-split.

Planner doesn't set the `has_local_target` field correctly

Bug: [IMPALA-3056](#)

MemPool allocation growth behavior

Bug: [IMPALA-2742](#)

Currently, the MemPool would always double the size of the last allocation. This can lead to bad behavior if the MemPool transferred the ownership of all its data except the last chunk. In the next allocation, the next allocated chunk would double the size of this large chunk, which can be undesirable.

Drop partition operations don't follow the catalog's locking protocol

Bug: [IMPALA-3035](#)

The `CatalogOpExecutor.alterTableDropPartition()` function violates the locking protocol used in the catalog that requires `catalogLock_` to be acquired before any table-level lock. That may cause deadlocks when `ALTER TABLE DROP PARTITION` is executed concurrently with other DDL operations.

HAVING clause without aggregation not applied properly

Bug: [IMPALA-2215](#)

A query with a `HAVING` clause but no `GROUP BY` clause was not being rejected, despite being invalid syntax. For example:

```
select case when 1=1 then 'didit' end as c1 from (select 1 as one) a having 1!=1;
```

Hit DCHECK Check failed: HasDateOrTime()

Bug: [IMPALA-2914](#)

`TimestampValue::ToTimestampVal()` requires a valid `TimestampValue` as input. This requirement was not enforced in some places, leading to serious errors.

Aggregation spill loop gives up too early leading to mem limit exceeded errors

Bug: [IMPALA-2986](#)

An aggregation query could fail with an out-of-memory error, despite sufficient memory being reported as available.

`DataStreamSender::Channel::CloseInternal()` does not close the channel on an error.

Bug: [IMPALA-2592](#)

Some queries do not close an internal communication channel on an error. This will cause the node on the other side of the channel to wait indefinitely, causing the query to hang. For example, this issue could happen on a Kerberos-enabled system if the credential cache was outdated. Although the affected query hangs, the `impalad` daemons continue processing other queries.

Codegen does not catch exceptions in FROM_UNIXTIME()

Bug: [IMPALA-2184](#)

Querying for the min or max value of a timestamp cast from a bigint via `from_unixtime()` fails silently and crashes instances of `impalad` when the input includes a value outside of the valid range.

Workaround: Disable native code generation with:

```
SET disable_codegen=true;
```

Impala returns wrong result for function 'conv(bigint, from_base, to_base)'

Bug: [IMPALA-2788](#)

Impala returns wrong result for function `conv()`. Function `conv(bigint, from_base, to_base)` returns an correct result, while `conv(string, from_base, to_base)` returns the correct value. For example:

```
select 2061013007, conv(2061013007, 16, 10), conv('2061013007', 16, 10);
+-----+-----+-----+
| 2061013007 | conv(2061013007, 16, 10) | conv('2061013007', 16, 10) |
+-----+-----+-----+
| 2061013007 | 1627467783                | 139066421255                |
+-----+-----+-----+
Fetched 1 row(s) in 0.65s
```

```
select 2061013007, conv(cast(2061013007 as bigint), 16, 10), conv('2061013007', 16, 10);
+-----+-----+-----+
| 2061013007 | conv(cast(2061013007 as bigint), 16, 10) | conv('2061013007', 16, 10) |
+-----+-----+-----+
```

```

+-----+-----+-----+
| 2061013007 | 1627467783 | 139066421255 |
+-----+-----+-----+

select 2061013007, conv(cast(2061013007 as string), 16, 10), conv('2061013007', 16, 10);
+-----+-----+-----+
| 2061013007 | conv(cast(2061013007 as string), 16, 10) | conv('2061013007', 16, 10) |
+-----+-----+-----+
| 2061013007 | 139066421255 | 139066421255 |
+-----+-----+-----+

select 2061013007, conv(cast(cast(2061013007 as decimal(20,0)) as bigint), 16, 10),
conv('2061013007', 16, 10);
+-----+-----+-----+
| 2061013007 | conv(cast(cast(2061013007 as decimal(20,0)) as bigint), 16, 10) |
conv('2061013007', 16, 10) |
+-----+-----+-----+
| 2061013007 | 1627467783 | 139066421255 |
+-----+-----+-----+

```

Workaround: Cast the value to string and use `conv(string, from_base, to_base)` for conversion.

Issues Fixed in Impala for CDH 5.6.1

For the full list of fixed issues for all CDH components, see [Upstream Issues Fixed](#) on page 2291.

- [IMPALA-852](#), [IMPALA-2215](#) - Analyze HAVING clause before aggregation
- [IMPALA-1092](#) - Fix estimates for trivial coord-only queries
- [IMPALA-1170](#) - Fix URL parsing when path contains '@'
- [IMPALA-1934](#) - Allow shell to retrieve LDAP password from shell cmd
- [IMPALA-2093](#) - Disallow NOT IN aggregate subqueries with a constant lhs expr
- [IMPALA-2184](#) - don't inline timestamp methods with try/catch blocks in IR
- [IMPALA-2425](#) - Broadcast join hint not enforced when low memory limit is set
- [IMPALA-2503](#) - Add missing String.format() arg in error message
- [IMPALA-2539](#) - Unmark collections slots of empty union operands
- [IMPALA-2554](#) - Change default buffer size for RPC servers and clients
- [IMPALA-2565](#) - Planner tests are flaky due to file size mismatches
- [IMPALA-2592](#) - DataStreamSender::Channel::CloseInternal() does not close the channel on an error
- [IMPALA-2599](#) - Pseudo-random sleep before acquiring kerberos ticket possibly not really pseudo-random
- [IMPALA-2711](#) - Fix memory leak in Rand()
- [IMPALA-2732](#) - Timestamp formats with non-padded values
- [IMPALA-2734](#) - Correlated EXISTS subqueries with HAVING clause return wrong results
- [IMPALA-2742](#) - Avoid unbounded MemPool growth with AcquireData()
- [IMPALA-2749](#) - Fix decimal multiplication overflow
- [IMPALA-2765](#) - Preserve return type of subexpressions substituted in isTrueWithNullSlots()
- [IMPALA-2788](#) - conv(bigint num, int from_base, int to_base) returns wrong result
- [IMPALA-2798](#) - Bring in AVRO-1617 fix and add test case for it
- [IMPALA-2818](#) - Fix cancellation crashes/hangs due to BlockOnWait() race
- [IMPALA-2820](#) - Support unquoted keywords as struct-field names
- [IMPALA-2832](#) - Fix cloning of FunctionCallExpr
- [IMPALA-2844](#) - Allow count(*) on RC files with complex types
- [IMPALA-2870](#) - Fix failing metadata.test_ddl.TestDdlStatements.test_create_table test
- [IMPALA-2894](#) - Move regression test into a different .test file
- [IMPALA-2906](#) - Fix an edge case with materializing TupleIsNullPredicates in analytic sorts
- [IMPALA-2914](#) - Fix DCHECK Check failed: HasDateOrTime()
- [IMPALA-2926](#) - Fix off-by-one bug in SelectNode::CopyRows()

- [IMPALA-2940](#) - Fix leak of dictionaries in Parquet scanner
- [IMPALA-3000](#) - Fix BitReader::Reset()
- [IMPALA-3034](#) - Verify all consumed memory of a MemTracker is always released at destruction time
- [IMPALA-3047](#) - Separate create table test with nested types
- [IMPALA-3054](#) - Disable probe side filters when spilling
- [IMPALA-3071](#) - Fix assignment of On-clause predicates belonging to an inner join
- [IMPALA-3085](#) - Unregister data sinks' MemTrackers at their Close() functions
- [IMPALA-3093](#) - ReopenClient() could NULL out 'client_key' causing a crash
- [IMPALA-3095](#) - Add configurable whitelist of authorized internal principals
- [IMPALA-3151](#) - Impala crash for avro table when casting to char data type
- [IMPALA-3194](#) - Allow queries materializing scalar type columns in RC/sequence files

Issues Fixed in Impala for CDH 5.6.0

The set of fixes for Impala in CDH 5.6.0 is the same as in CDH 5.5.2. See [Issues Fixed in Impala for CDH 5.5.2](#) on page 2427 for details.

Issues Fixed in Impala for CDH 5.5.6

For the full list of fixed issues for all CDH components, see [Issues Fixed in CDH 5.5.4](#) on page 2304.

Note: Impala 2.3.x is available as part of CDH 5.5.x and is not available for CDH 4. Cloudera does not intend to release future versions of Impala for CDH 4 outside patch and maintenance releases if required. Given the end-of-maintenance status for CDH 4, Cloudera recommends all customers to migrate to a recent CDH 5 release.

- [IMPALA-1928](#) - Fix Thrift client transport wrapping order
- [IMPALA-3369](#) - Add ALTER TABLE SET COLUMN STATS statement
- [IMPALA-3378](#) - HiveUdfCall::Open() produces unsynchronized access to JNIUtil::global_refs_vector
- [IMPALA-3379](#) - HBaseTableWriter::CreatePutList() produces unsynchronized access to JNIUtil::global_refs_vector
- [IMPALA-3441](#) - Check for malformed Avro data
- [IMPALA-3499](#) - Split catalog update
- [IMPALA-3575](#) - Add retry to backend connection request and rpc timeout
- [IMPALA-3633](#) - Cancel fragment if coordinator is gone
- [IMPALA-3682](#) - Do not retry unrecoverable socket creation errors
- [IMPALA-3687](#) - Prefer Avro field name during schema reconciliation
- [IMPALA-3698](#) - Fix Isilon permissions test
- [IMPALA-3711](#) - Remove unnecessary privilege checks in getDbsMetadata()
- [IMPALA-3732](#) - Handle string length overflow in Avro files
- [IMPALA-3751](#) - Fix clang build errors and warnings
- [IMPALA-3915](#) - Register privilege and audit requests when analyzing resolved table refs.
- [IMPALA-4135](#) - Thrift threaded server times-out connections during high load
- [IMPALA-4153](#) - Return valid non-NULL pointer for 0-byte allocations

Issues Fixed in Impala for CDH 5.5.4

For the full list of fixed issues for all CDH components, see [Issues Fixed in CDH 5.5.4](#) on page 2304.

Note: Impala 2.3.x is available as part of CDH 5.5.x and is not available for CDH 4. Cloudera does not intend to release future versions of Impala for CDH 4 outside patch and maintenance releases if required. Given the end-of-maintenance status for CDH 4, Cloudera recommends all customers to migrate to a recent CDH 5 release.

- [IMPALA-852](#) - ,IMPALA-2215: Analyze HAVING clause before aggregation

- [IMPALA-3194](#) - Allow queries materializing scalar type columns in RC/sequence files

Issues Fixed in Impala for CDH 5.5.2

This section lists the most serious or frequently encountered customer issues fixed in CDH 5.5.2 / Impala 2.3.2. For the full list of fixed Impala issues, see [Issues Fixed in CDH 5.5.2](#) on page 2310.

SEGV in AnalyticEvalNode touching NULL input_stream_

A query involving an analytic function could encounter a serious error. This issue was encountered infrequently, depending upon specific combinations of queries and data.

Bug: [IMPALA-2829](#)

Free local allocations per row batch in non-partitioned AGG and HJ

An outer join query could fail unexpectedly with an out-of-memory error when the “spill to disk” mechanism was turned off.

Bug: [IMPALA-2722](#)

Free local allocations once for every row batch when building hash tables

A join query could encounter a serious error due to an internal failure to allocate memory, which resulted in dereferencing a `NULL` pointer.

Bug: [IMPALA-2612](#)

Prevent migrating incorrectly inferred identity predicates into inline views

Referring to the same column twice in a view definition could cause the view to omit rows where that column contained a `NULL` value. This could cause incorrect results due to an inaccurate `COUNT (*)` value or rows missing from the result set.

Bug: [IMPALA-2643](#)

Fix GRANTS on URIs with uppercase letters

A `GRANT` statement for a URI could be ineffective if the URI contained uppercase letters, for example in an uppercase directory name. Subsequent statements, such as `CREATE EXTERNAL TABLE` with a `LOCATION` clause, could fail with an authorization exception.

Bug: [IMPALA-2695](#)

Avoid sending large partition stats objects over thrift

The `catalogd` daemon could encounter a serious error when loading the incremental statistics metadata for tables with large numbers of partitions and columns. The problem occurred when the internal representation of metadata for the table exceeded 2 GB, for example in a table with 20K partitions and 77 columns. The fix causes a `COMPUTE INCREMENTAL STATS` operation to fail if it would produce metadata that exceeded the maximum size.

Bug: [IMPALA-2664](#), [IMPALA-2648](#)

Throw `AnalysisError` if table properties are too large (for the Hive metastore)

`CREATE TABLE` or `ALTER TABLE` statements could fail with metastore database errors due to length limits on the `SERDEPROPERTIES` and `TBLPROPERTIES` clauses. (The limit on key size is 256, while the limit on value size is 4000.) The fix makes Impala handle these error conditions more cleanly, by detecting too-long values rather than passing them to the metastore database.

Bug: [IMPALA-2226](#)

Make `MAX_PAGE_HEADER_SIZE` configurable

Impala could fail to access Parquet data files with page headers larger than 8 MB, which could occur, for example, if the minimum or maximum values for a column were long strings. The fix adds a configuration setting `--max_page_header_size`, which you can use to increase the Impala size limit to a value higher than 8 MB.

Bug: [IMPALA-2273](#)

reduce scanner memory usage

Queries on Parquet tables could consume excessive memory (potentially multiple gigabytes) due to producing large intermediate data values while evaluating groups of rows. The workaround was to reduce the size of the `NUM_SCANNER_THREADS` query option, the `BATCH_SIZE` query option, or both.

Bug: [IMPALA-2473](#)

Handle error when `distinct` and aggregates are used with a `having` clause

A query that included a `DISTINCT` operator and a `HAVING` clause, but no aggregate functions or `GROUP BY`, would fail with an uninformative error message.

Bug: [IMPALA-2113](#)

Handle error when star based select item and aggregate are incorrectly used

A query that included * in the `SELECT` list, in addition to an aggregate function call, would fail with an uninformative message if the query had no `GROUP BY` clause.

Bug: [IMPALA-2225](#)

Refactor MemPool usage in HBase scan node

Queries involving HBase tables used substantially more memory than in earlier Impala versions. The problem occurred starting in Impala 2.2.8, as a result of the changes for IMPALA-2284. The fix for this issue involves removing a separate memory work area for HBase queries and reusing other memory that was already allocated.

Bug: [IMPALA-2731](#)

Fix migration/assignment of `ON`-clause predicates inside inline views

Some combinations of `ON` clauses in join queries could result in comparisons being applied at the wrong stage of query processing, leading to incorrect results. Wrong predicate assignment could happen under the following conditions:

- The query includes an inline view that contains an outer join.
- That inline view is joined with another table in the enclosing query block.
- That join has an `ON` clause containing a predicate that only references columns originating from the outer-joined tables inside the inline view.

Bug: [IMPALA-1459](#)

DCHECK in parquet scanner after block read error

A debug build of Impala could encounter a serious error after encountering some kinds of I/O errors for Parquet files. This issue only occurred in debug builds, not release builds.

Bug: [IMPALA-2558](#)

PAGG hits mem_limit when switching to I/O buffers

A join query could fail with an out-of-memory error despite the apparent presence of sufficient memory. The cause was the internal ordering of operations that could cause a later phase of the query to allocate memory required by an earlier phase of the query. The workaround was to either increase or decrease the `MEM_LIMIT` query option, because the issue would only occur for a specific combination of memory limit and data volume.

Bug: [IMPALA-2535](#)

Fix check failed: `sorter_runs_.back()->is_pinned_`

A query could fail with an internal error while calculating the memory limit. This was an infrequent condition uncovered during stress testing.

Bug: [IMPALA-2559](#)

Don't ignore Status returned by `DataStreamRecvr::CreateMerger()`

A query could fail with an internal error while calculating the memory limit. This was an infrequent condition uncovered during stress testing.

Bug: [IMPALA-2614](#), [IMPALA-2559](#)

`DataStreamSender::Send()` does not return an error status if `SendBatch()` failed

Bug: [IMPALA-2591](#)

Re-enable SSL and Kerberos on server-server

These fixes lift the restriction on using SSL encryption and Kerberos authentication together for internal communication between Impala components.

Bug: [IMPALA-2598](#), [IMPALA-2747](#)

Issues Fixed in Impala for CDH 5.5.1

The version of Impala that is included with CDH 5.5.1 / Impala 2.3.1 is identical to CDH 5.5.0 / Impala 2.3.0. There are no new bug fixes, new features, or incompatible changes.

Issues Fixed in Impala for CDH 5.5.0

This section lists the most serious or frequently encountered customer issues fixed in CDH 5.5.0 / Impala 2.3.0. Any issues already fixed in CDH 5.4 maintenance releases (up through CDH 5.4.8) are also included. Those issues are listed under the respective CDH 5.4 sections and are not repeated here. For the full list of fixed Impala issues, see [Issues Fixed in CDH 5.5.0](#) on page 2315.

Fixes for Serious Errors

A number of issues were resolved that could result in serious errors when encountered. The most critical or commonly encountered are listed here.

Bugs: [IMPALA-2168](#), [IMPALA-2378](#), [IMPALA-2369](#), [IMPALA-2357](#), [IMPALA-2319](#), [IMPALA-2314](#), [IMPALA-2016](#)

Fixes for Correctness Errors

A number of issues were resolved that could result in wrong results when encountered. The most critical or commonly encountered are listed here.

Bugs: [IMPALA-2192](#), [IMPALA-2440](#), [IMPALA-2090](#), [IMPALA-2086](#), [IMPALA-1947](#), [IMPALA-1917](#)

Issues Fixed in Impala for CDH 5.4.10

For the full list of fixed issues for all CDH components, see [Issues Fixed in CDH 5.4.10](#) on page 2323.

Note: The Impala 2.2.x maintenance releases now use the CDH 5.4.x numbering system rather than increasing the Impala version numbers. Impala 2.2 and higher are not available under CDH 4.

- [IMPALA-1702](#) - Check for duplicate table IDs at the end of analysis (issue not entirely fixed, but now fails gracefully)
- [IMPALA-2264](#) - Implicit casts to integers from decimals with higher precision sometimes allowed
- [IMPALA-2473](#) - Excessive memory usage by scan nodes
- [IMPALA-2621](#) - Fix flaky UNIX_TIMESTAMP() test
- [IMPALA-2643](#) - Nested inline view produces incorrect result when referencing the same column implicitly
- [IMPALA-2765](#) - AnalysisException: operands of type BOOLEAN and TIMESTAMP are not comparable when OUTER JOIN with CASE statement
- [IMPALA-2798](#) - After adding a column to avro table, Impala returns weird result if codegen is enabled.
- [IMPALA-2861](#) - Fix flaky scanner test added via IMPALA-2473 backport
- [IMPALA-2914](#) - Hit DCHECK Check failed: HasDateOrTime()
- [IMPALA-3034](#) - MemTracker leak on PHJ failure to spill
- [IMPALA-3085](#) - DataSinks' MemTrackers need to unregister themselves from parent
- [IMPALA-3093](#) - ReopenClient() could NULL out 'client_key' causing a crash
- [IMPALA-3095](#) - Allow additional Kerberos users to be authorized to access internal APIs

Issues Fixed in Impala for CDH 5.4.9

This section lists the most frequently encountered customer issues fixed in Impala for CDH 5.4.9.

Note: The Impala 2.2.x maintenance releases now use the CDH 5.4.x numbering system rather than increasing the Impala version numbers. Impala 2.2 and higher are not available under CDH 4.

For the full list of fixed issues, see [Issues Fixed in CDH 5.4.9](#) on page 2326.

Query return empty result if it contains NullLiteral in inlineview

If an inline view in a FROM clause contained a NULL literal, the result set was empty.

Bug: [IMPALA-1917](#)

HBase scan node uses 2-4x memory after upgrade to Impala 2.2.8

Queries involving HBase tables used substantially more memory than in earlier Impala versions. The problem occurred starting in Impala 2.2.8, as a result of the changes for IMPALA-2284. The fix for this issue involves removing a separate memory work area for HBase queries and reusing other memory that was already allocated.

Bug: [IMPALA-2731](#)

Fix migration/assignment of ON-clause predicates inside inline views

Some combinations of ON clauses in join queries could result in comparisons being applied at the wrong stage of query processing, leading to incorrect results. Wrong predicate assignment could happen under the following conditions:

- The query includes an inline view that contains an outer join.
- That inline view is joined with another table in the enclosing query block.
- That join has an ON clause containing a predicate that only references columns originating from the outer-joined tables inside the inline view.

Bug: [IMPALA-1459](#)

Fix wrong predicate assignment in outer joins

The join predicate for an OUTER JOIN clause could be applied at the wrong stage of query processing, leading to incorrect results.

Bug: [IMPALA-2446](#)

Avoid sending large partition stats objects over thrift

The `catalogd` daemon could encounter a serious error when loading the incremental statistics metadata for tables with large numbers of partitions and columns. The problem occurred when the internal representation of metadata for the table exceeded 2 GB, for example in a table with 20K partitions and 77 columns. The fix causes a `COMPUTE INCREMENTAL STATS` operation to fail if it would produce metadata that exceeded the maximum size.

Bug: [IMPALA-2648](#), [IMPALA-2664](#)

Avoid overflow when adding large intervals to TIMESTAMPS

Adding or subtracting a large INTERVAL value to a TIMESTAMP value could produce an incorrect result, with the value wrapping instead of returning an out-of-range error.

Bug: [IMPALA-1675](#)

Analysis exception when a binary operator contains an IN operator with values

An IN operator with literal values could cause a statement to fail if used as the argument to a binary operator, such as an equality test for a BOOLEAN value.

Bug: [IMPALA-1949](#)

Make MAX_PAGE_HEADER_SIZE configurable

Impala could fail to access Parquet data files with page headers larger than 8 MB, which could occur, for example, if the minimum or maximum values for a column were long strings. The fix adds a configuration setting `--max_page_header_size`, which you can use to increase the Impala size limit to a value higher than 8 MB.

Bug: [IMPALA-2273](#)

Fix spilling sorts with var-len slots that are NULL or empty.

A query that activated the spill-to-disk mechanism could fail if it contained a sort expression involving certain combinations of fixed-length or variable-length types.

Bug: [IMPALA-2357](#)

Work-around IMPALA-2344: Fail query with OOM in case block->Pin() fails

Some queries that activated the spill-to-disk mechanism could produce a serious error if there was insufficient memory to set up internal work areas. Now those queries produce normal out-of-memory errors instead.

Bug: [IMPALA-2344](#)

Crash (likely race) tearing down BufferedBlockMgr on query failure

A serious error could occur under rare circumstances, due to a race condition while freeing memory during heavily concurrent workloads.

Bug: [IMPALA-2252](#)

QueryExecState doesn't check for query cancellation or errors

A call to `setError()` in a user-defined function (UDF) would not cause the query to fail as expected.

Bug: [IMPALA-1746](#)

Impala throws `IllegalStateException` when inserting data into a partition while select subquery group by partition columns

An `INSERT ... SELECT` operation into a partitioned table could fail if the `SELECT` query included a `GROUP BY` clause referring to the partition key columns.

Bug: [IMPALA-2533](#)

Issues Fixed in Impala for CDH 5.4.8

This section lists the most frequently encountered customer issues fixed in Impala for CDH 5.4.8.

Note: The Impala 2.2.x maintenance releases now use the CDH 5.4.x numbering system rather than increasing the Impala version numbers. Impala 2.2 and higher are not available under CDH 4.

For the full list of fixed issues, see [Issues Fixed in CDH 5.4.8](#) on page 2328.

Impala is unable to read hive tables created with the "STORED AS AVRO" clause

Impala could not read Avro tables created in Hive with the `STORED AS AVRO` clause.

Bug: [IMPALA-1136](#), [IMPALA-2161](#)

make Parquet scanner fail query if the file size metadata is stale

If a Parquet file in HDFS was overwritten by a smaller file, Impala could encounter a serious error. Issuing a `INVALIDATE METADATA` statement before a subsequent query would avoid the error. The fix allows Impala to handle such inconsistencies in Parquet file length cleanly regardless of whether the table metadata is up-to-date.

Bug: [IMPALA-2213](#)

Avoid allocating `StringBuffer > 1GB` in `ScannerContext::Stream::GetBytesInternal()`

Impala could encounter a serious error when reading compressed text files larger than 1 GB. The fix causes Impala to issue an error message instead in this case.

Bug: [IMPALA-2249](#)

Disallow long ($1 << 30$) strings in `group_concat()`

A query using the `group_concat()` function could encounter a serious error if the returned string value was larger than 1 GB. Now the query fails with an error message in this case.

Bug: [IMPALA-2284](#)

avoid `FnvHash64to32` with empty inputs

An edge case in the algorithm used to distribute data among nodes could result in uneven distribution of work for some queries, with all data sent to the same node.

Bug: [IMPALA-2270](#)

The catalog does not close the connection to HMS during table invalidation

A communication error could occur between Impala and the Hive metastore database, causing Impala operations that update table metadata to fail.

Bug: [IMPALA-2348](#)

Wrong DCHECK in PHJ::ProcessProbeBatch

Certain queries could encounter a serious error if the spill-to-disk mechanism was activated.

Bug: [IMPALA-2364](#)

Avoid cardinality 0 in scan nodes of small tables and low selectivity

Impala could generate a suboptimal query plan for some queries involving small tables.

Bug: [IMPALA-2165](#)

Issues Fixed in Impala for CDH 5.4.7

This section lists the most frequently encountered customer issues fixed in Impala for CDH 5.4.7.

Note: The Impala 2.2.x maintenance releases now use the CDH 5.4.x numbering system rather than increasing the Impala version numbers. Impala 2.2 and higher are not available under CDH 4.

For the full list of fixed issues, see [Issues Fixed in CDH 5.4.7](#) on page 2331.

Warn if table stats are potentially corrupt.

Impala warns if it detects a discrepancy in table statistics: a table considered to have zero rows even though there are data files present. In this case, Impala also skips query optimizations that are normally applied to very small tables.

Bug: [IMPALA-1983:](#)

Pass correct child node in 2nd phase merge aggregation.

A query could encounter a serious error if it included a particular combination of aggregate functions and inline views.

Bug: [IMPALA-2266](#)

Set the output smap of an EmptySetNode produced from an empty inline view.

A query could encounter a serious error if it included an inline view whose subquery had no FROM clause.

Bug: [IMPALA-2216](#)

Set an InsertStmt's result exprs from the source statement's result exprs.

A CREATE TABLE AS SELECT or INSERT ... SELECT statement could produce different results than a SELECT statement, for queries including a FULL JOIN clause and including literal values in the select list.

Bug: [IMPALA-2203](#)

Fix planning of empty union operands with analytics.

A query could return incorrect results if it contained a UNION clause, calls to analytic functions, and a constant expression that evaluated to FALSE.

Bug: [IMPALA-2088](#)

Retain eq predicates bound by grouping slots with complex grouping exprs.

A query containing an INNER JOIN clause could return undesired rows. Some predicate specified in the ON clause could be omitted from the filtering operation.

Bug: [IMPALA-2089](#)

Row count not set for empty partition when spec is used with compute incremental stats

A `COMPUTE INCREMENTAL STATS` statement could leave the row count for an empty partition as -1, rather than initializing the row count to 0. The missing statistic value could result in reduced query performance.

Bug: [IMPALA-2199](#)

Explicit aliases + ordinals analysis bug

A query could encounter a serious error if it included column aliases with the same names as table columns, and used ordinal numbers in an `ORDER BY` or `GROUP BY` clause.

Bug: [IMPALA-1898](#)

Fix `TupleIsNullPredicate` to return false if no tuples are nullable.

A query could return incorrect results if it included an outer join clause, inline views, and calls to functions such as `coalesce()` that can generate `NULL` values.

Bug: [IMPALA-1987](#)

fix `Expr::ComputeResultsLayout()` logic

A query could return incorrect results if the table contained multiple `CHAR` columns with length of 2 or less, and the query included a `GROUP BY` clause that referred to multiple such columns.

Bug: [IMPALA-2178](#)

Substitute an `InsertStmt`'s partition key exprs with the root node's `smap`.

An `INSERT` statement could encounter a serious error if the `SELECT` portion called an analytic function.

Bug: [IMPALA-1737](#)

Issues Fixed in Impala for CDH 5.4.5

This section lists the most frequently encountered customer issues fixed in Impala for CDH 5.4.5.

Note: The Impala 2.2.x maintenance releases now use the CDH 5.4.x numbering system rather than increasing the Impala version numbers. Impala 2.2 and higher are not available under CDH 4.

For the full list of fixed issues, see [Issues Fixed in CDH 5.4.5](#) on page 2333.

Impala DML/DDL operations corrupt table metadata leading to Hive query failures

When the Impala `COMPUTE STATS` statement was run on a partitioned Parquet table that was created in Hive, the table subsequently became inaccessible in Hive. The table was still accessible to Impala. Regaining access in Hive required a workaround of creating a new table. The error displayed in Hive was:

```
Error: Error while compiling statement: FAILED: SemanticException Class not found:
com.cloudera.impala.hive.serde.ParquetInputFormat (state=42000,code=40000)
```

Bug: [IMPALA-2048](#)

Avoiding a `DCHECK` of `NULL` hash table in spilled right joins

A query could encounter a serious error if it contained a `RIGHT OUTER`, `RIGHT ANTI`, or `FULL OUTER` join clause and approached the memory limit on a host so that the “spill to disk” mechanism was activated.

Bug: [IMPALA-1929](#)

Bug in `PrintTColumnValue` caused wrong stats for `TINYINT` partition cols

Declaring a partition key column as a `TINYINT` caused problems with the `COMPUTE STATS` statement. The associated partitions would always have zero estimated rows, leading to potential inefficient query plans.

Bug: [IMPALA-2136](#)

Where clause does not propagate to joins inside nested views

A query that referred to a view whose query referred to another view containing a join, could return incorrect results. `WHERE` clauses for the outermost query were not always applied, causing the result set to include additional rows that should have been filtered out.

Bug: [IMPALA-2018](#)

Add `effective_user()` builtin

The `user()` function returned the name of the logged-in user, which might not be the same as the user name being checked for authorization if, for example, delegation was enabled.

Bug: [IMPALA-2064](#)

Resolution: Rather than change the behavior of the `user()` function, the fix introduces an additional function `effective_user()` that returns the user name that is checked during authorization.

Make UTC to local `TimestampValue` conversion faster.

Query performance was improved substantially for Parquet files containing `TIMESTAMP` data written by Hive, when the `-convert_legacy_hive_parquet_utc_timestamps=true` setting is in effect.

Bug: [IMPALA-2125](#)

Workaround [IMPALA-1619](#) in `BufferedBlockMgr::ConsumeMemory()`

A join query could encounter a serious error if the query approached the memory limit on a host so that the “spill to disk” mechanism was activated, and data volume in the join was large enough that an internal memory buffer exceeded 1 GB in size on a particular host. (Exceeding this limit would only happen for huge join queries, because Impala could split this intermediate data into 16 parts during the join query, and the buffer only contains compact bookkeeping data rather than the actual join column data.)

Bug: [IMPALA-2065](#)

Issues Fixed in Impala for CDH 5.4.3

This section lists the most frequently encountered customer issues fixed in Impala for CDH 5.4.3.

Note: The Impala 2.2.x maintenance releases now use the CDH 5.4.x numbering system rather than increasing the Impala version numbers. Impala 2.2 and higher are not available under CDH 4.

For the full list of fixed issues, see [Issues Fixed in CDH 5.4.3](#) on page 2337.

Enable using Isilon as the underlying filesystem.

The certification of CDH and Impala with the Isilon filesystem involves a number of fixes to performance and flexibility for dealing with I/O using remote reads. See [Using Impala with Isilon Storage](#) for details on using Impala and Isilon together.

Bug: [IMPALA-1968](#), [IMPALA-1730](#)

Expand set of supported timezones.

The set of timezones recognized by Impala was expanded. You can always find the latest list of supported timezones in the Impala source code, in the file [timezone_db.cc](#).

Bug: [IMPALA-1381](#)

Impala Timestamp ISO-8601 Support.

Impala can now process `TIMESTAMP` literals including a trailing `z`, signifying “Zulu” time, a synonym for UTC.

Bug: [IMPALA-1963](#)

Fix wrong warning when insert overwrite to empty table

An `INSERT OVERWRITE` operation would encounter an error if the `SELECT` portion of the statement returned zero rows, such as with a `LIMIT 0` clause.

Bug: [IMPALA-2008](#)

Expand parsing of decimals to include scientific notation

`DECIMAL` literals can now include `e` scientific notation. For example, now `CAST(1e3 AS DECIMAL(5,3))` is a valid expression. Formerly it returned `NULL`. Some scientific expressions might have worked before in `DECIMAL` context, but only when the scale was 0.

Bug: [IMPALA-1952](#)

Issues Fixed in Impala for CDH 5.4.1

This section lists the most frequently encountered customer issues fixed in Impala for CDH 5.4.1.

Note: The Impala 2.2.x maintenance releases now use the CDH 5.4.x numbering system rather than increasing the Impala version numbers. Impala 2.2 and higher are not available under CDH 4.

For the full list of fixed issues, see [Issues Fixed in CDH 5.4.1](#) on page 2339.

Issues Fixed in CDH 5.4 / Impala 2.2

This section lists the most frequently encountered customer issues fixed in Impala 2.2.0.

For the full list of fixed issues in Impala 2.2.0, including over 40 critical issues, see [this report in the JIRA system](#).

Note: Impala 2.2.0 is available as part of CDH 5.4.0 and is not available for CDH 4. Cloudera does not intend to release future versions of Impala for CDH 4 outside patch and maintenance releases if required. Given the end-of-maintenance status for CDH 4, Cloudera recommends all customers to migrate to a recent CDH 5 release.

Altering a column's type causes column stats to stop sticking for that column

When the type of a column was changed in either Hive or Impala through `ALTER TABLE CHANGE COLUMN`, the metastore database did not correctly propagate that change to the table that contains the column statistics. The statistics (particularly the `NDV`) for that column were permanently reset and could not be changed by Impala's `COMPUTE STATS` command. The underlying cause is a Hive bug (HIVE-9866).

Bug: [IMPALA-1607](#)

Resolution: Resolved by incorporating the fix for [HIVE-9866](#).

Workaround: On systems without the corresponding Hive fix, change the column back to its original type. The stats reappear and you can recompute or drop them.

Impala may leak or use too many file descriptors

If a file was truncated in HDFS without a corresponding `REFRESH` in Impala, Impala could allocate memory for file descriptors and not free that memory.

Bug: [IMPALA-1854](#)

Spurious stale block locality messages

Impala could issue messages stating the block locality metadata was stale, when the metadata was actually fine. The internal “remote bytes read” counter was not being reset properly. This issue did not cause an actual slowdown in query execution, but the spurious error could result in unnecessary debugging work and unnecessary use of the `INVALIDATE METADATA` statement.

Bug: [IMPALA-1712](#)

DROP TABLE fails after COMPUTE STATS and ALTER TABLE RENAME to a different database.

When a table was moved from one database to another, the column statistics were not pointed to the new database. This could result in lower performance for queries due to unavailable statistics, and also an inability to drop the table.

Bug: [IMPALA-1711](#)

IMPALA-1556 causes memory leak with secure connections

`impalad` daemons could experience a memory leak on clusters using Kerberos authentication, with memory usage growing as more data is transferred across the secure channel, either to the client program or between Impala nodes. The same issue affected LDAP-secured clusters to a lesser degree, because the LDAP security only covers data transferred back to client programs.

Bug: [IMPALA-1674](#)

`unix_timestamp()` does not return correct time

The `unix_timestamp()` function could return an incorrect value (a constant value of 1).

Bug: [IMPALA-1623](#)

Impala incorrectly handles text data missing a newline on the last line

Some queries did not recognize the final line of a text data file if the line did not end with a newline character. This could lead to inconsistent results, such as a different number of rows for `SELECT COUNT(*)` as opposed to `SELECT *`.

Bug: [IMPALA-1476](#)

Impala's ACLs check do not consider all group ACLs, only checked first one.

If the HDFS user ID associated with the `impalad` process had read or write access in HDFS based on group membership, Impala statements could still fail with HDFS permission errors if that group was not the first listed group for that user ID.

Bug: [IMPALA-1805](#)

Fix infinite loop opening or closing file with invalid metadata

Truncating a file in HDFS, after Impala had cached the file metadata, could produce a hang when Impala queried a table containing that file.

Bug: [IMPALA-1794](#)

Cannot write Parquet files when values are larger than 64KB

Impala could sometimes fail to `INSERT` into a Parquet table if a column value such as a `STRING` was larger than 64 KB.

Bug: [IMPALA-1705](#)

Impala Will Not Run on Certain Intel CPUs

This fix relaxes the CPU requirement for Impala. Now only the SSE3 instruction set is required. Formerly, SSE4.1 instructions were generated, making Impala refuse to start on some older CPUs.

Bug: [IMPALA-1646](#)

Issues Fixed in Impala for CDH 5.3.10

For the full list of fixed issues for all CDH components, see [Issues Fixed in CDH 5.3.10](#) on page 2346.

Note: This Impala maintenance release is only available as part of CDH 5, not under CDH 4.

- [IMPALA-1702](#) - "invalidate metadata" can cause duplicate TableIds (issue not entirely fixed, but now fails gracefully)
- [IMPALA-2125](#) - Improve perf when reading timestamps from parquet files written by hive

- [IMPALA-2565](#) - Planner tests are flaky due to file size mismatches
- [IMPALA-3095](#) - Allow additional Kerberos users to be authorized to access internal APIs

Issues Fixed in the 2.1.7 Release / CDH 5.3.9

This section lists the most significant Impala issues fixed in Impala 2.1.7 for CDH 5.3.9.

For the full list of Impala fixed issues in this release, see [Issues Fixed in CDH 5.3.9](#) on page 2348.

Note: This Impala maintenance release is only available as part of CDH 5, not under CDH 4.

Query return empty result if it contains NullLiteral in inlineview

If an inline view in a FROM clause contained a NULL literal, the result set was empty.

Bug: [IMPALA-1917](#)

Fix edge cases for decimal/integer cast

A value of type `DECIMAL(3,0)` could be incorrectly cast to `TINYINT`. The resulting out-of-range value could be incorrect. After the fix, the smallest type that is allowed for this cast is `INT`, and attempting to use `DECIMAL(3,0)` in a `TINYINT` context produces a “loss of precision” error.

Bug: [IMPALA-2264](#)

Constant filter expressions are not checked for errors and state cleanup on exception / DCHECK on destroying an ExprContext

An invalid constant expression in a WHERE clause (for example, an invalid regular expression pattern) could fail to clean up internal state after raising a query error. Therefore, certain combinations of invalid expressions in a query could cause a crash, or cause a query to continue when it should halt with an error.

Bug: [IMPALA-1756](#), [IMPALA-2514](#)

QueryExecState does not check for query cancellation or errors

A call to `setError()` in a user-defined function (UDF) would not cause the query to fail as expected.

Bug: [IMPALA-1746](#), [IMPALA-2141](#)

Issues Fixed in the 2.1.6 Release / CDH 5.3.8

This section lists the most significant Impala issues fixed in Impala 2.1.6 for CDH 5.3.8.

For the full list of Impala fixed issues in this release, see [Issues Fixed in CDH 5.3.8](#) on page 2350.

Note: This Impala maintenance release is only available as part of CDH 5, not under CDH 4.

Wrong DCHECK in PHJ::ProcessProbeBatch

Certain queries could encounter a serious error if the spill-to-disk mechanism was activated.

Bug: [IMPALA-2364](#)

LargestSpilledPartition was not checking if partition is closed

Certain queries could encounter a serious error if the spill-to-disk mechanism was activated.

Bug: [IMPALA-2314](#)

Avoid cardinality 0 in scan nodes of small tables and low selectivity

Impala could generate a suboptimal query plan for some queries involving small tables.

Bug: [IMPALA-2165](#)

fix Expr::ComputeResultsLayout() logic

Queries using the `GROUP BY` operator on multiple `CHAR` columns with length less than or equal to 2 characters could return incorrect results for some columns.

Bug: [IMPALA-2178](#)

Properly unescape string value for HBase filters

Queries against HBase tables could return incomplete results if the `WHERE` clause included string comparisons using literals containing escaped quotation marks.

Bug: [IMPALA-2133](#)

Avoiding a DCHECK of NULL hash table in spilled right joins

A query could encounter a serious error if it contained a `RIGHT OUTER`, `RIGHT ANTI`, or `FULL OUTER` join clause and approached the memory limit on a host so that the “spill to disk” mechanism was activated.

Bug: [IMPALA-1929](#)

Issues Fixed in the 2.1.5 Release / CDH 5.3.6

This section lists the most significant Impala issues fixed in Impala 2.1.5 for CDH 5.3.6.

For the full list of Impala fixed issues in this release, see [Issues Fixed in CDH 5.3.6](#) on page 2352.

Note: This Impala maintenance release is only available as part of CDH 5, not under CDH 4.

Avoid calling `ProcessBatch` with `out_batch->AtCapacity` in right joins

Queries including `RIGHT OUTER JOIN`, `RIGHT ANTI JOIN`, or `FULL OUTER JOIN` clauses and involving a high volume of data could encounter a serious error.

Bug: [IMPALA-1919](#)

Issues Fixed in the 2.1.4 Release / CDH 5.3.4

This section lists the most significant Impala issues fixed in Impala 2.1.4 for CDH 5.3.4. Because CDH 5.3.5 does not include any code changes for Impala, Impala 2.1.4 is included with both CDH 5.3.4 and 5.3.5.

For the full list of Impala fixed issues in Impala 2.1.4 for CDH 5.3.4, see [Issues Fixed in CDH 5.3.4](#) on page 2354.

Note: This Impala maintenance release is only available as part of CDH 5, not under CDH 4.

Crash: `impala::TuplesNullPredicate::Prepare`

When expressions that tested for `NULL` were used in combination with analytic functions, an error could occur. (The original crash issue was fixed by an earlier patch.)

Bug: [IMPALA-1519](#)

Expand parsing of decimals to include scientific notation

`DECIMAL` literals could include `e` scientific notation. For example, now `CAST(1e3 AS DECIMAL(5,3))` is a valid expression. Formerly it returned `NULL`. Some scientific expressions might have worked before in `DECIMAL` context, but only when the scale was 0.

Bug: [IMPALA-1952](#)

INSERT/CTAS evaluates and applies constant predicates.

An `INSERT OVERWRITE` statement would write new data, even if a constant clause such as `WHERE 1 = 0` should have prevented it from writing any rows.

Bug: [IMPALA-1860](#)

Assign predicates below analytic functions with a compatible partition by clause

If the `PARTITION BY` clause in an analytic function refers to partition key columns in a partitioned table, now Impala can perform partition pruning during the analytic query.

Bug: [IMPALA-1900](#)

FIRST_VALUE may produce incorrect results with preceding windows

A query using the `FIRST_VALUE` analytic function and a window defined with the `PRECEDING` keyword could produce wrong results.

Bug: [IMPALA-1888](#)

FIRST_VALUE rewrite fn type might not match slot type

A query referencing a `DECIMAL` column with the `FIRST_VALUE` analytic function could encounter an error.

Bug: [IMPALA-1559](#)

AnalyticEvalNode cannot handle partition/order by exprs with NaN

A query using an analytic function could encounter an error if the evaluation of an analytic `ORDER BY` or `PARTITION` expression resulted in a NaN value, for example if the `ORDER BY` or `PARTITION` contained a division operation where both operands were zero.

Bug: [IMPALA-1808](#)

AnalyticEvalNode not properly handling nullable tuples

An analytic function containing only an `OVER` clause could encounter an error if another part of the query (specifically an outer join) produced all-NULL tuples.

Bug: [IMPALA-1562](#)

Issues Fixed in the 2.1.3 Release / CDH 5.3.3

This section lists the most significant issues fixed in Impala 2.1.3.

For the full list of fixed issues in Impala 2.1.3, see [Issues Fixed in CDH 5.3.3](#) on page 2356.

Note: Impala 2.1.3 is available as part of CDH 5.3.3, not under CDH 4.

Add compatibility flag for Hive-Parquet-Timestamps

When Hive writes `TIMESTAMP` values, it represents them in the local time zone of the server. Impala expects `TIMESTAMP` values to always be in the UTC time zone, possibly leading to inconsistent results depending on which component created the data files. This patch introduces a new startup flag, `-convert_legacy_hive_parquet_utc_timestamps` for the `impalad` daemon. Specify `-convert_legacy_hive_parquet_utc_timestamps=true` to make Impala recognize Parquet data files written by Hive and automatically adjust `TIMESTAMP` values read from those files into the UTC time zone for compatibility with other Impala `TIMESTAMP` processing. Although this setting is currently turned off by default, consider enabling it if practical in your environment, for maximum interoperability with Hive-created Parquet files.

Bug: [IMPALA-1658](#)

Use `snprintf()` instead of `lexical_cast()` in float-to-string casts

Converting a floating-point value to a `STRING` could be slower than necessary.

Bug: [IMPALA-1738](#)

Fix partition spilling cleanup when new stream OOMs

Certain calls to aggregate functions with `STRING` arguments could encounter a serious error when the system ran low on memory and attempted to activate the spill-to-disk mechanism. The error message referenced the function `impala::AggregateFunctions::StringValGetValue`.

Bug: [IMPALA-1865](#)

Impala's ACLs check do not consider all group ACLs, only checked first one.

If the HDFS user ID associated with the `impalad` process had read or write access in HDFS based on group membership, Impala statements could still fail with HDFS permission errors if that group was not the first listed group for that user ID.

Bug: [IMPALA-1805](#)

Fix infinite loop opening or closing file with invalid metadata

Truncating a file in HDFS, after Impala had cached the file metadata, could produce a hang when Impala queried a table containing that file.

Bug: [IMPALA-1794](#)

external-data-source-executor leaking global jni refs

Successive calls to the data source API could result in excessive memory consumption, with memory allocated but never freed.

Bug: [IMPALA-1801](#)

Spurious stale block locality messages

Impala could issue messages stating the block locality metadata was stale, when the metadata was actually fine. The internal "remote bytes read" counter was not being reset properly. This issue did not cause an actual slowdown in query execution, but the spurious error could result in unnecessary debugging work and unnecessary use of the `INVALIDATE METADATA` statement.

Bug: [IMPALA-1712](#)

Issues Fixed in the 2.1.2 Release / CDH 5.3.2

This section lists the most significant issues fixed in Impala 2.1.2.

For the full list of fixed issues in Impala 2.1.2, see [this report in the JIRA system](#).

Note: Impala 2.1.2 is available as part of CDH 5.3.2, not under CDH 4.

Impala incorrectly handles double numbers with more than 19 significant decimal digits

When a floating-point value was read from a text file and interpreted as a `FLOAT` or `DOUBLE` value, it could be incorrectly interpreted if it included more than 19 significant digits.

Bug: [IMPALA-1622](#)

`unix_timestamp()` does not return correct time

The `unix_timestamp()` function could return an incorrect value (a constant value of 1).

Bug: [IMPALA-1623](#)

Row Count Mismatch: Partition pruning with `NULL`

A query against a partitioned table could return incorrect results if the `WHERE` clause compared the partition key to `NULL` using operators such as `=` or `!=`.

Bug: [IMPALA-1535](#)

Fetch column stats in bulk using new (Hive .13) HMS APIs

The performance of the `COMPUTE STATS` statement and queries was improved, particularly for wide tables.

Bug: [IMPALA-1120](#)

Issues Fixed in the 2.1.1 Release / CDH 5.3.1

This section lists the most significant issues fixed in Impala 2.1.1.

For the full list of fixed issues in Impala 2.1.1, see [this report in the JIRA system](#).

[IMPALA-1556 causes memory leak with secure connections](#)

`impalad` daemons could experience a memory leak on clusters using Kerberos authentication, with memory usage growing as more data is transferred across the secure channel, either to the client program or between Impala nodes. The same issue affected LDAP-secured clusters to a lesser degree, because the LDAP security only covers data transferred back to client programs.

Bug: [IMPALA-1674](#)

[TSaslServerTransport::Factory::getTransport\(\) leaks transport map entries](#)

`impalad` daemons in clusters secured by Kerberos or LDAP could experience a slight memory leak on each connection. The accumulation of unreleased memory could cause problems on long-running clusters.

Bug: [IMPALA-1668](#)

Issues Fixed in the 2.1.0 Release / CDH 5.3.0

This section lists the most significant issues fixed in Impala 2.1.0.

For the full list of fixed issues in Impala 2.1.0, see [this report in the JIRA system](#).

[Kerberos fetches 3x slower](#)

Transferring large result sets back to the client application on Kerberos

Bug: [IMPALA-1455](#)

[Compressed file needs to be hold on entirely in Memory](#)

Queries on gzipped text files required holding the entire data file and its uncompressed representation in memory at the same time. `SELECT` and `COMPUTE STATS` statements could fail or perform inefficiently as a result. The fix enables streaming reads for gzipped text, so that the data is uncompressed as it is read.

Bug: [IMPALA-1556](#)

[Cannot read hbase metadata with NullPointerException: null](#)

Impala might not be able to access HBase tables, depending on the associated levels of Impala and HBase on the system.

Bug: [IMPALA-1611](#)

[Serious errors / crashes](#)

Improved code coverage in Impala testing uncovered a number of potentially serious errors that could occur with specific query syntax. These errors are resolved in Impala 2.1.

Bug: [IMPALA-1553](#), [IMPALA-1528](#), [IMPALA-1526](#), [IMPALA-1524](#), [IMPALA-1508](#), [IMPALA-1493](#), [IMPALA-1501](#), [IMPALA-1483](#)

Issues Fixed in the 2.0.5 Release / CDH 5.2.6

For the full list of fixed issues in Impala 2.0.5, see [this report in the JIRA system](#).

Note: Impala 2.0.5 is available as part of CDH 5.2.6, not under CDH 4.

Issues Fixed in the 2.0.4 Release / CDH 5.2.5

This section lists the most significant issues fixed in Impala 2.0.4.

For the full list of fixed issues in Impala 2.0.4, see [this report in the JIRA system](#).

Note: Impala 2.0.4 is available as part of CDH 5.2.5, not under CDH 4.

Add compatibility flag for Hive-Parquet-Timestamps

When Hive writes `TIMESTAMP` values, it represents them in the local time zone of the server. Impala expects `TIMESTAMP` values to always be in the UTC time zone, possibly leading to inconsistent results depending on which component created the data files. This patch introduces a new startup flag, `-convert_legacy_hive_parquet_utc_timestamps` for the `impalad` daemon. Specify `-convert_legacy_hive_parquet_utc_timestamps=true` to make Impala recognize Parquet data files written by Hive and automatically adjust `TIMESTAMP` values read from those files into the UTC time zone for compatibility with other Impala `TIMESTAMP` processing. Although this setting is currently turned off by default, consider enabling it if practical in your environment, for maximum interoperability with Hive-created Parquet files.

Bug: [IMPALA-1658](#)

IoMgr infinite loop opening/closing file when shorter than cached metadata size

If a table data file was replaced by a shorter file outside of Impala, such as with `INSERT OVERWRITE` in Hive producing an empty output file, subsequent Impala queries could hang.

Bug: [IMPALA-1794](#)

Issues Fixed in the 2.0.3 Release / CDH 5.2.4

This section lists the most significant issues fixed in Impala 2.0.3.

For the full list of fixed issues in Impala 2.0.3, see [this report in the JIRA system](#).

Note: Impala 2.0.3 is available as part of CDH 5.2.4, not under CDH 4.

Anti join could produce incorrect results when spilling

An anti-join query (or a `NOT EXISTS` operation that was rewritten internally into an anti-join) could produce incorrect results if Impala reached its memory limit, causing the query to write temporary results to disk.

Bug: [IMPALA-1471](#)

Row Count Mismatch: Partition pruning with NULL

A query against a partitioned table could return incorrect results if the `WHERE` clause compared the partition key to `NULL` using operators such as `=` or `!=`.

Bug: [IMPALA-1535](#)

Fetch column stats in bulk using new (Hive .13) HMS APIs

The performance of the `COMPUTE STATS` statement and queries was improved, particularly for wide tables.

Bug: [IMPALA-1120](#)

Issues Fixed in the 2.0.2 Release / CDH 5.2.3

This section lists the most significant issues fixed in Impala 2.0.2.

For the full list of fixed issues in Impala 2.0.2, see [this report in the JIRA system](#).

Note: Impala 2.0.2 is available as part of CDH 5.2.3, not under CDH 4.

GROUP BY on STRING column produces inconsistent results

Some operations in queries submitted through Hue or other HiveServer2 clients could produce inconsistent results.

Bug: [IMPALA-1453](#)

Fix leaked file descriptor and excessive file descriptor use

Impala could encounter an error from running out of file descriptors. The fix reduces the amount of time file descriptors are kept open, and avoids leaking file descriptors when read operations encounter errors.

unix_timestamp() does not return correct time

The `unix_timestamp()` function could return a constant value 1 instead of a representation of the time.

Bug: [IMPALA-1623](#)

Impala should randomly select cached replica

To avoid putting too heavy a load on any one node, Impala now randomizes which scan node processes each HDFS data block rather than choosing the first cached block replica.

Bug: [IMPALA-1586](#)

Impala does not always give short name to Llama.

In clusters secured by Kerberos or LDAP, a discrepancy in internal transmission of user names could cause a communication error with Llama.

Bug: [IMPALA-1606](#)

accept unmangled native UDF symbols

The `CREATE FUNCTION` statement could report that it could not find a function entry point within the `.so` file for a UDF written in C++, even if the corresponding function was present.

Bug: [IMPALA-1475](#)

Issues Fixed in the 2.0.1 Release / CDH 5.2.1

This section lists the most significant issues fixed in Impala 2.0.1.

For the full list of fixed issues in Impala 2.0.1, see [this report in the JIRA system](#).

Queries fail with metastore exception after upgrade and compute stats

After running the `COMPUTE STATS` statement on an Impala table, subsequent queries on that table could fail with the exception message `Failed to load metadata for table: default.stats_test`.

Bug: [IMPALA-1416](#)

Workaround: Upgrading to CDH 5.2.1, or another level of CDH that includes the fix for HIVE-8627, prevents the problem from affecting future `COMPUTE STATS` statements. On affected levels of CDH, or for Impala tables that have become inaccessible, the workaround is to disable the `hive.metastore.try.direct.sql` setting in the Hive metastore `hive-site.xml` file and issue the `INVALIDATE METADATA` statement for the affected table. You do not need to rerun the `COMPUTE STATS` statement for the table.

Issues Fixed in the 2.0.0 Release / CDH 5.2.0

This section lists the most significant issues fixed in Impala 2.0.0.

For the full list of fixed issues in Impala 2.0.0, see [this report in the JIRA system](#).

Join Hint is dropped when used inside a view

Hints specified within a view query did not take effect when the view was queried, leading to slow performance. As part of this fix, Impala now supports hints embedded within comments.

Bug: [IMPALA-995](#)"

WHERE condition ignored in simple query with RIGHT JOIN

Potential wrong results for some types of queries.

Bug: [IMPALA-1101](#)"

Query with self joined table may produce incorrect results

Potential wrong results for some types of queries.

Bug: [IMPALA-1102](#)"

Incorrect plan after reordering predicates (inner join following outer join)

Potential wrong results for some types of queries.

Bug: [IMPALA-1118](#)"

Combining fragments with compatible data partitions can lead to incorrect results due to type incompatibilities (missing casts).

Potential wrong results for some types of queries.

Bug: [IMPALA-1123](#)"

Predicate dropped: Inline view + DISTINCT aggregate in outer query

Potential wrong results for some types of queries.

Bug: [IMPALA-1165](#)"

Reuse of a column in JOIN predicate may lead to incorrect results

Potential wrong results for some types of queries.

Bug: [IMPALA-1353](#)"

Usage of TRUNC with string timestamp reliably crashes node

Serious error for certain combinations of function calls and data types.

Bug: [IMPALA-1105](#)"

Timestamp Cast Returns invalid TIMESTAMP

Serious error for certain combinations of function calls and data types.

Bug: [IMPALA-1109](#)"

IllegalStateException upon JOIN of DECIMAL columns with different precision

DECIMAL columns with different precision could not be compared in join predicates.

Bug: [IMPALA-1121](#)"

Allow creating Avro tables without column definitions. Allow `COMPUTE STATS` to always work on Impala-created Avro tables.

Hive-created Avro tables with columns specified by a JSON file or literal could produce errors when queried in Impala, and could not be used with the `COMPUTE STATS` statement. Now you can create such tables in Impala to avoid such errors.

Bug: [IMPALA-1104](#)"

Ensure all webserver output is escaped

The Impala debug web UI did not properly encode all output.

Bug: [IMPALA-1133](#)"

Queries with union in inline view have empty resource requests

Certain queries could run without obeying the limits imposed by resource management.

Bug: [IMPALA-1236](#)"

Impala does not employ ACLs when checking path permissions for `LOAD` and `INSERT`

Certain `INSERT` and `LOAD DATA` statements could fail unnecessarily, if the target directories in HDFS had restrictive HDFS permissions, but those permissions were overridden by HDFS extended ACLs.

Bug: [IMPALA-1279](#)"

Impala does not map principals to lowercase, affecting Sentry authorisation

In a Kerberos environment, the principal name was not mapped to lowercase, causing issues when a user logged in with an uppercase principal name and Sentry authorization was enabled.

Bug: [IMPALA-1334](#)"

Issues Fixed in the 1.4.4 Release / CDH 5.1.5

For the list of fixed issues, see [Issues Fixed in CDH 5.1.5](#) in the *CDH 5 Release Notes*.

Note: Impala 1.4.4 is available as part of CDH 5.1.5, not under CDH 4.

Issues Fixed in the 1.4.3 Release / CDH 5.1.4

Impala 1.4.3 includes fixes to address what is known as the POODLE vulnerability in SSLv3. SSLv3 access is disabled in the Impala debug web UI.

Note: Impala 1.4.3 is available as part of CDH 5.1.4, and under CDH 4.

Issues Fixed in the 1.4.2 Release / CDH 5.1.3

This section lists the most significant issues fixed in Impala 1.4.2.

For the full list of fixed issues in Impala 1.4.2, see [this report in the JIRA system](#).

Note: Impala 1.4.3 is available as part of CDH 5.1.4, and under CDH 4.

Issues Fixed in the 1.4.1 Release / CDH 5.1.2

This section lists the most significant issues fixed in Impala 1.4.1.

For the full list of fixed issues in Impala 1.4.1, see [this report in the JIRA system](#).

Note: Impala 1.4.1 is only available as part of CDH 5.1.2, not under CDH 4.

impalad terminating with Boost exception

Occasionally, a non-trivial query run through Llama could encounter a serious error. The detailed error in the log was:

```
boost::exception_detail::clone_impl
<boost::exception_detail::error_info_injector<boost::lock_error> >
```

Severity: High

Impalad uses wrong string format when writing logs

Impala log files could contain internal error messages due to a problem formatting certain strings. The messages consisted of a Java call stack starting with:

```
jni-util.cc:177] java.util.MissingFormatArgumentException: Format specifier 's'
```

Update HS2 client API.

A downlevel version of the HiveServer2 API could cause difficulty retrieving the precision and scale of a DECIMAL value.

Bug: [IMPALA-1107](#)

Impalad catalog updates can fail with error: "IllegalArgumentException: fromKey out of range" at com.cloudera.impala.catalog.CatalogDeltaLog

The error in the title could occur following a DDL statement. This issue was discovered during internal testing and has not been reported in customer environments.

Bug: [IMPALA-1093](#)

"Total" time counter does not capture all the network transmit time

The time for some network operations was not counted in the report of total time for a query, making it difficult to diagnose network-related performance issues.

Bug: [IMPALA-1131](#)

Impala will crash when reading certain Avro files containing bytes data

Certain Avro fields for byte data could cause Impala to be unable to read an Avro data file, even if the field was not part of the Impala table definition. With this fix, Impala can now read these Avro data files, although Impala queries cannot refer to the "bytes" fields.

Bug: [IMPALA-1149](#)

Support specifying a custom AuthorizationProvider in Impala

The `--authorization_policy_provider_class` option for `impalad` was added back. This option specifies a custom `AuthorizationProvider` class rather than the default `HadoopGroupAuthorizationProvider`. It had been used for internal testing, then removed in Impala 1.4.0, but it was considered useful by some customers.

Bug: [IMPALA-1142](#)

Issues Fixed in the 1.4.0 Release / CDH 5.1.0

This section lists the most significant issues fixed in Impala 1.4.0.

For the full list of fixed issues in Impala 1.4.0, see [this report in the JIRA system](#).

Failed DCHECK in disk-io-mgr-reader-context.cc:174

The serious error in the title could occur, with the supplemental message:

```
num_used_buffers_ < 0: #used=-1 during cancellation HDFS cached data
```

The issue was due to the use of HDFS caching with data files accessed by Impala. Support for HDFS caching in Impala was introduced in Impala 1.4.0 for CDH 5.1.0. The fix for this issue was backported to Impala 1.3.x, and is the only change in Impala 1.3.2 for CDH 5.0.4.

Bug: [IMPALA-1019](#)

Workaround: On CDH 5.0.x, upgrade to CDH 5.0.4 with Impala 1.3.2, where this issue is fixed. In Impala 1.3.0 or 1.3.1 on CDH 5.0.x, do not use HDFS caching for Impala data files in Impala internal or external tables. If some of these data files are cached (for example because they are used by other components that take advantage of HDFS caching), set the query option `DISABLE_CACHED_READS=true`. To set that option for all Impala queries across all sessions, start `impalad` with the `-default_query_options` option and include this setting in the option argument, or on a cluster managed by Cloudera Manager, fill in this option setting on the **Impala Daemon** options page.

Resolution: This issue is fixed in Impala 1.3.2 for CDH 5.0.4. The addition of HDFS caching support in Impala 1.4 means that this issue does not apply to any new level of Impala on CDH 5.

impala-shell only works with ASCII characters

The `impala-shell` interpreter could encounter errors processing SQL statements containing non-ASCII characters.

Bug: [IMPALA-489](#)

The extended view definition SQL text in Views created by Impala should always have fully-qualified table names

When a view was accessed while inside a different database, references to tables were not resolved unless the names were fully qualified when the view was created.

Bug: [IMPALA-962](#)

Impala forgets about partitions with non-existent locations

If an `ALTER TABLE` specified a non-existent HDFS location for a partition, afterwards Impala would not be able to access the partition at all.

Bug: [IMPALA-741](#)

CREATE TABLE LIKE fails if source is a view

The `CREATE TABLE LIKE` clause was enhanced to be able to create a table with the same column definitions as a view. The resulting table is a text table unless the `STORED AS` clause is specified, because a view does not have an associated file format to inherit.

Bug: [IMPALA-834](#)

Improve partition pruning time

Operations on tables with many partitions could be slow due to the time to evaluate which partitions were affected. The partition pruning code was speeded up substantially.

Bug: [IMPALA-887](#)

Improve compute stats performance

The performance of the `COMPUTE STATS` statement was improved substantially. The efficiency of its internal operations was improved, and some statistics are no longer gathered because they are not currently used for planning Impala queries.

Bug: [IMPALA-1003](#)

When I run `CREATE TABLE new_table LIKE avro_table`, the schema does not get mapped properly from an avro schema to a hive schema

After a `CREATE TABLE LIKE` statement using an Avro table as the source, the new table could have incorrect metadata and be inaccessible, depending on how the original Avro table was created.

Bug: [IMPALA-185](#)

Race condition in IoMgr. Blocked ranges enqueued after cancel.

Impala could encounter a serious error after a query was cancelled.

Bug: [IMPALA-1046](#)

Deadlock in scan node

A deadlock condition could make all `impalad` daemons hang, making the cluster unresponsive for Impala queries.

Bug: [IMPALA-1083](#)

Issues Fixed in the 1.3.3 Release / CDH 5.0.5

Impala 1.3.3 includes fixes to address what is known as the POODLE vulnerability in SSLv3. SSLv3 access is disabled in the Impala debug web UI.

Note: Impala 1.3.3 is only available as part of CDH 5.0.5, not under CDH 4.

Issues Fixed in the 1.3.2 Release / CDH 5.0.4

This backported bug fix is the only change between Impala 1.3.1 and Impala 1.3.2.

Note: Impala 1.3.3 is only available as part of CDH 5.0.5, not under CDH 4.

Failed DCHECK in disk-io-mgr-reader-context.cc:174

The serious error in the title could occur, with the supplemental message:

```
num_used_buffers_ < 0: #used=-1 during cancellation HDFS cached data
```

The issue was due to the use of HDFS caching with data files accessed by Impala. Support for HDFS caching in Impala was introduced in Impala 1.4.0 for CDH 5.1.0. The fix for this issue was backported to Impala 1.3.x, and is the only change in Impala 1.3.2 for CDH 5.0.4.

Bug: [IMPALA-1019](#)

Workaround: On CDH 5.0.x, upgrade to CDH 5.0.4 with Impala 1.3.2, where this issue is fixed. In Impala 1.3.0 or 1.3.1 on CDH 5.0.x, do not use HDFS caching for Impala data files in Impala internal or external tables. If some of these data files are cached (for example because they are used by other components that take advantage of HDFS caching), set the query option `DISABLE_CACHED_READS=true`. To set that option for all Impala queries across all sessions, start `impalad` with the `-default_query_options` option and include this setting in the option argument, or on a cluster managed by Cloudera Manager, fill in this option setting on the **Impala Daemon** options page.

Resolution: This issue is fixed in Impala 1.3.2 for CDH 5.0.4. The addition of HDFS caching support in Impala 1.4 means that this issue does not apply to any new level of Impala on CDH 5.

Issues Fixed in the 1.3.1 Release / CDH 5.0.3

This section lists the most significant issues fixed in Impala 1.3.1.

For the full list of fixed issues in Impala 1.3.1, see [this report in the JIRA system](#).

Impalad crashes when left joining inline view that has aggregate using distinct

Impala could encounter a severe error in a query combining a left outer join with an inline view containing a `COUNT(DISTINCT)` operation.

Bug: [IMPALA-904](#)

Incorrect result with group by query with null value in group by data

If the result of a `GROUP BY` operation is `NULL`, the resulting row might be omitted from the result set. This issue depends on the data values and data types in the table.

Bug: [IMPALA-901](#)

Drop Function does not clear local library cache

When a UDF is dropped through the `DROP FUNCTION` statement, and then the UDF is re-created with a new `.so` library or JAR file, the original version of the UDF is still used when the UDF is called from queries.

Bug: [IMPALA-786](#)

Workaround: Restart the `impalad` daemon on all nodes.

Compute stats doesn't propagate underlying error correctly

If a `COMPUTE STATS` statement encountered an error, the error message is "Query aborted" with no further detail. Common reasons why a `COMPUTE STATS` statement might fail include network errors causing the coordinator node to lose contact with other `impalad` instances, and column names that match Impala [reserved words](#). (Currently, if a column name is an Impala reserved word, `COMPUTE STATS` always returns an error.)

Bug: [IMPALA-762](#)

Inserts should respect changes in partition location

After an `ALTER TABLE` statement that changes the `LOCATION` property of a partition, a subsequent `INSERT` statement would always use a path derived from the base data directory for the table.

Bug: [IMPALA-624](#)

Text data with carriage returns generates wrong results for `count(*)`

A `COUNT(*)` operation could return the wrong result for text tables using nul characters (ASCII value 0) as delimiters.

Bug: [IMPALA-13](#)

Workaround: Impala adds support for ASCII 0 characters as delimiters through the clause `FIELDS TERMINATED BY '\0'`.

IO Mgr should take instance memory limit into account when creating io buffers

Impala could allocate more memory than necessary during certain operations.

Bug: [IMPALA-488](#)

Workaround: Before issuing a `COMPUTE STATS` statement for a Parquet table, reduce the number of threads used in that operation by issuing `SET NUM_SCANNER_THREADS=2` in `impala-shell`. Then issue `UNSET NUM_SCANNER_THREADS` before continuing with queries.

Impala should provide an option for new sub directories to automatically inherit the permissions of the parent directory

When new subdirectories are created underneath a partitioned table by an `INSERT` statement, previously the new subdirectories always used the default HDFS permissions for the `impala` user, which might not be suitable for directories intended to be read and written by other components also.

Bug: [IMPALA-827](#)

Resolution: In Impala 1.3.1 and higher, you can specify the `--insert_inherit_permissions` configuration when starting the `impalad` daemon.

Illegal state exception (or crash) in query with UNION in inline view

Impala could encounter a severe error in a query where the `FROM` list contains an inline view that includes a `UNION`. The exact type of the error varies.

Bug: [IMPALA-888](#)

INSERT column reordering doesn't work with SELECT clause

The ability to specify a subset of columns in an `INSERT` statement, with order different than in the target table, was not working as intended.

Bug: [IMPALA-945](#)

Issues Fixed in the 1.3.0 Release / CDH 5.0.0

This section lists the most significant issues fixed in Impala 1.3.0, primarily issues that could cause wrong results, or cause problems running the `COMPUTE STATS` statement, which is very important for performance and scalability.

For the full list of fixed issues, see [this report in the JIRA system](#).

Inner join after right join may produce wrong results

The automatic join reordering optimization could incorrectly reorder queries with an outer join or semi join followed by an inner join, producing incorrect results.

Bug: [IMPALA-860](#)

Workaround: Including the `STRAIGHT_JOIN` keyword in the query prevented the issue from occurring.

Incorrect results with codegen on multi-column group by with NULLs.

A query with a `GROUP BY` clause referencing multiple columns could introduce incorrect `NULL` values in some columns of the result set. The incorrect `NULL` values could appear in rows where a different `GROUP BY` column actually did return `NULL`.

Bug: [IMPALA-850](#)

Using distinct inside aggregate function may cause incorrect result when using having clause

A query could return incorrect results if it combined an aggregate function call, a `DISTINCT` operator, and a `HAVING` clause, without a `GROUP BY` clause.

Bug: [IMPALA-845](#)

Aggregation on union inside (inline) view not distributed properly.

An aggregation query or a query with `ORDER BY` and `LIMIT` could be executed on a single node in some cases, rather than distributed across the cluster. This issue affected queries whose `FROM` clause referenced an inline view containing a `UNION`.

Bug: [IMPALA-831](#)

Wrong expression may be used in aggregate query if there are multiple similar expressions

If a `GROUP BY` query referenced the same columns multiple times using different operators, result rows could contain multiple copies of the same expression.

Bug: [IMPALA-817](#)

Incorrect results when changing the order of aggregates in the select list with codegen enabled

Referencing the same columns in both a `COUNT()` and a `SUM()` call in the same query, or some other combinations of aggregate function calls, could incorrectly return a result of 0 from one of the aggregate functions. This issue affected references to `TINYINT` and `SMALLINT` columns, but not `INT` or `BIGINT` columns.

Bug: [IMPALA-765](#)

Workaround: Setting the query option `DISABLE_CODEGEN=TRUE` prevented the incorrect results. Switching the order of the function calls could also prevent the issue from occurring.

Union queries give Wrong result in a UNION followed by SIGSEGV in another union

A UNION query could produce a wrong result, followed by a serious error for a subsequent UNION query.

Bug: [IMPALA-723](#)

String data in MR-produced parquet files may be read incorrectly

Impala could return incorrect string results when reading uncompressed Parquet data files containing multiple row groups. This issue only affected Parquet data files produced by MapReduce jobs.

Bug: [IMPALA-729](#)

Compute stats need to use quotes with identifiers that are Impala keywords

Using a column or table name that conflicted with Impala keywords could prevent running the COMPUTE STATS statement for the table.

Bug: [IMPALA-777](#)

COMPUTE STATS child queries do not inherit parent query options.

The COMPUTE STATS statement did not use the setting of the MEM_LIMIT query option in impala-shell, potentially causing problems gathering statistics for wide Parquet tables.

Bug: [IMPALA-903](#)

COMPUTE STATS should update partitions in batches

The COMPUTE STATS statement could be slow or encounter a timeout while analyzing a table with many partitions.

Bug: [IMPALA-880](#)

Fail early (in analysis) when COMPUTE STATS is run against Avro table with no columns

If the columns for an Avro table were all defined in the TBLPROPERTIES or SERDEPROPERTIES clauses, the COMPUTE STATS statement would fail after completely analyzing the table, potentially causing a long delay. Although the COMPUTE STATS statement still does not work for such tables, now the problem is detected and reported immediately.

Bug: [IMPALA-867](#)

Workaround: Re-create the Avro table with columns defined in SQL style, using the output of SHOW CREATE TABLE. (See the JIRA page for detailed steps.)

Issues Fixed in the 1.2.4 Release

This section lists the most significant issues fixed in Impala 1.2.4. For the full list of fixed issues, see [this report in the JIRA system](#).

The Catalog Server exits with an OOM error after a certain number of CREATE statements

A large number of concurrent CREATE TABLE statements can cause the catalogd process to consume excessive memory, and potentially be killed due to an out-of-memory condition.

Bug: [IMPALA-818](#)

Workaround: Restart the catalogd service and re-try the DDL operations that failed.

Catalog Server consumes excessive cpu cycle

A large number of tables and partitions could result in unnecessary CPU overhead during Impala idle time and background operations.

Bug: [IMPALA-821](#)

Resolution: Catalog server processing was optimized in several ways.

Query against Avro table crashes Impala with codegen enabled

A query against a TIMESTAMP column in an Avro table could encounter a serious issue.

Bug: [IMPALA-828](#)**Workaround:** Set the query option `DISABLE_CODEGEN=TRUE`

Statestore seems to send concurrent heartbeats to the same subscriber leading to repeated "Subscriber '*hostname*' is registering with statestore, ignoring update" messages

Impala nodes could produce repeated error messages after recovering from a communication error with the statestore service.

Bug: [IMPALA-809](#)

Join predicate incorrectly ignored

A join query could produce wrong results if multiple equality comparisons between the same tables referred to the same column.

Bug: [IMPALA-805](#)

Query result differing between Impala and Hive

Certain outer join queries could return wrong results. If one of the tables involved in the join was an inline view, some tests from the `WHERE` clauses could be applied to the wrong phase of the query.

[ArrayIndexOutOfBoundsException / Invalid query handle when reading large HBase cell](#)

An HBase cell could contain a value larger than 32 KB, leading to a serious error when Impala queries that table. The error could occur even if the applicable row is not part of the result set.

Bug: [IMPALA-715](#)

Workaround: Use smaller values in the HBase table, or exclude the column containing the large value from the result set.

[select with distinct and full outer join, impalad coredump](#)

A query involving a `DISTINCT` operator combined with a `FULL OUTER JOIN` could encounter a serious error.

Bug: [IMPALA-735](#)**Workaround:** Set the query option `DISABLE_CODEGEN=TRUE`

Impala cannot load tables with more than `Short.MAX_VALUE` number of partitions

If a table had more than 32,767 partitions, Impala would not recognize the partitions above the 32K limit and query results could be incomplete.

Bug: [IMPALA-749](#)

Various issues with HBase row key specification

Queries against HBase tables could fail with an error if the row key was compared to a function return value rather than a string constant. Also, queries against HBase tables could fail if the `WHERE` clause contained combinations of comparisons that could not possibly match any row key.

Resolution: Queries now return appropriate results when function calls are used in the row key comparison. For queries involving non-existent row keys, such as `WHERE row_key IS NULL` or where the lower bound is greater than the upper bound, the query succeeds and returns an empty result set.

Issues Fixed in the 1.2.3 Release

This release is a fix release that supercedes Impala 1.2.2, with the same features and fixes as 1.2.2 plus one additional fix for compatibility with Parquet files generated outside of Impala by components such as Hive, Pig, or MapReduce.

[Impala cannot read Parquet files with multiple row groups](#)

The `parquet-mr` library included with CDH4.5 writes files that are not readable by Impala, due to the presence of multiple row groups. Queries involving these data files might result in a crash or a failure with an error such as "Column chunk should not contain two dictionary pages".

This issue does not occur for Parquet files produced by Impala `INSERT` statements, because Impala only produces files with a single row group.

Bug: [IMPALA-720](#)

Issues Fixed in the 1.2.2 Release

This section lists the most significant issues fixed in Impala 1.2.2. For the full list of fixed issues, see [this report in the JIRA system](#).

Order of table references in FROM clause is critical for optimal performance

Impala does not currently optimize the join order of queries; instead, it joins tables in the order in which they are listed in the FROM clause. Queries that contain one or more large tables on the right hand side of joins (either an explicit join expressed as a JOIN statement or a join implicit in the list of table references in the FROM clause) may run slowly or crash Impala due to out-of-memory errors. For example:

```
SELECT ... FROM small_table JOIN large_table
```

Anticipated Resolution: Fixed in Impala 1.2.2.

Workaround: In Impala 1.2.2 and higher, use the `COMPUTE STATS` statement to gather statistics for each table involved in the join query, after data is loaded. Prior to Impala 1.2.2, modify the query, if possible, to join the largest table first. For example:

```
SELECT ... FROM small_table JOIN large_table
```

should be modified to:

```
SELECT ... FROM large_table JOIN small_table
```

Parquet in CDH4.5 writes data files that are sometimes unreadable by Impala

Some Parquet files could be generated by other components that Impala could not read.

Bug: [IMPALA-694](#)

Resolution: The underlying issue is being addressed by a fix in the CDH Parquet libraries. Impala 1.2.2 works around the problem and reads the existing data files.

Deadlock in statestore when unregistering a subscriber and building a topic update

The statestore service could experience an internal error leading to a hang.

Bug: [IMPALA-699](#)

IllegalStateException when doing a union involving a group by

A `UNION` query where one side involved a `GROUP BY` operation could cause a serious error.

Bug: [IMPALA-687](#)

Impala Parquet Writer hit DCHECK in RleEncoder

A serious error could occur when doing an `INSERT` into a Parquet table.

Bug: [IMPALA-689](#)

Hive UDF jars cannot be loaded by the FE

If the JAR file for a Java-based Hive UDF was not in the `CLASSPATH`, the UDF could not be called during a query.

Bug: [IMPALA-695](#)

Issues Fixed in the 1.2.1 Release

This section lists the most significant issues fixed in Impala 1.2.1. For the full list of fixed issues, see [this report in the JIRA system](#).

Scanners use too much memory when reading past scan range

While querying a table with long column values, Impala could over-allocate memory leading to an out-of-memory error. This problem was observed most frequently with tables using uncompressed RCFile or text data files.

Bug: [IMPALA-525](#)

Resolution: Fixed in 1.2.1

Join node consumes memory way beyond mem-limit

A join query could allocate a temporary work area that was larger than needed, leading to an out-of-memory error. The fix makes Impala return unused memory to the system when the memory limit is reached, avoiding unnecessary memory errors.

Bug: [IMPALA-657](#)

Resolution: Fixed in 1.2.1

Excessive memory consumption when query tables with 1k columns (Parquet file)

Impala could encounter an out-of-memory condition setting up work areas for Parquet tables with many columns. The fix reduces the size of the allocated memory when not actually needed to hold table data.

Bug: [IMPALA-652](#)

Resolution: Fixed in 1.2.1

Issues Fixed in the 1.2.0 Beta Release

This section lists the most significant issues fixed in Impala 1.2 (beta). For the full list of fixed issues, see [this report in the JIRA system](#).

Issues Fixed in the 1.1.1 Release

This section lists the most significant issues fixed in Impala 1.1.1. For the full list of fixed issues, see [this report in the JIRA system](#).

Unexpected LLVM Crash When Querying Doubles on CentOS 5.x

Certain queries involving `DOUBLE` columns could fail with a serious error. The fix improves the generation of native machine instructions for certain chipsets.

Bug: [IMPALA-477](#)

"block size is too big" error with Snappy-compressed RCFile containing null

Queries could fail with a "block size is too big" error, due to `NULL` values in RCFile tables using Snappy compression.

Bug: [IMPALA-482](#)

Cannot query RC file for table that has more columns than the data file

Queries could fail if an Impala RCFile table was defined with more columns than in the corresponding RCFile data files.

Bug: [IMPALA-510](#)

Views Sometimes Not Utilizing Partition Pruning

Certain combinations of clauses in a view definition for a partitioned table could result in inefficient performance and incorrect results.

Bug: [IMPALA-495](#)

Update the serde name we write into the metastore for Parquet tables

The SerDes class string written into Parquet data files created by Impala was updated for compatibility with Parquet support in Hive. See [Incompatible Changes Introduced in Impala 1.1.1](#) on page 1936 for the steps to update older Parquet data files for Hive compatibility.

Bug: [IMPALA-485](#)

Selective queries over large tables produce unnecessary memory consumption

A query returning a small result sets from a large table could tie up memory unnecessarily for the duration of the query.

Bug: [IMPALA-534](#)

Impala stopped to query AVRO tables

Queries against Avro tables could fail depending on whether the Avro schema URL was specified in the `TBLPROPERTIES` or `SERDEPROPERTIES` field. The fix causes Impala to check both fields for the schema URL.

Bug: [IMPALA-538](#)

Impala continues to allocate more memory even though it has exceed its mem-limit

Queries could allocate substantially more memory than specified in the `impalad -mem_limit` startup option. The fix causes more frequent checking of the limit during query execution.

Bug: [IMPALA-520](#)

Issues Fixed in the 1.1.0 Release

This section lists the most significant issues fixed in Impala 1.1. For the full list of fixed issues, see [this report in the JIRA system](#).

10-20% perf regression for most queries across all table formats

This issue is due to a performance tradeoff between systems running many queries concurrently, and systems running a single query. Systems running only a single query could experience lower performance than in early beta releases. Systems running many queries simultaneously should experience higher performance than in the beta releases.

planner fails with "Join requires at least one equality predicate between the two tables" when "from" table order does not match "where" join order

A query could fail if it involved 3 or more tables and the last join table was specified as a subquery.

Bug: [IMPALA-85](#)

Parquet writer uses excessive memory with partitions

`INSERT` statements against partitioned tables using the Parquet format could use excessive amounts of memory as the number of partitions grew large.

Bug: [IMPALA-257](#)

Comments in `impala-shell` in interactive mode are not handled properly causing syntax errors or wrong results

The `impala-shell` interpreter did not accept comment entered at the command line, making it problematic to copy and paste from scripts or other code examples.

Bug: [IMPALA-192](#)

Cancelled queries sometimes aren't removed from the inflight query list

The Impala web UI would sometimes display a query as if it were still running, after the query was cancelled.

Bug: [IMPALA-364](#)

Impala's 1.0.1 Shell Broke Python 2.4 Compatibility (AttributeError: 'module' object has no attribute 'field_size_limit')

The `impala-shell` command in Impala 1.0.1 does not work with Python 2.4, which is the default on Red Hat 5.

For the `impala-shell` command in Impala 1.0, the `-o` option (pipe output to a file) does not work with Python 2.4.

Bug: [IMPALA-396](#)

Issues Fixed in the 1.0.1 Release

This section lists the most significant issues fixed in Impala 1.0.1. For the full list of fixed issues, see [this report in the JIRA system](#).

Impala parquet scanner cannot read all data files generated by other frameworks

Impala might issue an erroneous error message when processing a Parquet data file produced by a non-Impala Hadoop component.

Bug: [IMPALA-333](#)

Resolution: Fixed

Impala is unable to query RCFile tables which describe fewer columns than the file's header.

If an RCFile table definition had fewer columns than the fields actually in the data files, queries would fail.

Bug: [IMPALA-293](#)

Resolution: Fixed

Impala does not correctly substitute `_HOST` with `hostname` in `--principal`

The `_HOST` placeholder in the `--principal` startup option was not substituted with the correct hostname, potentially leading to a startup error in setups using Kerberos authentication.

Bug: [IMPALA-351](#)

Resolution: Fixed

HBase query missed the last region

A query for an HBase table could omit data from the last region.

Bug: [IMPALA-356](#)

Resolution: Fixed

Hbase region changes are not handled correctly

After a region in an HBase table was split or moved, an Impala query might return incomplete or out-of-date results.

Bug: [IMPALA-300](#)

Resolution: Fixed

Query state for successful create table is EXCEPTION

After a successful `CREATE TABLE` statement, the corresponding query state would be incorrectly reported as `EXCEPTION`.

Bug: [IMPALA-349](#)

Resolution: Fixed

Double check release of JNI-allocated byte-strings

Operations involving calls to the Java JNI subsystem (for example, queries on HBase tables) could allocate memory but not release it.

Bug: [IMPALA-358](#)

Resolution: Fixed

Impala returns 0 for bad time values in `UNIX_TIMESTAMP`, Hive returns `NULL`

Impala returns 0 for bad time values in `UNIX_TIMESTAMP`, Hive returns `NULL`.

Impala:

```
impala> select UNIX_TIMESTAMP('10:02:01') ;
impala> 0
```

Hive:

```
hive> select UNIX_TIMESTAMP('10:02:01') FROM tmp;
hive> NULL
```

Bug: [IMPALA-16](#)**Anticipated Resolution:** Fixed

INSERT INTO TABLE SELECT <constant> does not work.

Insert INTO TABLE SELECT <constant> will not insert any data and may return an error.

Anticipated Resolution: Fixed

Issues Fixed in the 1.0 GA Release

Here are the major user-visible issues fixed in Impala 1.0. For a full list of fixed issues, see [this report in the public issue tracker](#).

Undeterministically receive "ERROR: unknown row batch destination..." and "ERROR: Invalid query handle" from impala shell when running union query

A query containing both UNION and LIMIT clauses could intermittently cause the `impalad` process to halt with a segmentation fault.

Bug: [IMPALA-183](#)**Resolution:** Fixed

Insert with NULL partition keys results in SIGSEGV.

An INSERT statement specifying a NULL value for one of the partitioning columns could cause the `impalad` process to halt with a segmentation fault.

Bug: [IMPALA-190](#)**Resolution:** Fixed

INSERT queries don't show completed profiles on the debug webpage

In the Impala web user interface, the profile page for an INSERT statement showed obsolete information for the statement once it was complete.

Bug: [IMPALA-217](#)**Resolution:** Fixed

Impala HBase scan is very slow

Queries involving an HBase table could be slower than expected, due to excessive memory usage on the Impala nodes.

Bug: [IMPALA-231](#)**Resolution:** FixedAdd some library version validation logic to `impalad` when loading `impala-lzo` shared library

No validation was done to check that the `impala-lzo` shared library was compatible with the version of Impala, possibly leading to a crash when using LZ0-compressed text files.

Bug: [IMPALA-234](#)**Resolution:** Fixed

Workaround: Always upgrade the `impala-lzo` library at the same time as you upgrade Impala itself.

Problems inserting into tables with `TIMESTAMP` partition columns leading table metadata loading failures and failed dchecks

`INSERT` statements for tables partitioned on columns involving datetime types could appear to succeed, but cause errors for subsequent queries on those tables. The problem was especially serious if an improperly formatted timestamp value was specified for the partition key.

Bug: [IMPALA-238](#)

Resolution: Fixed

Ctrl-C sometimes interrupts shell in system call, rather than cancelling query

Pressing Ctrl-C in the `impala-shell` interpreter could sometimes display an error and return control to the shell, making it impossible to cancel the query.

Bug: [IMPALA-243](#)

Resolution: Fixed

Empty string partition value causes metastore update failure

Specifying an empty string or `NULL` for a partition key in an `INSERT` statement would fail.

Bug: [IMPALA-252](#)

Resolution: Fixed. The behavior for empty partition keys was made more compatible with the corresponding Hive behavior.

`Round()` does not output the right precision

The `round()` function did not always return the correct number of significant digits.

Bug: [IMPALA-266](#)

Resolution: Fixed

Cannot cast string literal to string

Casting from a string literal back to the same type would cause an “invalid type cast” error rather than leaving the original value unchanged.

Bug: [IMPALA-267](#)

Resolution: Fixed

Excessive mem usage for certain queries which are very selective

Some queries that returned very few rows experienced unnecessary memory usage.

Bug: [IMPALA-288](#)

Resolution: Fixed

HdfsScanNode crashes in UpdateCounters

A serious error could occur for relatively small and inexpensive queries.

Bug: [IMPALA-289](#)

Resolution: Fixed

Parquet performance issues on large dataset

Certain aggregation queries against Parquet tables were inefficient due to lower than required thread utilization.

Bug: [IMPALA-292](#)

Resolution: Fixed

impala not populating hive metadata correctly for create table

The Impala `CREATE TABLE` command did not fill in the `owner` and `tbl_type` columns in the Hive metastore database.

Bug: [IMPALA-295](#)

Resolution: Fixed. The metadata was made more Hive-compatible.

impala daemons die if statestore goes down

The `impalad` instances in a cluster could halt when the `statestore` process became unavailable.

Bug: [IMPALA-312](#)

Resolution: Fixed

Constant `SELECT` clauses do not work in subqueries

A subquery would fail if the `SELECT` statement inside it returned a constant value rather than querying a table.

Bug: [IMPALA-67](#)

Resolution: Fixed

Right outer Join includes NULLs as well and hence wrong result count

The result set from a right outer join query could include erroneous rows containing `NULL` values.

Bug: [IMPALA-90](#)

Resolution: Fixed

Parquet scanner hangs for some queries

The Parquet scanner non-deterministically hangs when executing some queries.

Bug: [IMPALA-204](#)

Resolution: Fixed

Issues Fixed in Version 0.7 of the Beta Release

Impala does not gracefully handle unsupported Hive table types (`INDEX` and `VIEW` tables)

When attempting to load metadata from an unsupported Hive table type (`INDEX` and `VIEW` tables), Impala fails with an unclear error message.

Bug: [IMPALA-167](#)

Resolution: Fixed in 0.7

DDL statements (`CREATE/ALTER/DROP TABLE`) are not supported in the Impala Beta Release

Resolution: Fixed in 0.7

Avro is not supported in the Impala Beta Release

Resolution: Fixed in 0.7

Workaround: None

Impala does not currently allow limiting the memory consumption of a single query

It is currently not possible to limit the memory consumption of a single query. All tables on the right hand side of `JOIN` statements need to be able to fit in memory. If they do not, Impala may crash due to out of memory errors.

Resolution: Fixed in 0.7

Aggregate of a subquery result set returns wrong results if the subquery contains a 'limit' and data is distributed across multiple nodes

Aggregate of a subquery result set returns wrong results if the subquery contains a 'limit' clause and data is distributed across multiple nodes. From the query plan, it looks like we are just summing the results from each worker node.

Bug: [IMPALA-20](#)**Resolution:** Fixed in 0.7

Partition pruning for arbitrary predicates that are fully bound by a particular partition column

We currently cannot utilize a predicate like "country_code in ('DE', 'FR', 'US')" to do partitioning pruning, because that requires an equality predicate or a binary comparison.

We should create a superclass of `planner.ValueRange`, `ValueSet`, that can be constructed with an arbitrary predicate, and whose `isInRange(analyzer, valueExpr)` constructs a literal predicate by substitution of the `valueExpr` into the predicate.

Bug: [IMPALA-144](#)**Resolution:** Fixed in 0.7

Issues Fixed in Version 0.6 of the Beta Release

[Impala reads the NameNode address and port as command line parameters](#)

Impala reads the NameNode address and port as command line parameters rather than reading them from `core-site.xml`. Updating the NameNode address in the `core-site.xml` file does not propagate to Impala.

Severity: Low

Resolution: Fixed in 0.6 - Impala reads the namenode location and port from the Hadoop configuration files, though setting `-nn` and `-nn_port` overrides this. Users are advised not to set `-nn` or `-nn_port`.

[Queries may fail on secure environment due to impalad Kerberos ticket expiration](#)

Queries may fail on secure environment due to `impalad` Kerberos tickets expiring. This can happen if the Impala `-kerberos_reinit_interval` flag is set to a value ten minutes or less. This may lead to an `impalad` requesting a ticket with a lifetime that is less than the time to the next ticket renewal.

Bug: [IMPALA-64](#)**Resolution:** Fixed in 0.6[Concurrent queries may fail when Impala uses Thrift to communicate with the Hive Metastore](#)

Concurrent queries may fail when Impala is using Thrift to communicate with part of the Hive Metastore such as the Hive Metastore Service. In such a case, the error `get_fields failed: out of sequence response` may occur because Impala shared a single Hive Metastore Client connection across threads. With Impala 0.6, a separate connection is used for each metadata request.

Bug: [IMPALA-48](#)**Resolution:** Fixed in 0.6[impalad fails to start if unable to connect to the Hive Metastore](#)

Impala fails to start if it is unable to establish a connection with the Hive Metastore. This behavior was fixed, allowing Impala to start, even when no Metastore is available.

Bug: [IMPALA-58](#)**Resolution:** Fixed in 0.6[Impala treats database names as case-sensitive in some contexts](#)

In some queries (including "USE database" statements), database names are treated as case-sensitive. This may lead queries to fail with an `IllegalStateException`.

Bug: [IMPALA-44](#)**Resolution:** Fixed in 0.6

Impala does not ignore hidden HDFS files

Impala does not ignore hidden HDFS files, meaning those files prefixed with a period '.' or underscore '_'. This diverges from Hive/MapReduce, which skips these files.

Bug: [IMPALA-18](#)

Resolution: Fixed in 0.6

Issues Fixed in Version 0.5 of the Beta Release

Impala may have reduced performance on tables that contain a large number of partitions

Impala may have reduced performance on tables that contain a large number of partitions. This is due to extra overhead reading/parsing the partition metadata.

Resolution: Fixed in 0.5

Backend client connections not getting cached causes an observable latency in secure clusters

Backend impalads do not cache connections to the coordinator. On a secure cluster, this introduces a latency proportional to the number of backend clients involved in query execution, as the cost of establishing a secure connection is much higher than in the non-secure case.

Bug: [IMPALA-38](#)

Resolution: Fixed in 0.5

Concurrent queries may fail with error: "Table object has not been initialised : `PARTITIONS`"

Concurrent queries may fail with error: "Table object has not been initialised : `PARTITIONS`". This was due to a lack of locking in the Impala table/database metadata cache.

Bug: [IMPALA-30](#)

Resolution: Fixed in 0.5

UNIX_TIMESTAMP format behaviour deviates from Hive when format matches a prefix of the time value

The Impala UNIX_TIMESTAMP(val, format) operation compares the length of format and val and returns NULL if they do not match. Hive instead effectively truncates val to the length of the format parameter.

Bug: [IMPALA-15](#)

Resolution: Fixed in 0.5

Issues Fixed in Version 0.4 of the Beta Release

Impala fails to refresh the Hive metastore if a Hive temporary configuration file is removed

Impala is impacted by Hive bug [HIVE-3596](#) which may cause metastore refreshes to fail if a Hive temporary configuration file is deleted (normally located at /tmp/hive-<user>-<tmp_number>.xml). Additionally, the impala-shell will incorrectly report that the failed metadata refresh completed successfully.

Anticipated Resolution: To be fixed in a future release

Workaround: Restart the `impalad` service. Use the `impalad` log to check for metadata refresh errors.

lpad/rpad builtin functions is not correct.

The `lpad/rpad` builtin functions generate the wrong results.

Resolution: Fixed in 0.4

Files with .gz extension reported as 'not supported'

Compressed files with extensions incorrectly generate an exception.

Bug: [IMPALA-14](#)

Resolution: Fixed in 0.4

Queries with large limits would hang.

Some queries with large limits were hanging.

Resolution: Fixed in 0.4

Order by on a string column produces incorrect results if there are empty strings

Resolution: Fixed in 0.4

Issues Fixed in Version 0.3 of the Beta Release

All table loading errors show as unknown table

If Impala is unable to load the metadata for a table for any reason, a subsequent query referring to that table will return an `unknown table` error message, even if the table is known.

Resolution: Fixed in 0.3

A table that cannot be loaded will disappear from SHOW TABLES

After failing to load metadata for a table, Impala removes that table from the list of known tables returned in `SHOW TABLES`. Subsequent attempts to query the table returns 'unknown table', even if the metadata for that table is fixed.

Resolution: Fixed in 0.3

Impala cannot read from HBase tables that are not created as external tables in the hive metastore.

Attempting to select from these tables fails.

Resolution: Fixed in 0.3

Certain queries that contain OUTER JOINs may return incorrect results

Queries that contain OUTER JOINs may not return the correct results if there are predicates referencing any of the joined tables in the WHERE clause.

Resolution: Fixed in 0.3.

Issues Fixed in Version 0.2 of the Beta Release

Subqueries which contain aggregates cannot be joined with other tables or Impala may crash

Subqueries that contain an aggregate cannot be joined with another table or Impala may crash. For example:

```
SELECT * FROM (SELECT sum(col1) FROM some_table GROUP BY col1) t1 JOIN other_table ON (...);
```

Resolution: Fixed in 0.2

An insert with a limit that runs as more than one query fragment inserts more rows than the limit.

For example:

```
INSERT OVERWRITE TABLE test SELECT * FROM test2 LIMIT 1;
```

Resolution: Fixed in 0.2

Query with limit clause might fail.

For example:

```
SELECT * FROM test2 LIMIT 1;
```

Resolution: Fixed in 0.2

Files in unsupported compression formats are read as plain text.

Attempting to read such files does not generate a diagnostic.

Resolution: Fixed in 0.2

Impala server raises a null pointer exception when running an HBase query.

When querying an HBase table whose row-key is string type, the Impala server may raise a null pointer exception.

Resolution: Fixed in 0.2

Apache Kudu Fixed Issues

This topic includes the issues fixed in all generally available versions (GA) of Apache Kudu.

Issues Fixed in Kudu for CDH 5.16.2

The following is a list of upstream issues fixed in Kudu for CDH 5.16.2. For the full list of fixed issues for all CDH components in CDH 5.16.2, see [Upstream Issues Fixed in CDH 5.16.2](#).

- [KUDU-1678](#) - Fixed a crash caused by a race condition between altering tablet schemas and deleting tablet replicas.
- [KUDU-2195](#) - Now you can use the `--cmeta_force_fsync` flag to fsync Kudu's consensus metadata more aggressively. Setting this to `true` may decrease Kudu's performance, but will improve its durability in the face of power failures and forced shutdowns. The issue was much more likely to happen when Kudu was running on XFS.
- [KUDU-2463](#) - Fixed an issue in which incorrect results would be occasionally returned in scans following a server restart.
- [CDH-76920](#) - Fixed the issue where the Kudu CLI crashes when running the `'kudu cluster rebalance'` sub-command on some platforms.

Issues Fixed in Kudu 1.7.0 / CDH 5.16.1

The following is a list of upstream issues fixed in Kudu 1.7.0 / CDH 5.16.1. For the full list of fixed issues for all CDH components in CDH 5.16.1, see [Upstream Issues Fixed in CDH 5.16.1](#).

- [KUDU-2260](#) - Fixed a rare issue where system failure could leave unexpected null bytes at the end of metadata files, causing Kudu to be unable to restart.
- [KUDU-2364](#) - Fixed an issue when a tablet server was wiped and recreated with the same RPC address, ksck listed it twice, both as healthy, even though only one of them was there.
- [KUDU-2412](#) - The kudu-python client can now compile in environments where `__int128` is not supported. This was most commonly el6 environments.
- [KUDU-2509](#) - Fixed an issue that might result in a crash of a tablet server in case of a WAL replay error while bootstrapping a tablet.
- [KUDU-2580](#) - Fixed authentication token reacquisition in the C++ client.
- Fixed an issue that caused the kudu CLI tool to unexpectedly exit when the connection to the master or tserver was abruptly closed.

Issues Fixed in Kudu 1.7.0 / CDH 5.15.2

The following is a list of upstream issues fixed in Kudu 1.7.0 / CDH 5.15.2. For the full list of fixed issues for all CDH components in CDH 5.15.2, see [Upstream Issues Fixed in CDH 5.16.1](#).

- [KUDU-2463](#) - Fixed an issue in which incorrect results would be returned in scans following a server restart.
- [KUDU-2509](#) - Fixed an issue that might result in a crash of a tablet server in case of a WAL replay error while bootstrapping a tablet.
- [KUDU-2580](#) - Fixed authentication token reacquisition in the C++ client.

Issues Fixed in Kudu 1.7.0 / CDH 5.15.1

The following is a list of upstream issues fixed in Kudu 1.7.0 / CDH 5.15.1. For the full list of fixed issues for all CDH components in CDH 5.15.1, see [Upstream Issues Fixed in CDH 5.15.1](#).

- [KUDU-2367](#) - Fixed an issue where a permanently failed tablet replica was not properly identified, which could cause the tablet not to re-replicate in very small clusters.
- [KUDU-2377](#) - Fixed an issue that caused Kudu servers to fail to start when `RLIMIT_NPROC=-1`.
- [KUDU-2378](#) - Fixed unaligned loads of `int128` from rows.

- [KUDU-2379](#) - Fixed an issue that caused secure Spark jobs to fail.
- [KUDU-2416](#) - Fixed PartialRow.setMin.
- [KUDU-2443](#) - Fixed replica movement and replacement for RF=1.
- [KUDU-2447](#) - Fixed the tablet server crash with the error, "NONE predicate can not be pushed into key".
- [KUDU-2478](#) - Restored Python 2.6 compatibility.
- Added the ability to adjust scan timeouts in Spark.
- Increased the timeout to begin tablet copies, which improves Kudu's re-replication time when the cluster is busy.
- Fixed a NullPointerException thrown when calling ColumnSchema#toString on non-decimal types.
- Greatly improved the performance of many types of queries on tables from which many rows have been deleted.
- Fixed an issue that caused partition pruning to be too conservative for queries from the Java client that use Decimal predicates.

Issues Fixed in Kudu 1.7.0 / CDH 5.15.0

The following is a list of upstream issues fixed in Kudu 1.7.0 / CDH 5.15.0. For the full list of fixed issues for all CDH components in CDH 5.15.0, see [Upstream Issues Fixed in CDH 5.15.0](#).

- [KUDU-1613](#) - Fixed a scenario where the on-disk data of a tablet server was completely erased and a new tablet server was started on the same host. This issue could prevent tablet replicas previously hosted on the server from being evicted and re-replicated. Tablets now immediately evict replicas that respond with a different server UUID than expected.
- [KUDU-1927](#) - Fixed a rare race condition when connecting to masters during their startup which might cause a client to get a response without a CA certificate and/or authentication token. This would cause the client to fail to authenticate with other servers in the cluster. The leader master now always sends a CA certificate and an authentication token (when applicable) to a Kudu client with a successful ConnectToMaster response.
- [KUDU-2262](#) - The Kudu Java client now will retry a connection if no master is discovered as a leader, and the user has a valid authentication token. This avoids failure in recoverable cases when masters are in the process of the very first leader election after starting up.
- [KUDU-2264](#) - The Java client will now automatically attempt to re-acquire Kerberos credentials from the ticket cache when the prior credentials are about to expire. This allows client instances to persist longer than the expiration time of a single Kerberos ticket so long as some other process renews the credentials in the ticket cache. Documentation on interacting with Kerberos authentication has been added to the Javadoc for the `AsyncKuduClient` class.
- [KUDU-2265](#) - Follower masters are now able to verify authentication tokens even if they have never been a leader. Prior to this fix, if a follower master had never been a leader, clients would be unable to authenticate to that master, resulting in spurious error messages being logged.
- [KUDU-2295](#) - Fixed a tablet server crash when a tablet replica is deleted during a scan.
- [KUDU-2312](#) - The evaluation order of predicates in scans with multiple predicates has been made deterministic. Due to a bug, this was not necessarily the case previously. Predicates are applied in most to least selective order, with ties broken by column index. The evaluation order may change in the future, particularly when better column statistics are made available internally.
- [KUDU-2331](#) - Previously, the `kudu tablet change_config move_replica` tool required all tablet servers in the cluster to be available when performing a move. This restriction has been relaxed: only the tablet server that will receive a replica of the tablet being moved and the hosts of the tablet's existing replicas need to be available for the move to occur.
- [KUDU-2343](#) - Fixed a bug in the Java client which prevented the client from locating the new leader master after a leader failover in the case that the previous leader either remained online or restarted quickly. This bug resulted in the client timing out operations with errors indicating that there was no leader master.
- [KUDU-2259](#) - The Unix process username of the client is now included inside the exported security credentials, so that the effective username of clients who import credentials and subsequently use unauthenticated (SASL PLAIN) connections matches the client who exported the security credentials. For example, this is useful to let the Spark executors know which username to use if the Spark driver has no authentication token. This change only affects clusters with encryption disabled using `--rpc-encryption=disabled`.

Issues Fixed in Kudu for CDH 5.14.4

The following is a list of upstream issues fixed in Kudu for CDH 5.14.4. For the full list of fixed issues for all CDH components in CDH 5.14.4, see [Upstream Issues Fixed in CDH 5.14.4](#).

- [KUDU-2331](#) - The `kudu tablet change_config move_replica` tool no longer fails for an unavailable tablet server if the tablet server is not the source or destination of the move.
- Improved the speed of scans in cases where a large number of rows have previously been deleted from the table.

Issues Fixed in Kudu 1.6.0 / CDH 5.14.2

The following is a list of upstream issues fixed in Kudu 1.6.0 / CDH 5.14.2. For the full list of fixed issues for all CDH components in CDH 5.14.2, see [Upstream Issues Fixed in CDH 5.14.2](#).

- [KUDU-1613](#) - Fixed an issue where a reformatted server could prevent re-replication of the replicas it previously hosted.
- [KUDU-2238](#) - Fixed an issue where large updates were not flushed to disk under memory pressure.
- [KUDU-2251](#) - Fixed a crash due to an overflow bug that could occur when a tablet was updated very frequently.
- [KUDU-2274](#) - Fixed an issue where copying over a tombstoned replica could produce a replica in an inconsistent state.
- [KUDU-2343](#) - Fixed an issue where the Java client would fail to connect to the leader master after a leadership change.

Issues Fixed in Kudu 1.6.0 / CDH 5.14.0

The following is a list of upstream issues fixed in Kudu 1.6.0 / CDH 5.14.0. For the full list of fixed issues for all CDH components in CDH 5.14.0, see [Upstream Issues Fixed in CDH 5.14.0](#).

- [KUDU-1078](#) - Fixed an error message commonly found in tablet server logs indicating that operations were being read "from the future".
- [KUDU-1411](#) - HybridTime timestamp propagation now works in the Java client when using scan tokens.
- [KUDU-2044](#) - Tombstoned tablets no longer report metrics.
- [KUDU-2173](#) - Fixed a bug in the C++ client which could cause tablets to be erroneously pruned, or skipped, during certain scans, resulting in fewer results than expected being returned from queries. The bug only affected tables whose range partition columns are a proper prefix of the primary key.
- [KUDU-2188](#) - Published Kudu Java artifacts are now fully compatible with JRE 7 and JRE 8. There was previously a bug in the release process which made them compatible only with JRE 8.
- Fixed a typo in the list of default TLS ciphers used by Kudu servers. As a result, two additional cipher suites are now available:
 - ECDHE-RSA-AES128-SHA256 TLSv1.2 Kx=ECDH Au=RSA Enc=AES(128) Mac=SHA256
 - AES256-GCM-SHA384 TLSv1.2 Kx=RSA Au=RSA Enc=AESGCM(256) Mac=AEAD
- [KUDU-2231](#) - Sparse column predicates no longer cause excessive data-block reads.

Issues Fixed in Kudu 1.6.0 / CDH 5.13.3

This is a complete list of upstream issues fixed in Kudu 1.6.0 / CDH 5.13.3. For the full list of fixed issues for all CDH components in CDH 5.13.3, see [Upstream Issues Fixed in CDH 5.13.3](#).

- [KUDU-2238](#) - Fixed a bug where large updates were not flushed to disk, even when the server is under memory pressure..
- [KUDU-2274](#) - Fixed a very rare bug where a tombstone being copied over could produce a tablet replica in an inconsistent state.
- [KUDU-2343](#) - Java client doesn't properly reconnect to leader master when old leader is online.

Issues Fixed in Kudu 1.6.0 / CDH 5.13.2

This is a complete list of upstream issues fixed in Kudu 1.6.0 / CDH 5.13.2. For the full list of fixed issues for all CDH components in CDH 5.13.2, see [Upstream Issues Fixed in CDH 5.13.2](#).

- [KUDU-2147](#) - Consensus: Unknown leader should not be treated as valid UUID
- [KUDU-2231](#) - Sparse column predicate can cause excessive data-block reads.
- [KUDU-2251](#) - rowset size can overflow int in RowSetInfo.
- rpc: Allow setting `--rpc_tls_min_protocol` on older RHEL versions.

Issues Fixed in Kudu 1.5.0 / CDH 5.13.1

This is a complete list of upstream issues fixed in Kudu 1.5.0 / CDH 5.13.1. For the full list of fixed issues for all CDH components in CDH 5.13.1, see [Upstream Issues Fixed in CDH 5.13.1](#).

- [KUDU-1788](#) - Increase Raft RPC timeout to 30sec to avoid fruitless retries.
- [KUDU-2130](#) - (part 2): more fixes for ITClientStress
- [KUDU-2130](#) - java client: handle termination during negotiation edge case
- [KUDU-2167](#) - fix C++ client crash due to bad assumption regarding scan data
- [KUDU-2170](#) - Masters can start with duplicates specified
- [KUDU-2173](#) - Partitions are incorrectly pruned when range-partitioned on a PK prefix
- [KUDU-2188](#) - restore Java 7 compatibility to artifacts built with JDK8
- [KUDU-2209](#) - HybridClock doesn't handle changes in STA_NANO flag

Issues Fixed in Kudu 1.5.0 / CDH 5.13.0

- The Java Kudu client now automatically requests new authentication tokens after expiration. As a result, long-lived Java clients are now supported. See [KUDU-2013](#) for more details.
- Multiple Kerberos compatibility bugs have been fixed, including support for environments with disabled reverse DNS, FreeIPA compatibility, principal names including uppercase characters, and hosts without a FQDN.
- A bug in the binary prefix decoder which could cause a tablet server 'check' assertion crash has been fixed. The crash could only be triggered in very specific scenarios; see [KUDU-2085](#) for additional details.
- This is a complete list of upstream issues fixed in Kudu 1.5.0 / CDH 5.13.0. For the full list of fixed issues for all CDH components in CDH 5.13, see [Upstream Issues Fixed in CDH 5.13](#).
 - [KUDU-871](#) - Allow tombstoned tablets to vote
 - [KUDU-1125](#) - (part 1) catalog_manager: try to avoid unnecessarily rewriting tablet info
 - [KUDU-1407](#) - reassign failed tablets
 - [KUDU-1442](#) - log number of open log block containers
 - [KUDU-1544](#) - Race in Java client's AsyncKuduSession.apply()
 - [KUDU-1726](#) - Avoid fsync-per-block in tablet copy
 - [KUDU-1755](#) - Part 1: Improve tablet on disk size metric
 - [KUDU-1811](#) - C++ client: use larger batches when fetching scan tokens
 - [KUDU-1863](#) - improve overall safety of graceful server shutdown
 - [KUDU-1865](#) - Avoid heap allocation for payload slices
 - [KUDU-1894](#) - fixed deadlock in client.Connection
 - [KUDU-1911](#) - improve missing required arg message
 - [KUDU-1929](#) - [rpc] Allow using encrypted private keys for TLS
 - [KUDU-1942](#) - Kerberos fails to log in on hostnames with capital letters
 - [KUDU-1943](#) - Add BlockTransaction to Block Manager
 - [KUDU-1952](#) - Remove round-robin for block placement
 - [KUDU-1955](#) - refuse to use world-readable keytabs
 - [KUDU-2004](#) - Undefined behavior in TlsSocket::Writev()
 - [KUDU-2013](#) - Support for long lived auth tokens in Java client
 - [KUDU-2032](#) - Kerberos authentication fails with rdns disabled in krb5.conf
 - [KUDU-2039](#) - Fix the table count in the /tables page of master webUI
 - [KUDU-2041](#) - Fix negotiation deadlock
 - [KUDU-2049](#) - Fix too-strict CHECK in RleIntBlockDecoder::SeekToPositionInBlock

- [KUDU-2053](#) - Fix race in Java RequestTracker
- [KUDU-2058](#) - Fix LocatedTablet string comparisons
- [KUDU-2060](#) - Show primary keys in the master's table web UI page
- [KUDU-2066](#) - Add experimental Gradle build support
- [KUDU-2067](#) - Enable cfile checksumming by default
- [KUDU-2072](#) - upgrade to cmake 3.9.0 breaks sles12sp0 cmake patch
- [KUDU-2078](#) - Sink failure if batch size > session's flush buffer size
- [KUDU-2083](#) - Decrement running maintenance ops on failed prepare
- [KUDU-2085](#) - Fix crash when seeking past end of prefix-encoded blocks
- [KUDU-2087](#) - Fix failure to map Kerberos principal to username with FreeIPA
- [KUDU-2088](#) - Synchronizer may not go out of scope with outstanding references
- [KUDU-2091](#) - Certificates with intermediate CA's do not work with Kudu
- [KUDU-2101](#) - Include a table summary at the bottom
- [KUDU-2102](#) - fix PosixRWFile::Sync to guarantee durability when used concurrently
- [KUDU-2103](#) - [java]Canonicalize hostnames in client
- [KUDU-2104](#) - Upgrade to Spark 2.2.0
- [KUDU-2114](#) - Don't re-delete tombstoned replicas
- [KUDU-2118](#) - Fully shut down TabletReplica on delete
- [KUDU-2123](#) - Auto-vivify cmeta on tombstoned replicas if doesn't exist at startup
- [KUDU-2131](#) - switch to LIFO log container retrieval
- [KUDU-2138](#) - delete failed replicas in tablet report
- [KUDU-2141](#) - master: Remove DCHECK when tablet report has no opid_index

Issues Fixed in Kudu 1.4.0 / CDH 5.12.2

Apache Kudu 1.4.0 / CDH 5.12.2 is a bug-fix release which includes the following fixes:

- [KUDU-2209](#) - Fixed Kudu's handling of the STA_NANO flag, which caused spurious crashes due to one Kudu node thinking another node had a timestamp from the future.
- [KUDU-1788](#) - Increased the Raft RPC timeout to 30 seconds to avoid unsuccessful retries.
- [KUDU-2170](#) - Disallowed specifying the same address multiple times in Kudu's master list.
- [KUDU-2083](#) - Fixed an issue where, in rare circumstances, Kudu reduced the amount of maintenance ops it could run concurrently. The issue could cause the Kudu process to run out of memory and crash.
- [KUDU-1942](#) - Now Kerberos can successfully log in on hostnames with capital letters.
- [KUDU-2173](#) - Fixed an issue where scans with a predicate on a prefix of a range partition key could fail to return matching values.
- [KUDU-2167](#) - Fixed an issue where the C++ client would crash when the server filtered out all data in a scan RPC.
- [KUDU-2032](#) - Kerberos authentication no longer fails when `rdns = false` is configured in `krb5.conf`.
- Fixed a segmentation fault that could occur when running the `ksck` command against a master soon after the master was started.

Issues Fixed in Kudu 1.4.0 / CDH 5.12.1

Apache Kudu 1.4.0 / CDH 5.12.1 is a bug-fix release which includes the following fixes:

- [KUDU-2085](#) - Fixed a bug that caused crashes when seeking past the end of prefix-encoded blocks.
- [KUDU-2087](#) - Fixed an issue where Kudu would fail to start when Kerberos was enabled in FreeIPA-configured deployments.
- [KUDU-2053](#) - Fixed a race condition in the Java RequestTracker.
- [KUDU-2049](#) - Fixed an issue where scans on RLE-encoded integer columns would sometimes cause CHECK failures due to the CHECK condition being too strict.
- [KUDU-2052](#) - Kudu now uses `XFS_IOC_UNRESVSP64 ioctl` to punch holes on xfs filesystems. This fixes an issue with slow startup times on xfs when hole punching was done via `fallocate()`.
- [KUDU-1956](#) - Kudu will no longer crash if faced with a race condition when selecting rowsets for compaction.

Issues Fixed in Kudu 1.4.0 / CDH 5.12.0

- [KUDU-2020](#) - Fixed an issue where re-replication after a failure would proceed significantly slower than expected. This bug caused many tablets to be unnecessarily copied multiple times before successfully being considered re-replicated, resulting in significantly more network and IO bandwidth usage than expected. Mean time to recovery on clusters with large amounts of data is improved by up to 10x by this fix.
- [KUDU-1982](#) - Fixed an issue where the Java client would call `NetworkInterface.getByInetAddress` very often, causing performance problems particularly on Windows where this function can be quite slow.
- [KUDU-1755](#) - Improved the accuracy of the `on_disk_size` replica metrics to include the size consumed by bloom filters, primary key indexes, superblock metadata, and delta files. Note that because the size metric is now more accurate, the reported values are expected to increase after upgrading to Kudu 1.4.0. This does not indicate that replicas are using more space after the upgrade; rather, it is now accurately reporting the amount of space that has always been used.
- [KUDU-1192](#) - Kudu servers will now periodically flush their log messages to disk even if no `WARNING`-level messages have been logged. This makes it easier to tail the logs to see progress output during normal startup.

Issues Fixed in Kudu 1.3.0 / CDH 5.11.2

Apache Kudu 1.3.0 / CDH 5.11.2 is a bug-fix release which includes the following fixes:

- [KUDU-2053](#) - Fixed a race condition in the Java `RequestTracker`.
- [KUDU-2049](#) - Fixed an issue where scans on RLE-encoded integer columns would sometimes cause CHECK failures due to the CHECK condition being too strict.
- [KUDU-1963](#) - Fixed an issue where the Java client misdiagnoses an error and logs a `NullPointerException` when a connection is closed by client while a negotiation is in progress.
- [KUDU-1853](#) - Fixed an issue where data blocks could be orphaned after a failed tablet copy.

Issues Fixed in Kudu 1.3.0 / CDH 5.11.1

Apache Kudu 1.3.0 / CDH 5.11.1 is a bug-fix release which includes the following fixes:

- [KUDU-1999](#) - Fixed an issue where the Kudu Spark connector would fail to kinit with the principal and keytab provided to a job.
- [KUDU-1993](#) - Fixed a validation issue with grouped gflags.
- [KUDU-1981](#) - Fixed an issue where Kudu server components would fail to start on machines with fully-qualified domain names longer than 64 characters when security was enabled. This was due to hard-coded restrictions in the OpenSSL library.
- [KUDU-1607](#) - Fixed a case in which a tablet replica on a tablet server could retain blocks of data which prevented it from being fully deleted.
- [KUDU-1933](#) - Fixed an issue in which a tablet server would crash and fail to restart after a single tablet received more than two billion write operations.
- [KUDU-1964](#) - Fixed a performance degradation issue caused by OpenSSL locks under high concurrency.

Issues Fixed in Kudu 1.3.0 / CDH 5.11.0

- [KUDU-1968](#) - Fixed an issue in which the tablet server would delete an incorrect set of data blocks after an aborted attempt to copy a tablet from another server. This would produce data loss in unrelated tablets.
- [KUDU-1962](#) - Fixed a `NullPointerException` in the Java client in the case that the Kudu master is overloaded at the time the client requests location information. This could cause client applications to hang indefinitely regardless of configured timeouts.
- [KUDU-1893](#) - Fixed a critical bug in which wrong results would be returned when evaluating predicates applied to columns added using the `ALTER TABLE` operation.
- [KUDU-1905](#) - Fixed an issue where Kudu would crash after reinserts that resulted in an empty change list. This occurred in cases where the primary key was composed of all columns.

- [KUDU-1899](#) - Fixed a crash that occurred after inserting a row with an empty string as the single-column primary key.
- [KUDU-1904](#) - Fixed a potential crash when performing random reads against a column using RLE encoding and containing long runs of NULL values.
- [KUDU-1856](#) - Fixed an issue in which disk space could be leaked by Kudu servers storing data on partitions using the XFS file system. Any leaked disk space will now be automatically recovered upon upgrade.
- [KUDU-1888](#), [KUDU-1906](#) - Fixed multiple issues in the Java client where operation callbacks would never be triggered, causing the client to hang.

Issues Fixed in Kudu 1.2.0 / CDH 5.10.2

Apache Kudu 1.2.x / CDH 5.10.2 includes the following fixed issues.

- [KUDU-1933](#) - Fixed an issue that truncated the 64-bit log index in the OpId to 32 bits, causing overflow of the log index.
- [KUDU-1607](#) - Fixed an issue where Kudu could not delete failed tablets using the `DROP TABLE` command.
- [KUDU-1905](#) - Allow reinserts on tables when all columns are part of the primary key.
- [KUDU-1893](#) - Made a fix to avoid incorrect NULL results and ensure evaluation of predicates for columns added after table creation.

Issues Fixed in Kudu 1.2.0 / CDH 5.10.1

Apache Kudu 1.2.x / CDH 5.10.1 includes the following fixed issues.

- [KUDU-1904](#) - Fixed a bug where RLE columns with only NULL values would crash on scan.
- [KUDU-1899](#) - Fixed an issue where tablet servers would crash after inserting an empty string primary key (" ").
- [KUDU-1851](#) - Fixed an issue with the Python client which would crash whenever a `TableAlterer` is instantiated directly.
- [KUDU-1852](#) - `KuduTableAlterer` will no longer crash when given `nullptr` range bound arguments.
- [KUDU-1821](#) - Improved warnings when the catalog manager starts.

Issues Fixed in Kudu 1.2.0 / CDH 5.10.0

See [Issues resolved for Kudu 1.2.0](#) and [Git changes between 1.1.x and 1.2.x](#).

- [KUDU-1508](#) - Fixed a long-standing issue in which running Kudu on `ext4` file systems could cause file system corruption. While this issue has been known to still manifest in certain rare cases, the corruption is harmless and can be repaired as part of a regular `fsck`. Switching from `ext4` to `xfs` will also solve the problem.
- [KUDU-1399](#) - Implemented an LRU cache for open files, which prevents running out of file descriptors on long-lived Kudu clusters. By default, Kudu will limit its file descriptor usage to half of its configured `ulimit`.
- [Gerrit #5192](#) - Fixed an issue which caused data corruption and crashes in the case that a table had a non-composite (single-column) primary key, and that column was specified to use `DICT_ENCODING` or `BITSHUFFLE` encodings. If a table with an affected schema was written in previous versions of Kudu, the corruption will not be automatically repaired; users are encouraged to re-insert such tables after upgrading to Kudu 1.2 or later.
- [Gerrit #5541](#) - Fixed a bug in the Spark `KuduRDD` implementation which could cause rows in the result set to be silently skipped in some cases.
- [KUDU-1551](#) - Fixed an issue in which the tablet server would crash on restart in the case that it had previously crashed during the process of allocating a new WAL segment.
- [KUDU-1764](#) - Fixed an issue where Kudu servers would leak approximately 16-32MB of disk space for every 10GB of data written to disk. After upgrading to Kudu 1.2 or later, any disk space leaked in previous versions will be automatically recovered on startup.
- [KUDU-1750](#) - Fixed an issue where the API to drop a range partition would drop any partition with a matching lower `_or_` upper bound, rather than any partition with matching lower `_and_` upper bound.
- [KUDU-1766](#) - Fixed an issue in the Java client where equality predicates which compared an integer column to its maximum possible value (e.g. `Integer.MAX_VALUE`) would return incorrect results.

- [KUDU-1780](#) - Fixed the kudu-client Java artifact to properly shade classes in the `com.google.thirdparty` namespace. The lack of proper shading in prior releases could cause conflicts with certain versions of Google Guava.
- [Gerrit #5327](#) - Fixed shading issues in the `kudu-flume-sink` Java artifact. The sink now expects that Hadoop dependencies are provided by Flume, and properly shades the Kudu client's dependencies.
- Fixed a few issues using the Python client library from Python 3.

Cloudera Manager 5 Release Notes

These Release Notes provide information on the new features and known issues and limitations for Cloudera Manager 5. These Release Notes also include fixed issues for releases starting from Cloudera Manager 5.0.0 beta 1.

To view the Release Notes (or other documentation) for a specific Cloudera Manager release, go to [Cloudera Documentation](#), click a major version link, and use the drop-down menu to select the release.

For information about supported operating systems, and other requirements for using Cloudera Manager, see [CDH 5 and Cloudera Manager 5 Requirements and Supported Versions](#) on page 20.

New Features and Changes in Cloudera Manager 5

The following sections describe what's new and changed in each Cloudera Manager 5 release.

What's New in Cloudera Manager 5

The following sections describe what is new in each Cloudera Manager 5 release.

What's New in Cloudera Manager 5.16.2

Cloudera Manager 5.16.2 is a maintenance release with several fixed issues. See [Issues Fixed in Cloudera Manager 5.16.2](#) on page 2549.

What's New in Cloudera Manager 5.16.1

Cloudera Manager 5.16.1 is the first release of Cloudera Manager 5.16 and also has several fixed issues. See [Issues Fixed in Cloudera Manager 5.16.1](#) on page 2549.

OpenJDK Support

OpenJDK is now supported with Cloudera Manager and CDH 5.16. For information about migrating your Oracle JDK to OpenJDK, see [Upgrading the JDK](#). To use OpenJDK in a new deployment, see [Install Java Development Kit](#).

Cloudera Bug: CDH-60334

Backup and Disaster Recovery (BDR) Log retention

You can now configure the number of days Cloudera Manager retains BDR logs with the **Backup and Disaster Log Retention** property. For more information, see [BDR Log Retention](#).

Impala

Revised Impala charts library

The Impala chart library has been updated to include more meaningful metrics and remove rarely used plots.

Cloudera Bug: OPSAPS-46020

Impala Daemon's JVM heap size can now be configured

The Impala Daemon's JVM heap size can now be configured now using the **Java Heap Size of Impala Daemon in Bytes** configuration property. The property defaults to 4GB, and, like all memory parameters, may require tuning.

Cloudera Bug: OPSAPS-41238

New Impala Alert when reaching maximum client connections

A new health check has been added to report and alert when the Impala Daemon is reaching the maximum capacity of concurrent client connections. The **Impala Daemon Max Client Connections** configuration parameter has been added to configure this value.

Cloudera Bug: OPSAPS-46025

New Impala Idle Query Timeout and Idle Session Timeout configuration properties

The following new configuration properties have been added for Impala: **Idle Query Timeout** and **Idle Session Timeout** parameters.

Cloudera Bug: OPSAPS-38917

Impala Assignment Locality health test removed from Cloudera Manager

The **Impala Assignment Locality** health test has been removed.

Cloudera Bug: OPSAPS-46807

The Solr collection statistics page was not shown for Auditor or Dashboard user roles

A Cloudera Manager Dashboard or Audit user can now see the **Solr Collection Statistics** and the **HBase Table Statistics** page.

Cloudera Bug: OPSAPS-45238, OPSAPS-45238

New Kafka Health Tests

Two new Kafka Broker Health Tests have been added to Cloudera Manager: **Kafka Broker Swap Memory Usage** and **Kafka Broker Unexpected Exits**. These health tests are enabled by default when Kafka is running as a service in Cloudera Manager version 5.14 and later. See [Kafka Broker Health Tests](#).

Cloudera Bug: OPSAPS-45002

Sentry Object Ownership configurations in Cloudera Manager

A new configuration parameter has been added to the Sentry Configuration page that enables Sentry OWNER privileges (this parameter is disabled by default). For more information, see [Setting Object Owner Privileges in Cloudera Manager](#).

Cloudera Bug: OPSAPS-47434

Downgrade to Cloudera Express disabled when using HDFS encryption at rest

Added a warning to the **Downgrade License** dialog box if the installation uses HDFS encryption with KMS Key Trustee server and disabled the downgrade in this case. Users are instructed to convert their data to an unencrypted format before proceeding.

Cloudera Bug: OPSAPS-44373

ZooKeeper configuration changes

The **Enable Kerberos Authentication** and **Enable Server to Server SASL Authentication** settings in ZooKeeper are now linked together. If either parameter is changed to on or off, the other parameter will automatically change to the same value. A warning message has been added to indicate the effect.

Cloudera Bug: OPSAPS-46628

What's New in Cloudera Manager 5.15.2

Cloudera Manager 5.15.2 is a maintenance release with several fixed issues. See [Issues Fixed in Cloudera Manager 5.15.2](#) on page 2552.

What's New in Cloudera Manager 5.15.1

Cloudera Manager 5.15.1 is a maintenance release with several fixed issues. See [Issues Fixed in Cloudera Manager 5.15.1](#) on page 2553.

Dynamic Resource Pools UI

The Dynamic Resource Pools user interface now supports the following placement rules and pool creation policy can be separately configured for the parent group as well as the individual user group:

- root.primaryGroup.username
- root.secondaryExistingGroup.username
- root.[pool name].username.

Previously, only the `create="true|false"` flag could be added to the inner element of the `nestedUserQueue` element. This meant that a `root.primaryGroup` or `root.secondaryExistingGroup` pool could be created, which was not correct. Now, you can add the `create="true|false"` flag to the actual `nestedUserQueue` element as well as the inner element of the `nestedUserQueue` element. An additional restriction is that if `root.<parent>.username` should use an existing pool (`create = false`), then `root.<parent>` must also use an existing pool.

New fields in Cloudera Manager Python API for BDR

Cloudera Manager now exposes the following fields in the Python API to match the fields returned by the REST API:

- `raiseSnapshotDiffFailures` to `ApiHdfsReplicationArguments`
- `remainingTime`, `throughput`, and `estimatedCompletionTime` to `ApiHdfsCloudReplicationArguments`
- `numThreads`, `runInvalidateMetadata` to `ApiHiveReplicationArguments`
- `displayName`, `description` to `ApiReplicationSchedule`

These fields were already exposed in the Java Cloudera Manager API.

What's New in Cloudera Manager 5.15.0

- **Backup and Disaster Recovery (BDR)**

- **ADLS** - You can now replicate HDFS files and Hive data to and from Microsoft ADLS. To use ADLS as the source or destination, you must add Azure credentials to Cloudera Manager.

Note that the lowest supported version for Cloudera Manager and CDH for BDR replication to/from ADLS is version 5.15.0.

- **Metrics** - The amount of data read and written through Amazon S3 and Microsoft ADLS storage by MapReduce jobs can now be viewed as cluster metrics, such as `s3a_bytes_read` and `adl_bytes_written`.
- **Multi-threaded import and export for Hive Replication** - You can now configure the number of threads used for import and export during Hive Replication. When you create or modify a Hive Replication schedule, configure the **Number of concurrent HMS connections** on the **Advanced** tab. Increasing the number of threads can improve BDR performance. By default, any new replication schedules will use 5 connections.

If you set the value to 1 or more, BDR uses multi-threading with the number of connections specified.

If you set the value to 0 or fewer, BDR uses single threading and a single connection.

The source and destination clusters must both run Cloudera Manager 5.15.0 or higher in order to use this feature.

- **Security** - To improve security, BDR now uses an encrypted Hadoop credential store to authenticate with cloud providers, such as Amazon S3 or Microsoft ADLS, when backing up or restoring HDFS or Hive data.
- **Statistics** - Hive Replication phases now show the number of Hive Objects found/processed. Each type of Hive object is represented separately: databases, tables, indexes, functions, partitions and column statistics. This information can be used to determine how many objects are replicated in each run. This can also be used to deduce how long will it take for Hive Replication to complete.
- **Snapshot diff-based replication** - This feature compares two HDFS snapshots to reduce the number of files scanned during the copy-listing phase of replication. It can speed up replication performance when large number of files are unchanged between replications.

You must enable immutable snapshots for HDFS to use snapshot diff-based replication for BDR.

This feature is on by default. You can configure replications to abort on snapshot diff failure when you create or edit a replication schedule.

See the following pages for guidelines on using snapshot diff-based replication: [guidelines for Hive replication](#) and [guidelines for HDFS replication](#).

- **HDFS** - You can now enable immutable snapshots for HDFS with Cloudera Manager. Enabling this feature enables snapshot diff-based copy listing for BDR.

In the Cloudera Manager Admin Console, navigate to **Clusters > <HDFS cluster> > Configuration** and search for **Enable Immutable Snapshots**.

- **Maintenance and Support**

- **Cluster Restart** - Improved cluster restart performance.
- **Kudu** - Cloudera Manager now supports gathering the output of the ksck diagnostic tool from Kudu. This output is now collected in the diagnostic bundles.

- **Impala**

- **File Handle Cache** - You can now configure and monitor the following Impala parameters using Cloudera Manager: `max_cached_file_handles` and `unused_file_handle_timeout_sec`.
- **KRPC Port** - You can now configure the `krpc_port` startup parameter using Cloudera Manager. The default value is 27000
- **Metrics** - Cloudera Manager now collects the following metrics for Impala: `impala_jvm_heap_committed_usage_bytes`, `impala_jvm_heap_current_usage_bytes`, `impala_jvm_heap_init_usage_bytes`, `impala_jvm_heap_max_usage_bytes`. Impala administrators may find these metrics useful for monitoring Catalog size and Impala Daemon health and the amount of memory used by the JVM embedded in the Impala Daemon process. These are useful for understanding memory consumption, particularly the memory consumption of the Catalog cache stored in coordinator Impala Daemons.

- **Parcels** - When configuration changes are made on the **Parcels > Configuration** page, Cloudera Manager now automatically checks for any new parcels. Additionally, you can disable recurring checks for parcels by setting the **Parcel Update Frequency** to '0' on the **Parcels > Configurations** page.

- **Upgrade**

- **Agents** -

Cloudera Manager Agent upgrade now works with mixed environments where there are different distribution/versions of operating systems in a single Cloudera Manager deployment. These agents can be upgraded as a group for each set of operating systems.

The agents are grouped and displayed on a new page in the Cloudera Manager Upgrade wizard.

- **Documentation** - You can now find a link to the latest upgrade documentation in the Cloudera Manager Admin Console by going to **Support > Upgrade Guide**.

Upgrade documentation now includes new interactive features that allow you to select your operating system, upgrade version, database type, CDH installation type (Parcels or Packages), and other features, and a customized page displays only the steps required for your upgrade. See:

- [Upgrading Cloudera Manager Using Packages](#)
- [Upgrading CDH](#)

- **Summary Page** - All potential issues, conflicts, action items, and pre-upgrade checks are summarized on the first page of the CDH Upgrade wizard.

What's New in Cloudera Manager 5.14.4

Cloudera Manager 5.14.4 is a maintenance release with several fixed issues. See [Issues Fixed in Cloudera Manager 5.14.4](#) on page 2559.

What's New in Cloudera Manager 5.14.3

Cloudera Manager 5.14.3 is a maintenance release with several fixed issues. See [Issues Fixed in Cloudera Manager 5.14.3](#) on page 2561.

What's New in Cloudera Manager 5.14.2

Cloudera Manager 5.14.2 is a maintenance release with several fixed issues. See [Issues Fixed in Cloudera Manager 5.14.2](#) on page 2561.

What's New in Cloudera Manager 5.14.1

Cloudera Manager 5.14.1 is a maintenance release with several fixed issues. There is no corresponding CDH 5.14.1 release. See [Issues Fixed in Cloudera Manager 5.14.1](#) on page 2562.

What's New in Cloudera Manager 5.14.0

- **ADLS**

- You can now use Cloudera Manager to configure Microsoft Azure credentials for cluster access to ADLS. This access is enabled for running Hive and Impala queries on tables backed by data stored in ADLS and to browse ADLS data using Hue. See [Configuring ADLS Access Using Cloudera Manager](#).
- ADLS integration with Hue added. Hue can be setup to enable browsing files in Azure Data Lake Store, and Hue users can directly query and store data in ADLS without any intermediate moving or copying of data to and from HDFS.

- **Backup and Disaster Recovery (BDR)**

- Added the option to **Skip Checksum on Listing**. This option skips the checksum comparison between two files to determine whether they are the same or not. To detect modifications, BDR will use the file size and last modified time instead. Skipping the checksum on listing can improve performance.
- You can now perform a rolling restart of clusters or services such as HDFS or Hive while replication jobs are running.
- On the **Replication Schedules** page, you can see the **Throughput** and **Progress** for replications that are running. Additionally, this information can be seen in the log files.
- Added Advanced Configuration Snippets for `hdfs-site.xml` and `core-site.xml` that can be used for HDFS replication. You can use these to tune behavior such as the HDFS replication factor of files written by BDR. Previously, you had to use the HDFS Client Advanced Configuration Snippet, which would affect all HDFS client configuration on the target cluster.

- **Custom Service Descriptor (CSD)**

- Added a new capability for custom services. CSD authors can now specify, in the topology descriptor for a role type, that only an odd number of instances should be running.
- The CSD versioning logic has been improved. When a CSD loads during Cloudera Manager startup, only the latest version of a CSD service type is loaded. The version number has precedence over the CDH compatibility range.

- **Diagnostic Bundles**

Diagnostic Bundles now include the following additional data: cluster utilization report data and Cloudera Navigator dashboard data (if the cluster has a Cloudera Navigator instance).

- **Health Tests and Monitoring**

- Added a new health test for Linux host entropy monitoring. By default, the health test issues a warning for entropy < 100 and an alert for entropy < 50. Additionally, a chart is available in the Charts Library.
- Improved Kafka health monitoring:
 - Cloudera Manager now aggregates Kafka Broker health to the health of the Kafka service. If greater than 5% percent of the brokers' health statuses are concerning, the Kafka service's health will be set to concerning. If 50% or more of the brokers' health statuses are bad, then the service's health will be set to bad.
 - If at least one partition hosted by a broker is offline, the service's health will now be bad.

- If replication of any partitions hosted by a broker is lagging, then the health of the broker will be set to concerning.

- **Host Maintenance Mode**

Cloudera Manager now provides more options for performing host maintenance and decommissioning. In addition to decommissioning, you can now specify in the same dialog whether to suppress alerts from the decommissioned host and, for hosts running a DataNode role, you can specify whether or not to replicate under-replicated data blocks to other DataNodes during maintenance. This feature takes the DataNode into "offline" state and is useful when performing minor maintenance on hosts, such as adding memory or changing network cards or cables where the maintenance window is expected to be short, the disk drives on the host remain in place, and the extra cluster resources would be consumed in replicating blocks is undesirable. See [Tuning and Troubleshooting Host Decommissioning](#).

- **Installation**

- After a host installation is completed with the Cloudera Manager Admin Console or API, a command on the **Commands** page provides a link to a zipped file that contains the installation logs for each host.
- You can now add a service to a cluster that does not have any services. Previously, you could not add services to a cluster without deleting and re-adding the cluster if the cluster was empty.

- **Logs**

The `cloudera-scm-agent.out` directory now uses the same location as Agent log files. Specify the location in the Agent `config.ini` file.

- **Set default Oozie Configuration**

Added a new Oozie Advanced Configuration Snippet for `action-conf/default.xml`. Use this Advanced Configuration Snippet to propagate default configuration properties to all Oozie actions. [OPSAPS-42546](#)

- **Resource Pools**

- You can now specify a percentage for the maximum CPU and memory resources for a YARN resource pool. Previously, you could only specify a static value.
- Dynamic resource pools can be sorted on the configuration page, status page, and utilization reports page in the Cloudera Manager Admin Console.

- **Search and Sentry**

The Keystore Indexer (HBase indexer) can be configured to use Sentry service for authorization.

What's New in Cloudera Manager 5.13.3

Cloudera Manager 5.13.3 is a maintenance release with many fixed issues. See [Issues Fixed in Cloudera Manager 5.13.3](#) on page 2568.

What's New in Cloudera Manager 5.13.2

Cloudera Manager 5.13.2 is a maintenance release with many fixed issues. See [Issues Fixed in Cloudera Manager 5.13.2](#) on page 2568.

What's New in Cloudera Manager 5.13.1

Cloudera Manager 5.13.1 is a maintenance release with many fixed issues. See [Issues Fixed in Cloudera Manager 5.13.1](#) on page 2570.

What's New in Cloudera Manager 5.13.0

- **Cloudera Data Science Workbench**

Cloudera Data Science Workbench is now available as an add-on service for Cloudera Manager. To this end, Cloudera Data Science Workbench is now distributed in a parcel that integrates with Cloudera Manager using a

Custom Service Descriptor (CSD). You can use Cloudera Manager to install, upgrade, and monitor Cloudera Data Science Workbench. Additionally, diagnostic data bundles for Cloudera Data Science Workbench can be generated and submitted to Cloudera through Cloudera Manager.

- **Dashboard User Role**

Users assigned the Dashboard User can perform the following actions:

- Create, edit, or remove their own dashboards
- Create new charts or add existing charts to their own dashboards
- View data in Cloudera Manager
- View service and monitoring information

- **Impala Query Profiles Time Display**

Impala query profiles downloaded from Cloudera Manager in text format now include a human-readable version for the value of each profile counter instead of the raw value. For example, for time counters before CM 5.13 only the raw nanoseconds value was shown: TotalTime: 492626971556. Now a human-readable value is shown alongside the raw value: TotalTime: 8.2m (492626971556).

- **Sentry High Availability**

The Sentry Service now supports High Availability. See [Sentry High Availability](#).

- **Licensing Management Improvements**

- **License Information**

A banner now indicates when there are 60, 30, 14, or 0 days left on a license.

- **Downgrading from Cloudera Enterprise to Cloudera Express**

Previously, downgrading from Enterprise to Express required editing the Cloudera Manager database. Now this task can be performed by the user by using the **Downgrade** button on the license page.

- **Enable Kerberos Wizard shows warning for hostnames with uppercase letters**

Because Kerberos principal names cannot include upper-case letters, the Enable Kerberos wizard welcome screen will show a warning if any hostnames containing uppercase characters are detected. However, the user will be able to continue with the wizard regardless of this warning. When the warning is shown, up to 10 such detected hostnames will be listed. If the list is longer than 10, the message also says only 10 are shown.

- **New Validations for Hadoop Configuration Properties User impersonation**

A new validation has been added for the various username configuration properties used by the Service Monitor to ensure that the properties are valid Linux usernames. The properties affected by this check are:

- HDFS User to Impersonate - HDFS service
- HBase User to Impersonate - HBase service
- MapReduce User to Impersonate - MapReduce service
- YARN Container Usage MapReduce Job User - YARN service

If these properties are not valid, the respective services will not start.

- **Additions to the Cloudera Manager API**

- **New Cloudera Manager API to control MaintenanceMode for Management Services**

Added REST API endpoints for Cloudera Management Service and Cloudera Management Service roles to enter and exit maintenance mode. See:

- **Enter Maintenance Mode for Cloudera Management**

Service:http://cloudera.github.io/cm_api/apidocs/v18/path_cm_service_commands_enterMaintenanceMode.html

- **Exit Maintenance Mode for Cloudera Management**

Service:http://cloudera.github.io/cm_api/apidocs/v18/path_cm_service_commands_exitMaintenanceMode.html

- **Enter Maintenance Mode for Cloudera Management Service**
roles:http://cloudera.github.io/cm_api/apidocs/v18/path_cm_service_roles_roleName_commands_enterMaintenanceMode.html
- **Exit Maintenance Mode for Cloudera Management Service**
roles:http://cloudera.github.io/cm_api/apidocs/v18/path_cm_service_roles_roleName_commands_exitMaintenanceMode.html

– New Cloudera Manager API for Cluster Utilization Report

Three new API endpoints have been added that return the [cluster utilization reports](#) in CSV format. See:

- **Cluster Utilization:**http://cloudera.github.io/cm_api/apidocs/v18/path_clusters_clusterName_utilization.html
- **Impala Utilization:**
http://cloudera.github.io/cm_api/apidocs/v18/path_clusters_clusterName_impalaUtilization.html
- **YARN Utilization:**
http://cloudera.github.io/cm_api/apidocs/v18/path_clusters_clusterName_yarnUtilization.html

See [Cloudera Manager API documentation](#).

– Delete credentials API at cluster level

There is a new API endpoint that allows you to delete all of the Kerberos credentials of services belonging to a single cluster, rather than all credentials generated by Cloudera Manager for all of its managed clusters. See:

http://cloudera.github.io/cm_api/apidocs/v18/path_clusters_clusterName_commands_deleteCredentials.html

• New Guardrails for Operating Cloudera Manager at Scale

– New Validator for Management Roles

A new validator warns when if multiple Management roles are running on the same host when Cloudera Manager manages more than 80 hosts.

– New Validators for Service Monitor and Host Monitor Memory Allocations

New validators have been added for Service and Host Monitor that give warnings if the heap and non-java memory for these roles are below the recommended values for the cluster. These validators depend on the size of the clusters, as well as on the types of services running in the cluster.

• Solr Chart Library

Chart Library for Solr now contains example charts for every metric available for the Solr Service.

• Improved BDR Performance

BDR replication performance has been improved by running the first phase of replication on the source cluster (the copy-listing phase, which creates a list of files and folders to be copied). This can dramatically improve performance in scenarios where there is high latency between the source and destination clusters. This feature requires Cloudera Manager 5.13 or higher on both the source and target cluster and can be disabled by setting a feature flag with the API.

• New Configuration Property for Descriptors

A new property, `scm.server.proxy.timeout`, has been added for configuring the Descriptor fetch timeout in the Cloudera Manager Admin Console. This is useful when tuning Cloudera Manager for very large deployments. Previously, this value was configured at the service level in various Advanced configuration snippets.

You can find the property by navigating to **Administration > Settings**.

Cloudera Bug: [OPSAPS-41578](#)

• CSD Health Reporting

Added support for determining the health of a CSD service based on the health of its roles. For more information, see the Health Aggregation section in the [CSD Documentation](#).

- **New Validator for Banned YARN Users**

A new validator has been added to ensure that the **Banned System Users** list is the same across all YARN NodeManagers when using Kerberos authentication. The YARN service does not start if the validation fails. To see the list of banned users, select the YARN cluster and navigate to **Configuration**. Search for the `banned.users` property.

- **Resume Rolling Upgrade**

When running a Rolling Restart as part of an upgrade, you can resume the rolling restart after fixing problems that caused the upgrade to fail because one or more hosts did not successfully restart. After you fix the problems you can now resume the rolling restart and Cloudera Manager will skip restarting roles that have already successfully restarted. This change speeds up retrying rolling restarts for large clusters.

- **Diagnostic Bundles Collection for Upgrade Failures**

During a cluster upgrade, if there is a failure, Cloudera Manager now allows you to send a diagnostic bundle to Cloudera support. The Upgrade Wizard opens the **Send Diagnostic Data** dialog box with the current cluster name and time duration pre-populated.

- **New Impala metrics for hedged reads, JVM heap usage and connection setup queue size**

New metrics have been added JVM Heap usage of the Catalog Server and Hedged reads.

- **Support for Sentry with a highly available Hive Metastore**

It is now possible to use HDFS Sentry Sync when running a Hive Metastore using high availability.

- **New placement rules for CSD Services**

A new placement rule for CSD-based services has been added to the Service Descriptor Language called `alwaysWithAny`. When this rule is present, the specified role must always be placed on the same host where the roles specified in the rule are placed. The specified role no longer appears in the wizard when adding this service. Instead, one instance of this role is automatically placed on any host that has at least one of the primary roles. If more than one of the primary roles are themselves placed in the same host, then only one instance of this role is automatically placed on that host. There should be at least two unique primary roles defined in the `alwaysWithAny` rule. And, the `alwaysWithAny` rule is mutually exclusive to the `alwaysWith` rule and they should not be defined together for the same role. If a user assigns roles in a way that violates this placement rule, the service shows a configuration error and fails to start. See the [Service Descriptor Language Reference](#).

- **Navigator search and tagging are now on by default**

The Navigator search and tagging features of Hue are now enabled by default when adding a new Hue service to a cluster running CDH 5.12 or higher.

- **Add `protocol`, `accept_count`, and `acceptor_thread_count` parameters to LUNA_KMS and THALES_KMS CSDs**

New performance tuning parameters related to Tomcat have been exposed within the KMS services designed to work with the Luna and Thales Hardware Security Modules (HSM). These parameters only take effect when running CDH5.12.1 and higher. The following parameters were added:

- `protocol`
- `accept_count`
- `acceptor_thread_count`

What's New in Cloudera Manager 5.12.2

Cloudera Manager 5.12.2 is a maintenance release with many fixed issues. See [Issues Fixed in Cloudera Manager 5.12.2](#) on page 2576.

What's New in Cloudera Manager 5.12.1

Cloudera Manager 5.12.1 is a maintenance release with many fixed issues. See [Issues Fixed in Cloudera Manager 5.12.1](#) on page 2578.

What's New in Cloudera Manager 5.12.0

- **Backup and Disaster Recovery**

- **Refreshing Impala metadata during replication**

You can now use an option in the Cloudera Manager Admin Console to configure BDR to automatically refresh Impala's metadata cache in the destination cluster during replication. Previously, this feature required an **Advanced Configuration Snippet (Safety Valve)**. See [Invalidating Impala Metadata](#).

- **Automatic renewal of Kerberos tickets and Delegation Tokens**

Previously, BDR replication jobs would fail on a Kerberized cluster if the job duration was longer than the renewal interval for the HDFS delegation token. With this fix, both the delegation token and Kerberos ticket are renewed until the max lifetime of token/ticket (default value is 7 days). This enables longer replications without needing to bring down the source cluster to change the ticket timeout.

- **Streamlined Kerberos Configuration**

- As part of **Test Connectivity** for peers, Cloudera Manager now tests for properly configured Kerberos authentication on the source and destination clusters. **Test Connectivity** runs automatically when you add a peer for replication, or you can manually initiate Test Connectivity from the **Actions** menu. This feature is available when the source and destination clusters run Cloudera Manager 5.12 or higher. See [Enabling Replication Between Clusters with Kerberos Authentication](#).
 - If Cloudera Manager is managing the Kerberos configuration (`krb5.conf`) for your clusters, BDR can automatically make some required changes to your Kerberos configuration based on issues found during the **Test Connectivity** action.
 - The configuration process for adding peers when using Kerberized clusters is simplified if both the source and target clusters use Cloudera Manager 5.12 or later. Now, you only need to setup trust on the target cluster and not the source, reducing the complexity of enabling Hive Replication. See [Enabling Replication Between Clusters with Kerberos Authentication](#)

- **Add a name and description to replication schedules**

When you create or edit a replication schedule, you can add a name on the **General** tab and add a description on the **Advanced** tab.

- **Hive Metastore Schema Integrity Checker**

Cloudera Manager now uses the Hive Metastore schemaTool for validating the integrity of Hive metadata. When you upgrade a cluster that contains a Hive Service to CDH 5.12 or higher using the Cloudera Manager Upgrade Wizard or command line, before upgrading the Hive metastore schema, Cloudera Manager first runs a validation check to detect any corruption. If the validation check fails, Cloudera Manager displays the error and stops the upgrade. Corruption issues should be resolved before proceeding with the upgrade.

- **Support for HSM Key Provider**

The HDFS Encryption Wizard in Cloudera Manager now supports configuration of the Hardware Security Module (HSM) Key Providers supported by CDH 5.12 for encryption key management.

- **Sending Diagnostic Bundles**

The user interface in the Cloudera Manager Admin Console for collecting and sending diagnostic bundles has been improved. Regardless of how diagnostic data collection is configured before you start, each time you create a bundle, you can now select one of the following options: **Collect and Upload Diagnostic Data to Cloudera Support** or **Collect Diagnostics Data only**. Additionally, the Cloudera Manager Admin console better indicates the status of the bundle. For example, showing whether or not the bundle was successfully sent to Cloudera.

- **Delete Kerberos Service Principals**

You can now delete MIT Kerberos or Active Directory Service Principals that were previously created by Cloudera Manager while Kerberizing a cluster using the `delete_credentials` API.

- **HBase Region in Transition Health Check**

Cloudera Manager now performs a health check to detect whether HBase regions have become stuck in transition during splitting and merging operations.

- **Replication factor for MapReduce job submission files**

New auto-configuration logic for MR1 and MR2's **Submit Replication Factor** property attempts to choose a value that is at least the value of the HDFS Replication Factor for clusters with three or more DataNodes. Additionally, a new configuration validator raises a configuration warning if the existing Submit Replication Factor is lower than the HDFS Replication Factor if the cluster has at least 3 DataNodes.

- **Custom Header Color**

You can customize the header color that Cloudera Manager displays in the web UI. Select **Administration > Settings**. Select **Other** for the **Category** and use the drop-down menu for **Custom Header Color**.

- **Dynamic Resource Pools UI**

The **Dynamic Resource Pools** user interface now displays Access Control information about resource pools, showing whether they are freely usable, restricted to a custom set of users/groups, or inherit ACLs from their parent pool.

- **Example Impala Shell Command**

The Impala Service Status Page now includes an example Impala Shell Command.

- **Configurable S3 Endpoint**

The S3 Connector service now allows you to configure the default S3 endpoint used by HDFS clients (including Hive and Impala), ensuring all S3 data created/accessed by your cluster is (by default) stored in the AWS region of your choice. Additionally, Hue is configured to automatically use the default endpoint as the S3 Connector.

- **Solr**

- **Request Rate and Index Size Charts**

The graphs on the Solr status page now include the request rates against the service and the aggregate size of the indices.

- **New Tags in Solr Logs**

The logging for Solr has been improved. Logs now include the following IDs: thread, shard, replica, and collection.

What's New in Cloudera Manager 5.11.2

Cloudera Manager 5.11.2 is a maintenance release with many fixed issues. See [Issues Fixed in Cloudera Manager 5.11.2](#) on page 2585.

- **New Tags in Solr Logs**

The logging for Solr has been improved. Logs now include the following IDs: thread, shard, replica, and collection.

What's New in Cloudera Manager 5.11.1

Cloudera Manager 5.11.1 is a maintenance release with many fixed issues. See [Issues Fixed in Cloudera Manager 5.11.1](#) on page 2587.

What's New in Cloudera Manager 5.11.0

- **Amazon S3**

- **Amazon S3 Consistency with Metadata Caching (S3Guard)**

Data written to Amazon S3 buckets is subject to the "eventual consistency" guarantee provided by S3, which means that data written to S3 may not be immediately available for queries and listing operations. This can cause failures in multi-step ETL workflows, where data from a previous step is not available to the next step. To mitigate these consistency issues you can now configure metadata caching for data stored in Amazon S3 using S3Guard. Some workloads that access S3 may also see modest performance improvements with metadata caching. S3Guard requires that you provision a DynamoDB database from Amazon Web Services and configure S3Guard using the Cloudera Manager Admin Console or command-line tools. See [Configuring and Managing S3Guard](#).

- **Operating System Support**

- **SLES 12 SP2 Support**

SLES 12, SP2 is now supported as of Cloudera Manager and CDH 5.11 and higher.

- **Mixed Operating system support for gateway hosts running Cloudera Data Science Workbench**

A Gateway host that is dedicated to running Cloudera Data Science Workbench can use RHEL/CentOS 7.2 even if the remaining hosts in your cluster are running any of the other [supported operating systems](#). All hosts must run the same version of the [Oracle JDK](#).

- **Backup and Disaster Recovery**

- **Refreshing Impala metadata during replication**

You can now configure Hive/Impala replication jobs to run the `INVALIDATE METADATA` Impala statement in the destination cluster automatically at the end of the replication process, allowing newly replicated data to be immediately queried by Impala. See [Invalidating Impala Metadata](#).

- **Hive Replication to Amazon S3 now supported for regions that support only Signature Version 4 signing protocol**

Replications from Hive or HBase to Amazon S3 are now supported for S3 regions that only support Amazon's **Signature Version 4** signing protocol. You must add the `fs.s3a.endpoint` property to the **Cluster-wide Advanced Configuration Snippet (Safety Valve) for core-site.xml** property and set its value to the Amazon S3 region. For example:

```
<property>
<name>fs.s3a.endpoint</name>
<value>s3.us-east-2.amazonaws.com</value>
</property>
```

You can access this property in Cloudera Manager at **Home > Configuration > Advanced Configuration Snippets**.

- **Peak Memory Usage Filter now tracked per container for YARN applications**

Peak container memory usage is now tracked for YARN applications and new filter attribute, **Used Memory Max** has been added for monitoring YARN applications.

- **Improved Kerberos-Encryption-Type Handling by Cloudera Manager**

Cloudera Manager validates the Kerberos encryption type as it is being entered into the Cloudera Manager Admin Console, and displays an error message if the type is not a valid MIT or Microsoft Active Directory (Kerberos) encryption type. Administrators can disable the feature when necessary—for example, if new encryption types added to Kerberos are ahead of the encryption types supported by Cloudera Manager (invalid encryption types fail, regardless of warning message display).

- **Enabling SPNEGO authentication for Hue**

Enabling the Hue **Authentication Backend** property (for SPNEGO) now automatically adds all necessary environments and kerberos credentials. Previously, you needed to follow this procedure: [Enabling SPNEGO as an Authentication Backend for Hue](#).

- **New and Changed Configuration**

- **Auto-configuration of HBase Thrift Authentication when Kerberos is enabled**

When Kerberos is enabled for the cluster, the value of the HBase configuration parameter **HBase Thrift Authentication** is automatically set to `auth-conf`. Clusters that already have Kerberos enabled will not have this setting changed when upgrading Cloudera Manager, this only affects enabling Kerberos in the future.

- **New HDFS NameNode configuration property for deleting the trash**

A new HDFS NameNode property, **Filesystem Trash Checkpoint Interval** (`fs.trash.checkpoint.interval`) has been introduced with a default value of 1 hour. This property causes the NameNode better respect and accurately enforce the configured HDFS trash deletion interval set with the **Filesystem Trash Interval** property (`fs.trash.interval`).

The old behaviour without this property accidentally caused many files in the HDFS trash to be deleted only when twice the desired trash deletion interval had transpired because the checkpoint interval matched the deletion interval. If the older implicit behaviour of retaining trash files for a longer time is desired, consider raising the value of the **Filesystem Trash Interval** property to a more suitable value. When upgrading to this version of Cloudera Manager or when changing this property, all HDFS NameNode role instances will be marked stale, and you must restart the HDFS NameNode role instances and their dependent services for this change to take effect.

- **New Auto Logout Timeout property for Hue**

A new configuration property has been added for the Hue service. The **Auto Logout Timeout** property controls how long the Hue browser can remain idle before automatically logging out the user. Set the property to `-1` to disable automatic logout. To configure the property, go to the Hue service, select the **Configuration** tab and search for the property.

- **New performance tuning properties for Key Management Server (KMS)**

The following new properties have been added for tuning the performance of the KMS service:

- **KMS Accept Count**
- **KMS Handler Protocol**
- **KMS Acceptor Thread Count**

- **New API endpoint for refreshing parcel information**

A new REST API endpoint has been added to refresh parcel information from both local and remote repositories. The endpoint URL is:

```
/api/v16/cm/commands/refreshParcelRepos
```

See [Cloudera Manager API documentation](#)

- **New Metrics and Health Tests for Service Monitor and Host Monitor metric collection**

A new metric, **mgmt_aggregation_run_duration**, has been added to the Service Monitor and Host Monitor metrics to indicate how much time it takes to store metrics collected in last minute. This metric can be used to determine if more heap or non-heap memory is needed for these roles.

See [Cloudera Manager Metrics](#).

New Health Tests, **Host Monitor Metrics Aggregation Run Duration Test** and **Service Monitor Metrics Aggregation Run Duration Test** have also been added to detect potential resource configuration issues with service monitor and host monitor.

See [Cloudera Manager Health Tests](#).

- **New validation for YARN NodeManager log directory**

Cloudera Manager now validates whether all YARN NodeManagers are storing logs in the same distributed file system directory so that no logs are missing from Job History Server. If NodeManagers have different configuration values, there will be a configuration error after upgrading Cloudera Manager to 5.11.

- **New Dynamic Resource Pool option**

Configuration of Nested User Pools (except existingSecondaryGroup) now includes a **Create pool if it does not exist** checkbox to indicate whether to create a sub-pool.

What's New in Cloudera Manager 5.10.2

Cloudera Manager 5.10.2 is a maintenance release with many fixed issues. See [Issues Fixed in Cloudera Manager 5.10.2](#) on page 2592.

What's New in Cloudera Manager 5.10.1

Cloudera Manager 5.10.1 is a maintenance release with many fixed issues. See [Issues Fixed in Cloudera Manager 5.10.1](#) on page 2593.

What's New in Cloudera Manager 5.10.0

- **Backup and Disaster Recovery**

- **Change of default behavior for Impala metadata setting in Hive replications**

There are now three options for configuring replication of Impala metadata for Hive replication jobs:

- **No** – Impala metadata is not replicated.
- **Yes** – Impala metadata is replicated.
- **Auto** – Cloudera Manager decides the value for this option based on the version of CDH in your cluster.

In Cloudera Manager 5.9, when creating a Hive replication schedule, the **Replicate Impala Metadata** option was not selected by default (*false*). In Cloudera Manager 5.10, the value defaults to **Auto**, so that Cloudera Manager decides what the value should be.

- **Replication of Impala Cached Column statistics**

Table and partition-level column statistics stored in the Hive metastore and used by Impala are now replicated during Hive Replication. This is supported between a replication source with Cloudera Manager running version 5.10 or higher and a replication target running Cloudera Manager 5.10 or higher. Because this change replicates more information, the same schedule may take more time to complete if column statistics are present.

- **Performance summaries of HDFS and Hive replication jobs**

You can download full performance reports for HDFS and Hive replications from the **Replication Schedules** page and from the **Replication History** page. You can also filter the output by error, deleted, or skipped status. See [Monitoring the Performance of Hive/Impala Replications](#) and [Monitoring the Performance of HDFS Replications](#).

- **HDFS replication performance monitoring now reports an initial sample**

HDFS performance reports now display early samples during the start of a replication job to give users earlier information about the progress of the job.

- **Scheduler Pool field for replications moved to Resources tab**

When creating replication schedules, the **Scheduler Pool** input field has been moved to the **Resources** tab.

- **Amazon S3**

- **Amazon S3 Object Store**

You can configure auxiliary storage in your cluster using Amazon Simple Storage Service (S3). Client applications such as YARN, MapReduce, or Spark can access data stored in Amazon S3 using Amazon S3 URLs and credentials. See [Configuring the Amazon S3 Connector](#).

- **Amazon S3 Server-side Encryption (SSE-S3)**

Clusters that use Amazon S3 storage can encrypt data using Amazon [server-side encryption \(SSE-S3\)](#). Use Cloudera Manager Admin Console to configure the cluster to use this new feature as detailed in [How to Configure Encryption for Amazon S3](#).

- **Auto-configuration of Hue with AWS credentials (S3 access)**

Cloudera Manager now automatically configures S3 credentials for Hue in the `hue.ini` file.

- **Resource Management**

- **maxResources per user now configurable in YARN Dynamic Resource Pools**

YARN Dynamic Resource Pools now support default capacity limits which automatically apply to all child pools of a resource pool. Using these limits, you can now effectively control the YARN resources available to any user or group in the cluster by configuring these settings on a parent pool and then using placement rules to auto-create child pools per user or group.

- **Key Management Service (KMS)**

- **Java Option configuration added for KMS and Key Trustee KMS**

Additional Java Configuration Options can now be set for the KMS and Key Trustee KMS using Advanced Configuration Snippets. This allows customized Java configuration options for the KMS process.

- **Revised ACLs for KMS**

The ACL set generated by the KMS installation wizard has been updated to implement the recommended secure ACL policies for common key names. For more information, See [Configuring KMS Access Control Lists \(ACLs\)](#).

- **Security**

- **Redaction of stdout and stderr logs**

Redaction logic now applies to the output streams of a service to stdout and stderr logs to redact sensitive information from these files.

- **Encryption of Cloudera Manager database password**

By default the Cloudera Manager database password is stored as clear text in the `/etc/cloudera-scm-server/db.properties` file. You can now specify a program to execute whose standard output is the password. If `com.cloudera.cmf.db.password` is not found in `/etc/cloudera-scm-server/db.properties`, then the property `com.cloudera.cmf.db.password_script`, if it exists, is used. The value of this property is executed as a program, and the value returned to `stdout` is used as the password.

- **Monitoring**

- **Collection of Metrics can be disabled for specified roles**

A new configuration has been introduced at the role level to disable monitoring by the Cloudera Manager Agent for each individual role. By default, monitoring is enabled for all roles. Once disabled, you must restart the role to make the change take effect. This can help in scenarios where the Cloudera Manager Service Monitor is experiencing performance issues and does not have enough resources. See [Disabling Metrics for Specific Roles](#).

- **New chart display number of monitored entities**

A new chart displays on the Cloudera Management Service status page that shows the number of monitored entities by service monitor and host monitor.

- **Default timeouts configurable for Service Monitor, Host Monitor, Reports Manager, Events Server, and Activity Monitor**

The default timeout is now configurable for Service Monitor, Host Monitor, Reports Manager, Events Server, and Activity Monitor to register themselves to a cluster. Users can change the timeout by increasing the values of the **Descriptor Fetch Max Tries** property (the default value is 5) and the **Descriptor Fetch Tries Interval** property (the default value is 2).

- **New Health Test for Service Monitor heap usage.**

A health test has been added to monitor heap usage of the Service Monitor. This test can be useful when diagnosing out of memory errors in the Service Monitor.

- **Users can send feedback on Cloudera Manager**

You can go to **Support > Feedback** to send feedback to Cloudera about Cloudera Manager.

- **Suppression of warning about embedded database for Cloudera Manager.**

When Cloudera Manager is configured to use the embedded PostgreSQL data base, it displays a banner warning that the embedded PostgreSQL database is not recommended for production environments. You can now suppress this banner: Go to **Administration > Settings > Enable Embedded Database Check**.

- **New HDFS balancer related configuration options**

HDFS balancer can now be configured to specify which hosts are included and excluded or which hosts are used as sources for transferring replicas. Additional properties for tuning the performance of the balancer can now also be configured starting for CDH 5.10.0 and higher.

The following configuration will be marked stale: `dfs.datanode.balance.max.concurrent.moves`. You can safely ignore the warning and defer restarting.

- **Removing service dependencies**

Previously, when the user tries to delete a service that another service depends on, Cloudera Manager displays a dialog box explaining that the dependent service should be deleted. There is now a link that takes user to the configuration page where they can remove this dependency.

- **HBase topology files now deployed in client configurations**

When the HBase property **Enable Replication To Secondary Region Replicas** is enabled, the `topology.py` and `topology.mapp` files are deployed with the client configuration and the **Topology Script File Name** property is set to the deployed `topology.py` path.

- **The length of Impala queries retained by the Service Monitor is now configurable.**

The maximum size of impala queries is now configurable and the limit the default size to 10k chars.

What's New in Cloudera Manager 5.9.3

Cloudera Manager 5.9.3 is a maintenance release with many fixed issues. See [Issues Fixed in Cloudera Manager 5.9.3](#) on page 2597.

What's New in Cloudera Manager 5.9.2

Cloudera Manager 5.9.2 is a maintenance release with many fixed issues. See [Issues Fixed in Cloudera Manager 5.9.2](#) on page 2600.

What's New in Cloudera Manager 5.9.1

Cloudera Manager 5.9.1 is a maintenance release with many fixed issues. See [Issues Fixed in Cloudera Manager 5.9.1](#) on page 2601.

What's New in Cloudera Manager 5.9.0

- **Creating Virtual Machine Images**

Documentation has been added with procedures to create virtual images of Cloudera Manager and cluster hosts. See [Creating Virtual Images of Cluster Hosts](#).

- **Security**

- **External/Cloud account configuration in Cloudera Manager**

Account configuration for access to Amazon Web Services is now available through the centralized UI menu **External Accounts**.

- **Key Trustee Server rolling restart**

Key Trustee Server now supports rolling restart.

- **Backup and Disaster Recovery**

- You can now replicate HDFS files and Hive data to and from an Amazon S3 instance. See [HDFS Replication To and From Cloud Storage](#) and [Hive/Impala Replication To and From Cloud Storage](#).

- There are some new tuning options to improve performance of HDFS replication. See [HDFS Replication Tuning](#).

- You can now download performance data about HDFS replication jobs from the **Replication Schedules** and **Replication History** pages. See [Monitoring the Performance of HDFS Replications](#).

- Hive replication now stores Hive UDFs in the Hive metastore. [Replication of Impala and Hive User Defined Functions \(UDFs\)](#).

- The user interface for creating replication schedules has been reorganized to present the configuration options on three tabs: **General**, **Resources**, and **Advanced**.

- **Uncheck Replicate Impala Metadata by default**

When creating a Hive replication schedule, the option **Replicate Impala Metadata** was checked (*true*) by default. In Cloudera Manager 5.9 and higher, the value is unchecked (*false*) by default.

- **YARN BDR enhancement**

YARN jobs now include the BDR schedule ID that launched the job so you can connect logs with existing schedules, if multiple schedules exist.

- **Resource Management**

- **Custom Cluster Utilization Reports**

Documentation has been added to create custom Cluster Utilization reports that you can export data from. See [Creating a Custom Cluster Utilization Report](#).

- **New settings for continuous scheduling**

For new installs, default values for configurations have been changed.

`yarn_scheduler_fair_continuous_scheduling_enabled` is set to *false*.

`resourcemanager_fair_scheduler_assign_multiple` is set to *'true'*. Existing settings are preserved when you upgrade from a lower version.

- **YARN historical reports by user show pool-user entity**

When Cloudera Manager manages multiple clusters, there is no per user tracking for historical applications and queries across clusters. Instead, **Historical Applications by User** and **Historical Queries by User** show applications and queries per user and pool. (A pool is associated with a specific cluster.)

- **Directory Usage Report needs export capability**

Directory usage reports can be exported as a CSV file.

- **Cloudera Manager Admin Console User Interface**

- **Service colors**

A new set of colors is used to represent each kind of service.
- **Move the table sorting icon to the right**

The table sorting icon now appears consistently on the right hand side of each column.
- **Improved Configuration Diff Display**

Changes displayed in the configuration history page are much more user friendly. For a large section of changed text, Cloudera Manager generates a diff between the old and the new and displays the diff.

When a user changes only the password, Cloudera Manager does not show the delta: both the old and the new passwords are masked out before the comparison is performed.
- **Move actions menu to the top header**

The actions menu now appears next to the entity title.
- **Move Federation and High Availability to a separate page**

The **Federation** and **High Availability** sections used to appear on the **HDFS Instances** page of an HDFS service. They have been moved to a new page called **Federation and High Availability**. There is a link from the existing **Instances** page to this new page.
- **Remove repeated heading below the second level navigation**

Subtitles below the second level navigation tabs are removed because they repeated the content in the tabs.
- **Move maintenance mode and badges to the title area**

Maintenance mode, staleness badges now appear next to the title of the entity.
- **Express wizard allows you to add Kafka**

Kafka is now listed in the custom services when you click the **Add Cluster** button.
- **Cloudera Manager API**
 - **Add update_user to Python API client**

Added the `update_user()` method to the Python API client `api_client.py`.
 - **Expose API endpoint to add a specific path**

New API endpoints have been added that allow users to add, list and remove Watched Directories in HDFS service.
- **Logging**
 - **Include host in log file name**

Kafka log4j log files now include the host name in the format `kafka-broker- $\{host\}$.log`. Similarly, MirrorMaker logs now include the host name in the format `kafka-mirrormaker- $\{host\}$.log`. Due to the log file name change, when you upgrade Cloudera Manager it no longer recognizes your old log files in log search, though they are still present on disk.
 - **Configuration changes to Cloudera Manager audit log**

Cloudera Manager displays the **History** and **Rollback** support for the Cloudera Manager Settings. (**Administration > Settings**). This helps you to track the changes made by an administrator so that Cloudera Support can provide better service when certain Cloudera Manager administrative settings are modified.
- **Diagnostic Bundles**
 - **Show the Diagnostic Bundle Redaction Policy using the redaction config**

You can specify what information should be redacted in the diagnostic bundle in the UI using **Administration > Settings > Redaction Parameters for Diagnostic Bundles**.

- **Upgrade**

- **Report that a simple restart was performed if rolling restart could not be performed**

Informs you when a simple restart is performed instead of rolling restart on a service because rolling restart is not available.

- **Oozie**

- **Provide dump / load functionality for Oozie DB**

The **Actions** menu in the Oozie service has two new commands, **Dump Database** and **Load Database**. These commands make it easier to migrate an Oozie database to another database supported by Oozie. The **Dump Database** command exports Oozie's database to a file (configurable by **Database Dump File** setting). **Load Database** loads the file into a database.

- **Install Oozie ShareLib permissions change**

Install Oozie ShareLib Command assigns correct permissions to the uploaded libraries. This prevents breaking Oozie workflows with a custom umask setting.

- **Configuration Changes**

- **Solr zkClientTimeout option**

Added the `zkClientTimeout` parameter for ZooKeeper.

- **Add JHIST compression as a configuration option**

Added a new option for setting the file format used by an ApplicationMaster when generating the .jhist file.

- **Enable heap dump by default for all daemons**

Starting in version 5.9, when you configure roles that are JVM based, the *Dump Heap When Out of Memory* configuration parameter defaults to `true`. An upgrade from a pre-5.9 version maintains your pre-5.9 settings.

- **Cloudera Manager support for client-side YARN graceful decommissioning**

Adds the ability to perform a graceful decommission on YARN NodeManager roles whereby the Node Manager is not assigned new containers, and waits for any currently running applications to finish before being decommissioned unless a timeout occurs. You can configure the timeout using the *Node Manager Graceful Decommission Timeout* configuration property in the YARN Service. The default behavior has not changed, and continues to be a non-graceful decommission. Affects Cloudera Manager 5.9.0 and higher, and CDH 5.9.0 and higher.

- **Deploy Client Configuration command details page now shows stdout/stderr**

`stdout` and `stderr` log links are now shown in the UI when there is a failure while deploying client configurations.

- **Make EXTRA_RATIO configurable for Headlamp indexing**

Added the configuration parameter, *Extra Space Ratio for Indexing*, to Reports Manager. You can use the parameter to make the speed of indexing faster by allocating additional memory.

- **Configure HBase Indexer to wait longer for ZooKeeper to come up**

The default amount of time that HBase Indexer roles attempts to connect to ZooKeeper has been increased from 30 to 60 seconds. This default can be adjusted by setting a new Cloudera Manager configuration parameter, HBase Indexer ZooKeeper Session Timeout.

- **Embedded database mode improvements**

In version 5.9 and higher, Cloudera Manager can clearly identify whether or not a customer is using the embedded PostgreSQL database. Cloudera does not recommend the embedded database for production use, and requests that customers deploy production systems using an external database. The diagnostic bundles now contain information about whether or not a customer is using the embedded PostgreSQL database. Support can then reach out to customers accordingly.

If Cloudera Manager is configured to use the embedded PostgreSQL database, a yellow banner appears in the UI recommending that you upgrade to a supported external database.

- **Fix CatalogServiceClient to handle TLS connections to catalogd for UDF replication**

When Impala uses SSL, we now support TLS Connection to Catalog Server. Customers can enable replication for any Impala UDFs/Metadata (in Hive Replication) in Cloudera Manager 5.9 and higher.

- **Do not show steps that are unreachable (skipped)**

When running wizards from the Cloudera Manager Admin Console that add a cluster, add a service, perform an upgrade, and other tasks, steps do not display when they are not reachable or do not apply to the current configuration.

- **Improve Cloudera Manager provisioning performance on AWS**

Add support for resetting Cloudera Manager GUID/UUID. This is accomplished by checking the UUID file.

If Cloudera Manager finds the UUID file (`/etc/cloudera-scm-server/uuid`) and the UUID is different than the GUID in the `cm_version` table, it updates the GUID in the `cm_version` table with the contents of the UUID file and removes the UUID file.

What's New in Cloudera Manager 5.8.5

Cloudera Manager 5.8.5 is a maintenance release with many fixed issues. See [Issues Fixed in Cloudera Manager 5.8.5](#) on page 2606.

What's New in Cloudera Manager 5.8.4

Cloudera Manager 5.8.4 is a maintenance release with many fixed issues. See [Issues Fixed in Cloudera Manager 5.8.4](#) on page 2608.

What's New in Cloudera Manager 5.8.3

Cloudera Manager 5.8.3 is a maintenance release with many fixed issues. See [Issues Fixed in Cloudera Manager 5.8.3](#) on page 2609.

What's New in Cloudera Manager 5.8.2

Cloudera Manager 5.8.2 is a maintenance release with many fixed issues. See [Issues Fixed in Cloudera Manager 5.8.2](#) on page 2610.

What's New in Cloudera Manager 5.8.1

An issue has been fixed. See [Issues Fixed in Cloudera Manager 5.8.1](#) on page 2612.

Note: Although there is a Cloudera Manager 5.8.1 release, there is no synchronous CDH 5.8.1 release.

What's New in Cloudera Manager 5.8.0

- **Operating Systems** - Support for Debian 8.2.
- **Resource management and utilization** - Added support for nesting dynamic resource pools within a named pool at runtime.
- **Backup and Disaster Recovery**

- The **Replication Schedules** page now has a search function for finding scheduled replications.
- You can now specify a start and end time for the events that are included in manually-triggered diagnostic bundles. See [Manually Triggering Collection and Transfer of Diagnostic Data to Cloudera](#).
- **Impala**
 - Impala adds a new configuration option, `Use HDFS Rules to Map Kerberos Principals to Short Names`. Enabling this option makes Impala pickup `hadoop.security.auth_to_local` configuration from HDFS configurations and uses it for Kerberos principal-to-short-name translation. This only applies for Cloudera Manager 5.8.0 and higher and CDH 5.8.0 and higher. It only affects deployments where Impala is set up to use Kerberos as the authentication mechanism. It defaults to *false*, to preserve the behavior from earlier CDH versions. This has no impact on upgrade.
 - Enable Impala Admission Control and Enable Dynamic Resource Pools are now enabled by default. Customized configuration values are preserved during the upgrade.
 - Impala Admission Control now supports a global method for editing the Access Control List.
- **EMC Isilon**
 - Kerberos is now fully supported for replications between clusters using Isilon storage. You must configure a custom principal.
- **Security**
 - **Active Directory KDC**
 - Active Directory account properties are now configurable from Cloudera Manager's **Administration > Settings** page.
 - It is now possible to use Cloudera Manager to regenerate principals for clusters using an Active Directory KDC. Cloudera Manager 5.8 includes a new configuration called **Active Directory Delete Accounts on Credential Regeneration**. Enabling this will allow Cloudera Manager to automatically delete existing AD accounts and complete the regeneration process.
 - Cloudera Manager now allows you to configure the encryption types (or `encryptype`) used by an Active Directory KDC to protect its data.
 - **Redaction**: In the Cloudera Manager Admin Console, Advanced Configuration Snippet parameters will now be redacted to block sensitive information such as passwords or secret keys.
 - **Sentry**
 - Cloudera Search adds support for storing permissions in the Sentry service. You can enable storing permissions in the Sentry service by [Enabling the Sentry Service for Solr](#). If you have already configured Sentry's policy file-based approach, you can migrate existing authorization settings as described in [Migrating from Sentry Policy Files to the Sentry Service](#). `solrctl` has been extended to support:
 - Migrating existing policy files to the Sentry service
 - Managing managing permissions in the Sentry service
 - Sentry supports data stored on Amazon S3 and can secure URIs with an S3 schema.
- **YARN**
 - YARN Allowed System Users now includes `hbase` by default. This is helpful when running certain tools for HBase that need to execute MapReduce jobs.

What's New in Cloudera Manager 5.7.6

A number of issues have been fixed. See [Issues Fixed in Cloudera Manager 5.7.6](#) on page 2621.

What's New in Cloudera Manager 5.7.2

A number of issues have been fixed. See [Issues Fixed in Cloudera Manager 5.7.2](#) on page 2622.

What's New in Cloudera Manager 5.7.1

A number of issues have been fixed. See [Issues Fixed in Cloudera Manager 5.7.1](#) on page 2624.

What's New in Cloudera Manager 5.7.0

- **Operating Systems** - Support for:

- RHEL/CentOS 6.6, 6.7, 7.1, and 7.2
- Oracle Enterprise Linux (OEL) 7.1 and 7.2
- SUSE Linux Enterprise Server (SLES) 11 with Service Packs 2, 3, 4
- Debian: Wheezy 7.0, 7.1, and 7.8

Important: Cloudera supports RHEL 7 with the following limitations:

- Only RHEL 7.3, 7.2 and 7.1 are supported. RHEL 7.0 is not supported.
- RHEL 7.1 is only supported with CDH 5.5 and higher.
- RHEL 7.2 is only supported with CDH 5.7 and higher.
- Only new installations of RHEL 7.2 and 7.1 are supported by Cloudera. For upgrades to RHEL 7.1 or 7.2, contact your OS vendor and see [Does Red Hat support upgrades between major versions of Red Hat Enterprise Linux?](#)

- **Resource management and utilization**

- Simplified and expanded resource management. The screens for YARN and Impala dynamic resource pools are now managed separately.
- Resource pools now support the `allowPreemptionFrom`, `minSharePreemptionTimeout`, and `fairSharePreemptionTimeout` attributes.
- Cluster utilization reports track usage of resources allocated using dynamic resource pools.
- The new **Directory Usage Report** now shows aggregated usage information, including quotas and file sizes, which are sortable. You can also perform multiple actions on filesystem objects. .
- Two new predicates have been added to the tsquery language: `day in` and `hour in`. These allow you to limit streams to specified days of the week and specified hours of each day, respectively.

- **Extensibility** - For more information, see [Cloudera Manager Extensions](#).

- Parcels are typed according to the OS version. The parcel extension indicates the version. The library for developing external parcels now supports an extension for RHEL 7.
- A new environment variable, `ZK_PRINCIPAL_NAME`, is now defined for CSD processes when ZooKeeper is Kerberized and has a custom principal.
- A new flag, `jvmBased`, is now available to CSD authors to indicate that a CSD role is JVM-based. This flag enables a set of JVM-related features in Cloudera Manager—for example, the ability to automatically generate a heap dump when an Out Of Memory error occurs.

- **API**

- Cloudera Manager now attempts to gracefully handle overlapping API calls.
- All distributed filesystem services (such as HDFS or Isilon) installed in a cluster can now be enumerated using the API.
- You can export the complete configuration of a CDH cluster managed by Cloudera Manager as a template, modify the template, and import the template to create a new cluster.

- The advanced configuration snippet editor now allows you to edit properties as name/value pairs. This is the default, however you can also choose to edit the snippet as XML.
- HBase now includes metrics and charts for replication. These charts are available in the Chart Library for each RegionServer.

- When you click the **Role Log** link when viewing a role, the log is opened at the current timestamp, rather than the top of the log file. This enables you to see the relevant log messages when investigating an event that occurred recently.
- A new `tsquery` function called `counter_delta` has been added to accurately compute the difference between consecutive data points for counter metrics.
- The `distcp` utility now supports setting records per chunk, using the `distcp.dynamic.recordsPerChunk` in an advanced configuration snippet to set the number of records (paths) in each chunk. When a value is set for `distcp.dynamic.recordsPerChunk`, other related settings, such as the maximum number of chunks tolerable, the ideal number of chunks, and the split ratio, are ignored.
- A warning is shown when upgrading with incompatible versions of Kafka and CDH. The Kafka client libraries bundled in CDH cannot communicate with an older Kafka server.
- You can override the `sudo` commands that Cloudera Manager agent uses by redirecting the `sudo` commands to a script that you write to allow or disallow certain actions.
- **Hive**
 - Hive on Spark is now supported.
 - The default execution engine for Hive can now be configured, which makes it easy to run all Hive jobs on Spark.
 - HiveServer2 now has a Web UI.
 - Hive and HDFS replication source/target listings now work with Isilon.
 - A dialog box now displays when scheduling Hive replications, reminding you to take snapshots of the Hive warehouse directory.
 - The Direct SQL option is now enabled in Hive Metastore.
 - When upgrading to CDH 5.7, if Hive is configured to use YARN, all Hive on Spark parameters are automatically tuned to recommended values. If Hive on Spark was previously tuned, this is skipped.

A number of issues have been fixed. See [Issues Fixed in Cloudera Manager 5.7.0](#) on page 2627.

What's New in Cloudera Manager 5.6.1

A number of issues have been fixed. See [Issues Fixed in Cloudera Manager 5.6.1](#) on page 2630.

What's New in Cloudera Manager 5.6.0

What's New in Cloudera Manager 5.5.4

A number of issues have been fixed. See [Issues Fixed in Cloudera Manager 5.5.4](#) on page 2632.

What's New in Cloudera Manager 5.5.3

An issue has been fixed. See [Issues Fixed in Cloudera Manager 5.5.3](#) on page 2633.

What's New in Cloudera Manager 5.5.2

Note: If you are upgrading from a previous version of Cloudera Manager, Cloudera recommends that you upgrade to version 5.5.3 or higher.

- New Impala flags added for web server certificate files and passwords. This adds support for the `--webserver_private_key_file` and `--webserver_private_key_password_cmd` flags for the Impala Daemon, the Impala Catalog Server, and the Impala StateStore roles.

A number of issues have also been fixed. See [Issues Fixed in Cloudera Manager 5.5.2](#) on page 2634.

What's New in Cloudera Manager 5.5.1

An issue has been fixed. See [Issues Fixed in Cloudera Manager 5.5.1](#) on page 2637.

What's New in Cloudera Manager 5.5.0

- **Operating Systems** - Support for RHEL/CentOS 6.6 (in SE Linux mode), 6.7, and 7.1, and Oracle Enterprise Linux 7.1.

Important: Cloudera supports RHEL 7 with the following limitations:

- Only RHEL 7.1 is supported. RHEL 7.0 is not supported.
- Only new installations of RHEL 7.1 are supported by Cloudera. For upgrades to RHEL 7.1, contact your OS vendor and see [Does Red Hat support upgrades between major versions of Red Hat Enterprise Linux?](#)

- **Backup and Disaster Recovery (BDR)** - You can use the BDR UI or API to replicate data between encrypted clusters
- **Databases** - Supports MariaDB 5.5, Oracle 12c, and PostgreSQL 9.4.
- Selective service restart after activating parcels is supported.
- Retrying upgrade actions is supported. If a cluster upgrade command fails while in progress, you can retry a command after fixing the cause of failure. On retry, the command restarts from the command step where it failed.
- The command details page for running and recent commands has been redesigned for usability and scalability.
- Instead of serially starting all services for the first time, services that are not dependent are started in parallel. This decreases the time required to start services for the first time after creating a cluster.
- Performance has improved for service startup, client configuration deployment, and calculation of stale configurations.
- **Suppression of notifications**
 - You can suppress the warnings that Cloudera Manager issues when a configuration value is outside the recommended range or is invalid.
 - You can suppress health test warnings.

Suppression can be useful if a warning does not apply to your deployment and you no longer want to see the notification. Suppressed warnings are still retained by Cloudera Manager, and you can unsuppress the warnings at any time.

- **Multi Cloudera Manager Dashboard** - A special mode of Cloudera Manager that enables you to view monitoring data aggregated from multiple Cloudera Manager instances that manage one or more CDH clusters.
- You can decommission roles when services are completely stopped. This allows you to decommission hosts during cluster downtime.
- You can disable collection of certain domain metrics—for example, for HBase RegionServers, Kafka Brokers, and others—through new settings in the host advanced configuration snippet. This is useful in certain support situations and should only be done under the direction of Cloudera Support.
- You can configure which aggregate metrics are automatically generated. This advanced feature can be useful in certain situations to impact the monitoring workload, allowing unused or less-important aggregate metrics to be skipped. This may result in improved performance and the ability to handle larger monitoring workloads, or to retain data for a larger workload for longer. Cloudera recommends using this only under the direction of Cloudera Support.
- Alert Publisher can be configured to pass alert events to a user-defined script. Use this for integrating with other alerting systems or for custom logic (for example, to send some alerts to some people and others to other people).
- Agent minor version mismatches (5.4 to 5.5) now cause bad host health. Maintenance version mismatches (for example, 5.4.x to 5.4.y) still cause concerning host health.
- Cloudera Manager indicates if the Java version in use is too old.
- Cloudera Manager indicates if the supervisor component of the Agent needs to be restarted after an upgrade.
- Full and User Administrators can view active user sessions.
- Full Administrators and Auditors can audit failed and successful logins.
- Multiple user session logins can be disallowed.
- You can configure external authentication so that local administrator emergency access is disabled. This means that no local accounts can log in under any circumstances, including when the external system is not functioning.

- You can turn on authentication for the URLs for downloading client configuration zip files. Previously, authentication was never required.
- Passwords are no longer accessible in cleartext through the Cloudera Manager UI or in the configuration files stored on disk. There are some exceptions; see [Known Issues and Workarounds in Cloudera Manager 5](#) on page 2518.
- **HBase**
 - Use a configuration option in HBase to skip region reload during rolling restart and rolling upgrade, to increase the speed of the operations.
 - HBase rolling restart performance can be improved by increasing the number of Region Mover Threads. If the value of this property is 1, it can lower rolling restart speed. The Admin Console now displays this information and, if the value is 1, advises increasing it.
 - HBase Thrift Server and Rest Server support TLS/SSL.
- **HDFS**
 - HDFS encryption can be enabled using a wizard.
 - Exposes AES as an encryption option for HDFS RPC encryption.
- **Hive**
 - Hive can use TLS/SSL and Kerberos at the same time.
 - When Hive is configured to use TLS/SSL, Hue is automatically configured to use that protocol when communicating with Hive. Similarly, when Impala is configured to use TLS/SSL, Hue is automatically configured to use that protocol when communicating with Impala.
 - HiveServer2 supports a timeout value for idle sessions and operations. By default, it times out client sessions after a week and idle operations after three days. This helps alleviate problems with long-running sessions when using Hue.
 - Cloudera Manager collects and displays various operational metrics for Hive.
- **Hue**
 - Hue supports a Load Balancer role using HTTPD as a load balancer.
 - You can configure certificates trusted by Hue using the TLS/SSL Truststore configuration. This replaces the `REQUESTS_CA_BUNDLE` advanced configuration snippet entry.
 - You can specify a password that protects the Hue private key file.
 - Cloudera Manager collects and displays various operational metrics for Hue. New health tests have been added for Hue as well.
- **Impala** supports TLS/SSL internally between the StateStore and the Catalog Server roles as well as Impala Daemon.
- **Kafka**
 - Kafka supports rolling restart.
 - Kafka displays additional broker metrics.
 - Kafka exposes additional commonly configured parameters.
 - Existing Kafka parameter definitions have updated descriptions, default values, and validation settings.
 - The Kafka broker instance list now shows which broker is the active controller.
- **Key Trustee**
 - The Key Trustee Server CSD is included in Cloudera Manager. Manual installation of the Key Trustee Server CSD is not required.
 - A Key Administrator role in Cloudera Manager is used for configuring HDFS Data at Rest Encryption. Only a Key Administrator and a Full Administrator can make configuration changes to Java Keystore KMS, Key Trustee KMS, and Key Trustee Server. Configuring HDFS to use Data at Rest Encryption is also limited to the Key Administrator and Full Administrator roles. This allows organizations to keep Key Administrators and Cluster Administrators separate, which is a security best practice.
 - When running Key Trustee KMS in a highly available configuration, Cloudera Manager can automatically generate the load balancer URL.

- **Sentry**
 - Sentry introduces column-level access control for tables in Hive and Impala. Previously, Sentry supported privilege granularity only at the table level. You can now assign the `SELECT` privilege on a subset of columns in a table.
 - Sentry supports Kerberos authentication for the Sentry web server.
- **Solr**
 - Solr can be configured with a load balancer in a secure environment.
 - There is a new Solr Max Connector Threads property for Solr Server in CDH 5.1.0 and higher.
 - Solr supports LDAP/AD authentication.
- **Backup and Disaster Recovery**
 - The user interface for scheduling and reviewing replications and snapshots has been improved. You can now view the history of replication jobs and subtasks more easily.
 - When specifying an HDFS replication job, you can apply exclusion filters to exclude specific files or directories.
 - You can download or send to Cloudera Support a diagnostic bundle to troubleshoot replication jobs. Bundles include logs of the replication run. .
 - The performance of the file-listing phase of a replication job has been improved.
 - The performance of the initialization and running phase has been improved.
 - The following advanced configuration snippets for configuring replications have been added:
 - HDFS Replication Advanced Configuration Snippet (Safety Valve) for `hadoop-env.sh`
 - Hive Replication Advanced Configuration Snippet (Safety Valve) for `hive-site.xml`
 - HDFS Replication Advanced Configuration Snippet (Safety Valve) for `yarn-site.xml`
 - HDFS Replication Advanced Configuration Snippet (Safety Valve) for `mapred-site.xml`
 - Snapshot properties for HBase such as thread pool size can be configured in the **HBase Client Advanced Configuration Snippet (Safety Valve) for `hbase-site.xml`** property.
 - Hive partitions are chunked during export and import to avoid message size limitations.
 - Hive replications validate metadata on the destination Hive Metastore before copying HDFS data from the source to avoid copying errors during replication.
 - The use of snapshots to improve replications is documented.
 - The effect of network latency on replications is documented.
 - Scheduled snapshots can be disabled and re-enabled.
 - API improvements:
 - Explicit support for pausing snapshot policies
 - Failed file listing
 - Collection of diagnostic bundles for replication schedules and history

What's New in Cloudera Manager 5.4.10

A number of issues have been fixed. See [Issues Fixed in Cloudera Manager 5.4.10](#) on page 2642.

What's New in Cloudera Manager 5.4.9

A number of issues have been fixed. See [Issues Fixed in Cloudera Manager 5.4.9](#) on page 2643.

What's New in Cloudera Manager 5.4.8

New ability to decommission hosts with stopped services

Adds ability to decommission roles when services are completely stopped. This allows users to decommission hosts during cluster downtime.

A number of issues have also been fixed. See [Issues Fixed in Cloudera Manager 5.4.8](#) on page 2644.

What's New in Cloudera Manager 5.4.7

New service-level advanced configuration snippets for Solr

The following new properties were added:

- Solr Service Advanced Configuration Snippet (Safety Valve) for `core-site.xml`
- Solr Service Advanced Configuration Snippet (Safety Valve) for `hdfs-site.xml`

A number of issues have also been fixed. See [Issues Fixed in Cloudera Manager 5.4.7](#) on page 2644.

What's New in Cloudera Manager 5.4.6

An issue has been fixed. See [Issues Fixed in Cloudera Manager 5.4.6](#) on page 2645.

Note: Although there is a Cloudera Manager 5.4.6 release, there is no synchronous CDH 5.4.6 release.

What's New in Cloudera Manager 5.4.5

A number of issues have been fixed. See [Issues Fixed in Cloudera Manager 5.4.5](#) on page 2646.

Note: Although there is a CDH 5.4.4 release, there is no synchronous Cloudera Manager 5.4.4 release.

What's New in Cloudera Manager 5.4.3

Rollback for CDH 4 to CDH 5 Upgrades

- Rolling back a CDH 4 to CDH 5 upgrade is now supported using Cloudera Manager.

A number of issues have been fixed. See [Issues Fixed in Cloudera Manager 5.4.3](#) on page 2649.

Note: Although there is a CDH 5.4.2 release, there is no synchronous Cloudera Manager 5.4.2 release.

What's New in Cloudera Manager 5.4.1

Hue HA Improvements

- The Cloudera Manager Express and Add Service wizards allow you to add a Hue service with multiple Hue Server roles. For Kerberized clusters, the Add Service wizard automatically adds a collocated Kerberos Ticket Renewer role for each Hue Server role instance.
- When Kerberos is enabled, Cloudera Manager now checks to ensure each Hue Server role is collocated with a Kerberos Ticket Renewer role. If you forget to add a Kerberos Ticket Renewer role when adding a new Hue Server role, a configuration error is generated.

Cloudera Manager High Availability

- High availability for Cloudera Manager is now supported for 5.4.

A number of issues have also been fixed. See [Issues Fixed in Cloudera Manager 5.4.1](#) on page 2655.

What's New in Cloudera Manager 5.4.0

- **OS** - Added support for RHEL 6.6 and CentOS 6.6.
- Cloudera Manager prevents installing or upgrading to a CDH version that is too new for the Cloudera Manager version. When using parcels, it prevents parcel installation. When using packages, it prevents creating services.
- Installation and add service wizards now support the Oozie database.
- New wizard for NameNode, Failover Controller, and JournalNode role migration.

- Parcel page layout redesigned in terms of layout, performance and ease of use. A new parcel per host detail view is added.
- **Configuration**
 - Configuration pages use the new layout by default. The new layout is dramatically improved in terms of layout, performance, and ease of use. The existing layout is accessible via the **Switch to the classic layout** link.
 - New configuration actions:
 - Configuration can now be applied to all clusters as well as for a specific cluster.
 - Several new configuration views have been added to show all non-default values across all clusters and the Cloudera Management Service, as well as differences across all clusters and multiple services of the same type.
 - One-click differences in configuration settings for a specific service across multiple clusters.
- **Support**
 - Include a Cloudera support ticket with YARN application support bundles.
 - Reduce the size of support bundles by specifying log data of interest to include in the bundle.
- **HDFS**
 - Support for HDFS DataNode hot swap.
 - Option to include replication of extended attributes during HDFS replication. HDFS ACLs will now be replicated along with permissions.
- Added support for Hive on Spark.

Important: Hive on Spark is included in CDH 5.4 and higher but is not currently supported nor recommended for production use. To try this feature, use it in a test environment until Cloudera resolves currently existing issues and limitations to make it ready for production use.

- **Security**
 - Secure impersonation support for the Hue HBase app.
 - Redaction of sensitive data in log files and in SQL query history.
 - Support for custom Kerberos principals.
 - Added commands for regenerating Kerberos keytabs at service and host levels. These commands will clear existing keytabs from affected role instances and then trigger the **Generate Credentials** command to create new keytabs.
 - Kerberos support for Sqoop 2.
 - Kerberos and TLS/SSL support for Flume Thrift Source and Sink.
 - Solr TLS/SSL support.
 - Navigator Key Trustee Server can be installed and monitored by Cloudera Manager.
 - HBase Indexer integration with Sentry (File-based) for authorization.

What's New in Cloudera Manager 5.3.10

A number of issues have been fixed. See [Issues Fixed in Cloudera Manager 5.3.10](#) on page 2658.

What's New in Cloudera Manager 5.3.9

A number of issues have been fixed. See [Issues Fixed in Cloudera Manager 5.3.9](#) on page 2658.

What's New in Cloudera Manager 5.3.8

A number of issues have been fixed. See [Issues Fixed in Cloudera Manager 5.3.8](#) on page 2659.

What's New In Cloudera Manager 5.3.7

An issue has been fixed. See [Issues Fixed in Cloudera Manager 5.3.7](#) on page 2659.

Note: Although there is a Cloudera Manager 5.3.7 release, there is no synchronous CDH 5.3.7 release.

What's New in Cloudera Manager 5.3.6

A number of issues have been fixed. See [Issues Fixed in Cloudera Manager 5.3.6](#) on page 2660.

Note: Although there is a CDH 5.3.5 release, there is no synchronous Cloudera Manager 5.3.5 release.

What's New in Cloudera Manager 5.3.4

A number of issues have been fixed. See [Issues Fixed in Cloudera Manager 5.3.4](#) on page 2660.

What's New in Cloudera Manager 5.3.3

A number of issues have been fixed. See [Issues Fixed in Cloudera Manager 5.3.3](#) on page 2661.

What's New in Cloudera Manager 5.3.2

A number of issues have been fixed. See [Issues Fixed in Cloudera Manager 5.3.2](#) on page 2662.

What's New in Cloudera Manager 5.3.1

A number of issues have been fixed. See [Issues Fixed in Cloudera Manager 5.3.1](#) on page 2664.

What's New in Cloudera Manager 5.3.0

- **JDK 1.8** - Cloudera Manager adds support for Oracle JDK 1.8.
- **Single user mode** - The Cloudera Manager Agent and all service processes can now be run as a single configured user in environments where running as root is not permitted.
- **CDH upgrade wizard enhanced** - The CDH upgrade wizard now supports minor and maintenance version upgrade as well as major version upgrade.
- **Oozie Sharelib** - The Oozie Sharelib can be updated without restarting the Oozie service.
- **Read-only users prevented from viewing process logs or environment** - Read-only users can no longer view the environment or logs of a process. This is to prevent read-only users from seeing potentially sensitive information.
- New icons for the KMS and Key Trustee services.
- **Data-at-rest encryption**

Important: Cloudera provides two solutions:

- **Navigator Encrypt** is production ready and available to Cloudera customers licensed for Cloudera Navigator. Navigator Encrypt operates at the Linux volume level, so it can encrypt cluster data inside and outside HDFS. Consult your Cloudera account team for more information.
- **HDFS Encryption** is production ready and operates at the HDFS directory level, enabling encryption to be applied only to HDFS folders where needed.

HDFS encryption implements transparent, end-to-end encryption of data read from and written to HDFS by creating encryption zones. An encryption zone is a directory in HDFS with every file and subdirectory in it encrypted. Use *one* of the following services to store, manage, and access encryption zone keys:

- **KMS (File)** - The Hadoop Key Management Server with a file-based Java keystore; maintains a single copy of keys, using simple password-based protection.

- **KMS (Navigator Key Trustee)** - An enterprise-grade key management service that replaces the file-based Java keystore and leverages the advanced key-management capabilities of Cloudera Navigator Key Trustee. Navigator Key Trustee is designed for secure, authenticated administration and cryptographically strong storage of keys on multiple redundant servers that can be located outside the cluster.
- The Cloudera Manager Server now reports the correct number of physical cores and hyper-threading cores if hyper-threading is enabled.
- **Client configurations** - Client configurations are now managed so that they are redeployed when a machine is re-imaged.

Important: The changes to client configurations affect some API calls, as follows:

- When a host ceases to have a client configuration assigned to it, Cloudera Manager will remove it, rather than leaving it behind. If a host has a client configuration assigned and the client configuration is missing, Cloudera Manager will recreate it.
- If you currently use the API command `deployClientConfig` to deploy the client configurations for a particular service, and you pass a specific set of role names to this call to narrow the set of hosts that receive the new client configuration, then you should be aware that:
 - The API command will continue to generate and deploy the client configuration only to the hosts that correspond to the specified role names.
 - Any other hosts that previously had deployed client configurations, but do not have gateway roles assigned to them, will have those client configurations removed from them. This is the new behavior.
- The behavior of the cluster level `deployClientConfig` command, and calling the service level command with no arguments, is unchanged. The command still deploys a new client configuration to all hosts with roles corresponding to the specified service or cluster.
- As this change is due to internal functional changes inside CM, it is not restricted to any new API level. The `deployClientConfig` command in all API levels is affected.

- **Configuration**

- **NameNode configuration** - The decommissioning parameters `dfs.namenode.replication.max-streams` and `dfs.namenode.replication.max-streams-hard-limit` are now available.
- **Hue debug options** - Two service-level configuration parameters have been added to the Hue service to enable Django debug mode and debugging of internal server error responses.

What's New in Cloudera Manager 5.2.7

An issue has been fixed. See [Issues Fixed in Cloudera Manager 5.2.7](#) on page 2667.

Note: Although there is a Cloudera Manager 5.2.7 release, there is no synchronous CDH 5.2.7 release.

What's New in Cloudera Manager 5.2.6

A number of issues have been fixed, see [Issues Fixed in Cloudera Manager 5.2.6](#) on page 2668.

What's New in Cloudera Manager 5.2.5

A number of issues have been fixed, see [Issues Fixed in Cloudera Manager 5.2.5](#) on page 2669.

What's New in Cloudera Manager 5.2.4

There are no changes for Cloudera Manager 5.2.4. It was released to provide the Cloudera Navigator fix in .

Note: Although there is a CDH 5.2.3 release, there is no synchronous Cloudera Manager 5.2.3 release.

What's New in Cloudera Manager 5.2.2

- **HDFS Decommissioning** - The following decommissioning properties have been exposed in Cloudera Manager 5.2.2.
 - **Maximum number of replication threads on a Datanode** (`dfs.namenode.replication.max-streams`)
 - **Hard limit on the number of replication threads on a Datanode** (`dfs.namenode.replication.max-streams-hard-limit`)
- New icons for the KMS and Key Trustee services.

What's New in Cloudera Manager 5.2.1

This release fixes the “POODLE” vulnerability and a number of other issues. See [Issues Fixed in Cloudera Manager 5.2.1](#) on page 2669.

- The YARN `yarn.nodemanager.recovery.dir` property can be configured.
- A health check indicates whether the HDFS metadata upgrade has not been finalized.

What's New in Cloudera Manager 5.2.0

- **OS and database support** - Adds support for Ubuntu Trusty (version 14.04) and PostgreSQL 9.3.
- **Services** - the following new services have been added:
 - **Isilon** - supports the EMC Isilon distributed filesystem.
 - **KMS** - the Java keystore-based key management server.
 - **Key Trustee** - the enterprise-grade key management server using Cloudera Navigator Key Trustee.
 - **Spark** - running Spark applications on YARN. The existing Spark service has been renamed Spark (Standalone).
- **Accumulo** - Kerberos authentication is now supported. If you have been using advanced configuration snippets (safety valves) to configure Kerberos with Accumulo, you may now remove those settings and have Cloudera Manager generate the principal and keytab file for you.
- **HDFS Data at Rest Encryption** -

Note: Cloudera provides the following two solutions for data at rest encryption:

- **Navigator Encrypt** - Is production ready and available for Cloudera customers licensed for Cloudera Navigator. Navigator Encrypt operates at the Linux volume level, so it can encrypt cluster data inside and outside HDFS. Talk to your Cloudera account team for more information about this capability.
- **HDFS Encryption** - Included in CDH 5.2.0 and operates at the HDFS folder level, enabling encryption to be applied only to HDFS folders where needed. This feature has several known limitations. Therefore, Cloudera does not currently support this feature in CDH 5.2 and it is *not* recommended for production use. To try the feature, upgrade to the latest version of CDH 5.

HDFS now implements transparent, end-to-end encryption of data read from and written to HDFS by creating encryption zones. An encryption zone is a directory in HDFS with all of its contents, that is, every file and subdirectory in it, encrypted. You can use either the **KMS** or the **Key Trustee** service to store, manage, and access encryption zone keys.

- **HBase** - Support for configuring hedged reads has been added for HBase. The default configuration is to turn hedged reads off. Cloudera Manager will emit two properties, `dfs.client.hedged.read.threadpool.size` (default: 0) and `dfs.client.hedged.read.threshold.millis` (default: 500ms) to `hbase-site.xml`.

- **ZooKeeper** - the RMI port can be configured. The port is configured using the JDK7 flag `-Dcom.sun.management.jmxremote.rmi.port`. The default value is set to be same as the JMX Agent port. Also, a special value of 0 or -1 disables the setting and a random port is used. The configuration has no effect on versions lower than Oracle JDK 7u4.
- **Cloudera Manager Agent configuration**
 - The supervisord port can now be configured in the Agent configuration `supervisord_port`. The change takes effect the next time supervisord is restarted (not simply when the Agent is restarted).
 - Added an Agent configuration `local_filesystem_whitelist` that allows configuring the list of local filesystems that should always be monitored.
- **Proxy user configuration**
 - All services' proxy user configuration properties have been moved to the HDFS service. Other services running on the cluster inherit the configuration values provided in HDFS. If you have previously configured a service to have values different from those configured in HDFS, then the proxy user configuration properties will be moved to that service's Advanced Configuration Snippet (Safety Valve) for `core-site.xml` to retain existing behavior.

Oozie and Solr are exceptions to this. Oozie proxy user configuration properties have been moved to **Oozie Server Advanced Configuration Snippet (Safety Valve)** for `oozie-site.xml` if they differ from HDFS. Solr proxy user configuration properties have been moved to **Solr Service Environment Advanced Configuration Snippet (Safety Valve)** if they differ from HDFS.
- **Resource management** - YARN and Llama integrated resource management and Llama high availability wizard.
- **New and changed user roles** - BDR Administrator, Cluster Administrator, Navigator Administrator, and User Administrator. The Administrator role has been renamed Full Administrator.
- **Configuration UI**
 - Cluster-wide configuration - you can view all modified settings and configure log directories, disk space thresholds, and port settings.
 - New configuration layout - the new layout provides an alternate way to view configuration pages. In the **classic** layout, pages are organized by role group and categories within the role groups. The **new** layout allows you to filter on configuration status, category, and scope. On each configuration page you can easily switch between the classic and new layout.

Important: The classic layout is the default. All the configuration procedures described in the Cloudera Manager documentation assume the classic layout.

What's New in Cloudera Manager 5.1.6

A number of issues have been fixed. See [Issues Fixed in Cloudera Manager 5.1.6](#) on page 2672.

What's New in Cloudera Manager 5.1.5

A number of issue have been fixed. See [Fixed Issues in Cloudera Manager 5.1.5](#) on page 2673.

What's New in Cloudera Manager 5.1.4

A number of issues have been fixed. See [Fixed Issues in Cloudera Manager 5.1.4](#) on page 2673.

What's New in Cloudera Manager 5.1.3

A number of issues have been fixed. See [Fixed Issues in Cloudera Manager 5.1.3](#).

- **JDK Installation**

- Users who are adding or upgrading hosts can now choose not to install the JDK that ships with Cloudera Manager.

Cloudera Manager 5 Release Notes

What's New in Cloudera Manager 5.1.2

A number of issues have been fixed. See [Fixed Issues in Cloudera Manager 5.1.2](#).

- **New SAML configuration option**

- You can now specify the binding protocol to be used for AuthNResponses sent from the IDP to Cloudera Manager. Previously, Cloudera Manager would only use HTTP-Artifact, but it is now possible to choose HTTP-Post. HTTP-Artifact remains the default binding.

What's New in Cloudera Manager 5.1.1

An issue has been fixed. See [Issues Fixed in Cloudera Manager 5.1.1](#) on page 2675.

What's New in Cloudera Manager 5.1.0

Important: Cloudera Manager 5.1.0 is no longer available for download from the Cloudera website or from archive.cloudera.com due to the JCE policy file issue described in the [Fixed Issues in Cloudera 5.1.1](#) section of the Release Notes. The download URL at archive.cloudera.com for Cloudera Manager 5.1.0 now forwards to Cloudera Manager 5.1.1 for the RPM-based distributions for Linux RHEL and SLES.

- **SSL Encryption**

- Supports several new SSL-related configuration parameters for HDFS, MapReduce, YARN and HBase, which allow you to configure and enable encrypted shuffle and encrypted web UIs for these services.
- Cloudera Manager now also supports the monitoring of HDFS, MapReduce, YARN, and HBase when SSL is enabled for these services. New configuration parameters allow you to specify the location and password of the truststore used to verify certificates in HTTPS communication with CDH services and the Cloudera Manager Server.

- **Sentry Service**

- A new Sentry service that stores the authorization metadata in an underlying relational database and allows you to use Grant/Revoke statements to modify privileges.
- You can also configure the Sentry service to allow Pig, MapReduce, and WebHCat queries access to Sentry-secured data stored in Hive.

- **Kerberos Authentication**

- Now supports a Kerberos cluster using an Active Directory KDC.
- New wizard to enable Kerberos on an existing cluster. The wizard works with both MIT KDC and Active Directory KDC.
- Ability to configure and deploy Kerberos client configuration (`krb5.conf`) on a cluster.

- **Spark Service** - added the History Server role

- **Impala** - added support for Llama ApplicationMaster High Availability

- **User Roles** - there are two new roles: Operator and Configurator that support fine-grained access to Cloudera Manager features.

- **Monitoring**

- Updates to Oozie monitoring
- New Hive metastore canary

- **UI** - The UI has been updated to improve scalability. The **Home > Status** tab can be configured to display clusters in a full or summary format. There is a new Cluster page for each cluster. The Hosts and Instances pages have added faceted filters.

What's New In Cloudera Manager 5.0.7

A number of issues have been fixed. See [Fixed Issues in Cloudera Manager 5.0.7](#) on page 2678.

What's New in Cloudera Manager 5.0.6

A number of issues have been fixed. See [Fixed Issues in Cloudera Manager 5.0.6](#) on page 2679.

What's New in Cloudera Manager 5.0.5

A number of issues have been fixed. See [Fixed Issues in Cloudera Manager 5.0.5](#) on page 2679.

What's New in Cloudera Manager 5.0.2

A number of issues have been fixed. See [Issues Fixed in Cloudera Manager 5.0.2](#) on page 2679.

What's New in Cloudera Manager 5.0.1

A number of issues have been fixed. See [Issues Fixed in Cloudera Manager 5.0.1](#) on page 2679.

- **Monitoring**

- The Java Garbage Collection Duration health test for the Service Monitor, Host Monitor, and Activity Monitor has been replaced with the new Java Pause Duration health test.

What's New in Cloudera Manager 5.0.0

- **Service and Configuration Management**

- **HDFS** - cache management

- **Resource Management** - Impala admission control

- **Monitoring**

- Host disks overview
- Impala best practices
- HBase table statistics
- HDFS cache statistics

What's New in Cloudera Manager 5.0.0 Beta 2

- **Service and Configuration Management**

- **HDFS**

- HDFS NFS Gateway role
- Supports restoration of HDFS data from a snapshot

- **YARN**

- YARN Resource Manager High Availability
- Resource pool scheduler

- Support for Spark service
- Support for Accumulo service
- Support for service extensibility
- Support to set up Oozie server High Availability
- Granular configuration staleness UI
- Support for setting maximum file descriptors

- **Monitoring**

- Support for monitoring the Cloudera Search/Solr service
- New "failed" and "killed" badges displayed for unsuccessful YARN applications
- More attributes available for filtering displays of YARN applications and Impala queries
- New operational reports added for HBase tables and namespaces, Impala queries, and YARN applications
- Support for creating user-defined triggers for metrics accessible via charts/tsquery

Important: Because triggers are a new and evolving feature, backward compatibility between releases is not guaranteed at this time.

- Charting improvements
 - New table chart type
 - New options for displaying data and metadata from charts
 - Support for exporting data from charts to CSV or JSON files
- **Administrative Settings**
 - Added a new role type with limited administrator capabilities.
 - Cloudera Manager Server and all JVMs will create a heap dump if they run out of memory.
 - Configure the location of the parcel directory and specify whether and when to remove old parcels from cluster hosts.

What's New in Cloudera Manager 5.0.0 Beta 1

- **CDH Version**
 - Supports both CDH 4 and CDH 5
 - CDH 4 to CDH 5 upgrade wizard
 - Support for YARN as a production execution environment
 - MapReduce (MRv1) to YARN (MRv2) configuration import
 - YARN-based resource management for Impala 1.2
- **JDK Version** - Cloudera Manager 5 supports and installs both JDK 6 and JDK 7.
- **Resource Management**
 - Static and dynamic partitioning of resources: provides a wizard for configuring static partitioning of resources (cgroups) across core services (HBase, HDFS, MapReduce, Solr, YARN) and dynamic allocation of resources for YARN and Impala.
 - Pool, resource group, and queue administration for YARN and Impala.
 - Usage monitoring and trending.
- **Monitoring**
 - YARN service monitoring
 - YARN (MRv2) job monitoring
 - Configurable histograms of Impala query and YARN job attributes that can be used to quickly filter query and application lists
 - Scalable back-end database for monitoring metrics
 - Charting improvements
 - New chart types: histogram and heatmap
 - New scale types: logarithmic and power
 - Updates to tsquery language: new attribute values to support YARN and new functions to support new chart types
- **Extensibility**
 - Ability to manage both ISV applications and non-CDH services (for example, Accumulo, Spark, and so on)
 - Working with select ISVs as part of Beta 1
- **Single Sign-On** - Support for SAML to enable single sign-on
- **Parcels**

- Dependency enforcement to ensure incompatible parcels are not used together
- Option to not cache downloaded parcels, to save disk space
- Improved error reporting for management operations
- **Backup and Disaster Recovery (BDR)**
 - HBase and HDFS snapshots: Supports scheduling snapshots on a recurring basis.
 - Support for YARN (MRv2): Replication jobs can now run using YARN (MRv2) instead of MRv1.
 - Global replication page: All scheduled snapshots (HDFS and HBase) and replication jobs for either HDFS or Hive are shown on a single Replications page.
- **Other**
 - Global Search box
 - Several usability improvements
 - Comprehensive detection of configuration changes that require service restarts, refresh and redeployment of client configurations

Incompatible Changes in Cloudera Manager 5

The following sections describe incompatible changes in each Cloudera Manager 5 release.

Incompatible Changes Introduced in Cloudera Manager 5.15.0

- **Oozie Load Balancer Configuration Parameter -**

The `oozie_load_balancer` Cloudera Manager configuration parameter has been changed. Previously, it was specified as `<hostname>:<port>` format. In Cloudera Manager 5.15 and later, the format is `<hostname>`. This format change is incompatible.

Any client reading this value through the API should also read as necessary the load balancer port configuration parameter: `oozie_load_balancer_http_port` or `oozie_load_balancer_https_port`. The correct port parameter depends on whether TLS/SSL is enabled. Check the `oozie_use_ssl` property if you are unsure.

Incompatible Changes Introduced in Cloudera Manager 5.5.0

- Cloudera Manager no longer supports JDK 1.6.

Incompatible Changes Introduced in Cloudera Manager 5.4.0

- The Blacklisted Products property has been removed from the Hosts > Parcels configuration.

Incompatible Changes Introduced in Cloudera Manager 5.3.0

- Oozie metrics - The Oozie metrics framework is now controlled by the **Enable The Metrics Instrumentation Service** flag, which is enabled by default. When enabled, the old 'instrumentation' REST end-point is disabled and metrics are available on the new 'metrics' REST end-point (`hostname:port/v2/admin/metrics`).

Incompatible Changes Introduced in Cloudera Manager 5.2.0

- Due to various internal changes to configuration generation, all service and client configurations will be stale after upgrade. To propagate the updates, restart the cluster and redeploy client configurations.

Incompatible Changes Introduced in Cloudera Manager 5.1.0

- The Limited Administrator role has been renamed Limited Operator. The Limited Operator role is no longer available in Cloudera Manager Express. If you upgrade a Cloudera Manager Express installation, users in the Limited Operator role will not be able to log in. A user in the Administrator role must assign the Read-Only or Administrator role to those users.

Incompatible Changes Introduced in Cloudera Manager 5.0.0

• Cloudera Manager API

- New [upgradeCdh](#) command, which upgrades CDH cluster versions. Use this command to upgrade clusters from CDH 4 to CDH 5. The `upgradeServices` command previously used to upgrade CDH cluster versions is no longer supported.
 - The `hostId` field now contains a unique UUID and no longer matches the `hostName` field. When referring to a host, both `hostId` and `hostName` are accepted. However, any API clients that were previously cross-referencing host records with external information by `hostName`, but were using the `hostId` field in the API, must be updated to use the `hostName` field. Clients updated in this manner will function correctly with older versions of Cloudera Manager because the `hostName` field has always been present.
 - The `clusterName` field displayed when viewing service and role references is now an internal name and may not match the external `displayName` field of the cluster.
- All CDH 5 versions of Hue work only with the default system Python version of the operating system it is being installed on. For example, on RHEL/CentOS 6, you need Python 2.6 to start Hue.
 - Cloudera Manager 5.0 includes a change to the value of the `snmpTrapOID`. Earlier releases set the value of `snmpTrapOID` (OID: `.1.3.6.1.6.3.1.1.4.1.0`) wrongly to `clouderaManagerMIBNotifications` (OID `.1.3.6.1.4.1.38374.1.1.1`). This is fixed in Cloudera Manager 5.0 with the correct value, which is `clouderaManagerAlert` (OID `.1.3.6.1.4.1.38374.1.1.1.1`). This change will break SNMP server setups that are configured to expect `clouderaManagerMIBNotifications`. Cloudera Manager administrators should configure their SNMP receivers to accept the corrected OID.
 - The default values for the following configurations have changed to include the JVM option `-Djava.net.preferIPv4Stack=true`, which sets the preferred protocol stack to IPv4 on dual-stack machines. Any values set to the old defaults will automatically be changed to the new default when upgrading to Cloudera Manager 5.
 - MapReduce client configuration:
 - `hadoop-env.sh`: added to `HADOOP_CLIENT_OPTS`
 - `mapred-site.xml`: added to `mapred.child.java.opts`
 - YARN client configuration:
 - `hadoop-env.sh`: added to `YARN_OPTS`
 - `mapred-site.xml`: added to `yarn.app.mapreduce.am.command-opts`, `mapreduce.map.java.opts`, and `mapreduce.reduce.java.opts`
 - HDFS client configuration: `hadoop-env.sh`: added to `HADOOP_CLIENT_OPTS`
 - Hive client configuration: `hive-env.sh`: added to `HADOOP_CLIENT_OPTS`
 - MapReduce health tests have been removed:
 - Job failure
 - Map backlog
 - Reduce backlog
 - Map localityIf needed, the test can be replaced with a trigger. For example:
 - Looks at all the jobs that completed in the last hour and if there are more than 10% of failed jobs, change the health of the service to concerning:

```
IF (select (jobs_failed_rate * 3600) as jobs_failed,
((jobs_failed_rate + jobs_completed_rate + jobs_killed_rate) * 3600)
as all_jobs where roleType=JOBTRACKER AND serviceName=$SERVICENAME
and last(jobs_failed_rate / (jobs_failed_rate + jobs_completed_rate +
jobs_killed_rate)) >= 10 ending at $END_TIME duration "PT3600S")
DO health:concerning
```

- If there are more than 50% maps waiting than total slots available, health goes concerning.

```
IF (select waiting_maps / map_slots where roleType=JOBTRACKER and serviceName=$SERVICENAME
and last(waiting_maps / map_slots) > 50)
DO health:concerning
```

- If there are more than 50% reduce waiting than total slots available, health goes concerning.

```
IF (select waiting_reduces / reduce_slots where roleType=JOBTRACKER and
serviceName=$SERVICENAME
and last(waiting_reduces / reduce_slots) > 50)
DO health:concerning
```

- HDFS checkpointing metrics have been removed:

- end_checkpoint_num_ops
- end_checkpoint_avg_time
- start_checkpoint_num_ops
- start_checkpoint_avg_time

Incompatible Changes Introduced in Cloudera Manager 5.0.0 Beta 2

- Impala releases earlier than 1.2.1 are no longer supported.
- Some of the constants identifying health tests have changed. The following existed in Cloudera Manager 4:

- FAILOVERCONTROLLER_FILE_DESCRIPTOR
- FAILOVERCONTROLLER_HOST_HEALTH
- FAILOVERCONTROLLER_LOG_DIRECTORY_FREE_SPACE
- FAILOVERCONTROLLER_SCM_HEALTH
- FAILOVERCONTROLLER_UNEXPECTED_EXITS

They are now:

- MAPREDUCE_FAILOVERCONTROLLER_FILE_DESCRIPTOR
- MAPREDUCE_FAILOVERCONTROLLER_HOST_HEALTH
- MAPREDUCE_FAILOVERCONTROLLER_LOG_DIRECTORY_FREE_SPACE
- MAPREDUCE_FAILOVERCONTROLLER_SCM_HEALTH
- MAPREDUCE_FAILOVERCONTROLLER_UNEXPECTED_EXITS

and

- HDFS_FAILOVERCONTROLLER_FILE_DESCRIPTOR
- HDFS_FAILOVERCONTROLLER_HOST_HEALTH
- HDFS_FAILOVERCONTROLLER_LOG_DIRECTORY_FREE_SPACE
- HDFS_FAILOVERCONTROLLER_SCM_HEALTH
- HDFS_FAILOVERCONTROLLER_UNEXPECTED_EXITS

The reason for the change is to better distinguish between MapReduce and HDFS failover controller monitoring in the health system.

Incompatible Changes Introduced in Cloudera Manager 5.0.0 Beta 1

- **Services**

- **Impala** - With Cloudera Manager 4.8 (released in late November 2013), only Impala 1.2.1 is supported, due to the introduction of the Impala Catalog Server. However, CDH 5.0.0 Beta 1 was released with Impala 1.2.0 (Beta). Therefore, if you upgrade from Cloudera Manager 4.8 (with Impala 1.2.1) to Cloudera Manager 5.0.0 Beta 1, and then upgrade your CDH to CDH 5.0.0 Beta 1, your version of Impala will be downgraded to Impala 1.2.0 from 1.2.1. This will result in some loss of functionality. See [New Features in Impala](#) for a list of the new features in Impala 1.2.1 that are not in Impala 1.2.0 (Beta).

- **Hive** - HiveServer 2 is a mandatory role for Hive in CDH 5.
- **Hue** - In CDH 5, Hue no longer has a Beeswax Server role. Hue now submits queries to HiveServer2.
- **HDFS** - Cloudera Manager 5 does not support NFS-mounted shared edits directories for HDFS High Availability. It only supports the Quorum Journal method for shared edits. If you upgrade from Cloudera Manager 4 with a working CDH 4 High Availability configuration that uses NFS-mounted directories, your installation will continue to work until you disable High Availability. You will not be able to re-enable High Availability with NFS-mounted directories. Furthermore, you will not be able to upgrade to CDH 5 unless you disable High Availability, and you will need to use Quorum-based storage in order to re-enable High Availability after the upgrade.
- **YARN**
 - The YARN (MRv2) configuration `mapreduce.job.userlog.retain.hours` has been replaced by `yarn.log-aggregation.retain-seconds`. Any existing value in `mapreduce.job.userlog.retain.hours` will be lost. However, this configuration never had any effect, so no functionality is affected.
 - The following configuration parameters were removed from YARN. These never had any effect, so no functionality is affected.
 - `mapreduce.jobtracker.maxtasks.perjob`
 - `mapreduce.jobtracker.handler.count` (non-functional duplicate of `yarn.resourcemanager.resource-tracker.client.thread-count`)
 - `mapreduce.jobtracker.persist.jobstatus.active`
 - `mapreduce.jobtracker.persist.jobstatus.hours`
 - `mapreduce.job.jvm.numtasks`
 - The following YARN configuration parameters were replaced. Only the YARN parameters were replaced. Old configurations will be lost, but they never had any effect so this does not affect functionality.
 - `mapreduce.jobtracker.restart.recover` replaced by `yarn.resourcemanager.recovery.enabled` (changed from Gateway to ResourceManager)
 - `mapreduce.tasktracker.http.threads` replaced by `mapreduce.shuffle.max.connections`
 - `mapreduce.jobtracker.staging.root.dir` replaced by `yarn.app.mapreduce.am.staging-dir`
 - Cloudera Manager 5 sets the default YARN Resource Scheduler to FairScheduler. If a cluster was previously running YARN with the FIFO scheduler, it will be changed to FairScheduler the next time YARN restarts. The FairScheduler is only supported with CDH 4.2.1 and later, and older clusters may hit failures and need to manually change the scheduler to FIFO or CapacityScheduler. See the Known Issues section of this Release Note for information on how to change the scheduler back to FIFO or CapacityScheduler.

Changed Features and Behaviors in Cloudera Manager 5

The following sections describe what's changed in each Cloudera Manager 5 release.

Note: Rolling upgrade is not supported between CDH 4 and CDH 5. Rolling upgrade will also *not* be supported from CDH 5.0.0 Beta 2 to any later releases, and may not be supported between any future beta versions of CDH 5 and the General Availability release of CDH 5.

What's Changed in Cloudera Manager 5.16

- **Backup and Disaster Recovery** - BDR now ignores Kudu tables during replication. The change does not affect functionality since BDR does not support Kudu tables. This change was made to guard against data loss due to how the Hive MetaStore, Imapla, and Kudu interact.

What's Changed in Cloudera Manager 5.15

- **Host Inspector** - Previously, the Host Inspector displayed a list of components and version numbers. Now, all mismatched versions of a component are grouped together.
- **Key Trustee Server** - You cannot run the CDH Upgrade wizard from Key Trustee Server clusters. Previously, you could run the upgrade wizard on a Key Trustee Server cluster even though it is not part of the CDH upgrade.
To upgrade Key Trustee Server, distribute and activate a new Key Trustee Server parcel. Then restart the Key Trustee Server service. OPSAPS-42792
- **Key Trustee Server KMS Service** - Previously, you always had to enter a key admin user when you add a Key Trustee Service. Now, as long as the key admin user or key admin group contain a non-empty value, the Generate ACLs button is enabled.
- **Menu and UI Labels**
Previously, **Hive-on-S3** was a **Replication Option** when you create or edit a Hive replication schedule. The option has been renamed **Hive-on-Cloud** since Microsoft ADLS is now supported by Backup and Disaster Recovery
- **Stale Services** - Previously, stale services were not preselected in the Restart Staled Services wizard. They are now preselected.

What's Changed in Cloudera Manager 5.14

- **API**
 - The enum field `apiCluster.apiClusterVersion` is deprecated. Use the string field `apiCluster.fullVersion` instead.
 - You can now configure the timeout for `TimeSeriesQueryService` with the API. Previously, there was a hard-coded 20 second timeout.
- **Authorization**
 - The Reports Manager role is no longer required to run Cloudera Management Service anymore.
 - When Cloudera Manager users external authentication, such as LDAP, role assignment from the **Users** page is now disabled.
- **BDR**
 - You no longer have to select the **Skip checksum check** option for BDR replication to function properly when one or both clusters use encryption. The checksum check is transparently and automatically skipped in this situation.
 - Removed an extra RPC call to source NameNode in the mapper phase of back up replications. The fix reduces the number of RPC calls to the NameNode to less than half. After this fix:
 - Customers will see an improvement in replication (Backup and Disaster Recovery) performance.
 - Customers will be better able to scale their replication jobs and the production cluster NameNode is no longer a bottleneck during the mapper phase.
- **Installation**
 - CDH4 no longer appears as an install option in the Cloudera Manager Installation Wizard. CDH4 builds will also not be recognized if users try to use the REST API to install CDH4 on a new host.
 - The list of available versions of CDH5 for package-based installation is now obtained by querying `archive.cloudera.com`. New maintenance versions of CDH will now be available for install without having to upgrade Cloudera Manager. If `archive.cloudera.com` is not reachable, the list of CDH versions available will be empty.
 - Cloudera Manager now only installs Java 7. Previously when you installed Java on managed hosts using Cloudera Manager, both Java 6 and 7 were installed.

What's Changed in Cloudera Manager 5.13

- **External Accounts**

The **AWS Credentials** and **Altus Credentials** under **Administration** have been consolidated. You can find the pages for the credentials by selecting **Administration > External Accounts**.

- **RPC Wait Behavior**

When starting or restarting HDFS, Cloudera Manager now waits for any NameNode daemons that are started to begin responding to RPC requests before considering the start/restart operation to be complete. Previously, this wait was only performed in certain workflows; now, it is always done when starting HDFS.

- **Hue Load Balancer Enabled by Default**

For better Hue web site performance, the Hue Load Balancer is now enabled by default. In a secure cluster, Hue Load Balancer (apache httpd 2.4) requires "use_x_forwarded_host" to be set to "true". This change will cause staleness.

What's Changed in Cloudera Manager 5.12

- **Backup and Disaster Recovery**

- **Replicate Impala metadata feature for CDH 5.12 or later**

Replication of "native" Impala UDFs (transient UDFs created with the old syntax prior to CDH 5.7) is no longer available for CDH clusters that run version 5.12 or later because Impala native UDFs are deprecated. If you still use Impala native UDFs and want them to be replicated, you should recreate them within the Hive Metastore using the new Create Function syntax supported since CDH 5.7.

- **Dynamic Resource Pool Scheduling Rules**

You can no longer specify a one-time scheduling rule for a dynamic resource pool. Recurring scheduling rules are still supported. To make one-time changed to resource pool configuration, simply update the pools via the Cloudera Manager UI or API.

- **Add Cluster Wizard**

MapReduce1 has been removed as an option from the **Add Cluster Wizard**. It can still be added to a cluster after initial cluster creation or through the API.

- **Web UI**

- **Icons**

The icons in the Cloudera Manager web UI are more usable and distinct.

- **Stack Traces**

By default, stack traces are no longer displayed in the web UI. Please view the Cloudera Manager Server log under **Diagnostics > Server Log** to view stack traces of exceptions generated by Cloudera Manager.

- **Key Trustee Parcel**

The Key Trustee Parcel will no longer be released via archive.cloudera.com. The parcel will now be released via <http://www.cloudera.com/downloads>. Parcels already released on the archive site will continue to be available there.

- **Database names and DB usernames for the Cloudera Manager database.**

You can now only use alphanumeric characters and underscores for database names and usernames with the `scm_prepare_database.sh` script to ensure properly supported database names and usernames.

- **Cloudera Manager Agent Dependencies**

The Cloudera Manager Agent has new package dependencies. The `netstat` and `ifconfig` commands have been replaced with the `ss` and `ip` commands respectively.

For more information, see [iproute package requirement](#).

What's Changed in Cloudera Manager 5.11

- **Change to default fencing method for HDFS High Availability**

The default value of the HDFS High Availability Fencing Methods property (`dfs.ha.fencing.methods`) has been changed from `shell(/cloudera_manager_agent_fencer.py)` to `shell(true)`. While the old default value was reasonable for early versions of HDFS, it is no longer recommended for HAQJ-based versions of HDFS HA, as it can lead to HDFS service outages. The new default, `shell(true)`, is the setting that Cloudera recommends. It uses the built-in HDFS fencing method, which causes the fenced NameNode to exit if it attempts a write operation when it is not supposed to be active. If auto-restart is enabled for the NameNode, Cloudera Manager will then restart it.

Most clusters already have the HDFS High Availability Fencing Methods explicitly set to `shell(true)` since that is the value set by the HDFS Enable High Availability Wizard. When such clusters are upgraded to Cloudera Manager 5.11, this explicit setting of `shell(true)` will be removed. This does not change the effective value of the property since it takes on the new default value, which is also `shell(true)`. The cluster will experience no change in fencing behavior.

When clusters that have HDFS High Availability Fencing Methods set to the pre-5.11 default value are upgraded to Cloudera Manager 5.11, the effective value of the property changes to `shell(true)`, and the fencing behavior changes accordingly. This also causes the HDFS service to become stale, requiring a restart of HDFS and dependent services. If HDFS High Availability Fencing Methods is set to a non-default value other than `shell(true)`, no change occurs in the property's value when the cluster is upgraded to Cloudera Manager 5.11. Because the fencing method `shell(/cloudera_manager_agent_fencer.py)` can lead to service outages, a new configuration warning message will be displayed if it is in use after the upgrade to Cloudera Manager 5.11 is complete.

What's Changed in Cloudera Manager 5.10

- **Configuration Changes**

- **Llama configuration options removed**

Llama roles must be removed before upgrading to CDH 5.10.0 or higher. If your cluster has an Impala Llama role and you are using Cloudera Manager to upgrade, Cloudera Manager displays an error message and prevents the upgrade from going forward. You must first remove any existing Llama roles, using the **Disable YARN and Impala Integrated Resource Management** command (Before upgrading, go to the Impala Service and select **Actions > Disable YARN and Impala Integrated Resource Management**.) Cloudera Manager also generates a configuration error if a Llama role is added to a CDH 5.10 cluster, and prevents Impala from starting until the role is removed.

- **JAVA_HOME in agent configuration deprecated in 5.x**

Specifying host agent environment variable `CMF_AGENT_JAVA_HOME` is deprecated and will not be supported in a future release. Instead, specify **Java Home Directory** property in Cloudera Manager.

- **The `hbase.client.scanner.timeout.period` property is now configurable for clients**

The Scan API-related property `hbase.client.scanner.timeout.period` in the HBase service is now configurable at the Client (Gateway) level. Its value may be set to be equal to or lesser than the RegionServer-side equivalent of **HBase RegionServer Lease Period**.

- **Warning if KeyTrustee Server is located on cluster machines**

The KeyTrustee Server should be installed on dedicated hosts in a separate cluster. While this is adequate for proof of concept deployments, Cloudera does not recommend such installations for use in a production environment. Cloudera now shows a warning to the user when adding a Key Trustee server service onto an existing CDH cluster host.

What's Changed in Cloudera Manager 5.9.0

- You must now have the **BDR, Cluster, or Full Administrator** role to view the following pages:
 - HDFS File Browser
 - Directory Usage Report
 - HBase Table Browser
 - Solr Collections
 - HBase Table Statistics

Previously, you only needed the **Read-Only** role.

What's Changed in Cloudera Manager 5.8.0

- The YARN service's list of **Allowed System Users** now includes the `hbase` user by default. The reason for this change is that several essential HBase tools such as the MOB Sweeper, Import/Export tools, and CopyTable, need to interact with HBase as the `hbase` user to be able to execute MapReduce jobs.

Note that this change is only applicable to new Cloudera Manager deployments. Upgrading to Cloudera Manager 5.8 will not add the `hbase` user to the list of defaults.

What's Changed in Cloudera Manager 5.7.0

- The Navigator Metadata Server requires 192 MiB of Java PermGen space instead of 128 MiB. The value of this internal setting used by the JDK is increased automatically when upgrading to Cloudera Manager 5.7.
- The default value for `hive.compute.query.using.stats` is changed to `false`. The reason for the change is that certain queries such as `count`, `max`, and `min` return incorrect results with this optimization on.
- By default, Hive sessions now only consider sessions with no recent activity to be idle (`hive.server2.idle.session.timeout_check_operation`) and idle session timeouts have been reduced (`hive.server2.idle.session.timeout` and `hive.server2.idle.operation.timeout`). This helps reduce the strain on HiveServer2 from too many open sessions.
- Cloudera Manager no longer automatically refreshes scheduler configurations when dynamic resource pool settings are changed. You must explicitly refresh the configurations. This allows you to schedule the changes to minimize the impact on your cluster.
- For YARN, the default number of log directories (`yarn.nodemanager.log-dirs`) has changed from 1 to be equal to the number of mount points, to prevent applications with a large number of logs from filling up a single disk.
- The default for Java Heap Size of JournalNode in Bytes is now 512 MB.
- The **Sources** page for HDFS and Hive replications has been removed. A list of sources is available from a drop-down menu when you schedule a replication.
- The number of watched directories you can specify for the Disk Usage Report is now unlimited.
- Cloudera Manager now uses a new memory allocation algorithm to allocate memory when multiple roles are installed on the same host.
- User sessions in the Cloudera Manager Admin Console now timeout after a configurable period of time of inactivity. A dialog box warns the user before automatically logging out the user.
- The **All Recent Commands** page now loads more quickly.
- The **Disk Usage** reports now have links that take users to the **Directory Usage Report** with the correct filter applied.
- When searching for hosts on the **Hosts** page, you can now filter the hosts list by entering search terms (hostname, IP address, or role) in the search box separated by commas or spaces. You can use quotes for exact matches (for example, strings that contain spaces, such as a role name) and brackets to search for ranges. Hosts that match any of the search terms are displayed.
- Isilon is now supported as a source or destination service for HDFS replications.
- For CDH 5.7 and higher if `CDH_PYTHON` is set by a Spark plug-in, `PYSPARK_PYTHON` is set to `CDH_PYTHON` in `spark-env.sh`. If you install a Python runtime parcel, such as the [Anaconda](#) parcel, Python Spark jobs run in both YARN client and YARN cluster modes are automatically configured by redeploying the Spark client configuration.

What's Changed in Cloudera Manager 5.5.0

- Removed `-XX:-CMSConcurrentMTEnabled` from the default JVM options. This setting makes the JVM run in single threaded mode. This was needed for Java 1.6_31 and lower but not for Java 1.6_32 or higher. Anybody using Java 1.6_31 or lower should upgrade to the latest recommended version of Java 1.7.

This change causes all roles to be stale after you upgrade to Cloudera Manager 5.5 and they are indicated as requiring restart in the Cloudera Manager Admin Console. However, as with any upgrade, this is a valid, functional Cloudera Manager state, and the cluster only needs to be restarted when you want the new configurations to take effect.

- `HADOOP_USER_CLASSPATH_FIRST` is now adhered to in Hadoop client configurations. After you upgrade Cloudera Manager, services display a client configuration redeployment required icon .
- For RHEL 7, the `force_start`, `fast_*`, `clean_*`, and `hard_*` commands on the `server-scm-*` services no longer work, as custom start, restart, and stop commands are not supported on systemd based distributions. These have been replaced with `*_next_*` operations, which do not trigger an immediate operation, but signal that the next invoked operation will be forced, fast, clean, or hard.
- The Cloudera EULA is now shown when using the Cloudera Manager Admin Console for the first time.
- The Home tab has been removed from the Cloudera Manager Admin Console navigation bar. You can return to the Home page Status tab by clicking the Cloudera Manager logo.
- All the icons have been refreshed to make them cleaner and easier to read.
- In 5.4.0 an externally assigned role was combined with a Cloudera Manager assigned role and the user had the union of the role privileges. As a consequence, an external user could be assigned an administrator role in Cloudera Manager and they would be an administrator regardless of the externally assigned role. Now only the externally assigned roles are respected. No roles can be assigned to an external user in Cloudera Manager and any roles for an external user in the Cloudera Manager are ignored.

As a result of this change, external users with previously-assigned Cloudera Manager roles will have their permissions modified depending on the LDAP group they belong to. To restore permissions for external users, configure the LDAP groups for these users by navigating to **Administration > Settings**, and click **Category > External Authentication** to display the relevant properties.

- Cloudera Manager and CDH components support TLS 1.0, TLS 1.1, and TLS 1.2, but not SSL 3.0. SSL remains part of the TLS/SSL name for historical reasons.
- The label on the **Generate Credentials** button has been changed to **Generate Missing Credentials** to better reflect the fact that it only creates Kerberos principals that are not present yet in Cloudera Manager.
- Cloudera Manager now downloads binaries from <https://archive.cloudera.com> instead of <https://archive.cloudera.com>.
- The embedded `hbcck` feature has been removed from HBase monitoring for stability reasons.
- Increased the default heap sizes for Hive roles. On clusters with sufficient memory, newly created Hive roles have these values:
 - HiveServer2 - 4 G heap, 512 M perm gen
 - Hive Metastore - 8 G heap, 512 M perm gen
 - Gateway - 2 G heap, 512 M perm gen
- By default, Oozie now purges eligible completed workflows and coordinator actions for long-running coordinator jobs.
- Oozie actions that omit the `<job-tracker>` and `<name-node>` elements (and the workflow does not define them in the `<global>` section) use the default values for the JobTracker, Resource Manager, and NameNode from Cloudera Manager in CDH 5.5 and higher.
- Increased the defaults for Oozie parameters:
 - `oozie.service.CallableQueueService.callable.concurrency` - 10
 - `oozie.service.CallableQueueService.threads` - 50

- Sqoop 2 is no longer in the default services to be created in any of the options in the installation wizard. You can choose to add it to the Custom Services option in the Installation wizard or can add it with the Add Service wizard after installation.
- For CDH 5.5.0 and higher the default values of the YARN properties `mapreduce.[map|reduce].java.opts.max.heap` and `mapreduce.[map|reduce].memory.mb` have been changed to 0, which tells YARN to automatically select a default. This helps avoid issues where either `heap` or `memory.mb` is updated, but not the other one (`memory.mb` should be ~30% higher than `heap` to allow for JVM overhead).
- The Host DNS Resolution Duration health test was removed. Its functionality is now covered in the Host DNS Resolution health test.
- The default Replication Strategy is now **Dynamic**.

What's Changed in Cloudera Manager 5.4.1

HDFS Read Throughput Impala query monitoring property is misleading

The `hbase_bytes_read_per_second` and `hdfs_bytes_read_per_second` Impala query properties have been renamed to `hbase_scanner_average_bytes_read_per_second` and `hdfs_scanner_average_bytes_read_per_second` to more accurately reflect that these properties return the average throughput of the query's HBase and HDFS scanner threads respectively. The previous names and descriptions gave the impression that these properties were the query's total HBase and HDFS throughput, which was not accurate.

What's Changed in Cloudera Manager 5.4.0

- Cloudera Manager checks the specified version of CDH before an installation and upgrade to ensure that it is compatible with Cloudera Manager before proceeding. Specifically, for Cloudera Manager 5.4 that means no version of CDH newer than 5.4.x is supported (Cloudera Manager must be upgraded before upgrading to such a version of CDH). Cloudera Manager no longer shows these "too-new" versions of CDH. The 'latest' parcel repository URL will be replaced by the 'latest_supported' repository in the parcel configuration.
- The minimum Java heap size for the Activity Monitor, Host Monitor, and Service Monitor has been changed from 50 MB to 256 MB.
- Regenerating Kerberos principals will be denied if any roles that are using those principals are running. Stop those roles and then attempt to regenerate the principals.
- In previous versions of Cloudera Manager, the 'version' attribute in `tsquery` had values that were integers, for example, 4 for CDH4, 5 for CDH5, -1 for Cloudera Manager. Starting in the Cloudera Manager 5.4, the values for the 'version' attribute are in release string format, for example "cdh5.0.0".
- **Hive**
 - `hive.exec.reducers.max` default value changed from 999 to 1099
 - `hive.exec.reducers.bytes.per.reducer` default value changed from 1 GB to 64 MB
 - The default heap size for the Hive CLI is increased to 1 GB.
 - The property `hive.log.explain.output` is known to create instability of Cloudera Manager Agents in some specific circumstances, specially when the hive queries generate extremely large EXPLAIN outputs. Therefore, the property has been hidden from the Cloudera Manager configuration UI. The property can still be configured through the use of advanced configuration snippets.
- **Impala** - The Impala Daemon now supports the Impala Maximum Log Files property which specifies the total number of log files per severity level that should be retained before they are deleted. By default, after upgrading to CDH 5.4 this property is set to 10, which means that Impala Daemons will only retain up to 10 log files for each severity level. Any additional files will be deleted.
- **HBase** - Moved three settings for HBase coprocessors from Main to Advanced category:
 - Service Wide > HBase Coprocessor Abort on Error: move to 'Service Wide > Advanced > HBase Coprocessor Abort on Error'
 - 'Master Default Group > HBase Coprocessor Master Classes': move to 'Master Default Group > Advanced > HBase Coprocessor Master Classes'
 - RegionServer Default Group > HBase Coprocessor Region Classes': move to 'RegionServer Default Group > Advanced > HBase Coprocessor Region Classes'

What's Changed in Cloudera Manager 5.3.2

- Turning on the internal HBase canary (not to be confused with Cloudera Manager monitoring canary) is optional. On new clusters, it will not be enabled by default. Existing clusters will continue to run the canary until it is disabled from the HBase configuration page.

What's Changed in Cloudera Manager 5.3.0

- **Cloudera Manager upgrade** - If you have any active commands running before upgrade, the server *will fail to start* after upgrade. This includes commands a user might have run and also for commands Cloudera Manager automatically triggers, either in response to a state change, or something that's on a schedule.

What's Changed in Cloudera Manager 5.2.1

- The default value of the YARN `yarn.nodemanager.recovery.dir` property has changed from `{hadoop.tmp.dir}/yarn-nm-recovery` to `/var/lib/hadoop-yarn/yarn-nm-recovery`.

What's Changed in Cloudera Manager 5.2.0

- **Rolling upgrade** - As a result of a recent change in the way DataNodes handle block deletions during a rolling upgrade ([HDFS-5907](#)), the Trash directory may grow unexpectedly while the upgrade is in progress. Deleted blocks are kept during upgrade in case you want to roll back. The blocks are cleaned up after you finalize the upgrade.
- **Agent** -
 - The `hard_stop`, `hard_restart`, and `clean_restart` commands now show a warning message about the impact of using these commands instead of performing the actions. To actually perform the actions, you use the `hard_stop_confirmed`, `hard_restart_confirmed`, and `clean_restart_confirmed` commands.
 - The default supervisor port is changed from 9001 to 19001
- YARN application attributes renamed: `slot_millis` to `slots_millis` and `fallow_slot_millis` to `fallow_slots_millis`

What's Changed in Cloudera Manager 5.1.0

- **UI refresh for scalability**
- Revised authorization privilege model in Sentry.

What's Changed in Cloudera Manager 5.0.0

- MapReduce now inherits topology from HDFS NameNode. Topology configuration for MapReduce JobTracker was removed. The configuration was redundant and the two parameters should always have been set to the same value.
- **UI**
 - The Clusters tab no longer has Activities, Other, and Manage Resources sections.

What's Changed in Cloudera Manager 5.0.0 Beta 2

- **Product**
 - Cloudera Backup and Disaster Recovery (BDR) is now included with Cloudera Enterprise.
 - Cloudera Standard has been renamed to Cloudera Express.
- **OS and packaging**
 - The name of the Cloudera Manager embedded database package has changed from `cloudera-manager-server-db` to `cloudera-manager-server-db-2`. For details, read the upgrade and install topics for your OS.
 - Support for Ubuntu 10.04 and Debian 6.0 is deprecated.
- **HDFS** - enabling High Availability automatically enables auto-failover, unlike in Cloudera Manager 4 where enable auto-failover was a separate command.

- **HBase**
 - In CDH 5 there is no HBase canary because HBase is now monitored by a watchdog process. In CDH 4, the HBase canary is still used.
 - The RegionServer default heap size has been increased to 4GB.
- **Monitoring**
 - Chart "Views" and actions related to views have been renamed to "Dashboard".
 - Changes to how attribute filters are displayed in the Impala queries and YARN applications screens
 - The outdated configuration indicator on the Home, service, and role pages has a new graphic  and now has a tooltip that displays whether a cluster refresh or restart is required. There is a new indicator  for changes that require redeploying client configurations. You can click an indicator to go to the new Stale Configurations page to view and resolve the conditions that gave rise to the indicator.
 - To match the naming convention of tsquery metrics, multiword Impala query and YARN application attribute names have changed from camel case to using an underscore separator. For example `queryType` has changed to `query_type`. For backward compatibility, camel case names are still supported.
- **UI**
 - The main navigation bar in Cloudera Manager Admin Console has been reorganized. The Services tab has been replaced by a Clusters tab that contains links to individual services, which were previously under the Services tab, Activities and Reports sections, which were removed from the main bar, and a new Manage Resources section, which contains links to the new resource pools and service pools features. The All Services page has been removed.
 - The "Safety Valve" properties have been renamed "Advanced Configuration Snippet".
 - The screen for specifying assignment of roles to hosts has been redesigned for improved scalability and usability.
- **Misc**
 - The `io.compression.codecs` property has moved from MapReduce to HDFS.

What's Changed in Cloudera Manager 5.0.0 Beta 1

- When CDH 5 is installed, YARN is installed by default, rather than MapReduce, and is the default execution environment. MapReduce is deprecated in CDH 5 but is fully supported for backward compatibility through CDH 5. In CDH 4, MapReduce is still the default.
- The setting for `yarn.scheduler.maximum-allocation-mb` has been increased to a default of 64GB.
- The minimum heap size for the Solr service has been increased to 200MB (from 50MB previously) to enable it to better handle collection creation.

Known Issues and Workarounds in Cloudera Manager 5

The following sections describe the current known issues in Cloudera Manager 5.

Cloudera Manager 6.x issue with the service role Resume

If a selected service role on a node is restarted and fails, and the customer clicks the "Resume" button in Cloudera Manager, the service role on all of the nodes will be restarted concurrently.

Products affected: Cloudera Manager

Releases affected:

- Cloudera Manager 5.5 and later
- Cloudera Manager 6.0 until 6.3.3
- Cloudera Manager 7.1.x

Users affected: Users with admin role in Cloudera Manager can impact end users of the service.

Impact: In production clusters this can result in a cluster-wide service outage; Already observed for the YARN service and the HDFS service in a few clusters.

Severity: High

Action required:

- A workaround exists where instead of performing a restart we recommend performing a stop/start of the services.
- Issue is fixed in CM-6.3.4, CM-7.2.1 and above.

Knowledge Article: For the latest update on this issue see the corresponding Knowledge article: [Cloudera Customer Advisory: Cloudera Manager 6.x issue with service role Resume](#)

ZooKeeper JMX did not support TLS when managed by Cloudera Manager

The ZooKeeper service optionally exposes a JMX port used for reporting and metrics. By default, Cloudera Manager enables this port, but prior to Cloudera Manager 6.1.0, it did not support mutual TLS authentication on this connection. While JMX has a password-based authentication mechanism that Cloudera Manager enables by default, weaknesses have been found in the authentication mechanism, and Oracle now advises JMX connections to enable mutual TLS authentication in addition to password-based authentication. A successful attack may leak data, cause denial of service, or even allow arbitrary code execution on the Java process that exposes a JMX port. Beginning in Cloudera Manager 6.1.0, it is possible to configure mutual TLS authentication on ZooKeeper's JMX port.

Products affected: ZooKeeper

Releases affected: Cloudera Manager 6.1.0 and lower, Cloudera Manager 5.16 and lower

Users affected: All

Date/time of detection: June 7, 2018

Severity (Low/Medium/High): 9.8 High ([CVSS:3.0/AV:N/AC:L/PR:N/UI:N/S:U/C:H/I:H/A:H](#))

Impact: Remote code execution

CVE: CVE-2018-11744

Immediate action required: Upgrade to Cloudera Manager 6.1.0 and enable TLS for the ZooKeeper JMX port by turning on the configuration settings "Enable TLS/SSL for ZooKeeper JMX" and "Enable TLS client authentication for JMX port" on the ZooKeeper service and configuring the appropriate TLS settings. Alternatively, disable the ZooKeeper JMX port via the configuration setting "Enable JMX Agent" on the ZooKeeper service.

Note: Disabling the ZooKeeper JMX port prevents Cloudera Manager from performing health checks on the ZooKeeper service.

Addressed in release/refresh/patch: Cloudera Manager 6.1.0

Yarn Application Masters fail when a concurrent Deploy Client Configuration job is executed

Yarn Application Masters fail because the `container-executor.cfg` file is missing when a YARN application is executed concurrently with a Deploy Client Configurations job. The container-executor hierarchy has been moved to `/var/lib/yarn-ce`, which is not modified by the Deploy Client Configuration command.

Cloudera Bug: OPSAPS-24398

No changes are required for Cloudera Manager/CDH 5.16.0 and higher. Use the following **Workaround** for Cloudera Manager/CDH 5.15.1 and 5.14.4:

1. On the Cloudera Manager server host, add the following line to the `/etc/default/cloudera-scm-server` file:

```
export CMF_FF_YARN_SAFE_CONTAINER_EXECUTOR_DIR=true
```

2. Restart the Cloudera Manager Server:

```
service cloudera-scm-server restart
```

3. Restart the NodeManager(s) so they can pick up the new configuration change:

- a. In the Cloudera Manager Admin console, go to the YARN service.
- b. Click the **Instances** tab.
- c. Select all hosts with the NodeManager **Role Type**.
- d. Click **Actions for Selected > Restart**.

Fixed Versions: Cloudera Manager/CDH 5.16.1 5.16.0 5.15.1, 5.14.4

Affected Versions Cloudera Manager 5.15 and lower

Cloudera Manager Agent Failed to deactivate alternatives for parcels

In the Cloudera Manager host's agent logs, during the agent startup there are many repeated error entries if the listed parcel in the error logs has a "Distributed" status on the Cloudera Manager Parcels page. The confirmed issue is that the alternative configuration for the second (deactivated) parcel isn't present, resulting in the error seen in the agent log file.

For more information, see this [knowledge base article](#).

Workaround: Un-distribute/remove the affected parcel(s) from the host.

Cloudera bug: OPSAPS-52745

Fixed versions: Cloudera Manager 6.x

Affected versions: Cloudera Manager 5.x

The client configuration deployment fails after upgrade

After upgrade to Cloudera Manager 5.x, client configuration deployment fails with the following error:
"/var/lib/alternatives/hadoop-conf empty!"

Workaround: Either update the /var/lib/alternatives/hadoop-conf file from other working hosts, or remove it and restart the CM agent. This re-generates the file. For more information, see this [knowledge base article](#).

Cloudera bug: OPSAPS-38704

Fixed versions: Cloudera Manager 6.x

Affected versions: Cloudera Manager 5.x

Backup and Disaster Recovery replication with Isilon storage can fail

Backup and Disaster Recovery (BDR) jobs with Isilon storage can fail due to Cloudera Manager's host selection policy for BDR jobs or Cloudera Manager not accepting Isilon as a valid storage type for HDFS replication.

Affected Versions: Cloudera Manager 5.8.5, 5.9.3, 5.11.1, 5.12, 5.14.x, 5.15.1

Fixed Versions: Cloudera Manager 5.15.2

Backup and Disaster Recovery replication can fail if one of the destination KMSs fail

Even with KMS HA enabled on the destination cluster, BDR replication can still fail if one of the KMSs cannot be reached.

Workaround: Ensure all of the KMSs are online. Then, perform the replication again.

Affected Versions: Cloudera Manager 5.15.x, 5.16.x

Cloudera Manager installation fails on MariaDB 10.2.8 and later

When installing Cloudera Manager using MariaDB 10.2.8 or later, the Cloudera Manager web server doesn't come up and the install process ends with a failed status. The `cloudera-scm-server.log` includes the following SQL error:

```
2019-08-28 04:37:10,171 FATAL main:org.hsqldb.cmdline.SqlFile: SQL Error at 'UTF-8' line
57:
  "alter table ROLE_CONFIG_GROUPS
  drop column REVISION_ID"
  Key column 'REVISION_ID' doesn't exist in table
2019-08-28 04:37:10,171 FATAL main:org.hsqldb.cmdline.SqlFile: Rolling back SQL
transaction.
2019-08-28 04:37:10,172 ERROR main:com.cloudera.enterprise.dbutil.SqlFileRunner: Exception
while executing ddl scripts.
  com.mysql.jdbc.exceptions.jdbc4.MySQLSyntaxErrorException: Key column 'REVISION_ID'
doesn't exist in table
```

Note that MariaDB 10.2.8 is provided by default in some operating systems, including SLES 12 SP4.

Workaround: Replace the default MariaDB 10.2.x version with MariaDB 10.0.x.

Affected Versions: MariaDB 10.2.8 and later

Cloudera Issue: OPSAPS-52340

Failures during Cloudera Manager installation or upgrade

Cloudera Manager agent installation or upgrade fails due to misconfigured or problematic third-party repositories that were interfering with the process.

Cloudera Bug: OPSAPS-45576

Workaround: None

Affected versions: Cloudera Manager 5.14, 5.15

Fix versions: Cloudera Manager 5.16.1

Upgrade to CDH 5.15.1 fails with CM 5.15.1 and OpenJDK

Due to a Java version parsing issue with OpenJDK during Cloudera Manager upgrade, upgrades where OpenJDK is deployed fail.

Note: OpenJDK is only supported in Cloudera Manager and CDH 5.16.

Cloudera Bug: OPSAPS-47620

Fixed Version: Cloudera Manager and CDH 5.16.1, 5.15.2

After upgrade to Cloudera Manager 6, Kafka brokers and MirrorMaker marked as having stale configurations

The configurations that will be marked as stale are: - **BROKER_JAVA_OPTS** of the Kafka Broker role, and **MM_JAVA_OPTS** of the Kafka MirrorMaker role.

Workaround: Add the following options to the **Additional Broker Java Options** and **Additional MirrorMaker Java Options** Kafka configuration properties:

- `-Dcom.sun.management.jmxremote.host=127.0.0.1`
- `-Dcom.sun.management.jmxremote.local.only`

Restart the Kafka brokers.

Affected Versions: Cloudera Manager 5.15.0

Fixed Versions: Cloudera Manager 5.16.1, 5.15.2

Cloudera Bug: OPSAPS-47365

Parcel distribution fails and times out on Ubuntu 14.04 with Cloudera Express license

Parcel distribution to hosts from Cloudera Manager server is known to fail and timeout on Ubuntu 14.04 with a Cloudera Express license.

Workaround: None

Affected Versions: Cloudera Manager 5.15.0 and higher

Cloudera Issue: OPSAPS-44590

Flume service with Kafka over TLS marked as stale after upgrading Cloudera Manager from 5.15.0

After upgrading from Cloudera Manager 5.15.0, if you are using Flume + with Kafka over TLS, your Flume service will be marked as stale. To resolve this issue, restart the Flume service after the upgrade.

Affected Versions: Cloudera Manager 5.15.0

Flume uses default values for Kafka TLS settings

Cloudera Manager 5.15 added support for automatically configuring TLS settings when connecting to a Kafka service. In 5.15.0, the Flume configuration generated by Cloudera Manager when Flume is configured to connect to a secure Kafka cluster contains the default truststore location and password. Kafka TLS configuration inheritance does not handle non-default truststore file and password, which causes the connection to fail when the default values have been changed.

Workaround: Edit the Flume configuration file in Cloudera Manager to override the default parameters and use empty values for the Kafka producer and consumer truststore settings by adding the following lines to the Flume configuration file:

For Kafka channels:

```
AGENT_NAME.channels.CHANNEL_NAME.kafka.producer.ssl.truststore.location=  
AGENT_NAME.channels.CHANNEL_NAME.kafka.producer.ssl.truststore.password=  
AGENT_NAME.channels.CHANNEL_NAME.kafka.consumer.ssl.truststore.location=  
AGENT_NAME.channels.CHANNEL_NAME.kafka.consumer.ssl.truststore.password=
```

For Kafka sources:

```
AGENT_NAME.sources.SOURCE_NAME.kafka.consumer.ssl.truststore.location=  
AGENT_NAME.sources.SOURCE_NAME.kafka.consumer.ssl.truststore.password=
```

For Kafka sinks:

```
AGENT_NAME.sinks.SINK_NAME.kafka.producer.ssl.truststore.location=  
AGENT_NAME.sinks.SINK_NAME.kafka.producer.ssl.truststore.password=
```

AGENT_NAME, CHANNEL_NAME, SOURCE_NAME and SINK_NAME need to be replaced with the actual agent, channel, source and sink names respectively.

Affected Versions: Cloudera Manager 5.15.0

Fixed Versions: Cloudera Manager 5.15.1, 5.15.2, 5.16.1

After upgrading from Cloudera Manager 5.15.0, if you are using Flume with Kafka over TLS, your Flume service will be marked as stale. To resolve the problem, restart the Flume service after the upgrade.

Cloudera Issue: OPSAPS-45669

Upgrades from Cloudera Enterprise 5.15 to 6.0 Not Supported

You cannot upgrade from Cloudera Manager or CDH 5.15 to the upcoming release of Cloudera Manager and CDH 6.0.

Cloudera Manager read-only user can access sensitive cluster information

Due to a security vulnerability, a Cloudera Manager read-only user can access sensitive cluster information.

Products affected: Cloudera Manager

Releases affected:

- Cloudera Manager 5.12 and all prior releases
- Cloudera Manager 5.13.0, 5.13.1, 5.13.2, 5.13.3
- Cloudera Manager 5.14.0, 5.14.1, 5.14.2, 5.14.3

Users affected: All

Date of detection: April 18th, 2018

Detected by: Cloudera

Severity: High

Impact: Sensitive Information Disclosure

CVE: CVE-2018-10815

Immediate action required: Upgrade Cloudera Manager to a release with the fix.

Addressed in release/refresh/patch: Cloudera Manager 5.15.0 and higher, 5.14.4

Knowledge base: For the latest update on this issue, see the corresponding Knowledge article: TSB 2018-306: Cloudera Manager Information Disclosure

Accumulo health check fails on Cloudera Manager upgrade

After upgrading Cloudera Manager from 5.14.0 to 5.15.0, a health check failed with the message "ACCUMULO16-ACCUMULO16_MASTER-1 has undesired health: BAD"

Workaround:

Products affected: Cloudera Manager, Accumulo

Cloudera Bug: CDH-69677

Cloudera Manager should not omit LDAP GROUP_MAPPING passwords from NodeManager

After upgrading Cloudera Manager, clusters on CDH 5.5 or higher will be marked as stale if they had set a value for the **Hadoop User Group Mapping LDAP TLS/SSL Truststore Password** or **Hadoop User Group Mapping LDAP Bind User Password** configuration properties.

Workaround: Restart the stale services to pick up this fix. The configurations that will be marked stale are:

```
hadoop.security.group.mapping.ldap.ssl.keystore.password,  
hadoop.security.group.mapping.ldap.bind.password.
```

Products affected: Cloudera Manager

Affected versions: Cloudera Manager 5.5 or higher

Fixed versions: Cloudera Manager 5.16.1

Cloudera Bug: OPSAPS-45440

Import step in Hive replication can fail in 5.15.0 due to a Hive concurrency issue

In Cloudera Manager 5.15.0, BDR uses multi-threaded import and export for Hive replication by default. Because of a known Hive concurrency issue, the import step may occasionally fail with a `NullPointerException` for either the add partition or create table operations.

Workaround: Most of the time, running the replication again will be successful. If you continue to run into this issue, you can disable multi-threaded import and export by setting the **Number of concurrent HMS connections** on the **Advanced** tab of the replication schedule to 0 or fewer.

Products affected: Cloudera Manager

Affected versions: Cloudera Manager 5.15.0 and higher

Cloudera Bug: CDH-67557

Hard Restart of Cloudera Manager Agents May Cause Subsequent Service Errors

If a “hard restart” or “hard stop” operation is performed on a Cloudera Manager Agent, the restarted agent will erroneously restart roles that existed prior to the restart and, subsequently, 60 days later, these roles may experience errors or be killed.

Products affected: Cloudera Manager

Releases affected: All versions of Cloudera Manager 5.x

Cloudera Bug: OPSAPS-43550, TSB-308

Knowledge base: For the latest update on this issue, see the corresponding Knowledge article: [TSB 2018-308: Hard Restart of Cloudera Manager Agents May Cause Subsequent Service Errors](#)

Editing Cloudera Manager configurations in Google Chrome may lead to unexpected configuration loss

Google Chrome version 66, released on 28 April 2018, introduced behavior changes that can trigger unintended modification of existing configuration values in Cloudera Manager. If a page contains a password field, the browser aggressively applies auto-complete form data to the first text field and first password form fields. These unintended changes to the fields could be accidentally submitted unless the user pays careful attention to the visual cues (auto-filled fields that are highlighted) or change summary view presented just before submitting the changes.

Products affected: Cloudera Manager

Releases affected: All releases of Cloudera Manager

For the latest update on this issue see the corresponding Knowledge article: [TSB 2018-314: Editing Cloudera Manager configuration in Google Chrome may lead to unexpected configuration loss](#).

Impala Dynamic Resource Pools wrongly gives everyone access to root pool (and all child pools)

When you use ACLs for YARN queue management in the Cloudera Manager Admin Console and you do not specify any users or groups for the root pool, all users are allowed to access the pools.

Products affected: Cloudera Manager Admin Console: Dynamic Resource Pools

Releases affected: Cloudera Manager 5.12.1 or higher

Workaround: Specify a user or group for the root pool.

Cloudera Bug: OPSAPS-45046

Cross-site scripting vulnerability in Cloudera Manager

Several pages in the Cloudera Manager Admin console are vulnerable to a cross-site scripting attack.

Products affected: Cloudera Manager Admin Console

Releases affected:

- Cloudera Manager releases lower than 5.12
- Cloudera Manager 5.12.0, 5.12.1, 5.12.2
- Cloudera Manager 5.13.0, 5.13.1
- Cloudera Manager 5.14.0, 5.14.1

Users roles affected: Cluster Administrator, Full Administrator

Date of detection: January 19, 2018

Detected by: Shafeeque Olasey Kunnikkal of Ingram Micro Asia Ltd, Security Consulting & Services

Severity (Low/Medium/High): High

Impact: A cross-site scripting vulnerability can be used by an attacker to perform malicious actions. One probable form of attack is to steal the credentials of a victim's Cloudera Manager account.

CVE: CVE-2018-5798

Immediate action required: Upgrade to a release in which this issue has been fixed.

Addressed in release/refresh/patch:

- Cloudera Manager 5.13.2 and higher
- Cloudera Manager 5.14.2 and higher

Knowledge base: For the latest update on this issue, see the corresponding Knowledge article: [XSS Scripting Vulnerability in Cloudera Manager](#)

Backup and Disaster Recovery (BDR) HDFS and Hive Replications may fail when replicating from source clusters which use HDFS HA and are managed by Cloudera Manager 5.13.3 or 5.14.2 to destination clusters managed by Cloudera 5.14.2.

All HDFS and Hive replication schedules fail when all the following conditions are met:

- The destination cluster is managed by Cloudera Manager 5.14.2.
- The source cluster is managed by Cloudera Manager 5.13.3+ or 5.14.2+.
- The source cluster uses HDFS HA.

Customers may observe logs with an error exception "java.net.UnknownHostException" that causes all replication jobs on to fail.

There is a workaround described below, which can have a performance impact on replication jobs (especially if the environment was previously running Cloudera Manager 5.13 or 5.14). The preferred solution is to upgrade to a later release. Upgrading is strongly recommended for any customer running HDFS or Hive replications and using Cloudera Manager 5.14.2, and is mandatory when any of the source cluster replicating data to the 5.14.2 clusters is a cluster managed by Cloudera Manager 5.13.3+ or 5.14.2+.

Products affected: Cloudera Manager Backup and Disaster Recovery

Releases affected: Cloudera Manager 5.14.2 (when used as the destination cluster of HDFS and/or Hive replication)

Users affected: Customers using HDFS or Hive Replication

Severity (Low/Medium/High): High

Root Cause and Impact:

In HDFS Replication, Cloudera Manager first runs a process on the source cluster that lists the files to be copied. Due to a bug, inconsistent arguments are issued to this process. This results in an attempt to copy an incorrect file that can't be accessed, resulting in an exception: `java.net.UnknownHostException`.

This issue affects all HDFS & Hive replication schedules when the destination cluster is managed by Cloudera Manager 5.14.2 and the source cluster is managed by either Cloudera Manager 5.13.3+ or 5.14.2+.

Immediate action required: If you use BDR, do not upgrade a destination environment to Cloudera Manager 5.14.2. Upgrade to Cloudera Manager 5.14.3 or higher when it becomes available.

If you have already upgraded to Cloudera Manager 5.14.2, you can work around this bug by disabling the process that runs the file listing (copy listing) on the source cluster. This results in file listing phase happening in the destination environment, which can be slower when there is significant network latency between environments. This feature became available in Cloudera Manager 5.13.0.

To disable the feature that runs the copy listing phase, set the feature flag to false with the Cloudera Manager API as follows:

API endpoint for setting feature flag (HTTP PUT call):

```
api/v18/cm/config
```

Body of the API call:

```
{"items":[{"name":"feature_flag_run_copylist_source","value":"false"}]}
```

Please note that if you are upgrading from Cloudera Manager 5.12 or earlier to Cloudera Manager 5.14.2, disabling this feature will not have any impact on runtime. If you upgraded from Cloudera Manager 5.13.0 or Cloudera Manager 5.14.x to 5.14.2, you will see some performance degradation in the file listing phase of HDFS & Hive Replication as the process will be running on the destination cluster. The impact is driven by the number of HDFS files and folders in the source cluster.

Addressed in release/refresh/patch: Cloudera Manager 5.14.3 and higher

Knowledge base: For the latest update on this issue, see the corresponding Knowledge article: [TSB 2018-305: Backup and Disaster Recovery \(BDR\) HDFS and Hive Replications may fail after upgrading to Cloudera Manager 5.14.2](#)

Hive Replications Can Fail Intermittently

Hive replication jobs can fail intermittently during the first step of replication while exporting Hive metadata. When this happens, the following message displays in Cloudera Manager: **The remote command failed with error message: Hive Replication Export Step failed.** The likelihood that this error can occur increases with the length of time it takes to export Hive metadata. If you have a very large Hive deployment (those containing many tables and partitions), and/or environments in which the Hive metastore server is under-resourced, you are more likely to see this issue. However, having many tables and partitions or having an under-resourced Hive metastore server do not cause this issue. The problem is caused by a bug and the only solution is to upgrade to a later release. Cloudera strongly recommends upgrading to anyone running Hive Replication and using Cloudera Manager 5.13.0 or 5.13.1 versions.

Affected Products: Cloudera Manager

Affected Versions: Cloudera Manager 5.13.0, 5.13.1

Who is Affected: Anyone using Hive Replication

Severity (Low/Medium/High): High

Cause and Impact: A file is created during the Hive Export Phase, and is used by later phases, such as the Transfer/Import phases. Because of a bug, sometimes the file is overwritten by another process. Hive Replication can thus fail intermittently because of `FileNotFoundException`s. A retry may or may not resolve the issue. This issue can potentially affect some or all Hive replication schedules.

Workaround: Upgrade to Cloudera Manager 5.13.2, 5.14.1, or higher versions

Addressed in release/refresh/patch: Cloudera Manager 5.13.2, 5.14.1, or higher versions.

For the latest updates on this issue, see the following corresponding Knowledge Base article:

[TSB 2018-276: Hive Replications can fail intermittently in Cloudera Manager 5.13.0, 5.13.1 versions](#)

HDFS DataNode stale configuration

After upgrading to Cloudera Manager 5.10 or higher, the following configuration for HDFS DataNodes will be marked as stale: `dfs.datanode.balance.max.concurrent.moves`.

The staleness is caused by the following new feature: HDFS balancer can now be configured to specify which hosts are included and excluded or which hosts are used as sources for transferring replicas. Additional properties for tuning the performance of the balancer can now also be configured starting with CDH 5.10.0.

Workaround: You can safely ignore this warning and defer restarting.

Affected versions: Cloudera Manager 5.10.0 and lower

Cloudera Bug: OPSAPS-36642

YARN MapReduce Job History stale configuration

When upgrading to Cloudera Manager 5.10, YARN will be marked as having stale configuration due to `mapreduce.jobhistory.loadedjob.tasks.max`. Unless you change this parameter and want the non-default value to take effect (only takes effect in CDH 5.9+), you can simply ignore this staleness and defer restarting YARN.

Cloudera bug: OPSAPS-32132

Logging issue slows down Backup and Disaster Recovery Hive and HDFS Replication jobs

When using Cloudera Manager for cross-cluster replication of HDFS and Hive, unnecessary warning logs are printed during the initial phase of replication ('copy listing'). These logs are printed for each and every file that Cloudera Backup and Disaster Recovery (BDR) copies. This causes a very verbose log output which slows down this phase of the replication job and can affect overall replication times considerably. This happens only when both source and target clusters are running Cloudera Manager 5.14.0.

Workaround: Upgrade to Cloudera Manager 5.14.1 (or higher), or:

1. In the Cloudera Manager Admin Console for the **source** cluster, go to the HDFS service and click **Configuration > HDFS Replication Environment Advanced Configuration Snippet (Safety Valve)**.
2. Add the following parameter to the configuration snippet: `HADOOP_ROOT_LOGGER=ERROR`
3. Save the Configuration.

Warning: With this change, the amount of logging available for replication jobs will be significantly reduced, which can make it difficult to debug any issues with BDR replication. We highly recommend you revert this configuration change after upgrading to a version that includes the fix (5.14.1 or higher).

Affected versions: Cloudera Manager 5.14.0

Fixed version: Cloudera Manager 5.15.0, Cloudera Manager 5.14.1

Cloudera bug: OPSAPS-44160

See TSB-289.

Cloudera Manager upgrade workflow incorrectly requires deploying some optional management roles

When a user upgrades to Cloudera Manager 5.14.0, after all the agents have been updated to 5.14.0, the user sees an Upgrade Wizard, and is asked to select where to place the Navigator Metadata Server, Navigator Audit Server, and the Reports Manager roles. The **Continue** button is disabled until user adds one of the roles.

Workaround:

1. When prompted to add Navigator and Reports Manager roles, click the main Cloudera Manager Logo to exit the wizard.
2. Note that this action skips over a review of the Java heap size of the Host Monitor and Service Monitor roles. (Normally, Cloudera Manager recommends a value if it finds the existing values to be too small for the number of nodes being managed). If configured properly, this is not a concern. For more information on resource requirements for Cloudera Manager, see: [Cloudera Manager Hardware Requirements](#).
3. To complete the upgrade, start (or restart) the Cloudera Management Service (not the Cloudera Manager server). From the Cloudera Manager **Status** page, click the drop-down list next to **Cloudera Management Service** and select **Start** or **Restart**.

Alternatively, when prompted to add the Navigator and Reports Manager roles, users can:

1. Add the Navigator Metadata Server role and click **Continue**.
2. Configure a database for the Navigator Metadata Server and click **Continue**.
3. Stop and Delete the Navigator Metadata Server role from the **Cloudera Management Service > Instances** page immediately afterwards. See [Deleting Role Instances](#).

Affected Versions: Cloudera Manager 5.14.0

Fixed version: Cloudera Manager 5.14.1, 5.15.0

Cloudera Bug: OPSAPS-44629

See TSB-290

ADLS Credentials in Log Files

When you use Cloudera Manager to configure the ADLS Connector service using the **Less Secure** option for the **Credentials Protection Policy**, it is possible for Hive audit logs to include Microsoft Azure credentials. If you are using Navigator Audit Server, these credentials may appear in audit reports. To mitigate this problem, make sure that access to Hive logs is appropriately controlled and that Navigator users with **Auditing Viewer** roles are cleared to have access to the Hive credentials.

Affected Versions: Cloudera Manager 5.14.x

Cloudera Bug: CDH-56241

Installing Cloudera Manager on SLES Using the Installer Does Not Work

[Installing](#) Cloudera Manager 5 using the installer does not work on SLES due to PostgreSQL dependency issues

Workaround:

Perform a [regular installation](#).

Affected Versions: Cloudera Manager 5

Fixed Versions: Cloudera Manager 5.15.0

Cloudera Bug: OPSAPS-44284, OPSAPS-44628

Cloudera Navigator is not supported in multi-cluster deployments of Cloudera Manager versions 5.12.0, 5.12.1, and 5.13.0

Navigator is not able to uniquely identify more than one cluster in installations of Cloudera Manager that support multiple clusters. This problem only occurs for Cloudera Manager deployments of version 5.12.0, 5.12.1, or 5.13.0. Avoid multi-cluster installations with these releases if you expect to use Cloudera Navigator. This problem does not affect single cluster deployments or Altus clusters.

Fixed in versions: Cloudera Manager 5.14.0 (Cloudera Navigator 2.13.0), 5.13.1 (2.12.1), 5.12.2 (2.11.2)

Cloudera Bug: NAV-5615

Backup and Disaster Recovery Hive replication fails intermittently

In rare situations, due to a race condition, Hive Replication jobs can fail intermittently during the first step of replication with the following error: `The remote command failed with error message: Hive Replication Export Step failed.`

Workaround: Run the replication again or upgrade to a version that includes the bug fix.

Affected versions: Cloudera Manager 5.13.x

Fixed in: Cloudera Manager 5.14.0, 5.13.1

Cloudera bug: OPSAPS-43676

Impala logs missing from diagnostic bundle

Impala and Kudu role logs can be missing from the diagnostic bundles if their log directories have broken symlinks.

Affected versions: Cloudera Manager 5.14.0, 5.13.x

Cloudera bug: OPSAPS-41194

Accumulo logs are not included in diagnostic bundles

Accumulo logs are missing from the diagnostic bundle when collected by "date range".

Affected versions: Cloudera Manager 5.14.0, 5.13.x

Cloudera bug: OPSAPS-43206

Backup and Disaster Recovery replication fails between two clusters when data is copied from one encryption zone to another when using CDH 5.12.0 or higher.

This issue occurs when the two clusters use HDFS high availability, and the nameservice names are the same.

Workaround: Use unique nameservice names for the HDFS clusters.

Affected versions: CDH 5.12.0 and higher

Fixed in: Cloudera Manager 5.15.0, 5.14.3, 5.13.3

Cloudera bug: OPSAPS-43406, OPSAPS-43556

Backup and Disaster Recovery Hive replication fails during the Export Hive metastore step when using encrypted zones

If the `/user` or `/user/hdfs` directory is encrypted, then Hive replication fails with the following message: `User :hdfs not allowed to do 'DECRYPT_EEK' on some-key-name.`

Workaround: Configure a directory to store transient data during Hive replication:

1. Open the **Cloudera Manager Admin Console**.
2. Click **Backup > Replication Schedules**.
3. Select the replication schedule that fails and click **Actions > Edit Configuration**.
4. On the **Advanced** tab, specify an unencrypted directory for the **Export Path** or **Directory for metadata file** field. The field name depends on your Cloudera Manager version.

Affected versions: Cloudera Manager 5.13, 5.12.x, 5.11.x, 5.10.x, 5.9.x, 5.8.x

Cloudera bug: OPSAPS-43108

Backup and Disaster Recovery replication fails if the previous run is aborted

BDR replication fails with "another command" error if the previous run is aborted during the second or third step.

Workaround: Restart the Cloudera Manager Server. To prevent this error from occurring, do not abort replication during the second or third step.

Affected versions: Cloudera Manager 5.13

Fixed in: Cloudera Manager 5.14.0, 5.13.1

Backup and Disaster Recovery (Hive) replication fails if the user directory is encrypted

BDR replication fails if the user directory of the user specified in the **Run as Peer User** or **Run as username** field in the replication schedule is encrypted due to a change in how replications are performed. If no **Run as Peer User** is configured, then replication fails if the `hdfs` user directory is encrypted. For example, Hive replication fails on clusters where the `/user/testuser` directory is encrypted and the **Run as username** field specifies the "testuser" user.

Affected versions: Cloudera Manager 5.13.0, 5.12.x

Fixed in: Cloudera Manager 5.14.0, 5.13.1

Workaround: Make the user directory unencrypted or configure a user for the replication who does not have an encrypted user directory. Alternatively, disable copylisting on source with the following Cloudera Manager API:

- API endpoint: `/cm/config`
- Payload: `{"items":[{"name":"feature_flag_run_copylist_source","value":"false"}]}`

Cloudera bug: OPSAPS-42445

Upgrade to CDH 5.13 or higher Requires Pre-installation of Spark 2.1 or Spark 2.2

If your cluster has Spark 2.0 or Spark 2.1 installed and you want to upgrade to CDH 5.13 or higher, you must first upgrade to Spark 2.1 release 2 or later before upgrading CDH. To install these versions of Spark, do the following before running the CDH Upgrade Wizard:

1. Install the Custom Service Descriptor (CSD) file. See

- [Installing Spark 2.1](#)
- [Installing Spark 2.2](#)

Note:

Spark 2.2 requires that JDK 1.8 be deployed throughout the cluster. JDK 1.7 is not supported for Spark 2.2.

See [Step 2: Install Java Development Kit](#).

2. Download, distribute, and activate the Parcel for the version of Spark that you are installing:

- **Spark 2.1 release 2:** The parcel name includes "cloudera2" in its name.
- **Spark 2.2 release 1:** The parcel name includes "cloudera1" in its name.

See [Managing Parcels](#).

Affected versions: CDH 5.13.0 and higher

Cloudera bug: CDH-56775

Record Service no longer supported as of CDH 5.13; upgrade fails after from some lower versions

When upgrading a cluster with Record Service installed from CDH 5.10.0 or lower to CDH 5.13 or higher, Record Service fails with a `java.lang.NoClassDefFoundError`. Record Service is no longer supported in CDH.

Affected CDH Versions: 5.10.0 and lower when upgrading to CDH 5.13.0 or higher.

Cloudera bug: CDH-59372

Sentry may require increased Java heap settings before upgrading CDH to 5.13

Before upgrading to CDH 5.13 or higher, you may need to increase the size of the Java heap for Sentry. A warning will be displayed during upgrade, but it's the user's responsibility to ensure this setting is adjusted properly before proceeding. See [Performance Guidelines](#).

Affected versions: CDH 5.13 or higher

Cloudera bug: OPSAPS-42541

Renaming an empty directory on Amazon S3 when using DynamoDB with S3Guard may fail

Renaming an empty directory on Amazon S3 when a DynamoDB table is used for S3Guard may fail and result in an error.

Affected versions: Cloudera Manager 5.12.0, 5.11.2, 5.11.1, 5.11.0

Fixed in: Cloudera Manager 5.12.0

Cloudera bug: CDH-51869

Apache bug: HADOOP-14036

Change in Hue Load Balancer version causes Hue Load Balancer and Server to be marked with stale configuration

After upgrading Cloudera Manager, the Hue Load Balancer and Server roles will be marked as having a stale configuration if all of these are true:

- The **Enable TLS/SSL for Hue** property is set to true.
- The Hue load balancer is enabled

Workaround: If your cluster uses Apache httpd 2.4 as the Hue load balancer, restart the Hue service promptly. If your cluster uses an earlier version of httpd, there is no urgency to restart the Hue service. (Apache httpd 2.4 is installed automatically by some recent versions of Linux, or may have been explicitly installed.)

Cloudera bug: OPSAPS-40700, OPSAPS-41850

Hue Load Balancer SSL Handshake error

Fixed an issue with the SSL handshake in Hue when Apache httpd 2.4 or higher is used as the load balancer. The Hue load balancer previously set the `ProxyPreserveHost` directive to `On`, when it should have been set to `Off`. This causes problems making SSL connections when using Apache httpd 2.4 or higher. The error caused problems when verifying the CN, which older versions of Apache httpd did not encounter because they did not properly verify the CN.

When upgrading Cloudera Manager, the Hue load balancer may be marked as having a stale configuration. If you are experiencing issues connecting to Hue with SSL, restart the Hue service to update the configuration.

Cloudera bug: OPSAPS-40700

Apache MapReduce Jobs May Fail During Rolling Upgrade to CDH 5.11.0 or CDH 5.11.1

In CDH 5.11, Cloudera introduced four new counters that are reported by MapReduce jobs. During a rolling upgrade from a cluster running CDH 5.10.x or lower to CDH 5.11.0 or CDH 5.11.1, a MapReduce job with an application master running on a host running CDH 5.10.x or lower may launch a map or reduce task on one of the newly-upgraded CDH 5.11.0 or CDH 5.11.1 hosts. The new task will attempt to report the new counter values, which the old application master will not understand, causing an error in the logs similar to the following:

```
2017-06-08 17:43:37,173 WARN [Socket Reader #1 for port 41187]
org.apache.hadoop.ipc.Server: Unable to read call parameters for client 10.17.242.22 on
connection protocol org.apache.hadoop.mapred.TaskUmbilicalProtocol for rpcKind
RPC_WRITABLE
java.lang.ArrayIndexOutOfBoundsException: 23
    at
    ...
```

This error could cause the task and the job to fail.

Workaround:

Avoid performing a rolling upgrade to CDH 5.11.0 or CDH 5.11.1 from CDH 5.10.x or lower. Instead, skip CDH 5.11.0 and CDH 5.11.1 if you are performing a rolling upgrade, and upgrade to CDH 5.12 or higher, or CDH 5.11.2 or higher when the release becomes available.

Cloudera bug: DOCS-2384, TSB-241

Rolling Upgrade with GPL Extras Parcel Causes Oozie to Fail

After performing a rolling upgrade where the GPL Extras parcel is upgraded, you must restart the Oozie service after completing the upgrade to let it pick up the latest client configurations. Otherwise, jobs newly submitted through Oozie may fail.

Affected versions: 5.14.0, 5.13.x, 5.12.x, 5.11.x

Cloudera bug: OPSAPS-41564

Maintenance State Minimal Block Replication staleness after upgrade

Upgrading to Cloudera Manager 5.12 or later may show `Maintenance State Minimal Block Replication` as a stale configuration under HDFS, suggesting a restart. It is safe to ignore this warning and delay restart.

Cloudera bug: OPSAPS-39102

Affected versions: Cloudera Manager 5.12 or higher

YARN ACL configuration property staleness after upgrade

After upgrading to Cloudera Manager 5.12, the following YARN configuration properties may show staleness warnings:

- ACL for viewing a job - `mapreduce.job.acl-view-job`
- ACL for modifying a job - `mapreduce.job.acl-modify-job`
- Enable MapReduce ACLs - `mapreduce.cluster.acls.enabled`

It is safe to defer restart if you are not using YARN job view/modify ACLs.

Affected versions: Cloudera Manager 5.12 or higher

Cloudera bug: OPSAPS-33586

Adding a service to an existing cluster

When you try to add a service such as Impala, Solr, Key-Value Store, or Sentry to an existing cluster, a timeout occurs.

Workaround

Deactivate the following parcels before you try to add a service: `KEYTRUSTEE`, `SQOOP_TERADATA_CONNECTOR` and any custom parcels.

Fixed in Cloudera Manager versions 5.8.5, 5.9.2, 5.10.1, and 5.11.

Cloudera bug: OPSAPS-38304

Services die due to HDFS taking too long to start

On Cloudera Manager managed clusters where HDFS takes a long time to come up after a restart, some dependent services may fail to start.

Workaround:

You can either manually start cluster services while waiting between steps or configure HDFS clients to automatically retry.

To manually start the cluster services, perform the following steps:

1. Start ZooKeeper and, if it's used, Kudu.
2. Start HDFS and wait for the HDFS NameNode to finish starting.
3. Run the following command:`hdfs dfsadmin -safemode get`.

This command turns safe mode off.

4. Start the remaining services.

To configure HDFS clients to automatically retry, perform the following steps:

1. In the Cloudera Manager web UI, select the HDFS service.
2. Select **Configuration > Gateway**.
3. In the **HDFS Client Advanced Configuration Snippet (Safety Valve) for hdfs-site.xml** field, add the following property: `dfs.client.retry.policy.enabled`.
4. Set the value to true.
5. Add a description.
6. Save the changes.
7. Select **Actions > Deploy Client Configuration**.
8. Start the cluster.

Cloudera bug: CDH-54889

hostname parameter is not passed to Impala catalog role

[IMPALA-5253](#) contained a security fix for clusters using Impala with TLS (SSL) security enabled. This fix was also made in several maintenance versions of CDH that require you to upgrade Cloudera Manager. If you upgrade to a CDH version with this fix without upgrading Cloudera Manager, Impala will not function when TLS is enabled for Impala. You should upgrade Cloudera Manager first if you want to move to a CDH version with the security fix.

This issue affects upgrades of Cloudera Manager and CDH to version 5.11.1.

There are two ways you can workaround this issue:

- Upgrade to one of the following versions of Cloudera Manager before upgrading CDH:
 - 5.13.0
 - 5.12.1
 - 5.11.2
 - 5.10.2
 - 5.9.3
 - 5.8.5

-or-

- *Before upgrading CDH*, set the `-hostname` option to the fully-qualified domain name of the Catalog Server using the **Catalog Server Command Line Argument Advanced Configuration Snippet (Safety Valve)** configuration property:

```
-hostname=fully-qualified-domain-name of Impala Catalog Server
```

(To set this property, in Cloudera Manager, go to the Impala service, select the **Configuration** tab and search for the property.

CDH versions with the Impala security fix:

- 5.11.1
- 5.10.2
- 5.9.3
- 5.8.5

Cloudera bug: OPSAPS-41218

Zookeeper Package Installation fails with Debian 7

Zookeeper installation fails because Debian 7 installs its own version of the Zookeeper package instead of the Cloudera version. As versions change, this may also affect additional Cloudera packages.

Workaround:

- For manual installations of Zookeeper, run the following `apt-get` command instead of the documented command when installing Zookeeper:

```
apt-get install zookeeper=3.4.5+cdh5.10.2+108-1.cdh5.10.2.p0.4~wheezy-cdh5.10.2
```

- To ensure the installation uses the current Cloudera version of all packages, create a file called `cloudera.pref` in the `/etc/apt/preferences.d` directory and add the following content before running the `apt-get` command to manually install CDH or using Cloudera Manager to install the packages:

```
Package: *  
Pin: release o=Cloudera, l=Cloudera  
Pin-Priority: 501
```

This change gives Cloudera packages higher priority than Debian-supplied packages.

The change assumes your base packages have the priority set to '500'. You can check whether the priority is correctly set by running the `apt-cache policy package_name` command. The output should list Cloudera packages as highest priority. This step must be done before both manual and Cloudera Manager-assisted package installations.

Cloudera bug: DOCS-2278

Automated Cloudera Manager installer fails on Ubuntu 16.04

Running the `cloudera-manager-installer.bin` installer file (as described in the [documentation](#)) fails on Ubuntu 16.04 LTS (Xenial).

Affected versions: Cloudera Manager 5.11.0

Fixed in: Cloudera Manager 5.11.1 and higher.

Cloudera bug: DOCS-2037

Reboot of HDFS nodes running RHEL 7 or CentOS 7 shortly after enabling High Availability or migrating NameNodes can lead to data loss or other issues

This issue affects Cloudera Manager 5.7.0 and 5.7.1 installed on RHEL 7.x or CentOS 7.x.

On RHEL 7.x and CentOS 7.x systems, certain configuration actions intended to be executed only once during enablement of HDFS HA or migration of HDFS roles might be erroneously re-executed if a system shutdown or reboot occurs within next 24 hours of either operation. This can result in data loss and inconsistent state if the user has performed a NameNode format or JournalNode format, which are part of both the enablement of HDFS HA (adding a standby NameNode) and relocation (migration) of NameNodes roles to other hosts. Edits to HDFS metadata stored in JournalNodes could be lost in these situations, requiring manual repair to recover recent changes to HDFS data. If you experience this issue, please contact Cloudera Support for assistance.

For the latest update on this issue see the corresponding Knowledge article: [TSB 2017-161: Reboot of HDFS nodes running RHEL 7/CentOS 7 after enabling High Availability or migrating NameNodes can lead to data loss or other issues.](#)

Resolution:

Upgrade to Cloudera Manager 5.7.2 or higher immediately, and perform a hard restart of Cloudera Manager agents.

Note: A hard agent restart will cause CDH roles to be restarted but can be performed after the upgrade in a scheduled, rolling manner, leveraging the HA capabilities of the CDH services. A normal rolling restart from the Cloudera Manager UI will not perform a hard restart.

Fixed in: Cloudera Manager 5.7.2 and higher.

The `Limit Nonsecure Container Executor Users` property has no effect in Cloudera 5.11

Workaround:

To configure the `yarn.nodemanager.linux-container-executor.nonsecure-mode.limit-users` property to true or false, you can do so using the YARN parameter **NodeManager Advanced Configuration Snippet (Safety Valve) for yarn-site.xml**.

Cloudera bug: OPSAPS-27702

Graceful shutdown of Kafka brokers does not work as expected

In CM 5.11.0, the new **Graceful Shutdown Timeout** configuration property does not work as expected. As a result, Kafka takes an additional 30 seconds (by default) to shut down, but will still only have 30 seconds to complete its controlled shutdown, before Cloudera Manager forcibly shuts down Kafka brokers regardless of the configured timeout.

Workaround:

Wait longer for the shutdown to occur, or reduce the **Graceful Shutdown Timeout** to a very low value, for example: 1. (You should restore the original value when you upgrade to a Cloudera Manager release with the fix for this issue, although it will not cause a critical problem if left at a low value.) There is no workaround that allows you to increase the real time that Kafka has to perform shutdown until this issue is fixed.

Fixed in Cloudera Manager 5.11.1.

Cloudera bug: OPSAPS-40106

Spark Gateway roles should be added to every host

If you are using Cloudera Manager 5.9.0, 5.9.1, or 5.10.0 and have hosts with the NodeManager role but without the Spark Gateway role, you must [add the Spark Gateway role](#) to all NodeManager hosts and [redploy the client configurations](#). If you do not use this workaround, Cloudera Manager fails to locate the `topology.py` file, which can cause task localization issues and failures for very large jobs.

Fixed in Cloudera Manager 5.10.1.

Cloudera bug: OPSAPS-39119

HBase configuration is supplied for Hive when HBase service is not selected

Cloudera Manager provides configuration for the `hive-site.xml` file even if the HBase Service setting in Hive is not selected. This can cause unnecessary errors when Hive-on-Spark attempts to connect to HBase.

Workaround:

1. In Cloudera Manager, go to the Hive service.
2. Click the **Configuration** tab.
3. Search for the following Advanced Configuration Snippets:
 - **HiveServer2 Advanced Configuration Snippet (Safety Valve) for hive-site.xml**
 - **Hive Client Advanced Configuration Snippet (Safety Valve) for hive-site.xml**
4. Click the **+** icon to add the following property and value to both Advanced Configuration Snippets:
Name: `spark.yarn.security.tokens.hbase.enabled`
Value: `false`
5. Click **Save Changes**.
6. Click the stale configuration icon to restart stale services, including any dependent services. Follow the on-screen prompts.
7. Click **Actions > Deploy Client Configuration**.

8. When you execute a query that uses a HBase-backed table, set this parameter back to `true`. You can do this by changing the configuration as described above (set each value to `true`) or by using a `set` command and then issuing the query. For example:

```
set spark.yarn.security.tokens.hbase.enabled=true;  
SELECT * FROM HBASE_BACKED_TABLE ...
```

Fixed in Cloudera Manager 5.8.5 and 5.9.3.

Cloudera bug: OPSAPS-39021

Hive Replication fails when Impala is SSL enabled but Hadoop services are not

Support for Impala Replication with SSL enabled was added in Cloudera Manager 5.7.4, 5.8.2, 5.9.0 and higher.

Workaround:

1. In Cloudera Manager, go to the HDFS service.
2. Click the **Configuration** tab.
3. Search for and enter the appropriate values for the following parameters:
 - **Cluster-Wide Default TLS/SSL Client Truststore Location**
 - **Cluster-Wide Default TLS/SSL Client Truststore Password**

Impala metadata replication is not supported, but will be supported in a later maintenance release.

This support also ensures that connection to Impala is successful when SSL is enabled even if Kerberos is not enabled.

Cloudera bug: OPSAPS-38700, OPSAPS-38720

Fixed in Cloudera Manager 5.11, 5.10.1, 5.9.2, 5.8.4, 5.7.6.

python-psycopg2 Dependency

Cloudera Manager 5.8 and higher has a new dependency on the package `python-psycopg2`. This package is not available in standard SLES 11 and SLES 12 repositories. You need to add this repository or install it manually to any machine that runs the Cloudera Manager Agent before you install or upgrade Cloudera Manager.

If the Cloudera Manager Server and Agent run on the same host, install the Cloudera Manager Server first and then add the `python-psycopg2` repository or package. After adding the repository or package, install the Cloudera Manager Agent.

Workaround

Download the `python-psycopg2` repository or package from the following URL by selecting the correct SLES version: <https://software.opensuse.org/package/python-psycopg2>.

Pauses in Cloudera Manager after adding peer

Pauses and slow performance of the Cloudera Manager Admin Console occur after creating a peer.

Workaround:

Increase the memory allocated to Cloudera Manager:

1. On the Cloudera Manager server host, edit the `/etc/default/cloudera-scm-server` file.
2. In the `Java Options` section, change the value of the `-Xmx` argument of the `CMF_JAVA_OPTS` property from `-Xmx2G` to `-Xmx4G`. For example:

```
export CMF_JAVA_OPTS="-Xmx4G -XX:MaxPermSize=256m -XX:+HeapDumpOnOutOfMemoryError  
-XX:HeapDumpPath=/tmp"
```

3. Restart the Cloudera Manager server:

```
sudo service cloudera-scm-server restart
```

Fixed in Cloudera Manager 5.11

Cloudera bug: OPSAPS-38868

Cannot select time period in custom charts in C5.9

The quick time selection (30m, 1h, and so on) on custom dashboards does not work in 5.9.x.

Fixed in Cloudera Manager 5.9.1 and higher.

Cloudera bug: OPSAPS-37190

Cloudera Manager 5.8.2 allows you to select nonexistent CDH 5.8.1 package installation

The Cloudera manager 5.8.2 install/upgrade wizard allows you to select CDH 5.8.1 as a package installation, even though CDH 5.8.1 does not exist. The installation fails with an error message similar to the following:

```
[Errno 14] HTTPS Error 404 - Not Found
```

Workaround

Return to the package selection page, and select **Latest Release of CDH5 component compatible with this version of Cloudera Manager** or **CDH 5.8.2**.

Cloudera bug: OPSAPS-36860

Error when distributing parcels: No such torrent

Parcel distribution might fail with an error message conforming to:

```
Error when distributing to <host>: No such torrent: <parcel_name>.torrent
```

Workaround

Remove the file `/opt/cloudera/parcel-cache/<parcel_name>.torrent` from the host.

Cloudera bug: OPSAPS-37183

Hive Replication Metadata Transfer Step fails with Temporary AWS Credential Provider

Hive Replication Schedules that use Amazon S3 as the **Source** or **Destination** fail when using temporary AWS credentials. The following error displays:

```
Message: Hive Replication Metadata Transfer Step Failed -
com.cloudera.com.amazonaws.services.s3.model.AmazonS3Exception:
Status Code: 403, AWS Service: Amazon S3, AWS Request ID: 76D1F6A02792908A,
AWS Error Code: null, AWS Error Message: Forbidden,
S3 Extended Request ID:
Xy3nAS4HSPKLA6hHKvpqReBud7M1Fhk7On0HttYGE0eKPHKwiFkTPQxEVU82OZq5d8omSrdhbcI=.
```

Cloudera bug: OPSAPS-37514

Hive table Views do not get restored from S3

When creating a Hive Replication schedule that copies Hive data from S3 and you select the **Reference Data From Cloud** option, Hive table Views are not restored correctly and result in a Null Pointer Exception when querying data from the view.

Fixed in Cloudera Manager 5.9.1 and higher.

Cloudera bug: OPSAPS-37549

ACLs are not replicated when restoring Hive data from S3

ACLs are never replicated when the **Enable Access Control Lists** option in the configuration of the HDFS service is not selected the first time a Replication Schedule that replicates from S3 to Hive runs. Enabling it and re-running the restore operation does not restore the ACLs.

Cloudera bug: OPSAPS-37004

Snapshot diff is not working for Hive to S3 replication when data is deleted on source

If you have enabled snapshots on an HDFS folder and a Hive table uses an external file in that folder, and then you replicate that data to S3 and delete the file on the source cluster, the file is not deleted in subsequent replications to S3, even if the **Delete Permanently** option is selected.

Cloudera bug: OPSAPS-36910

Block agents from heartbeating to a Cloudera Manager with different UUID until agent restart

If for some reason Cloudera Manager server's identity (Cloudera Manager guid) is changed, agents drop heartbeat requests and will not follow any requested commands from Cloudera Manager server. As a result, the agents report bad health. This situation can be fixed by taking either of the following approaches:

- Restore the previous Cloudera Manager server guid

OR

- Remove the cm_guid file from each of the agents and then restart the agent.

Cloudera bug: OPSAPS-34847

Cloudera Manager set catalogd default jvm memory to 4G can cause out of memory error on upgrade to Cloudera Manager 5.7 or higher

After upgrading to 5.7 or higher, you might see a reduced Java heap maximum on Impala Catalog Server due to a change in its default value. Upgrading from Cloudera Manager lower than 5.7 to Cloudera Manager 5.8.2 no longer causes any effective change in the Impala Catalog Server Java Heap size.

When upgrading from Cloudera Manager 5.7 or later to Cloudera Manager 5.8.2, if the Impala Catalog Server Java Heap Size is set at the default (4GB), it is automatically changed to either 1/4 of the physical RAM on that host, or 32GB, whichever is lower. This can result in a higher or a lower heap, which could cause additional resource contention or out of memory errors, respectively.

Cloudera bug: OPSAPS-34039

Cloudera Manager 5.7.4 installer does not show Key Trustee KMS

A fresh install of Cloudera Manager tries to install Key Trustee KMS 5.8.2 when trying to install the latest version. You must either choose 5.7.0 as the Key Trustee KMS version, or manually provide a link to the 5.7.4 bits.

Class Not Found Error when upgrading to Cloudera Manager 5.7.2

When you upgrade to version 5.7.2 of Cloudera Manager, the client configuration for all services is marked *stale*.

Workaround:

From the **Cluster** menu, select **Deploy Client Configuration** to redeploy the client configuration.

Kerberos setup fails on Debian 8.2

This issue is due to the following Debian bug: <https://bugs.debian.org/cgi-bin/bugreport.cgi?bug=777579;msg=5;att=0>.

Workaround:

1. Log in to the host where the Cloudera Manager server is running.
2. Edit the `systemd/system/krb5-admin-server.service` file and add `/etc/krb5kdc` to the `ReadWriteDirectories` section.
3. Run the following commands:

```
systemctl daemon-reload
sudo service krb5-admin-server restart
```

4. Generate the credentials.

Cloudera bug: OPSAPS-33713

Password in Cloudera Manager's `db.properties` file is not redacted

The `db.properties` file is managed by customers and is populated manually when the Cloudera Manager Server database is being set up for the first time. Since this occurs before the Cloudera Manager Server has even started, encrypting the contents of this file is a completely different challenge as compared to that of redacting configuration files.

Releases affected: 5.3 and higher

Cloudera bug: OPSAPS-24813

Cluster provisioning fails

In some cases, provisioning of a cluster may fail at the start of the process. This does not happen in all cases and is mainly noticed on RHEL 6 and especially when some hosts are reporting bad health.

Releases affected: 5.5.0-5.5.3, 5.6.0-5.6.1, 5.7.0

Releases containing the fix: 5.5.4, 5.7.1

For releases containing the fix, parcel activation and first run command now completes as expected, even when some hosts report bad health.

This issue is fixed in Cloudera Manager 5.5.4 and 5.7.1 and higher.

Cloudera bug: OPSAPS-33564

Cloudera Manager can run out of memory if a remote repository URL is unreachable

If one of the URLs specified in on the **Parcel Settings** page (**Hosts > Parcels > Configuration**) becomes unreachable, Cloudera Manager may run out of memory.

Workaround:

Do one of the following:

- If the URL is incorrect, enter the correct URL.
- Deselect the **Automatically Download New Parcels** setting on the **Parcel Settings** page.
- Set the value of the **Parcel Update Frequency** on the **Parcel Settings** to a large interval such as several days.

Cloudera bug: OPSAPS-31732

Clients can run Hive on Spark jobs even if Hive dependency on Spark is not configured

In CDH 5.7 and higher, when Hive and Spark on YARN both are configured, but Hive is not configured to depend on Spark on YARN, clients can set the execution engine to `spark` and Hive on Spark jobs will still be executed but will run in an unsupported mode. These jobs may not appear in the Spark History Server.

Workaround: Configure Hive to depend on Spark on YARN.

Cloudera bug: OPSAPS-32023

The YARN NodeManager connectivity health test does not work for CDH 5

The NodeManager connectivity is always GOOD (green) even if the ResourceManager considers the NodeManager to be LOST or DECOMMISSIONED.

Cloudera bug: OPSAPS-31251

Workaround: None.

HDFS HA clusters see NameNode failures when KDC connectivity is bad

When KDC connectivity is bad, the JVM takes 30 seconds before retrying or declaring failure to connect. Meanwhile, the JournalNode write timeout (which needs KDC authentication for the first write, or under troubled connectivity), is only 20 seconds.

Workaround: In `krb5.conf`, set the `kdc_timeout` parameter value to 3 seconds. In Cloudera Manager, perform the following steps:

1. Go to **Administration > Settings > Kerberos**.
2. Add the `kdc_timeout` parameter to the **Advanced Configuration Snippet (Safety Valve) for [libdefaults]** section of `krb5.conf` property. This should give the JVM enough time to try connecting to a KDC before the JournalNode timeout.

The HDFS File browser in Cloudera Manager fails when HDFS federation is enabled

Workaround: Use the command-line `hdfs dfs` commands to directly manipulate HDFS files when federation is enabled. CDH supports HDFS federation.

Hive Metastore canary fails to drop database

The Hive Metastore canary fails to drop the database due to [HIVE-11418](#).

Cloudera bug: OPSAPS-27632

Workaround: Turn off the Hive Metastore canary by disabling the Hive Metastore Canary Health Test:

1. Go to the Hive service.
2. Click the **Configuration** tab.
3. Select **SCOPE > Hive Metastore Server**.
4. Select **CATEGORY > Monitoring**.
5. Deselect the **Hive Metastore Canary Health Test** checkbox for the Hive Metastore Server Default Group.
6. Click **Save Changes** to commit the changes.

Cloudera Manager upgrade fails due to incorrect Sqoop 2 path

Sqoop 2 will not start or loses data when upgrading from Cloudera Manager 5.4.0 or 5.4.1 to Cloudera Manager 5.4.3, or when upgrading Cloudera Manager 3 or 4 to Cloudera Manager 5.4.0 or 5.4.1. This is due to Cloudera Manager erroneously configuring the Derby path with "reposito~~y~~" instead of "repository". To upgrade Cloudera Manager, use one of the following workarounds:

- **Workaround for Upgrading from Cloudera Manager 3 or 4 to Cloudera Manager 5.4.0 or 5.4.1**
 1. Log in to your Sqoop 2 server host using SSH and move the Derby database files to the new location, usually from `/var/lib/sqoop2/repositoy` to `/var/lib/sqoop2/repository`.
 2. Start Sqoop2. If you found this problem while upgrading CDH, run the Sqoop 2 database upgrade command using the **Actions** drop-down menu for Sqoop 2.
- **Workaround for Upgrading from Cloudera Manager 5.4.0 or 5.4.1 to Cloudera Manager 5.4.3**
 1. Log in to your Sqoop 2 server host using SSH and move the Derby database files to the new location, usually from `/var/lib/sqoop2/repositoy` to `/var/lib/sqoop2/repository`.

2. Start Sqoop2, or if you found this problem while upgrading CDH, run the Sqoop 2 database upgrade command using the **Actions** drop-down menu for Sqoop 2.

NameNode incorrectly reports missing blocks during rolling upgrade

During a rolling upgrade to any of the CDH releases listed below, the NameNode may report missing blocks after rolling back multiple DataNodes. This is caused by a race condition with block reporting between the DataNode and the NameNode. No permanent data loss occurs, but data can be unavailable for up to six hours before the problem corrects itself.

Releases affected: CDH 5.0.6, 5.1.5, 5.2.5, 5.3.3, 5.4.1, 5.4.2.

Releases containing the fix:: CDH 5.2.6, 5.3.4, 5.4.3

Workaround:

- **To avoid the problem** - Cloudera advises skipping the affected releases and installing a release containing the fix. For example, do not upgrade to CDH 5.4.2; upgrade to CDH 5.4.3 instead.
- **If you have already completed an upgrade to an affected release, or are installing a new cluster** - You can continue to run the release, or upgrade to a release that is not affected.

Cloudera bug: OPSAPS-27205

Using ext3 for server dirs easily hit inode limit

Using the ext3 filesystem for the Cloudera Manager command storage directory may exceed the maximum subdirectory size of 32000.

Workaround: Either decrease the value of the **Command Eviction Age** property so that the directories are more aggressively cleaned up, or migrate to the ext4 filesystem.

Cloudera bug: OPSAPS-26951

Backup and disaster recovery replication does not set MapReduce Java options

Replication used for backup and disaster recovery relies on system-wide MapReduce memory options, and you cannot configure the options using the Advanced Configuration Snippet.

Cloudera bug: OPSAPS-25503

Kafka 1.2 CSD conflicts with CSD included in Cloudera Manager

If the Kafka CSD was installed in Cloudera Manager to 5.3 or lower, the old version must be uninstalled, otherwise it will conflict with the version of the Kafka CSD bundled with Cloudera Manager 5.4.

Workaround: Remove the Kafka 1.2 CSD before upgrading Cloudera Manager to 5.4:

1. Determine the location of the CSD directory:
 - a. Select **Administration > Settings**.
 - b. Click the **Custom Service Descriptors** category.
 - c. Retrieve the directory from the **Local Descriptor Repository Path** property.
2. Delete the Kafka CSD from the directory.

Cloudera bug: OPSAPS-25995

Recommission host does not deploy client configurations

The failure to deploy client configurations can result in client configuration pointing to the wrong locations, which can cause errors such as the NodeManager failing to start with "Failed to initialize container executor".

Workaround: Deploy client configurations first and then restart roles on the recommissioned host.

Cloudera bug: OPSAPS-25995

Hive on Spark is not supported in Cloudera Manager and CDH 5.4 and CDH 5.5

You can configure Hive on Spark, but it is not recommended for production clusters.

Cloudera bug: OPSAPS-25983

Upgrade wizard incorrectly upgrades the Sentry DB

There's no Sentry DB upgrade in 5.4, but the upgrade wizard says there is. Performing the upgrade command is not harmful, and taking the backup is also not harmful, but the steps are unnecessary.

Cloudera bug: OPSAPS-25405

Cloudera Manager does not correctly generate client configurations for services deployed using CSDs

HiveServer2 requires a Spark on YARN gateway on the same host in order for Hive on Spark to work. You must deploy Spark client configurations whenever there's a change in order for HiveServer2 to pick up the change.

CSDs that depend on Spark will get incomplete Spark client configuration. Note that Cloudera Manager does not ship with any such CSDs by default.

Cloudera bug: OPSAPS-25695

Workaround: Use `/etc/spark/conf` for Spark configuration, and ensure there is a Spark on YARN gateway on that host.

Solr, Oozie and HttpFS fail when KMS and TLS/SSL are enabled using self-signed certificates

When the KMS service is added and TLS/SSL is enabled, Solr, Oozie and HttpFS are not automatically configured to trust the KMS's self-signed certificate and you might see the following error.

```
org.apache.oozie.service.AuthorizationException: E0501: Could not perform authorization operation,
sun.security.validator.ValidatorException: PKIX path building failed:
sun.security.provider.certpath.SunCertPathBuilderException:
unable to find valid certification path to requested target
```

Cloudera bug: OPSAPS-23392, CDH-23460, CDH-23189

Workaround: You must explicitly load the relevant truststores with the KMS certificate to allow these services to communicate with the KMS. To do so, edit the truststore location and password for Solr, Oozie and HttpFS (found under the HDFS service) as follows.

1. Go to the Cloudera Manager Admin Console.
2. Go to the Solr/Oozie/HDFS service.
3. Click the **Configuration** tab.
4. Search for "<service> TLS/SSL Certificate Trust Store File" and set this property to the location of truststore file.
5. Search for "<service> TLS/SSL Certificate Trust Store Password" and set this property to the password of the truststore.
6. Click **Save Changes** to commit the changes.

Cloudera Manager 5.3.1 upgrade fails if Spark standalone and Kerberos are configured

CDH upgrade fails if Kerberos is enabled and Spark standalone is installed. Spark standalone does not work in a kerberized cluster.

Cloudera bug: OPSAPS-24983

Workaround: To upgrade, remove the Spark standalone service first and then proceed with upgrade.

Adding Key Trustee KMS 5.4 to Cloudera Manager 5.5 displays warning

Adding the Key Trustee KMS service to a CDH 5.4 cluster managed by Cloudera Manager 5.5 displays the following message, even if Key Trustee KMS is installed:

"The following selected services cannot be used due to missing components: keytrustee-keyprovider. Are you sure you wish to continue with them?"

Workaround: Verify that the Key Trustee KMS parcel or package is installed and click **OK** to continue adding the service.

KMS and Key Trustee ACLs do not work in Cloudera Manager

ACLs configured for the KMS (File) and KMS (Navigator Key Trustee) services do not work since these services do not receive the values for `hadoop.security.group.mapping` and related group mapping configuration properties.

Cloudera bug: OPSAPS-24483

Workaround:

KMS (File): Add all configuration properties starting with `hadoop.security.group.mapping` from the NameNode `core-site.xml` to the KMS (File) property, **Key Management Server Advanced Configuration Snippet (Safety Valve) for core-site.xml**

KMS (Navigator Key Trustee): Add all configuration properties starting with `hadoop.security.group.mapping` from the NameNode `core-site.xml` to the KMS (Navigator Key Trustee) property, **Key Management Server Proxy Advanced Configuration Snippet (Safety Valve) for core-site.xml**.

Exporting and importing Hue database sometimes times out after 90 seconds

Executing 'dump database' or 'load database' of Hue from Cloudera Manager returns "command aborted because of exception: Command timed-out after 90 seconds". The Hue database can be exported to JSON from within Cloudera Manager. Unfortunately, sometimes the Hue database is quite large and the export times out after 90 seconds.

Cloudera bug: OPSAPS-24470

Workaround: Ignore the timeout. The command should eventually succeed even though Cloudera Manager reports that it timed out.

Changing the Key Trustee Server hostname requires editing keytrustee.conf

If you change the hostname of your active or passive Key Trustee Server, you must edit the `keytrustee.conf` file. This issue typically arises if you replace an active or passive server with a server having a different hostname. If the same hostname is used on the replacement server, there are no issues.

Cloudera bug: OPSAPS-24133

Workaround: Use the same hostname on the replacement server.

Hosts with Impala Llama roles must also have at least one YARN role

When integrated resource management is enabled for Impala, host(s) where the Impala Llama role(s) are running must have at least one YARN role. This is because Llama requires the `topology.py` script from the YARN configuration. If this requirement is not met, you may see errors such as:

```
"Exception running /etc/hadoop/conf.cloudera.yarn/topology.py
java.io.IOException: Cannot run program "/etc/hadoop/conf.cloudera.yarn/topology.py"
```

in the Llama role logs, and Impala queries may fail.

Cloudera bug: OPSAPS-23728

Workaround: Add a YARN gateway role to each Llama host that does not already have at least one YARN role (of any type).

The high availability wizard does not verify that there is a running ZooKeeper service

If one of the following is true:

- 1. ZooKeeper present and not running and the HDFS dependency on ZooKeeper dependency is not set
- 2. ZooKeeper absent

the enable high-availability wizard fails.

Cloudera bug: OPSAPS-23709

Workaround: Before enabling high availability, do the following:

1. Create and start a ZooKeeper service if one does not exist.
2. Go to the HDFS service.
3. Click the **Configuration** tab.
4. Select **Scope > Service-Wide**
5. Set the **ZooKeeper Service** property to the ZooKeeper service.
6. Click **Save Changes** to commit the changes.

Cloudera Manager Installation Path A fails on RHEL 5.7 due to PostgreSQL conflict

On RHEL 5.7, `cloudera-manager-installer.bin` fails due to a PostgreSQL conflict if PostgreSQL 8.1 is already installed on your host.

Cloudera bug: OPSAPS-23392

Workaround: Remove PostgreSQL from host and rerun `cloudera-manager-installer.bin`.

Spurious warning on Accumulo 1.6 gateway hosts

When using the Accumulo shell on a host with only an Accumulo 1.6 Service gateway role, users will receive a warning about failing to create the directory `/var/log/accumulo`. The shell works normally otherwise.

Workaround: The warning is safe to ignore.

Cloudera bug: OPSAPS-21699

Accumulo 1.6 service log aggregation and search does not work

Cloudera Manager log aggregation and search features are incompatible with the log formatting needed by the Accumulo Monitor. Attempting to use either the "Log Search" diagnostics feature or the log file link off of an individual service role's summary page will result in empty search results.

Cloudera bug: OPSAPS-21675

Severity: High

Workaround: Operators can use the Accumulo Monitor to see recent severe log messages. They can see recent log messages below the WARNING level via a given role's process page and can inspect full logs on individual hosts by looking in `/var/log/accumulo`.

Cloudera Manager incorrectly sizes Accumulo Tablet Server max heap size after 1.4.4-cdh4.5.0 to 1.6.0-cdh4.6.0 upgrade

Because the upgrade path from Accumulo 1.4.4-cdh4.5.0 to 1.6.0-cdh4.6.0 involves having both services installed simultaneously, Cloudera Manager will be under the impression that worker hosts in the cluster are oversubscribed on memory and attempt to downsize the max heap size allowed for 1.6.0-cdh4.6.0 Tablet Servers.

Cloudera bug: OPSAPS-21806

Severity: High

Workaround: Manually verify that the Accumulo 1.6.0-cdh4.6.0 Tablet Server max heap size is large enough for your needs. Cloudera recommends you set this value to the sum of 1.4.4-cdh4.5.0 Tablet Server and Logger heap sizes.

Accumulo installations using LZO do not indicate dependence on the GPL Extras parcel

Accumulo 1.6 installations that use LZO compression functionality do not indicate that LZO depends on the GPL Extras parcel. When Accumulo is configured to use LZO, Cloudera Manager has no way to track that the Accumulo service now relies on the GPL Extras parcel. This prevents Cloudera Manager from warning administrators before they remove the parcel while Accumulo still requires it for proper operation.

Cloudera bug: OPSAPS-21680

Workaround: Check your Accumulo 1.6 service for the configuration changes mentioned in the Cloudera documentation for using Accumulo with CDH prior to removing the GPL Extras parcel. If the parcel is mistakenly removed, reinstall it and restart the Accumulo 1.6 service.

Created pools are not preserved when Dynamic Resource Pools page is used to configure YARN or Impala

Pools created on demand are not preserved when changes are made using the Dynamic Resource Pools page. If the Dynamic Resource Pools page is used to configure YARN or Impala services in a cluster, it is possible to specify pool placement rules that create a pool if one does not already exist. If changes are made to the configuration using this page, pools created as a result of such rules are not preserved across the configuration change.

Cloudera bug: OPSAPS-19942

Workaround: Submit the YARN application or Impala query as before, and the pool will be created on demand once again.

User should be prompted to add the AMON role when adding MapReduce to a CDH 5 cluster

When the MapReduce service is added to a CDH 5 cluster, the user is not asked to add the AMON role. Then, an error displays when the user tries to view MapReduce activities.

Cloudera bug: OPSAPS-20379

Workaround: Manually add the AMON role after adding the MapReduce service.

Enterprise license expiration alert not displayed until Cloudera Manager Server is restarted

When an enterprise license expires, the expiration notification banner is not displayed until the Cloudera Manager Server has been restarted. The enterprise features of Cloudera Manager are not affected by an expired license.

Cloudera bug: OPSAPS-15711

Workaround: None.

Configurations for decommissioned roles not migrated from MapReduce to YARN

When the **Import MapReduce Configuration** wizard is used to import MapReduce configurations to YARN, decommissioned roles in the MapReduce service do not cause the corresponding imported roles to be marked as decommissioned in YARN.

Cloudera bug: OPSAPS-16670

Workaround: Delete or decommission the roles in YARN after running the import.

The HDFS command Roll Edits does not work in the UI when HDFS is federated

The HDFS command Roll Edits does not work in the Cloudera Manager UI when HDFS is federated because the command does not know which nameservice to use.

Cloudera bug: OPSAPS-10034

Workaround: Use the API, not the Cloudera Manager UI, to execute the Roll Edits command.

Cloudera Manager reports a confusing version number if you have oozie-client, but not oozie installed on a CDH 4.4 node

In CDH versions before 4.4, the metadata identifying Oozie was placed in the client, rather than the server package. Consequently, if the client package is not installed, but the server is, Cloudera Manager will report Oozie has been present but as coming from CDH 3 instead of CDH 4.

Cloudera bug: OPSAPS-15778

Workaround: Either install the oozie-client package, or upgrade to at least CDH 4.4. Parcel based installations are unaffected.

Cloudera Manager does not work with CDH 5.0.0 Beta 1

When you upgrade from Cloudera Manager 5.0.0 Beta 1 with CDH 5.0.0 Beta 1 to Cloudera Manager 5.0.0 Beta 2, Cloudera Manager won't work with CDH 5.0.0 Beta 1 and there's no notification of that fact.

Cloudera bug: OPSAPS-17802

Workaround: None. Do a new installation of CDH 5.0.0 Beta 2.

On CDH 4.1 secure clusters managed by Cloudera Manager 4.8.1 and higher, the Impala Catalog server needs advanced configuration snippet update

Impala queries fail on CDH 4.1 when Hive "Bypass Hive Metastore Server" option is selected.

Workaround: Add the following to Impala catalog server advanced configuration snippet for `hive-site.xml`, replacing `Hive_Metastore_Server_Host` with the host name of your Hive Metastore Server:

```
<property>
<name>hive.metastore.local</name>
<value>>false</value>
</property>
<property>
<name>hive.metastore.uris</name>
<value>thrift://Hive_Metastore_Server_Host:9083</value>
</property>
```

Rolling Upgrade to CDH 5 is not supported.

Rolling upgrade between CDH 4 and CDH 5 is not supported. Incompatibilities between major versions means rolling restarts are not possible. In addition, rolling upgrade will *not* be supported from CDH 5.0.0 Beta 1 to any later releases, and may not be supported between *any future beta versions* of CDH 5 and the General Availability release of CDH 5.

Workaround: None.

Error reading .zip file created with the Collect Diagnostic Data command.

After collecting Diagnostic Data and using the Download Diagnostic Data button to download the created zip file to the local system, the zip file cannot be opened using the FireFox browser on a Macintosh. This is because the zip file is created as a Zip64 file, and the unzip utility included with Macs does not support Zip64. The zip utility must be version 6.0 or later. You can determine the zip version with `unzip -v`.

Cloudera bug: OPSAPS-13850

Workaround: Update the unzip utility to a version that supports Zip64.

After JobTracker failover, complete jobs from the previous active JobTracker are not visible.

When a JobTracker failover occurs and a new JobTracker becomes active, the new JobTracker UI does not show the completed jobs from the previously active JobTracker (that is now the standby JobTracker). For these jobs the "Job Details" link does not work.

Cloudera bug: OPSAPS-13864

Severity: Med

Workaround: None.

After JobTracker failover, information about rerun jobs is not updated in Activity Monitor.

When a JobTracker failover occurs while there are running jobs, jobs are restarted by the new active JobTracker by default. For the restarted jobs the Activity Monitor will not update the following: 1) The start time of the restarted job will remain the start time of the original job. 2) Any Map or Reduce task that had finished before the failure happened will not be updated with information about the corresponding task that was rerun by the new active JobTracker.

Cloudera bug: OPSAPS-13879

Severity: Med

Workaround: None.

Installing on AWS, you must use private EC2 hostnames.

When installing on an AWS instance, and adding hosts using their public names, the installation will fail when the hosts fail to heartbeat.

Severity: Med

Workaround:

Use the Back button in the wizard to return to the original screen, where it prompts for a license.

Rerun the wizard, but choose "Use existing hosts" instead of searching for hosts. Now those hosts show up with their internal EC2 names.

Continue through the wizard and the installation should succeed.

If HDFS uses Quorum-based Storage without HA enabled, the SecondaryNameNode cannot checkpoint.

If HDFS is set up in non-HA mode, but with Quorum-based storage configured, the `dfs.namenode.edits.dir` is automatically configured to the Quorum-based Storage URI. However, the SecondaryNameNode cannot currently read the edits from a Quorum-based Storage URI, and will be unable to do a checkpoint.

Severity: Medium

Workaround: Add to the NameNode's advanced configuration snippet the `dfs.namenode.edits.dir` property with both the value of the Quorum-based Storage URI as well as a local directory, and restart the NameNode. For example,

```
<property> <name>dfs.namenode.edits.dir</name>
<value>qjournal://jn1HostName:8485; jn2HostName:8485; jn3HostName:8485/journalhdfs1, file:///dfs/edits</value>
</property>
```

Changing the rack configuration may temporarily cause mis-replicated blocks to be reported.

A rack re-configuration will cause HDFS to report mis-replicated blocks until HDFS rebalances the system, which may take some time. This is a normal side-effect of changing the configuration.

Severity: Low

Workaround: None

Cannot use '/' as a mount point with a Federated HDFS Nameservice.

A Federated HDFS Service does not support nested mount points, so it is impossible to mount anything at '/'. Because of this issue, the root directory will always be read-only, and any client application that requires a writeable root directory will fail.

Severity: Low

Workaround:

1. In the CDH 4 HDFS Service > Configuration tab of the Cloudera Manager Admin Console, search for "nameservice".
2. In the Mountpoints field, change the mount point from "/" to a list of mount points that are in the namespace that the Nameservice will manage. (You can enter this as a comma-separated list - for example, "/hbase, /tmp, /user" or by clicking the plus icon to add each mount point in its own field.) You can determine the list of mount points by running the command `hadoop fs -ls /` from the CLI on the NameNode host.

Historical disk usage reports do not work with federated HDFS.

Severity: Low

Workaround: None.

(CDH 4 only) Activity monitoring does not work on YARN activities.

Activity monitoring is not supported for YARN in CDH 4.

Severity: Low

Workaround: None

HDFS monitoring configuration applies to all Nameservices

The monitoring configurations at the HDFS level apply to all Nameservices. So, if there are two federated Nameservices, it's not possible to disable a check on one but not the other. Likewise, it's not possible to have different thresholds for the two Nameservices.

Severity: Low

Workaround: None

Supported and Unsupported Replication Scenarios and Limitations

See [Data Replication](#).

Restoring snapshot of a file to an empty directory does not overwrite the directory

Restoring the snapshot of an HDFS file to an HDFS path that is an empty HDFS directory (using the Restore As action) will result in the restored file present inside the HDFS directory instead of overwriting the empty HDFS directory.

Workaround: None.

HDFS Snapshot appears to fail if policy specifies duplicate directories.

In an HDFS snapshot policy, if a directory is specified more than once, the snapshot appears to fail with an error message on the Snapshot page. However, in the HDFS Browser, the snapshot is shown as having been created successfully.

Severity: Low

Workaround: Remove the duplicate directory specification from the policy.

Hive replication fails if "Force Overwrite" is not set.

The Force Overwrite option, if checked, forces overwriting data in the target metastore if there are incompatible changes detected. For example, if the target metastore was modified and a new partition was added to a table, this option would force deletion of that partition, overwriting the table with the version found on the source. If the Force Overwrite option is not set, recurring replications may fail.

Severity: Med

Workaround: Set the Force Overwrite option.

Cloudera Manager set cataloged default JVM memory to 4G can cause an out of memory error during upgrade to Cloudera Manager 5.7 and higher

When upgrading from Cloudera Manager 5.7 or higher to Cloudera Manager 5.8.2, if the Impala Catalog Server Java Heap Size is set at the default (4GB), it is automatically changed to either 1/4 of the physical RAM on that host, or 32GB, whichever is lower. This can result in a higher or a lower heap, which could cause additional resource contention or out of memory errors, respectively.

Host Monitor Cannot Monitor NTP Status on SLES Hosts

In Cloudera Manager 5.11.0 and lower, Host Monitor queries the NTP status using the `ntpd` command. Later versions of SLES disable this command by default.

Workaround: Add the following line to `/etc/ntp.conf`:

```
enable mode7
```

Affected versions: Cloudera Manager 5.11.0 and lower

Fixed versions: Cloudera Manager 5.11.1 and higher, Cloudera Manager 5.12.0 and higher

Cloudera Issue: OPSAPS-38268

Issues Fixed in Cloudera Manager 5

The following sections describe issues fixed in each Cloudera Manager 5 release.

Issues Fixed in Cloudera Manager 5.16.2

The API method "ApiHiveCloudReplicationArguments" is missing for Cloudera Manager 5.15

The Cloudera Manager Python API client released in 5.16.1 missed changes that were introduced in version 5.15, including changes related to Backup and Disaster Recovery (BDR) Hive Replication. Those missing changes have been ported.

Cloudera Bug: OPSAPS-48873

Backup and Disaster Recovery fails if `dfs.nameservices` is overridden with multiple nameservice names

This fix handles the scenario for multiple nameservices in the `dfs.nameservices` configuration. Now the feature cross-checks that with the `fs.defaultFS` configured in `core-site.xml`.

Cloudera Bug: OPSAPS-48579

Error handling differs between multi-thread and single-thread Hive replication

This fix aligns multi-thread Hive replication error handling with the single-thread case. Multi-thread Hive replication now has the appropriate error types, suppressed by the `replication.hive.ignoreTableNotFound` and `replication.hive.ignoreDataBaseNotFound` safety valves implicitly.

Cloudera Bug: OPSAPS-49987

Issues Fixed in Cloudera Manager 5.16.1

Note: The first release of Cloudera Manager 5.16 is numbered 5.16.1.

Yarn Application Masters fail when a concurrent Deploy Client Configuration job is executed

Yarn Application Masters fail because the `container-executor.cfg` file is missing when a YARN application is executed concurrently with a Deploy Client Configurations job. The container-executor hierarchy has been moved to `/var/lib/yarn-ce`, which is not modified by the Deploy Client Configuration command.

No changes are required for Cloudera Manager/CDH 5.16.0 and higher. Use the following **Workaround** for Cloudera Manager/CDH 5.15.1 and 5.14.4:

1. On the Cloudera Manager server host, add the following line to the `/etc/default/cloudera-scm-server` file:

```
export CMF_FF_YARN_SAFE_CONTAINER_EXECUTOR_DIR=true
```

2. Restart the Cloudera Manager Server:

```
service cloudera-scm-server restart
```

3. Restart the NodeManager(s) so they can pick up the new configuration change:
 - a. In the Cloudera Manager Admin console, go to the YARN service.
 - b. Click the **Instances** tab.
 - c. Select all hosts with the NodeManager **Role Type**.
 - d. Click **Actions for Selected > Restart**.

Cloudera Bug: OPSAPS-24398

Aborting a BDR replication does not stop and issues an empty error

The abort functionality now works as expected.

Cloudera Bug: OPSAPS-39694

HDFS replication fails when reserved raw data is replicated

Fixed an issue with HDFS replication where reserved raw data is replicated with the delete strategy.

Cloudera Bug: OPSAPS-47244

Threshold settings prevent correct configuration

When Threshold settings are saved with values such as Any or Never, a bug in the validation code prevented the user from saving the threshold to a specific value. This is now fixed.

Cloudera Bug: OPSAPS-46657

Gateway roles and Isilon replication jobs

Fixed a bug where Cloudera Manager did not allow Gateway roles for Isilon clusters, which prevented replications jobs from running.

Cloudera Bug: OPSAPS-46154

Save Changes remains enabled after clicking (possible autocomplete issue)

Google Chrome version 66, released on 28 April 2018, introduced behavior changes which can trigger unintended modification of existing configuration values in Cloudera Manager. If a page contains a password field, the browser aggressively applies auto-complete form data to the first text field and first password form fields. These changes are applied without user input or explicit notification (fields are highlighted).

Cloudera Bug: OPSAPS-46118

Spark cross-realm authentication fails

Spark now correctly respects `auth_to_local` name rules for HDFS services with cross-realm trust configured.

Cloudera Bug: OPSAPS-46103

Host installation or upgrade using key based authentication where private key is protected by passphrase does not work

In Cloudera Manager, host installation and upgrade does not work when using key-based host authentication with SSH where the private key is protected by a passphrase.

Cloudera Bug: OPSAPS-45571

Failures during Cloudera Manager installation or upgrade

Fixed an issue where Cloudera Manager agent installation or upgrade failed due to misconfigured or problematic third-party repositories that were interfering with the process.

Cloudera Bug: OPSAPS-45576

Cloudera Manager should not omit LDAP GROUP_MAPPING passwords from NodeManager

Some sensitive authentication configurations were not emitted for the Yarn Node Manager when using LDAP group mapping. This is now corrected for clusters running CDH 5.5 and higher where encryption is available for those sensitive configurations.

Cloudera Bug: OPSAPS-45440

Upgrading a license finishes on wrong page

The Enable Trial workflow previously finished on the upgrade page, now it goes back to the Home page upon completion.

Cloudera Bug: OPSAPS-45444

Flume uses default values for Kafka TLS settings

Fixed an issue where Flume used default values for Kafka TLS settings. For further details, see the original [Known Issue](#).

Note that this fix causes Flume to be marked as having a stale configuration. To resolve the staleness, restart Flume.

Cloudera Bug: OPSAPS-45669

Cloudera Manager upgrade page load issues in Internet Explorer

The new Cloudera Manager Upgrade page doesn't load in IE9, 10 or 11 due to using a feature that is not supported in IE. This is now fixed in 5.15.1.

Cloudera Bug: OPSAPS-45779

Do not expose configuration history to non-admin users

Users were previously able to go directly to the configuration history and rollback page using the URL, even though the link itself is not visible. This is now protected.

Cloudera Bug: OPSAPS-45781

Incorrect page reloads on Instances and All Hosts paged

The Instances page and the All Hosts page now do not reload when a command finishes.

Cloudera Bug: OPSAPS-45761

Kudu package missing from CDH installation using packages

Fixed an issue where Cloudera Manager did not install Kudu packages when CDH was installed using packages instead of parcels.

Cloudera Manager 5 Release Notes

Cloudera Bug: OPSAPS-45692

Reports Manager displays incorrectly

When the Reports Manager is not installed, Cloudera Manager Admin Console pages now display correctly and irrelevant links have been removed.

Cloudera Bug: OPSAPS-44873

Cloudera Manager fails when enabling Kerberos if TLS is already configured

When enabling kerberos for a cluster running TLS, the system cannot use the privileged ports (< 1024). Instead, the wizard will prompt user to use the appropriate port values.

Cloudera Bug: OPSAPS-33345

Kafka JMX connections listen on all interfaces unnecessarily

Kafka broker and MirrorMaker processes now listen on only the loopback interface for JMX connections. This caused Cloudera Manager to report that Kafka had stale configurations.

Cloudera Bug: OPSAPS-47365

BDR replicates Kudu HMS entries as-is

Hive tables created by Kudu are now excluded from Backup and Disaster Recovery replication.

Cloudera Bug: OPSAPS-46549

Restart warnings are incorrect after starting role with outdated configuration

Fixed an issue where some roles that required restarts were not correctly identified after starting a role marked as **Started with Outdated Configuration**.

Cloudera Bug: OPSAPS-45237

Host inspector should check system user group membership

The new Host Inspector will now warn if user doesn't belong to its own group

Cloudera Bug: OPSAPS-46592

Null Pointer Exception on Cloudera Manager Upgrade Page

Fixed a NPE on the new Cloudera Manager Upgrade page. This only happens when the agent could not retrieve the host status.

Cloudera Bug: OPSAPS-46616

Upgrade to CDH 5.15.1 fails with CM 5.15.1 and OpenJDK

Fixes Java version parsing issue with OpenJDK during Cloudera Manager upgrade.

Note: OpenJDK is only supported in Cloudera Manager and CDH 5.16.

Cloudera Bug: OPSAPS-47620

Issues Fixed in Cloudera Manager 5.15.2

Restart Warnings are incorrect after starting a role with an outdated configuration

Fixed an issue where some roles that required restarts were not correctly identified after starting a role marked as "Started with Outdated Configuration".

Cloudera Bug: OPSAPS-47775, OPSAPS-47493

Releases affected: 5.13, 5.14, 5.15

Upgrade to CDH 5.15.1 fails with CM 5.15.1 and OpenJDK

Fixes Java version parsing issue with OpenJDK during Cloudera Manager upgrade.

Note: OpenJDK is only supported in Cloudera Manager and CDH 5.16.

Cloudera Bug: OPSAPS-47620

Kafka JMX connections listen on all interfaces unnecessarily

Kafka broker and MirrorMaker processes now listen on only the loopback interface for JMX connections. This caused Cloudera Manager to report that Kafka had stale configurations.

Cloudera Bug: OPSAPS-47365

Flume uses default values for Kafka TLS settings

Fixed an issue where Flume used default values for Kafka TLS settings. For further details, see the original [Known Issue](#).

Note that this fix causes Flume to be marked as having a stale configuration. To resolve the staleness, restart Flume.

Cloudera Bug: OPSAPS-45669

Issues Fixed in Cloudera Manager 5.15.1

Cloudera Manager read-only user can access sensitive cluster information

Fixed an issue where, due to a security vulnerability, a Cloudera Manager read-only user can access sensitive cluster information.

For the latest update on this issue, see the corresponding Knowledge article:

TSB 2018-306: Cloudera Manager Information Disclosure

Cloudera Bug: OPSAPS-45688

Open Redirect and XSS in Cloudera Manager

Technical Service Bulletin 2018-321 (TSB)

One type of page in Cloudera Manager uses a `returnUrl` parameter to redirect the user to another page in Cloudera Manager once a wizard is completed. The validity of this parameter was not checked. As a result, the user could be automatically redirected to an attacker's external site or perform a malicious JavaScript function that results in cross-site scripting (XSS).

With this fix, Cloudera Manager no longer allows any value in the `returnUrl` parameter with patterns such as `http://`, `https://`, `///`, or `javascript`. The only exceptions to this rule are the SAML login/logout URLs, since they are explicitly configured and are not passed via the `returnUrl` parameter.

Products affected: Cloudera Manager

Releases affected:

- 5.15.0 and all earlier releases

Users affected: The following Cloudera Manager roles: "cluster administrator", "full administrators", and "configurators".

Date/time of detection: June 20, 2018

Detected by: Mohit Rawat & Ekta Mittal

Severity (Low/Medium/High): 8.8 High ([CVSS](#):3.0/AV:N/AC:L/PR:N/UI:R/S:U/C:H/I:H/A:H)

Impact: [Open redirects](#) can silently redirect a victim to an attacker's site. XSS vulnerabilities can be used to steal credentials or to perform arbitrary actions as the targeted user.

CVE: CVE-2018-15913

Immediate action required: Upgrade to Cloudera Manager 5.15.1 or higher

Addressed in release/refresh/patch:

- Cloudera Manager 5.15.1 and higher
- Cloudera Manager 6.0.0

Flume uses default values for Kafka TLS settings

Fixed an issue where Flume used default values for Kafka TLS settings. For further details, see the original [Known Issue](#).

Note that this fix causes Flume to be marked as having a stale configuration. To resolve the staleness, restart Flume.

Cloudera Bug: OPSAPS-45669

Abort Installation button causes errors

Abort Installation button causes errors When installing or upgrading hosts using the Upgrade or Installation wizards, when the ""abort"" link is clicked an error message is displayed. (waiting for answer in comments)

Cloudera Bug: OPSAPS-45655

Host Inspector reports identical JDK versions as different.

The Host Inspector was reporting JDKs installed with a different installation path as different JDK versions.

Cloudera Bug: OPSAPS-44931

Upgrading a license finishes on wrong page

The Enable Trial workflow previously finished on the upgrade page, now it goes back to the Home page upon completion.

Cloudera Bug: OPSAPS-45444

Cloudera Manager should not omit LDAP GROUP_MAPPING passwords from NodeManager

Some sensitive authentication configurations were not emitted for the Yarn Node Manager when using LDAP group mapping. This is now corrected for clusters running CDH 5.5 and higher where encryption is available for those sensitive configurations.

Cloudera Bug: OPSAPS-45440

Do not expose configuration history to non-admin users

Users were previously able to go directly to the configuration history and rollback page using the URL, even though the link itself is not visible. This is now protected.

Cloudera Bug: OPSAPS-45781

Cloudera Manager upgrade page load issues in Internet Explorer

The new Cloudera Manager Upgrade page doesn't load in IE9, 10 or 11 due to using a feature that is not supported in IE. This is now fixed in 5.15.1.

Cloudera Bug: OPSAPS-45779

Gateway roles and Isilon replication jobs

Fixed a bug where Cloudera Manager did not allow Gateway roles for Isilon clusters, which prevented replications jobs from running.

Cloudera Bug: OPSAPS-46154

Cloudera Backup and Disaster Recovery cannot import Hive metadata

Fixed a bug where Cloudera Backup and Disaster Recovery could not import Hive metadata that included a Partitioned View with a null StorageDescriptor.

Cloudera Bug: OPSAPS-45900

Threshold settings prevent correct configuration

When Threshold settings are saved with values such as Any or Never, a bug in the validation code prevented the user from saving the threshold to a specific value. This is now fixed.

Cloudera Bug: OPSAPS-46657

Incorrect page reloads on Instances and All Hosts paged

The Instances page and the All Hosts page now do not reload when a command finishes.

Cloudera Bug: OPSAPS-45761

Null Pointer Exception on Cloudera Manager Upgrade Page

Fixed a NPE on the new Cloudera Manager Upgrade page. This only happens when the agent could not retrieve the host status.

Cloudera Bug: OPSAPS-46616

Spark cross-realm authentication fails

Spark now correctly respects `auth_to_local` name rules for HDFS services with cross-realm trust configured.

Cloudera Bug: OPSAPS-46103

Yarn Application Masters fail when a concurrent Deploy Client Configuration job is executed

Yarn Application Masters fail because the `container-executor.cfg` file is missing when a YARN application is executed concurrently with a Deploy Client Configurations job. The container-executor hierarchy has been moved to `/var/lib/yarn-ce`, which is not modified by the Deploy Client Configuration command.

No changes are required for Cloudera Manager/CDH 5.16.0 and higher. Use the following **Workaround** for Cloudera Manager/CDH 5.15.1 and 5.14.4:

1. On the Cloudera Manager server host, add the following line to the `/etc/default/cloudera-scm-server` file:

```
export CMF_FF_YARN_SAFE_CONTAINER_EXECUTOR_DIR=true
```

2. Restart the Cloudera Manager Server:

```
service cloudera-scm-server restart
```

3. Restart the NodeManager(s) so they can pick up the new configuration change:
 - a. In the Cloudera Manager Admin console, go to the YARN service.
 - b. Click the **Instances** tab.
 - c. Select all hosts with the NodeManager **Role Type**.
 - d. Click **Actions for Selected** > **Restart**.

Cloudera Bug: OPSAPS-24398

Cloudera Manager does not list any CDH package options other than "custom"

When doing a package installation or upgrade of CDH, no versions of CDH5 are shown in the Cloudera Manager Admin Console.

Cloudera Bug: OPSAPS-45732

Issues Fixed in Cloudera Manager 5.15.0

[Cloudera Manager read-only user can access sensitive cluster information](#)

Fixed an issue where, due to a security vulnerability, a Cloudera Manager read-only user can access sensitive cluster information.

For the latest update on this issue, see the corresponding Knowledge article:

TSB 2018-306: Cloudera Manager Information Disclosure

Cloudera Bug: OPSAPS-45688

[Cross-site scripting vulnerability in Cloudera Manager](#)

Fixed the cross-site vulnerability described in [TSB-2018-285 \(XSS Scripting Vulnerability in Cloudera Manager\)](#). For more information, see [the Known Issue description](#)

Cloudera Bug: DOCS-3186

[Cannot install or start Cloudera Manager on SLES12](#)

Fixed an issue where [Path A](#) (non-production) installations of Cloudera Manager do not work on SLES version 12.

See TSB-279 for more information.

Cloudera Bug: OPSAPS-44284

[Extra entries in the Manage Host Override dialog](#)

Fixed an issue where duplicate hostnames appeared when editing configuration overrides for Host level configurations.

Cloudera Bug: OPSAPS-44814

[Cloudera logo disappears in Upgrade Wizard](#)

Fixed an issue where the Cloudera Manager logo might not get refreshed in the browser automatically when upgrading from Cloudera Manager 5.10 to 5.11 or higher. This issue caused the logo to disappear.

Cloudera Bug: OPSAPS-44676

[Errors thrown for Hive replications managed by a single Cloudera Manager](#)

Fixed an issue where an exception is thrown when collecting replication diagnostics for a Hive replication schedule between two clusters managed by a single Cloudera Manager.

Cloudera Bug: OPSAPS-45197

[YARN NodeManager stale due to missing CGroups](#)

Fixed an issue where the YARN NodeManager may show as being stale due to System Resources even when it is not. The `named-cpu` value may show as changed even though it was not modified.

Cloudera Bug: OPSAPS-43973

[Warning message "Cloud file creation time does not match saved time" in S3 replication](#)

Fixed multiple false warning log message issue during HDFS-S3 restore operation.

Cloudera Bug: OPSAPS-43681

[Concurrent Hive replications on different Hives fail with clashing command error](#)

Fixed an issue that caused Hive replications to fail due to conflicting Hive replication schedules when there are two clusters managed by the same Cloudera Manager.

Cloudera Bug: OPSAPS-43652

Impala Dynamic Resource Pools access

Fixed an issue where Cloudera Manager did not generate the `aclSubmitApps` element in the `fair-scheduler.xml` file when a user did not specify any user or groups for the root pool. Cloudera Manager now automatically generates `aclSubmitApps` with a space character. This change means the default is no access for all users.

Cloudera Bug: OPSAPS-45046

Cannot start CM5.13.1 after one-click manual install on SLES12 SP2

This fix upgrades the PostgreSQL JDBC driver. The new JDBC driver only supports PostgreSQL versions 8.2 and higher. RHEL5 defaults to PostgreSQL 8.1.

Use the following workaround for RHEL5

1. Download PostgreSQL 9.0-802 JDBC4: <https://jdbc.postgresql.org/download/postgresql-9.0-802.jdbc4.jar>
2. Copy it as `/usr/share/java/postgresql-connector-java.jar` and then install the server.

Cloudera Bug: OPSAPS-43624

AvroTypeException preventing Cloudera Manager Agent from connecting to the Cloudera Manager Server

Fixed an issue where an agent heartbeat fails and leads to the agent not connecting to the Cloudera Manager Server.

Cloudera Bug: OPSAPS-44971

Host Templates Regression on CM 5.13.x or 5.14

Fixed an issue where the Apply Host Template feature in the Add Host wizard was broken.

Cloudera Bug: OPSAPS-45334

Agent stops heartbeating due to Avro parsing errors.

Fixed an issue where, under certain conditions, the Cloudera Manager Agent stops heart beating with the Cloudera Manager Server due to Avro RPC parsing errors.

Cloudera Bug: OPSAPS-45282

Error "Mismatched input PATTERN expecting EOF" on the Detail Usage page of the Resource Manager

Fixed an issue where a user sees an error message about `Mismatched input PATTERN`.

Cloudera Bug: OPSAPS-42437

Agent exception "Could not evaluate resource {u'hard_limit': 500, u'soft_limit': 300}: 'unicode' object has no attribute 'items'"

Fixes an issue in Cloudera Manager agent where cgroup soft and hard memory limits were not applied on the host.

Cloudera Bug: OPSAPS-45229

Host installation or upgrade using key based authentication where private key is protected by passphrase does not work

In Cloudera Manager, host installation and upgrade does not work when using key-based host authentication with SSH where the private key is protected by a passphrase.

Cloudera Bug: OPSAPS-45571

Backup and Disaster Recovery replication fails between two clusters when data is copied from one encryption zone to another when using CDH 5.12.0 or higher

Fixed an issue where replication fails when two clusters use HDFS HA, and the nameservice names are the same.

Both the source and destination clusters must upgrade to a release that contains the fix.

Important: Cloudera recommends using unique names for the nameservices.

Cloudera Bug: OPSAPS-43556

Fixed in: Cloudera Manager 5.15.0, 5.14.3, 5.13.3

Logging issue slows down Hive and HDFS Replication jobs

Fixed an issue that occurred when using Cloudera Manager for cross-cluster replication of HDFS and Hive. Unnecessary warning logs are printed during the initial phase of replication ('copy listing'). These logs were printed for each and every file that Cloudera Backup and Disaster Recovery (BDR) copies. This causes very verbose log output which slows down this phase of the replication job and can affect overall replication times considerably. This happens only when both source and target clusters are running Cloudera Manager 5.14.0.

See TSB-290 for more information.

Fixed Versions: Cloudera Manager 5.15.0, 5.14.1

Cloudera Bug: OPSAPS-44160

Scheduled snapshot and replication jobs are skipped

Fixed an issue where scheduled Snapshot and Replication jobs can be skipped if there are too many commands scheduled to run at the same time (more than 100), or if Cloudera Manager has paused due to garbage collection.

Fixed Versions: Cloudera Manager 5.15.0, 5.14.2, 5.13.2

Cloudera Bug: OPSAPS-44153

Table statistics are lost when replicating an existing table without partitions

Cloudera Backup and Disaster Recovery added a workaround for the Hive bug HIVE-15653 and now preserves table statistics for unpartitioned tables during subsequent runs.

Fixed Versions: Cloudera Manager 5.15.0, 5.14.2, 5.13.2

Cloudera Bug: OPSAPS-44070

The Replication performance CSV file header does not match content

Fixed an issue where the header in the HDFS Replication performance file (in CSV format) does not match its contents.

Fixed in: Cloudera Manager 5.15.0, 5.14.2, 5.13.2

Cloudera Bug: OPSAPS-43997

BDR Cloud (s3) Replication job fail with delegation token creation issue

Fixed an issue where HDFS to Amazon S3 or Hive to Amazon S3 replication jobs fail when an expired delegation token is used to run a MapReduce/YARN job.

Cloudera Bug: OPSAPS-44008

Spark CSD should emit proper environment variables for older CDH version 5.4.x

Fixed configuration of Kerberos credentials for the Spark History Server in CDH 5.4.

Cloudera Bug: OPSAPS-43985

Hive Replication export step fails with StaleObjectStateException

Fixed an issue where replication commands sometimes fail because of concurrent executions in the database.

Cloudera Bug: OPSAPS-43964

Add "sentry" group in "hadoop.proxyuser.hive.groups" on upgrade to CDH 5.13.0 and higher

For CDH5.13.0 and higher, when Hive is used with Sentry, Hive Proxy Groups should contain either a wildcard (*) for the Sentry Group for Sentry to work with Hive. If this is not present, Cloudera Manager adds the Sentry Group to Hive Proxy Groups when upgrading CDH.

Cloudera Bug: OPSAPS-43809

Cloudera Manager Server reports 'Too many open files' error

Fixed an issue where collection of diagnostic bundles would lead to slow file descriptor leaks in Cloudera Manager Server that eventually cause the server to become non-operational or unresponsive.

Cloudera Bug: OPSAPS-44922

Cloudera Manager Upgrade (5.14.0 to 5.14.1) stuck at refreshing package metadata - configurator not found

Fixed a bug in the host installation/upgrade wizard that occurred when retrying individual hosts. The error message "Configurator not found" might appear and prevent installation or upgrade of all hosts.

Cloudera Bug: OPSAPS-44694

Issues Fixed in Cloudera Manager 5.14.4

Cloudera Manager read-only user can access sensitive cluster information

Fixed an issue where, due to a security vulnerability, a Cloudera Manager read-only user can access sensitive cluster information.

For the latest update on this issue, see the corresponding Knowledge article:

TSB 2018-306: Cloudera Manager Information Disclosure

Cloudera Bug: OPSAPS-45688

Gateway roles and Isilon replication jobs

Fixed a bug where Cloudera Manager did not allow Gateway roles for Isilon clusters, which prevented replications jobs from running.

Cloudera Bug: OPSAPS-46154

Save Changes remains enabled after clicking (possible autocomplete issue)

Google Chrome version 66, released on 28 April 2018, introduced behavior changes which can trigger unintended modification of existing configuration values in Cloudera Manager. If a page contains a password field, the browser aggressively applies auto-complete form data to the first text field and first password form fields. These changes are applied without user input or explicit notification (fields are highlighted).

Cloudera Bug: OPSAPS-46118

Cloudera Backup and Disaster Recovery cannot import Hive metadata

Fixed a bug where Cloudera Backup and Disaster Recovery could not import Hive metadata that included a Partitioned View with a null StorageDescriptor.

Cloudera Bug: OPSAPS-45900

Do not expose configuration history to non-admin users

Users were previously able to go directly to the configuration history and rollback page using the URL, even though the link itself is not visible. This is now protected.

Cloudera Bug: OPSAPS-45781

Cloudera Manager 5 Release Notes

Cloudera Manager should not omit LDAP GROUP_MAPPING passwords from NodeManager

Some sensitive authentication configurations were not emitted for the Yarn Node Manager when using LDAP group mapping. This is now corrected for clusters running CDH 5.5 and higher where encryption is available for those sensitive configurations.

Cloudera Bug: OPSAPS-45440

Errors thrown for Hive replications managed by a single Cloudera Manager

Fixed an issue where an exception is thrown when collecting replication diagnostics for a Hive replication schedule between two clusters managed by a single Cloudera Manager.

Cloudera Bug: OPSAPS-45197

Agent exception "Could not evaluate resource {u'hard_limit': 500, u'soft_limit': 300}: 'unicode' object has no attribute 'items'"

Fixes an issue in Cloudera Manager agent where cgroup soft and hard memory limits were not applied on the host.

Cloudera Bug: OPSAPS-45229

Yarn Application Masters fail when a concurrent Deploy Client Configuration job is executed

Yarn Application Masters fail because the `container-executor.cfg` file is missing when a YARN application is executed concurrently with a Deploy Client Configurations job. The container-executor hierarchy has been moved to `/var/lib/yarn-ce`, which is not modified by the Deploy Client Configuration command.

No changes are required for Cloudera Manager/CDH 5.16.0 and higher. Use the following **Workaround** for Cloudera Manager/CDH 5.15.1 and 5.14.4:

1. On the Cloudera Manager server host, add the following line to the `/etc/default/cloudera-scm-server` file:

```
export CMF_FF_YARN_SAFE_CONTAINER_EXECUTOR_DIR=true
```

2. Restart the Cloudera Manager Server:

```
service cloudera-scm-server restart
```

3. Restart the NodeManager(s) so they can pick up the new configuration change:
 - a. In the Cloudera Manager Admin console, go to the YARN service.
 - b. Click the **Instances** tab.
 - c. Select all hosts with the NodeManager **Role Type**.
 - d. Click **Actions for Selected > Restart**.

Cloudera Bug: OPSAPS-24398

Host installation or upgrade using key based authentication where private key is protected by passphrase does not work

In Cloudera Manager, host installation and upgrade does not work when using key-based host authentication with SSH where the private key is protected by a passphrase.

Cloudera Bug: OPSAPS-45571

Cloudera Manager does not list any CDH package options other than "custom"

When doing a package installation or upgrade of CDH, no versions of CDH5 are shown in the Cloudera Manager Admin Console.

Cloudera Bug: OPSAPS-45732

Issues Fixed in Cloudera Manager 5.14.3

Cross-site scripting vulnerability in Cloudera Manager

Fixed the cross-site vulnerability described in [TSB-2018-285 \(XSS Scripting Vulnerability in Cloudera Manager\)](#). For more information, see [the Known Issue description](#)

Cloudera Bug: DOCS-3186

Backup and Disaster Recovery replication fails between two clusters when data is copied from one encryption zone to another when using CDH 5.12.0 or higher

Fixed an issue where replication fails when two clusters use HDFS HA, and the nameservice names are the same.

Both the source and destination clusters must upgrade to a release that contains the fix.

Important: Cloudera recommends using unique names for the nameservices.

Cloudera Bug: OPSAPS-43556

Fixed in: Cloudera Manager 5.15.0, 5.14.3, 5.13.3

HDFS and Hive Replications may fail after upgrading to CM 5.14.2 on clusters where HDFS HA is enabled

Fixed an issue that caused HDFS and Hive replications to fail if the destination cluster is managed by Cloudera Manager 5.14.2.

For more information, see [TSB-305](#).

Cloudera Bug: OPSAPS-45600

Issues Fixed in Cloudera Manager 5.14.2

Cross-site scripting vulnerability in Cloudera Manager

Fixed the cross-site vulnerability described in [TSB-2018-285 \(XSS Scripting Vulnerability in Cloudera Manager\)](#). For more information, see [the Known Issue description](#)

Cloudera Bug: DOCS-3186

CGroup Hard Memory resource reports incorrect units of measurement

The **Host > Resources** page now reports the correct units for the CGroup Hard Memory resource.

Cloudera Bug: OPSAPS-41473

Scheduled snapshot and replication jobs are skipped

Fixed an issue where scheduled Snapshot and Replication jobs can be skipped if there are too many commands scheduled to run at the same time (more than 100), or if Cloudera Manager has paused due to garbage collection.

Fixed Versions: Cloudera Manager 5.15.0, 5.14.2, 5.13.2

Cloudera Bug: OPSAPS-44153

The Replication performance CSV file header does not match content

Fixed an issue where the header in the HDFS Replication performance file (in CSV format) does not match its contents.

Fixed in: Cloudera Manager 5.15.0, 5.14.2, 5.13.2

Cloudera Bug: OPSAPS-43997

Cloudera Manager 5 Release Notes

BDR Cloud (s3) Replication job fail with delegation token creation issue

Fixed an issue where HDFS to Amazon S3 or Hive to Amazon S3 replication jobs fail when an expired delegation token is used to run a MapReduce/YARN job.

Cloudera Bug: OPSAPS-44008

Cloudera Manager Upgrade (5.14.0 to 5.14.1) stuck at refreshing package metadata - configurator not found

Fixed a bug in the host installation/upgrade wizard that occurred when retrying individual hosts. The error message "Configurator not found" might appear and prevent installation or upgrade of all hosts.

Cloudera Bug: OPSAPS-44694

Hive Replication export step fails with StaleObjectStateException

Fixed an issue where replication commands sometimes fail because of concurrent executions in the database.

Cloudera Bug: OPSAPS-43964

Add "sentry" group in "hadoop.proxyuser.hive.groups" on upgrade to CDH 5.13.0 and higher

For CDH 5.13.0 and higher, when Hive is used with Sentry, Hive Proxy Groups should contain either a wildcard (*) for the Sentry Group for Sentry to work with Hive. If this is not present, Cloudera Manager adds the Sentry Group to Hive Proxy Groups when upgrading CDH.

Cloudera Bug: OPSAPS-43809

Spark CSD should emit proper environment variables for older CDH version 5.4.x

Fixed configuration of Kerberos credentials for the Spark History Server in CDH 5.4.

Cloudera Bug: OPSAPS-43985

Cloudera Manager Server reports 'Too many open files' error

Fixed an issue where collection of diagnostic bundles would lead to slow file descriptor leaks in Cloudera Manager Server that eventually cause the server to become non-operational or unresponsive.

Cloudera Bug: OPSAPS-44922

Table statistics are lost when replicating an existing table without partitions

Cloudera Backup and Disaster Recovery added a workaround for the Hive bug HIVE-15653 and now preserves table statistics for unpartitioned tables during subsequent runs.

Fixed Versions: Cloudera Manager 5.15.0, 5.14.2, 5.13.2

Cloudera Bug: OPSAPS-44070

Issues Fixed in Cloudera Manager 5.14.1

Hive Replications Can Fail Intermittently

This issue, which was also reported in [TSB-2018-276](#), is fixed in CDH 5.13.2. For further details, see the original [Known Issue](#).

Cloudera Manager upgrade workflow incorrectly requires deploying some optional management roles

Fixed an issue that occurred when a user upgrades to Cloudera Manager 5.14.0, and after all the agents have been updated to 5.14.0. The user sees an Upgrade Wizard, and is asked to select where to place the Navigator Metadata Server, Navigator Audit Server, and the Reports Manager roles. The **Continue** button is disabled until user adds one of these roles.

See TSB-289.

Cloudera Bug: OPSAPS-44629

Cloudera Bug: [OPSAPS-44629](#)

Logging issue slows down Hive and HDFS Replication jobs

Fixed an issue that occurred when using Cloudera Manager for cross-cluster replication of HDFS and Hive. Unnecessary warning logs are printed during the initial phase of replication ('copy listing'). These logs were printed for each and every file that Cloudera Backup and Disaster Recovery (BDR) copies. This causes very verbose log output which slows down this phase of the replication job and can affect overall replication times considerably. This happens only when both source and target clusters are running Cloudera Manager 5.14.0.

See TSB-290 for more information.

Fixed Versions: Cloudera Manager 5.15.0, 5.14.1

Cloudera Bug: OPSAPS-44160

Issues Fixed in Cloudera Manager 5.14.0

Transient 502 proxy error displays red popup in Hue

As of CDH 5.12 and later, the Hue Load balancer started throwing transient 502 proxy error that appear as a red popup on Hue web pages. This happens frequently on a secure cluster. The Hue server's `runcpserver.log` file does not log these 502 errors. The error is logged in `/var/log/hue-httpd/error_log`. Cloudera Manager now properly configures the Hue load balancer to avoid these issues.

Cloudera Bug: OPSAPS-43317

Cloudera Manager User Administrator role Error

Fixed a bug that occurred when a Cloudera Manager user with the **User Administrator** goes to the **Settings** page. The **Redaction Parameters for Diagnostic Bundles** parameter displays the following error message:

Invalid JSON configuration: SyntaxError: Unexpected token * in JSON at position 0.

Cloudera Bug: OPSAPS-41286

Cluster upgrade fails in wizard with "There is already a pending command on this entity."

Previously, if the customer selects the **Skip Host Inspector** option, the wizard proceeds to the next page but the command still runs in the background and the user sees the message "There is already a pending command on this entity." Cloudera Manager now ensures that the Host Inspector command is aborted when user selects **Skip Host Inspector**. It is still possible that other commands (scheduled or not) will run at the same time as the upgrade command. In this case, user will still see the same error message.

Cloudera Bug: OPSAPS-43740

Configuration "diff" throws TypeMismatchException

The feature that compares the configuration between multiple services or multiple clusters on the configuration page threw an error in Cloudera Manager 5.13. This is now fixed.

Cloudera Bug: OPSAPS-43130

Send Test Alert response dialog does not work

Since Cloudera Manager 5.12, the ability to send a Test Alert has been broken. This is now fixed.

Cloudera Bug: OPSAPS-42826

Incorrect warnings when configuring HBase Thrift Server in Kerberized cluster

Previously, when configuring the HBase Thrift Server security in a Kerberized cluster, incorrect warnings such as "When HBase is configured to use Kerberos, HBase Thrift Authentication is ignored when Enable TLS/SSL for HBase Thrift Server over HTTP is enabled" would appear. With this fix, these warnings are eliminated.

Cloudera Bug: OPSAPS-41441

Cloudera Manager 5 Release Notes

Historical Disk Usage By User download CSV is not adding the metric type customer is choosing

When creating the "Historical Disk Usage By User" report from the **Cluster** > **Cluster_name** > **Reports** page, the download button did not honor the chosen metric. This is now fixed.

Cloudera Bug: OPSAPS-43474

WebServerMetricCollector breaks

Fixed a bug causing broken Impala monitoring functionality when password authentication is enabled for the Impala Daemon Web server.

Cloudera Bug: OPSAPS-43216

Cloudera Manager LDAP authentication fails

When the External Authentication type is set to LDAP, and the LDAP server is Active Directory, and the LDAP Group Search Base field is configured to be the root of the directory tree, authentication may fail with a `PartialResultException` message in the logs. This exception is now handled so that authentication succeeds.

Cloudera Bug: OPSAPS-43262

Logging in to Cloudera Manager 5.12.x with Internet Explorer 11 fails

Fixed an issue where Internet Explorer defaults to DocMode 7 due to the removal of the `X-UA-Compatible` header in Cloudera Manager 5.12. When the user uses Compatibility Mode in Internet Explorer 9, 10, 11, or Edge, the browser is incorrectly identified as Internet Explorer 7.0 and as a result Cloudera Manager issues an error message (You are using an unsupported browser) and does not allow the user to log in.

Cloudera Bug: OPSAPS-42870

Hive Replication jobs fail intermittently

Fixed a bug where Hive Replications can fail intermittently on the first step. The failure message says: "The remote command failed with error message: Hive Replication Export Step failed".

See TSB-276.

Fixed in: Cloudera Manager 5.14.0, 5.13.1

Cloudera Bug: OPSAPS-43676

Collect HDFS Replication process files in Hive Replication Diagnostic Bundle

The Hive Replication Diagnostic bundle now collects the HDFS Replication step's process log files.

Cloudera Bug: OPSAPS-43583

Hive Replication fails in unsecured clusters when proxy user is not a superuser on replication source

Fixed a bug that caused Hive Replication jobs to fail in unsecured clusters during the transfer step if the proxy user is not a superuser on the replication source.

Cloudera Bug: OPSAPS-43505

lsOf output in host statistics can be huge due to duplicate per-thread entries

Fixed an issue where the output of the `lsOf` command that is captured in support bundles showed open files per-thread as well as per-process. This could cause the size of the support bundle to increase significantly, and in some cases could cause the host statistics collection phase of support bundle collection to fail. Because the per-thread information is generally redundant, it has been removed from the `lsOf` output.

Cloudera Bug: OPSAPS-42646

Cloudera Manager unable to refresh parcel information

Fixes an issue with refreshing parcels. Information about all available parcels was failing to refresh if one of the repositories contained an invalid manifest file.

Cloudera Bug: OPSAPS-43614

Collection of Impala logs should not fail even when some log files are not present

Fixed an issue of missing Impala and Kudu role logs in the diagnostic bundle when their log directories have broken symlinks.

Cloudera Bug: OPSAPS-41194

Transfer Metadata Files step fails when the home directory of the username is encrypted

This fixes a known issue with Hive and HDFS replication where those replications fail if the `/user/$proxyuser` or `/user/hdfs` directories are encrypted. The bug was introduced in Cloudera Manager 5.12 for Hive Replication and in Cloudera Manager 5.13 for HDFS Replication.

Cloudera Bug: OPSAPS-42439

Duplicate replication job on Cloudera Manager restart

This fixes a known issue where a restart of Cloudera Manager that occurs while HDFS or Hive replication jobs are running can cause a duplicate replication job to be started.

Cloudera Bug: OPSAPS-42557

ACLs and external attributes comparison in HDFS and Hive Replication can be incorrect

Fixes a bug where ACLs and external attributes (Xattrs) may be copied over during HDFS and Hive replication even when they have not changed.

Cloudera Bug: OPSAPS-42818

HDFS Replication does not show the progress marker

This fixes an issue in Cloudera Manager in which progress markers for HDFS Replication were not visible in the Admin Console.

Cloudera Bug: OPSAPS-42805

ACLs and external attributes comparison in HDFS and Hive Replication can be incorrect

Fixes a bug where ACLs and external attributes (Xattrs) may be copied over during HDFS and Hive replication even when they have not changed.

Cloudera Bug: OPSAPS-42818

Cloudera Manager fails to start when gateway roles have configuration overrides

Fixes an issue where descriptor generation fails and the Cloudera Management Service fails to start if any Gateway roles have a configuration override.

Cloudera Bug: OPSAPS-43517

Replication fails with 'another command' error when the previous run is aborted

Fixes a bug introduced in Cloudera Manager 5.13 where a replication command is aborted, the next run of the command fails with the following error message: "Another HDFS replication command is in progress".

Cloudera Bug: OPSAPS-42808

Do not include unhealthy hosts when calculating acceptable estimation rate

Fixed an issue affecting the reliable generation of diagnostic bundles when some hosts are in an unhealthy state.

Cloudera Bug: OPSAPS-42720

Duplicate Hive Logs in diagnostic bundles.

Fixes a bug where some Hive logs would be duplicated in diagnostic bundles.

Cloudera Bug: OPSAPS-41611

"100%" health aggregation thresholds no longer permitted

Cloudera Manager now validates that custom services (CSDs) cannot define an invalid threshold for the role health of a service that affects overall service health. Now the thresholds for these health warnings ("percentGreenForGreen" and "percentYellowGreenForYellow ") must be less than 100%.

Cloudera Bug: OPSAPS-42853

Allow validations for HIVE_METASTORE_MAX_MESSAGE_SIZE to be suppressible

Fixed an issue where the validation warning for "Max Message Size for Hive MetaStore" configuration parameter could not be suppressed. The new behavior allows any validations to be suppressed.

Cloudera Bug: OPSAPS-43320

Preserve export.json and distcp-staging path when a different user runs /user replication

This fixes an issue in which a replication job that replicates the `/user` directory in HDFS using the "delete missing" delete policy causes other concurrent replication jobs to fail.

Cloudera Bug: OPSAPS-43050

Spark History Server ignores hadoop.security.auth_to_local mapping

The Spark History Server now respects the configured Kerberos-to-local user name mappings of the HDFS service.

Cloudera Bug: OPSAPS-42577

Impala Queries State are displayed wrong

The Impala queries page now shows the state of running queries correctly instead of calling them Finished.

Cloudera Bug: OPSAPS-43410

Rolling upgrade can fail when high availability services are stopped

Fixed a bug where rolling upgrades of CDH could fail when certain services Cloudera Manager expects to be able to restart without downtime are already stopped. Now, Cloudera Manager tolerates this and starts those services after upgrade as part of the cluster's rolling restart.

Cloudera Bug: OPSAPS-42515

Pagination on Commands page skips some commands

Fixed a bug with the pagination on the **All Recent Commands** page in which commands were not always listed consistently.

Cloudera Bug: OPSAPS-43052

Get all schedules operation is very slow in Cloudera Manager 5.11 and higher

Before Cloudera Manager 5.14, the `getAllSchedules` API returned a list of failed files for all runs of a schedule. This operation slows down execution of the API and has been changed so that a list of failed files is returned only when the view is specified as `full`.

Cloudera Bug: OPSAPS-42587

Improve reporting of Replication progress

Live monitoring of throughput and estimated completion time for HDFS and Hive Replications running using Cloudera Manager Backup and Disaster Recovery (BDR) are now available in log files.

Cloudera Bug: OPSAPS-42756

Remove the recommendation to restart Cloudera Manager when adding trusted Kerberos realm

Changing the list of trusted Kerberos realms no longer requires a restart of Cloudera Manager.

Cloudera Bug: OPSAPS-43237

Inefficiency when checking staleness and host status

Fixed an inefficiency in staleness checking and checking host status that caused slowness in the Cloudera Manager Admin Console.

Cloudera Bug: OPSAPS-42698

NameNode migration timeout while saving namespace of size more than 7GB

Fixes an issue during HDFS NameNode migration between hosts, where the "Saving Namespace" step may timeout if the fsimage size is large.

Cloudera Bug: OPSAPS-38236

Add Diagnostic Events for Agent Upgrades

Added installation and upgrade events for the Cloudera Manager agent software running on a cluster host to the diagnostic bundle.

Cloudera Bug: OPSAPS-42468

Limit the size of Hive log files collected in BDR diagnostic

Hive-related log files included in diagnostic bundle are now be limited to 100MB (before compression).

Cloudera Bug: OPSAPS-41610

Hive partitions not dropped in Hive replication

When partitions are deleted from a Hive table on the source cluster, Cloudera Backup and Disaster Recovery now correctly deletes the same partitions on Hive replication target. This fixes the bug introduced in Cloudera Manager 5.8.

Cloudera Bug: OPSAPS-42613

MR2Params.DEFAULT_MAPREDUCE_REDACTED_PROPERTIES should include Microsoft Azure credentials

Fixes a bug that caused a possible leak of sensitive cloud account information because redaction of these job configuration properties was not enabled by default for MapReduce jobs.

Cloudera Bug: OPSAPS-43753

Cross-site scripting issues fixed

A number of cross-site scripting issues have been identified through internal auditing and have all been fixed.

Cloudera Bug: OPSAPS-42828

Default end time in cluster utilization APIs is not parsed correctly

Fixed an issue where the cluster utilization report APIs did not work if the end time of the report was not specified with the `to` parameter. End time is meant to be an optional parameter, and now such API calls work without the `to` parameter.

Cloudera Bug: OPSAPS-42820

Cloudera Manager 5 Release Notes

Replication fails if the home directory of the username in the schedule is encrypted

Fixed an issue where BDR replication fails if the user directory of the user specified in the **Run as Peer User** or **Run as username** field in the replication schedule is encrypted.

Fixed in: Cloudera Manager 5.14.0, 5.13.1

Cloudera Bug: OPSAPS-42445

Issues Fixed in Cloudera Manager 5.13.3

Cross-site scripting vulnerability in Cloudera Manager

Fixed the cross-site vulnerability described in [TSB-2018-285 \(XSS Scripting Vulnerability in Cloudera Manager\)](#). For more information, see [the Known Issue description](#)

Cloudera Bug: DOCS-3186

Cloudera Manager Server reports 'Too many open files' error

Fixed an issue where collection of diagnostic bundles would lead to slow file descriptor leaks in Cloudera Manager Server that eventually cause the server to become non-operational or unresponsive.

Cloudera Bug: OPSAPS-44922

Backup and Disaster Recovery replication fails between two clusters when data is copied from one encryption zone to another when using CDH 5.12.0 or higher

Fixed an issue where replication fails when two clusters use HDFS HA, and the nameservice names are the same.

Both the source and destination clusters must upgrade to a release that contains the fix.

Important: Cloudera recommends using unique names for the nameservices.

Cloudera Bug: OPSAPS-43556

Fixed in: Cloudera Manager 5.15.0, 5.14.3, 5.13.3

Issues Fixed in Cloudera Manager 5.13.2

Cross-site scripting vulnerability in Cloudera Manager

Fixed the cross-site vulnerability described in [TSB-2018-285 \(XSS Scripting Vulnerability in Cloudera Manager\)](#). For more information, see [the Known Issue description](#)

Cloudera Bug: DOCS-3186

Hive Replications Can Fail Intermittently

This issue, which was also reported in [TSB-2018-276](#), is fixed in CDH 5.13.2. For further details, see the original [Known Issue](#).

Add "sentry" group in "hadoop.proxyuser.hive.groups" on upgrade to CDH 5.13.0 and higher

For CDH 5.13.0 and higher, when Hive is used with Sentry, Hive Proxy Groups should contain either a wildcard (*) for the Sentry Group for Sentry to work with Hive. If this is not present, Cloudera Manager adds the Sentry Group to Hive Proxy Groups when upgrading CDH.

Cloudera Bug: OPSAPS-43809

BDR Cloud (s3) Replication job fail with delegation token creation issue

Fixed an issue where HDFS to Amazon S3 or Hive to Amazon S3 replication jobs fail when an expired delegation token is used to run a MapReduce/YARN job.

Cloudera Bug: OPSAPS-44008

Cloudera Manager User Administrator role Error

Fixed a bug that occurred when a Cloudera Manager user with the **User Administrator** goes to the **Settings** page. The **Redaction Parameters for Diagnostic Bundles** parameter displays the following error message:

Invalid JSON configuration: SyntaxError: Unexpected token * in JSON at position 0.

Cloudera Bug: OPSAPS-41286

Cluster upgrade fails in wizard with "There is already a pending command on this entity."

Previously, if the customer selects the **Skip Host Inspector** option, the wizard proceeds to the next page but the command still runs in the background and the user sees the message "There is already a pending command on this entity." Cloudera Manager now ensures that the Host Inspector command is aborted when user selects **Skip Host Inspector**. It is still possible that other commands (scheduled or not) will run at the same time as the upgrade command. In this case, user will still see the same error message.

Cloudera Bug: OPSAPS-43740

Collect HDFS Replication process files in Hive Replication Diagnostic Bundle

The Hive Replication Diagnostic bundle now collects the HDFS Replication step's process log files.

Cloudera Bug: OPSAPS-43583

Configuration "diff" throws TypeMismatchException

The feature that compares the configuration between multiple services or multiple clusters on the configuration page threw an error in Cloudera Manager 5.13. This is now fixed.

Cloudera Bug: OPSAPS-43130

Historical Disk Usage By User download CSV is not adding the metric type customer is choosing

When creating the "Historical Disk Usage By User" report from the **Cluster > Cluster_name > Reports** page, the download button did not honor the chosen metric. This is now fixed.

Cloudera Bug: OPSAPS-43474

Hive Replication export step fails with StaleObjectStateException

Fixed an issue where replication commands sometimes fail because of concurrent executions in the database.

Cloudera Bug: OPSAPS-43964

Hive Replication fails in unsecured clusters when proxy user is not a superuser on replication source

Fixed a bug that caused Hive Replication jobs to fail in unsecured clusters during the transfer step if the proxy user is not a superuser on the replication source.

Cloudera Bug: OPSAPS-43505

Hive Replication jobs fail intermittently

Fixed a bug where Hive Replications can fail intermittently on the first step. The failure message says: "The remote command failed with error message: Hive Replication Export Step failed".

See TSB-276.

Fixed in: Cloudera Manager 5.14.0, 5.13.1

Cloudera Manager 5 Release Notes

Cloudera Bug: OPSAPS-43676

Collection of Impala logs should not fail even when some log files are not present

Fixed an issue of missing Impala and Kudu role logs in the diagnostic bundle when their log directories have broken symlinks.

Cloudera Bug: OPSAPS-41194

Scheduled snapshot and replication jobs are skipped

Fixed an issue where scheduled Snapshot and Replication jobs can be skipped if there are too many commands scheduled to run at the same time (more than 100), or if Cloudera Manager has paused due to garbage collection.

Fixed Versions: Cloudera Manager 5.15.0, 5.14.2, 5.13.2

Cloudera Bug: OPSAPS-44153

Table statistics are lost when replicating an existing table without partitions

Cloudera Backup and Disaster Recovery added a workaround for the Hive bug HIVE-15653 and now preserves table statistics for unpartitioned tables during subsequent runs.

Fixed Versions: Cloudera Manager 5.15.0, 5.14.2, 5.13.2

Cloudera Bug: OPSAPS-44070

The Replication performance CSV file header does not match content

Fixed an issue where the header in the HDFS Replication performance file (in CSV format) does not match its contents.

Fixed in: Cloudera Manager 5.15.0, 5.14.2, 5.13.2

Cloudera Bug: OPSAPS-43997

WebServerMetricCollector breaks

Fixed a bug causing broken Impala monitoring functionality when password authentication is enabled for the Impala Daemon Web server.

Cloudera Bug: OPSAPS-43216

Spark CSD should emit proper environment variables for older CDH version 5.4.x

Fixed configuration of Kerberos credentials for the Spark History Server in CDH 5.4.

Cloudera Bug: OPSAPS-43985

lsOf output in host statistics can be huge due to duplicate per-thread entries

Fixed an issue where the output of the `lsOf` command that is captured in support bundles showed open files per-thread as well as per-process. This could cause the size of the support bundle to increase significantly, and in some cases could cause the host statistics collection phase of support bundle collection to fail. Because the per-thread information is generally redundant, it has been removed from the `lsOf` output.

Cloudera Bug: OPSAPS-42646

Issues Fixed in Cloudera Manager 5.13.1

Replication fails if the home directory of the username in the schedule is encrypted

Fixed an issue where BDR replication fails if the user directory of the user specified in the **Run as Peer User** or **Run as username** field in the replication schedule is encrypted.

Fixed in: Cloudera Manager 5.14.0, 5.13.1

Cloudera Bug: OPSAPS-42445

Add Diagnostic Events for Agent Upgrades

Added installation and upgrade events for the Cloudera Manager agent software running on a cluster host to the diagnostic bundle.

Cloudera Bug: OPSAPS-42468

Cross-site scripting issues fixed

A number of cross-site scripting issues have been identified through internal auditing and have all been fixed.

Cloudera Bug: OPSAPS-42828

Logging in to Cloudera Manager 5.12.x with Internet Explorer 11 fails

Fixed an issue where Internet Explorer defaults to DocMode 7 due to the removal of the `X-UA-Compatible` header in Cloudera Manager 5.12. When the user uses Compatibility Mode in Internet Explorer 9, 10, 11, or Edge, the browser is incorrectly identified as Internet Explorer 7.0 and as a result Cloudera Manager issues an error message (You are using an unsupported browser) and does not allow the user to log in.

Cloudera Bug: OPSAPS-42870

ACLs and external attributes comparison in HDFS and Hive Replication can be incorrect

Fixes a bug where ACLs and external attributes (Xattrs) may be copied over during HDFS and Hive replication even when they have not changed.

Cloudera Bug: OPSAPS-42818

Transfer Metadata Files step fails when the home directory of the username is encrypted

This fixes a known issue with Hive and HDFS replication where those replications fail if the `/user/$proxyuser` or `/user/hdfs` directories are encrypted. The bug was introduced in Cloudera Manager 5.12 for Hive Replication and in Cloudera Manager 5.13 for HDFS Replication.

Cloudera Bug: OPSAPS-42439

Replication fails with 'another command' error when the previous run is aborted

Fixes a bug introduced in Cloudera Manager 5.13 where a replication command is aborted, the next run of the command fails with the following error message: "Another HDFS replication command is in progress".

Cloudera Bug: OPSAPS-42808

New Advanced Configuration Snippet for overriding the hdfs-site/core-site.xml values for Impala configurations

You can now use the following Advanced Configuration Snippets for `core-site.xml` for all Impalad and Catalog Server roles:

- **Impala Catalog Server Advanced Configuration Snippet (Safety Valve) for core-site.xml**
- **Impala Daemon Advanced Configuration Snippet (Safety Valve) for core-site.xml**

Cloudera Bug: OPSAPS-9586

Improve reporting of Replication progress

Live monitoring of throughput and estimated completion time for HDFS and Hive Replications running using Cloudera Manager Backup and Disaster Recovery (BDR) are now available in log files.

Cloudera Bug: OPSAPS-42756

Cloudera Manager fails to start when gateway roles have configuration overrides

Fixes an issue where descriptor generation fails and the Cloudera Management Service fails to start if any Gateway roles have a configuration override.

Cloudera Bug: OPSAPS-43517

Cloudera Manager 5 Release Notes

Limit the size of Hive log files collected in BDR diagnostic

Hive-related log files included in diagnostic bundle are now be limited to 100MB (before compression).

Cloudera Bug: OPSAPS-41610

Do not include unhealthy hosts when calculating acceptable estimation rate

Fixed an issue affecting the reliable generation of diagnostic bundles when some hosts are in an unhealthy state.

Cloudera Bug: OPSAPS-42720

Duplicate Hive Logs in diagnostic bundles.

Fixes a bug where some Hive logs would be duplicated in diagnostic bundles.

Cloudera Bug: OPSAPS-41611

Hive partitions not dropped in replication target cluster

Fixes a bug introduced in Backup and Disaster Recovery for Cloudera Manager 5.8 where HDFS and Hive replication were not dropping partitions on the target cluster that had been dropped on the source cluster.

Cloudera Bug: OPSAPS-43282

Incorrect warnings when configuring HBase Thrift Server in Kerberized cluster

Previously, when configuring the HBase Thrift Server security in a Kerberized cluster, incorrect warnings such as "When HBase is configured to use Kerberos, HBase Thrift Authentication is ignored when Enable TLS/SSL for HBase Thrift Server over HTTP is enabled" would appear. With this fix, these warnings are eliminated.

Cloudera Bug: OPSAPS-41441

"100%" health aggregation thresholds no longer permitted

Cloudera Manager now validates that custom services (CSDs) cannot define an invalid threshold for the role health of a service that affects overall service health. Now the thresholds for these health warnings ("percentGreenForGreen" and "percentYellowGreenForYellow ") must be less than 100%.

Cloudera Bug: OPSAPS-42853

Duplicate replication job on Cloudera Manager restart

This fixes a known issue where a restart of Cloudera Manager that occurs while HDFS or Hive replication jobs are running can cause a duplicate replication job to be started.

Cloudera Bug: OPSAPS-42557

Allow validations for HIVE_METASTORE_MAX_MESSAGE_SIZE to be suppressible

Fixed an issue where the validation warning for "Max Message Size for Hive MetaStore" configuration parameter could not be suppressed. The new behavior allows any validations to be suppressed.

Cloudera Bug: OPSAPS-43320

Preserve export.json and distcp-staging path when a different user runs /user replication

This fixes an issue in which a replication job that replicates the `/user` directory in HDFS using the "delete missing" delete policy causes other concurrent replication jobs to fail.

Cloudera Bug: OPSAPS-43050

HDFS Replication does not show the progress marker

This fixes an issue in Cloudera Manager in which progress markers for HDFS Replication were not visible in the Admin Console.

Cloudera Bug: OPSAPS-42805

YARN postponed cgroups cleanup could remove hadoop-yarn directory when NodeManager is running

This fixes a bug in which, under certain conditions after a YARN or cluster restart, Cloudera Manager would delete the local directory used by the YARN NodeManager for creation of YARN container cgroups. On systems configured to use cgroups for YARN CPU isolation, this would prevent new YARN workloads from running on specific hosts until the directory was recreated manually.

Cloudera Bug: OPSAPS-40755

Inefficiency when checking staleness and host status

Fixed an inefficiency in staleness checking and checking host status that caused slowness in the Cloudera Manager Admin Console.

Cloudera Bug: OPSAPS-42698

Improved dynamic chunk operation of BDR

For HDFS and Hive replication, copying data in chunks sized by bytes, not a fixed number of files is now the default behavior.

Cloudera Bug: OPSAPS-42682

Remove the recommendation to restart Cloudera Manager when adding trusted Kerberos realm

Changing the list of trusted Kerberos realms no longer requires a restart of Cloudera Manager.

Cloudera Bug: OPSAPS-43237

BDR performance improvement

This fix delivers a big performance boost by parallelizing the process of checking for changes in file permissions, ACLs, and external attributes. Directory permissions are now preserved in the CopyMapper phase instead of the CopyCommitter phase.

Cloudera Bug: OPSAPS-42834

Spark History Server ignores hadoop.security.auth_to_local mapping

The Spark History Server now respects the configured Kerberos-to-local user name mappings of the HDFS service.

Cloudera Bug: OPSAPS-42577

NameNode migration timeout while saving namespace of size more than 7GB

Fixes an issue during HDFS NameNode migration between hosts, where the "Saving Namespace" step may timeout if the fsimage size is large.

Cloudera Bug: OPSAPS-38236

Issues Fixed in Cloudera Manager 5.13.0

CM should report Spark service health as bad when the SparkHistoryServer is down

The Spark service health now reflects the health of its configured roles.

Cloudera Bug: OPSAPS-34698

Timeout between BDR peers increased

The communications timeout between two peer Cloudera Manager servers for communication during BDR replication has been increased to 10 seconds.

Cloudera Bug: OPSAPS-39225

New Impala metrics for hedged reads, JVM heap usage and connection setup queue size

The new metrics are for JVM Heap usage of the Catalog Server and Hedged reads.

Cloudera Bug: OPSAPS-39831, OPSAPS-40212, OPSAPS-40771

ClassCastException during upgrade with custom services (CSD) that support rolling restart

Fixed a bug that caused a `ClassCastException` during upgrade of clusters with custom (CSD) services that explicitly define rolling restart steps for master roles.

Cloudera Bug: OPSAPS-40182

Only one existing NodeManager role marked stale in Cloudera Manager when a new NodeManager is added

Fixes an issue with staleness detection logic. The new staleness detection logic, introduced in 5.11.0, caused a regression where it does not mark all the services stale. This affects rolling restart of the services.

Cloudera Bug: OPSAPS-40332

Proper termination and cleanup of YARN applications during decommissioning

Fixed an issue where YARN applications may not exit gracefully or clean-up properly if hosts are decommissioned while application containers are still running. This could lead to unexpected container/application failure and/or orphaned container processes on YARN worker nodes. Now, when decommissioning a NodeManager or host running a NodeManager, Cloudera Manager first waits for the configured YARN graceful decommission timeout (if applicable), and allows additional time for ResourceManager to properly terminate the NodeManager and its child processes.

Cloudera Bug: OPSAPS-40731

Health Event Startup Policy incorrectly mutes health events

Fixed an issue where all health events are ignored and no alerts get sent when the **Health Event Startup Policy** is set to none.

Cloudera Bug: OPSAPS-40851

Non-ASCII characters in logs caused failure of log collection for diagnostic bundles

Fixed an issue where log files did not get collected correctly as part of diagnostic bundles because they contained non-ASCII characters.

Cloudera Bug: OPSAPS-40949

Exception thrown when searching large log files

Fixed an issue where an exception might be thrown when searching a log when the log file size is larger than 2 GB.

Cloudera Bug: OPSAPS-41710

Exception thrown when accessing a service status page while stopping one of its roles

Fixed an issue where a `NullPointerException` occurred when accessing the service status page in the Cloudera Manager Admin Console while stopping a role.

Cloudera Bug: OPSAPS-41222

Increase Maximum Document Buffer size default to 2047 in Reports Manager

The default upper limit for the Reports Manager's **Maximum Document Buffer Size** configuration parameter has been increased to 2047 MB.

Cloudera Bug: OPSAPS-41358

Spilled memory not populated in Impala queries and in the Spilled Memory tab in the Cluster Utilization report

Fixed an issue where the **Memory Spilled** metric for each Impala query was not correctly populated. This prevented various features that depend on this metric from functioning correctly. For example, the **Spilled Memory** tab of the **Cluster Utilization Report** was not populated with data.

Cloudera Bug: OPSAPS-41447

HSM KMS trust store password is visible in logs

In previous releases, when using the Cloudera Navigator HSM KMS (for use with a Thales or Luna Hardware Security Module), the KMS's trust store password was displayed in some process logs on the KMS hosts. While the trust store password is not considered sensitive, some customers set their trust store password to the same value as their key store password, which is sensitive. In this release, the HSM KMS's trust store password is no longer displayed.

Cloudera Bug: OPSAPS-41626

Hue Load Balancer caused login failure

Fixed an issue where using Apache httpd 2.4 as the Hue load balancer caused Hue logins to fail when TLS is enabled for Hue. This change requires Cloudera Manager to set the `use_x_forwarded_host` parameter in the `hue.ini` file to "true". After upgrading Cloudera Manager, Cloudera Manager will report that the Hue Server and Load Balancer role configurations are stale. If your cluster is affected by this bug, you must restart the Hue service.

Cloudera Bug: OPSAPS-41850

Upgrade is blocked when HMS validation fails

While upgrading to Cloudera Manager 5.12 and CDH 5.12, Cloudera Manager added a new Hive Metastore validation step that is executed as a part of the CDH upgrade command to detect any corruption in the Hive Metastore. In 5.12, when corruption is detected and validation fails, the upgrade command fails and leaves the cluster in an intermediate state, meaning that some services may be started while others are stopped, which is not desirable.

This issue has been fixed in Cloudera Manager 5.12.1. Because it is possible for Hive to tolerate some forms of minor schema corruption, and because it is impossible to run the schema validation tool prior to CDH 5.12, the Hive Metastore validation is now executed as the last step of the upgrade command, which occurs after all the services in the cluster have fully been upgraded and restarted. Although this step still appears to be part of upgrade step, your upgrade is actually complete and you can deal with schema integrity issues following the upgrade. If you see this step failing, exit the upgrade wizard and contact Cloudera Support for assistance repairing any schema corruption. You may then re-run the validation tool manually from the Hive service actions menu after repair is complete to verify a successful repair.

Cloudera Bug: OPSAPS-41936

Default values for `yarn.scheduler.fair.assignmultiple` can block YARN applications from running on CDH 5.5 or CDH 5.6

In some previous versions of Cloudera Manager, the default value of `yarn.scheduler.fair.assignmultiple` was incorrect and can cause problems in CDH 5.5 and 5.6. This has been fixed. Note: if you use CDH versions 5.5.x or 5.6.x and upgrade to CM 5.13, you may see a staleness indicator for the YARN service. The staleness shows `yarn.scheduler.fair.max.assign` as being added. This is expected, and you should restart the YARN service to avoid a serious bug in the Resource Manager ([YARN-4477](#)).

Cloudera Bug: OPSAPS-42118

Add Host Wizard does not apply host template

Fixed an issue where the **Apply Host Template** feature in the **Add Hosts Wizard** did not apply the host template.

Cloudera Bug: OPSAPS-42134

Advanced configuration properties for Hue Load Balancer have no effect

Fixed an issue where Advanced Configuration Snippets for the Hue Load Balancer were not able to override the settings **SSLProtocol** and **SSLCipherSuite**.

Cloudera Bug: OPSAPS-42187

Cloudera Manager 5 Release Notes

Issues with Kafka Active Controller when managing multiple Kafka services

Fixed an issue where Cloudera Manager did not track the Active Controller in Kafka correctly if there were multiple Kafka services running under the same Cloudera Manager instance.

Cloudera Bug: OPSAPS-42216

JDK 7 performance regression for Cloudera Manager-managed deployments of HBase

This change sets the JVM property `ReservedCodeCacheSize` to 256MB in the default JVM startup options for HBase roles. This change attempts to prevent performance issues seen when HBase uses Java 7. The value set is the same as the default when using Java 8.

Cloudera Bug: OPSAPS-42259

NullPointerException on the Command Details page while deploying client configuration

Fixed a `NullPointerException` on the Command Details page that caused the **Deploy Client Configuration** status to not display.

Cloudera Bug: OPSAPS-42390

BDR jobs replicating specific directories can cause other jobs to fail when using certain Delete Policy modes

Fixed an issue where a replication schedule copying the `/user/`, `/user/hdfs` or `/user/$bdr_user` directory with the **Delete Policy** set to delete missing files can cause other replication jobs that run simultaneously to fail.

Cloudera Bug: OPSAPS-42492

Rolling upgrade can fail when high availability services are stopped

Fixed a bug where rolling upgrades of CDH could fail when certain services Cloudera Manager expects to be able to restart without downtime are already stopped. Now, Cloudera Manager tolerates this and starts those services after upgrade as part of the cluster's rolling restart.

Cloudera Bug: OPSAPS-42515

Issues Fixed in Cloudera Manager 5.12.2

Do not include unhealthy hosts when calculating acceptable estimation rate

Fixed an issue affecting the reliable generation of diagnostic bundles when some hosts are in an unhealthy state.

Cloudera Bug: OPSAPS-42720

BDR jobs replicating specific directories can cause other jobs to fail when using certain Delete Policy modes

Fixed an issue where a replication schedule copying the `/user/`, `/user/hdfs` or `/user/$bdr_user` directory with the **Delete Policy** set to delete missing files can cause other replication jobs that run simultaneously to fail.

Cloudera Bug: OPSAPS-42492

Rolling upgrade can fail when high availability services are stopped

Fixed a bug where rolling upgrades of CDH could fail when certain services Cloudera Manager expects to be able to restart without downtime are already stopped. Now, Cloudera Manager tolerates this and starts those services after upgrade as part of the cluster's rolling restart.

Cloudera Bug: OPSAPS-42515

Spark History Server ignores `hadoop.security.auth_to_local` mapping

The Spark History Server now respects the configured Kerberos-to-local user name mappings of the HDFS service.

Cloudera Bug: OPSAPS-42577

Default values for `yarn.scheduler.fair.assignmultiple` can block YARN applications from running on CDH 5.5 or CDH 5.6

In some previous versions of Cloudera Manager, the default value of `yarn.scheduler.fair.assignmultiple` was incorrect and can cause problems in CDH 5.5 and 5.6. This has been fixed. Note: if you use CDH versions 5.5.x or 5.6.x and upgrade to CM 5.13, you may see a staleness indicator for the YARN service. The staleness shows `yarn.scheduler.fair.max.assign` as being added. This is expected, and you should restart the YARN service to avoid a serious bug in the Resource Manager ([YARN-4477](#)).

Cloudera Bug: OPSAPS-42118

[Add Host Wizard does not apply host template](#)

Fixed an issue where the **Apply Host Template** feature in the **Add Hosts Wizard** did not apply the host template.

Cloudera Bug: OPSAPS-42134

[Incorrect warnings when configuring HBase Thrift Server in Kerberized cluster](#)

Previously, when configuring the HBase Thrift Server security in a Kerberized cluster, incorrect warnings such as "When HBase is configured to use Kerberos, HBase Thrift Authentication is ignored when Enable TLS/SSL for HBase Thrift Server over HTTP is enabled" would appear. With this fix, these warnings are eliminated.

Cloudera Bug: OPSAPS-41441

[CM - log refresh takes me to the top of the page every 5 seconds](#)

Fixed an issue in the Install Details dialog that scrolling position was not respected and always moves to the very top. Now it stays in the location that user has scrolled to.

Cloudera Bug: OPSAPS-40836

[YARN postponed cgroups cleanup could remove hadoop-yarn directory when NodeManager is running](#)

This fixes a bug in which, under certain conditions after a YARN or cluster restart, Cloudera Manager would delete the local directory used by the YARN NodeManager for creation of YARN container cgroups. On systems configured to use cgroups for YARN CPU isolation, this would prevent new YARN workloads from running on specific hosts until the directory was recreated manually.

Cloudera Bug: OPSAPS-40755

[New Advanced Configuration Snippet for overriding the hdfs-site/core-site.xml values for Impala configurations](#)

You can now use the following Advanced Configuration Snippets for `core-site.xml` for all Impalad and Catalog Server roles:

- **Impala Catalog Server Advanced Configuration Snippet (Safety Valve) for core-site.xml**
- **Impala Daemon Advanced Configuration Snippet (Safety Valve) for core-site.xml**

Cloudera Bug: OPSAPS-9586

[Allow validations for HIVE_METASTORE_MAX_MESSAGE_SIZE to be suppressible](#)

Fixed an issue where the validation warning for "Max Message Size for Hive MetaStore" configuration parameter could not be suppressed. The new behavior allows any validations to be suppressed.

Cloudera Bug: OPSAPS-43320

[Preserve export.json and distcp-staging path when a different user runs /user replication](#)

This fixes an issue in which a replication job that replicates the `/user` directory in HDFS using the "delete missing" delete policy causes other concurrent replication jobs to fail.

Cloudera Bug: OPSAPS-43050

Cloudera Manager 5 Release Notes

[sentry] Warn when policy files are in use

New Behavior: CM will show a suppressible warning when Sentry Policy files are used when the service can be configured to work with the Sentry Service in that CDH version. Note: HBase Solr Indexer does not currently support the Sentry Service in any CDH version and only supports policy files. Therefore, this validation warning will not be available for HBase Solr Indexer.

Cloudera Bug: OPSAPS-42865

Logging in to Cloudera Manager 5.12.x with Internet Explorer 11 fails

Fixed an issue where Internet Explorer defaults to DocMode 7 due to the removal of the `X-UA-Compatible` header in Cloudera Manager 5.12. When the user uses Compatibility Mode in Internet Explorer 9, 10, 11, or Edge, the browser is incorrectly identified as Internet Explorer 7.0 and as a result Cloudera Manager issues an error message (You are using an unsupported browser) and does not allow the user to log in.

Cloudera Bug: OPSAPS-42870

BDR performance improvement

This fix delivers a big performance boost by parallelizing the process of checking for changes in file permissions, ACLs, and external attributes. Directory permissions are now preserved in the CopyMapper phase instead of the CopyCommitter phase.

Cloudera Bug: OPSAPS-42834

ACLs and external attributes comparison in HDFS and Hive Replication can be incorrect

Fixes a bug where ACLs and external attributes (Xattrs) may be copied over during HDFS and Hive replication even when they have not changed.

Cloudera Bug: OPSAPS-42818

NullPointerException on the Command Details page while deploying client configuration

Fixed a NullPointerException on the Command Details page that caused the **Deploy Client Configuration** status to not display.

Cloudera Bug: OPSAPS-42390

Issues Fixed in Cloudera Manager 5.12.1

Hue Load Balancer caused login failure

Fixed an issue where using Apache httpd 2.4 as the Hue load balancer caused Hue logins to fail when TLS is enabled for Hue. This change requires Cloudera Manager to set the `use_x_forwarded_host` parameter in the `hue.ini` file to "true". After upgrading Cloudera Manager, Cloudera Manager will report that the Hue Server and Load Balancer role configurations are stale. If your cluster is affected by this bug, you must restart the Hue service.

Cloudera Bug: OPSAPS-41850

HSM KMS trust store password is visible in logs

In previous releases, when using the Cloudera Navigator HSM KMS (for use with a Thales or Luna Hardware Security Module), the KMS's trust store password was displayed in some process logs on the KMS hosts. While the trust store password is not considered sensitive, some customers set their trust store password to the same value as their key store password, which is sensitive. In this release, the HSM KMS's trust store password is no longer displayed.

Cloudera Bug: OPSAPS-41626

Maximum Diagnostic Bundle Size reported incorrectly

- The **Send Diagnostic Data** command was erroneously reporting the maximum allowed bundle size when the diagnostic bundle is created using the **By Date Range** option. This message was fixed to show the right allowed bundle size.

- The **Send Diagnostic Data** command displayed unclear error messages when the estimation step fails. This has been fixed to show a clear error message.

Cloudera Bug: OPSAPS-41020

Upgrade is blocked when HMS validation fails

While upgrading to Cloudera Manager 5.12 and CDH 5.12, Cloudera Manager added a new Hive Metastore validation step that is executed as a part of the CDH upgrade command to detect any corruption in the Hive Metastore. In 5.12, when corruption is detected and validation fails, the upgrade command fails and leaves the cluster in an intermediate state, meaning that some services may be started while others are stopped, which is not desirable.

This issue has been fixed in Cloudera Manager 5.12.1. Because it is possible for Hive to tolerate some forms of minor schema corruption, and because it is impossible to run the schema validation tool prior to CDH 5.12, the Hive Metastore validation is now executed as the last step of the upgrade command, which occurs after all the services in the cluster have fully been upgraded and restarted. Although this step still appears to be part of upgrade step, your upgrade is actually complete and you can deal with schema integrity issues following the upgrade. If you see this step failing, exit the upgrade wizard and contact Cloudera Support for assistance repairing any schema corruption. You may then re-run the validation tool manually from the Hive service actions menu after repair is complete to verify a successful repair.

Cloudera Bug: OPSAPS-41936

Spilled memory not populated in Impala queries and in the Spilled Memory tab in the Cluster Utilization report

Fixed an issue where the **Memory Spilled** metric for each Impala query was not correctly populated. This prevented various features that depend on this metric from functioning correctly. For example, the **Spilled Memory** tab of the **Cluster Utilization Report** was not populated with data.

Cloudera Bug: OPSAPS-41447

Increase Maximum Document Buffer size default to 2047 in Reports Manager

The default upper limit for the Reports Manager's **Maximum Document Buffer Size** configuration parameter has been increased to 2047 MB.

Cloudera Bug: OPSAPS-41358

Exception thrown when searching large log files

Fixed an issue where an exception might be thrown when searching a log when the log file size is larger than 2 GB.

Cloudera Bug: OPSAPS-41710

Proper termination and cleanup of YARN applications during decommissioning

Fixed an issue where YARN applications may not exit gracefully or clean-up properly if hosts are decommissioned while application containers are still running. This could lead to unexpected container/application failure and/or orphaned container processes on YARN worker nodes. Now, when decommissioning a NodeManager or host running a NodeManager, Cloudera Manager first waits for the configured YARN graceful decommission timeout (if applicable), and allows additional time for ResourceManager to properly terminate the NodeManager and its child processes.

Cloudera Bug: OPSAPS-40731

Viewing agent logs in Internet Explorer renders incorrectly

When viewing agent logs in Internet Explorer, the logs may render as HTML instead of text. This has been fixed by forcing browsers to render the log page as text.

Cloudera Bug: OPSAPS-41122

Threads CPU time and Total Time are not populated in Impala Query Monitoring

The **Thread CPU** Time and **Total Time** attributes of Impala Query Monitoring are now correctly populated.

Cloudera Bug: OPSAPS-39647

Issues Fixed in Cloudera Manager 5.12.0

Renaming an empty directory on Amazon S3 when using DynamoDB with S3Guard may fail

Fixed an issue where renaming an empty directory on Amazon S3 when using DynamoDB with S3Guard may fail

Cloudera bug: CDH-51869

Apache bug: HADOOP-14036

Changes to the `/tmp` directory causes Hue failures

Changing permissions or removing files in the `/tmp` directory can cause Hue to fail because the Hue Kerberos ticket cache file, located by default in the `/tmp` directory, is no longer available. The default location has been changed to `/var/run/hue`.

You can change the location of the Hue Kerberos ticket cache by changing the **Hue Kerberos Credentials Cache Directory** property. In Cloudera Manager, go to the Hue service, select the **Configuration** tab, and search for the property. Restart the Hue service to enable the change.

After upgrading Cloudera Manager you must also restart the Hue service.

Cloudera Bug: OPSAPS-26101

Exception when setting `maintenanceOwners` to null

Fixed how null values for the `maintenanceOwners` parameter are handled when creating clusters with the Cloudera Manager API.

Cloudera Bug: OPSAPS-32880

Upgrade continues when there are hosts with warnings

Fixed an issue where an upgrade continues even if hosts have a warning. Host warnings must be resolved before an upgrade can complete.

Cloudera Bug: OPSAPS-40945

Address renewal requirements for delegation tokens in DR

Fixed an issue where BDR replication jobs fail on a Kerberos enabled cluster if the job duration is longer than the renewal interval for the hdfs delegation token. With this fix, both the delegation token and Kerberos ticket are renewed until the max lifetime of token/ticket (default value is 7 days). This enables longer replications without needing to bring down the source cluster.

Cloudera Bug: OPSAPS-32811

`hostname` parameter is not passed to Impala catalog role

[IMPALA-5253](#) contained a security fix for clusters using Impala with TLS (SSL) security enabled. This fix was also made in several maintenance versions of CDH that require you to upgrade Cloudera Manager. If you upgrade to a CDH version with this fix without upgrading Cloudera Manager, Impala will not function when TLS is enabled for Impala. You should upgrade Cloudera Manager first if you want to move to a CDH version with the security fix.

This issue affects upgrades of Cloudera Manager and CDH to version 5.11.1.

There are two ways you can workaround this issue:

- Upgrade to one of the following versions of Cloudera Manager before upgrading CDH:
 - 5.13.0
 - 5.12.1
 - 5.11.2
 - 5.10.2
 - 5.9.3

– 5.8.5

-or-

- *Before upgrading CDH*, set the `-hostname` option to the fully-qualified domain name of the Catalog Server using the **Catalog Server Command Line Argument Advanced Configuration Snippet (Safety Valve)** configuration property:

```
-hostname=fully-qualified-domain-name of Impala Catalog Server
```

(To set this property, in Cloudera Manager, go to the Impala service, select the **Configuration** tab and search for the property.

CDH versions with the Impala security fix:

- 5.11.1
- 5.10.2
- 5.9.3
- 5.8.5

Cloudera bug: OPSAPS-41218

Hive Replication fails with OTHER_ERROR with duplicate view/table names

Fixed an issue where Hive replication fails if the same name is used for a table on the target cluster which is also used for a view on the source cluster. With this change, Hive replication properly handles all cases where a view and table on source/target clusters have the same name.

Cloudera Bug: OPSAPS-36302

Underscores in LDAP domain names not allowed

Fixed an issue where LDAP domain names could not contain underscores. This fix affects Cloudera Manager, Hue and Cloudera Navigator.

Cloudera Bug: OPSAPS-40487

Only use healthy HDFS/Hive hosts for launching replication jobs

BDR Replication Host Selection Policy has been updated. The process that launches and coordinates a HDFS/Hive replication job will now only run on the following hosts:

- Hosts that run any role of the HDFS/Hive Service (for HDFS or Hive replication)
- Hosts that have a Non-Gateway role
- Hosts where the health status is in the GOOD or CONCERNING state with preference given to GOOD
- Hosts that are whitelisted, if configured

Cloudera Bug: OPSAPS-40040

Low watermark value for Memstore Flush default is incorrect

For CDH versions 5.8 and higher, the **Low Watermark for Memstore Flush** configuration parameter is associated with the HBase parameter `hbase.regionserver.global.memstore.lowerLimit`.

This value represents the fullness threshold of the memstore as a percentage of memstore capacity. The default value for this parameter was incorrectly set too low at `.38`. This can cause severe under utilization of the memstore.

The default has been corrected to be `.95`. When upgrading to a version of Cloudera Manager with this fix, if the value was previously set to the old default of `.38`, it will automatically be increased to the new default, which may cause Cloudera Manager to mark your HBase service as having a stale configuration, requiring a restart.

Additionally, if an existing **Low Watermark for Memstore Flush** configuration parameter has a value $\leq .9$, it will be flagged as a configuration warning.

Cloudera Manager 5 Release Notes

Fixed in: Cloudera Manager 5.12, 5.11.1, 5.10.2, 5.9.3, 5.8.5

Cloudera Bug: OPSAPS-38468

Accessing Sqoop2 with Hue fails

Fixed an issue where accessing Sqoop2 with Hue fails with the following error: Sqoop error: Could not get connectors.

CDH 5.5.0 or higher clusters running a Hue Service require a restart of Hue services because of a new configuration file. This new configuration file is required for Hue's Sqoop2 Application functions in secure settings, but it will show up whether or not Sqoop or security settings are in use.

Cloudera Bug: OPSAPS-27286

Make Oozie Load-balancer URL mandatory when enabling Oozie HA

Fixed an issue when the **Oozie Load Balancer** field in the Oozie configuration is not set and Oozie high availability is in use (two or more Oozie Server roles are deployed). This now creates a validation error and Cloudera Manager does not let you start or restart Oozie until the problem is fixed.

Fixed in: Cloudera Manager 5.12, 5.11.2, 5.10.2, 5.9.3

Cloudera Bug: OPSAPS-39372

Wire encryption configuration properties

HDFS client data-transfer encryption cipher related properties are now published to HTTPFs. Previously they were emitted just to HDFS Gateways, which caused HTTPFs performance to suffer when Data Transfer Encryption was turned on. When upgrading to Cloudera Manager 5.12, all HTTPFs instances will be marked stale, and a restart of those roles is required for these properties to take effect.

Cloudera Bug: OPSAPS-39981

Missing Sentry configuration files

Fixed an issue where some configuration files (core-site.xml) were missing from Sentry configuration.

Cloudera Bug: OPSAPS-33710

LoggingOutInterceptor log level

To enhance security, when API debugging is enabled, the entire API request and response is no longer printed at the DEBUG log level. To see the request/response, set the logging level to TRACE. Note that this may expose sensitive information in the logs.

Cloudera Bug: OPSAPS-34538

Failed health checks because of deprecated ntpdc command

Fixed an issue where the `ntpdc` command was used in the host Clock Offset health test even if the command is deprecated for an operating system.

Cloudera Bug: OPSAPS-38268

Reports Manager throws ArrayIndexOutOfBoundsException when indexing fsimage

Fixes an issue where an `ArrayIndexOutOfBoundsException` can be thrown by Reports Manager.

Fixed in Cloudera Manager 5.12, 5.11.2, 5.10.2, 5.9.3

Cloudera Bug: OPSAPS-40914

Spark History Server password handling

Improved password handling for the Spark History Server. After upgrading to Cloudera Manager 5.12, Cloudera Manager may consider the Spark service as having a stale configuration due to this change, requiring a restart.

Cloudera Bug: OPSAPS-40298

Agent process directories re-mounted on agent restart

Fixed an issue where restarting an agent on newer Linux distributions such as Ubuntu 16.04 or Red Hat 7 would result in process run directories being remounted and lost.

Cloudera Bug: OPSAPS-41259

Process secrets no longer protected with file permissions

Fixed an issue where secret data, including passwords and other data, can be exposed in the `/var/run/cloudera-scm-agent/process-name/proc.json` or `/var/run/cloudera-scm-agent/process-name/config.zip` files because these files are world readable. See TSB-235 for more information.

Fixed in: Cloudera Manager 5.12, 5.11, 5.10.2, 5.9.3

Cloudera Bug: OPSAPS-40536

Configuration files can be downloaded from the UI

Certain files that may contain sensitive information can no longer be downloaded from the Processes tab in Cloudera Manager. If access to those files is required, you must log into the appropriate host.

Cloudera Bug: OPSAPS-40309

Command download filename uniqueness

Fixed an issue where downloading the command output did not generate a unique file name.

Cloudera Bug: OPSAPS-40249

StopRunner is not honouring the keyAdministrator Role Activities

Fixed an issue where a CSD descriptor was not respecting the correct authorization for start/stop when specifying a service-level stopRunner (which enables graceful shutdown). This could cause some user roles to be able to start but not stop some services.

Cloudera Bug: OPSAPS-41030

Hue Load Balancer SSL Handshake error

Fixed an issue with the SSL handshake in Hue when Apache httpd 2.4 or higher is used as the load balancer. The Hue load balancer previously set the `ProxyPreserveHost` directive to `On`, when it should have been set to `Off`. This causes problems making SSL connections when using Apache httpd 2.4 or higher. The error caused problems when verifying the CN, which older versions of Apache httpd did not encounter because they did not properly verify the CN.

When upgrading Cloudera Manager, the Hue load balancer may be marked as having a stale configuration. If you are experiencing issues connecting to Hue with SSL, restart the Hue service to update the configuration.

Cloudera Bug: OPSAPS-40700

LDAP trust failures not showing in stack traces

When an external user authenticating via LDAP or Active Directory fails to login to Cloudera Manager, the failure stack trace is now logged in the Cloudera Manager server log to help debug the failure.

Cloudera Bug: OPSAPS-40065

getRoles filtering is not working with Cloudera Manager API version 11 and higher

Fixed a bug that broke backwards compatibility with Cloudera Manager API version 11 (introduced with the Cloudera Manager 5.6 release) for the following endpoint:

```
/api//clusters/clusterName/services/serviceName/roles?filter=type==ROLE_TYPE
```

Cloudera Bug: OPSAPS-40184

Cluster templates don't include role level configuration

Fixed an issue with Cluster Templates where role level configuration was not getting exported. This was causing cluster to fail when trying user try to import a cluster template exported from a cluster on which HDFS HA was enabled.

Cloudera Bug: OPSAPS-31528

Dynamic Resource Pool drop-down options are not visible when using Internet Explorer 11

Fixed a typo on the **Dynamic Resource Pools** page that prevents Internet Explorer from rendering the add/edit resource pool dialog box.

Cloudera Bug: OPSAPS-40522

Cloudera Manager Server not validating agent hostnames with TLS

Fixed an issue where, when using TLS, hostnames were not verified during agent to server communication. To fix this, Cloudera Manager has a new setting: **Verify Agent Hostname Against Certificate**. When enabled, agent hostnames must match the hostname in the agent certificate, which is validated when agents send heartbeats to the Cloudera Manager Server.

Cloudera Bug: OPSAPS-40125

User Administrator role cannot configure S3Guard

Fixed an issue where the user administrator role was disallowed from managing S3 configuration.

Cloudera Bug: OPSAPS-40083

Allow diagnostic bundle estimation timeout to be configurable

Sometimes on a large or busy cluster, collection of diagnostic data using the **By Date Range** option can fail due to a timeout during estimation step of the diagnostic bundle collection. You can now configure both the host level estimation timeout and the overall estimation timeout using Java options. These options can be set on the Cloudera Manager Server host I in the `/etc/default/cloudera-scm-server` file by adding the following to the line that begins with `export CMF_JAVA_OPTS:`

- `-Dcom.cloudera.RoleLogEstimator.maxEstimateTimeoutSeconds=number of seconds` (If not specified, the default is 90 seconds)
- `-Dcom.cloudera.RoleLogEstimator.estimateTimeoutPerHostSeconds=number of seconds` (If not specified, default is 60 seconds)

Note:

The value of `-Dcom.cloudera.RoleLogEstimator.maxEstimateTimeoutSeconds=number of seconds` must be `>=` the value of `-Dcom.cloudera.RoleLogEstimator.estimateTimeoutPerHostSeconds=number of seconds`.

Restart the Cloudera Manager server for the updated Java flags to take effect:

```
sudo service cloudera-scm-server restart
```

Fixed in: Cloudera Manager 5.12, 5.11.2, 5.10.2, 5.9.3

Cloudera Bug: OPSAPS-40987

Peak Memory Usage report for Impala does not display data

Fixed an issue where the **Impala Peak Memory Usage** page in the Cluster Utilization Report did not display any data in Cloudera Manager.

Fixed in: Cloudera Manager 5.12, 5.11.2, 5.9.3

Cloudera Bug: OPSAPS-39836

NullPointerException when accessing the configuration page for Alerts

Fixed an issue where a NullPointerException occurred when viewing the configuration page for alerts.

Fixed in Cloudera Manager 5.12, 5.11.2, 5.10.2

Cloudera Bug: OPSAPS-39296

Issues Fixed in Cloudera Manager 5.11.2

Agent process directories re-mounted on agent restart

Fixed an issue where restarting an agent on newer Linux distributions such as Ubuntu 16.04 or Red Hat 7 would result in process run directories being remounted and lost.

Cloudera Bug: OPSAPS-41259

hostname parameter is not passed to Impala catalog role

[IMPALA-5253](#) contained a security fix for clusters using Impala with TLS (SSL) security enabled. This fix was also made in several maintenance versions of CDH that require you to upgrade Cloudera Manager. If you upgrade to a CDH version with this fix without upgrading Cloudera Manager, Impala will not function when TLS is enabled for Impala. You should upgrade Cloudera Manager first if you want to move to a CDH version with the security fix.

This issue affects upgrades of Cloudera Manager and CDH to version 5.11.1.

There are two ways you can workaround this issue:

- Upgrade to one of the following versions of Cloudera Manager before upgrading CDH:
 - 5.13.0
 - 5.12.1
 - 5.11.2
 - 5.10.2
 - 5.9.3
 - 5.8.5

-or-

- *Before upgrading CDH*, set the `-hostname` option to the fully-qualified domain name of the Catalog Server using the **Catalog Server Command Line Argument Advanced Configuration Snippet (Safety Valve)** configuration property:

```
-hostname=fully-qualified-domain-name of Impala Catalog Server
```

(To set this property, in Cloudera Manager, go to the Impala service, select the **Configuration** tab and search for the property.

CDH versions with the Impala security fix:

- 5.11.1
- 5.10.2
- 5.9.3
- 5.8.5

Cloudera bug: OPSAPS-41218

Maximum Diagnostic Bundle Size reported incorrectly

- The **Send Diagnostic Data** command was erroneously reporting the maximum allowed bundle size when the diagnostic bundle is created using the **By Date Range** option. This message was fixed to show the right allowed bundle size.
- The **Send Diagnostic Data** command displayed unclear error messages when the estimation step fails. This has been fixed to show a clear error message.

Cloudera Bug: OPSAPS-41020

Allow diagnostic bundle estimation timeout to be configurable

Sometimes on a large or busy cluster, collection of diagnostic data using the **By Date Range** option can fail due to a timeout during estimation step of the diagnostic bundle collection. You can now configure both the host level estimation timeout and the overall estimation timeout using Java options. These options can be set on the Cloudera Manager Server host I in the `/etc/default/cloudera-scm-server` file by adding the following to the line that begins with `export CMF_JAVA_OPTS:`

- `-Dcom.cloudera.RoleLogEstimator.maxEstimateTimeoutSeconds=number of seconds` (If not specified, the default is 90 seconds)
- `-Dcom.cloudera.RoleLogEstimator.estimateTimeoutPerHostSeconds=number of seconds` (If not specified, default is 60 seconds)

Note:

The value of `-Dcom.cloudera.RoleLogEstimator.maxEstimateTimeoutSeconds=number of seconds` must be \geq the value of `-Dcom.cloudera.RoleLogEstimator.estimateTimeoutPerHostSeconds=number of seconds`.

Restart the Cloudera Manager server for the updated Java flags to take effect:

```
sudo service cloudera-scm-server restart
```

Fixed in: Cloudera Manager 5.12, 5.11.2, 5.10.2, 5.9.3

Cloudera Bug: OPSAPS-40987

Reports Manager throws `ArrayIndexOutOfBoundsException` when indexing fsimage

Fixes an issue where an `ArrayIndexOutOfBoundsException` can be thrown by Reports Manager.

Fixed in Cloudera Manager 5.12, 5.11.2, 5.10.2, 5.9.3

Cloudera Bug: OPSAPS-40914

Proper termination and cleanup of YARN applications during decommissioning

Fixed an issue where YARN applications may not exit gracefully or clean-up properly if hosts are decommissioned while application containers are still running. This could lead to unexpected container/application failure and/or orphaned container processes on YARN worker nodes. Now, when decommissioning a NodeManager or host running a NodeManager, Cloudera Manager first waits for the configured YARN graceful decommission timeout (if applicable), and allows additional time for ResourceManager to properly terminate the NodeManager and its child processes.

Cloudera Bug: OPSAPS-40731

Peak Memory Usage report for Impala does not display data

Fixed an issue where the **Impala Peak Memory Usage** page in the Cluster Utilization Report did not display any data in Cloudera Manager.

Fixed in: Cloudera Manager 5.12, 5.11.2, 5.9.3

Cloudera Bug: OPSAPS-39836

Make Oozie Load-balancer URL mandatory when enabling Oozie HA

Fixed an issue when the **Oozie Load Balancer** field in the Oozie configuration is not set and Oozie high availability is in use (two or more Oozie Server roles are deployed). This now creates a validation error and Cloudera Manager does not let you start or restart Oozie until the problem is fixed.

Fixed in: Cloudera Manager 5.12, 5.11.2, 5.10.2, 5.9.3

Cloudera Bug: OPSAPS-39372

NullPointerException when accessing the configuration page for Alerts

Fixed an issue where a NullPointerException occurred when viewing the configuration page for alerts.

Fixed in Cloudera Manager 5.12, 5.11.2, 5.10.2

Cloudera Bug: OPSAPS-39296

Issues Fixed in Cloudera Manager 5.11.1

All required fonts are now installed by Cloudera Manager

Fixed an issue where Cloudera Manager made requests to googleapi.com to download some of its required fonts, which fails if the browser does not have Internet access. Cloudera Manager now includes all of the necessary fonts.

Cloudera Bug: OPSAPS-40609.

Automated Cloudera Manager installer fails on Ubuntu 16.04

Fixed an issue where running the `cloudera-manager-installer.bin` installer file (as described in the [documentation](#)) fails on Ubuntu 16.04 LTS (Xenial).

Cloudera Bug: DOCS-2037.

Unable to connect to Oozie with curl

Fixed an issue where some Linux distributions could not connect to Oozie with `curl` through HTTPS when DHE-based ciphers are present.

Cloudera Bug: OPSAPS-40407

getRoles filtering is not working with Cloudera Manager API version 11 and higher

Fixed a bug that broke backwards compatibility with Cloudera Manager API version 11 (introduced with the Cloudera Manager 5.6 release) for the following endpoint:

```
/api//clusters/clusterName/services/serviceName/roles?filter=type==ROLE_TYPE
```

Cloudera Bug: OPSAPS-40184

Exception when setting maintenanceOwners to null

Fixed how null values for the `maintenanceOwners` parameter are handled when creating clusters with the Cloudera Manager API.

Fixed in: Cloudera Manager 5.12, 5.11.1, 5.10.2, 5.9.3

Cloudera Bug: OPSAPS-32880

HBase configuration is supplied for Hive when HBase service is not selected

Fixed an issue where Cloudera Manager provided configuration for the `hive-site.xml` file even if the HBase Service setting in Hive is not selected, which could cause unnecessary errors when Hive-on-Spark attempts to connect to HBase.

Cloudera Manager 5 Release Notes

Cloudera Manager now correctly emits the HBase-related configuration in the `hive-site.xml` only when Hive is dependent on HBase.

This issue has been fixed in the following releases:

- CM5.8.5 and higher maintenance releases,
- CM5.9.2 and higher maintenance releases,
- CM5.10.2 and higher maintenance releases,
- CM5.11.1 and higher maintenance releases

When you upgrade Cloudera Manager from an older version to one of the fixed versions, many services may have stale configurations. You must restart all the stale services in order for them to receive the updated configuration in the `hive-site.xml` file.

Cloudera Bug: OPSAPS-39021

Accessing Sqoop2 with Hue fails

Fixed an issue where accessing Sqoop2 with Hue fails with the following error: Sqoop error: Could not get connectors.

CDH 5.5.0 or higher clusters running a Hue Service require a restart of Hue services because of a new configuration file. This new configuration file is required for Hue's Sqoop2 Application functions in secure settings, but it will show up whether or not Sqoop or security settings are in use.

Cloudera Bug: OPSAPS-27286

Exception when setting maintenanceOwners to null

Fixed how null values for the `maintenanceOwners` parameter are handled when creating clusters with the Cloudera Manager API.

Cloudera Bug: OPSAPS-32880

Underscores in LDAP domain names not allowed

Fixed an issue where LDAP domain names could not contain underscores. This fix affects Cloudera Manager, Hue and Cloudera Navigator.

Cloudera Bug: OPSAPS-40487

Only use healthy HDFS/Hive hosts for launching replication jobs

BDR Replication Host Selection Policy has been updated. The process that launches and coordinates a HDFS/Hive replication job will now only run on the following hosts:

- Hosts that run any role of the HDFS/Hive Service (for HDFS or Hive replication)
- Hosts that have a Non-Gateway role
- Hosts where the health status is in the GOOD or CONCERNING state with preference given to GOOD
- Hosts that are whitelisted, if configured

Cloudera Bug: OPSAPS-40040

CSD graceful service stop second step failure

Fixed an issue in the stop command execution for CSD services authored to use a service-level graceful shutdown. The stop command could be shown with the second step (forced kill) marked as failed when all roles were already stopped. This issue also affects shutdown of Kafka using Cloudera Manager 5.11.0 and can impact Kafka upgrades.

Fixed in: Cloudera Manager 5.11.1, 5.10.2, 5.9.3

Cloudera Bug: OPSAPS-40002

Metric missing from Workload Summary for Kudu

Fixed an issue where the `total_kudu_rows_upserted_rate_across_kudu_replicas` metric was not included in the Workload Summary for Kudu.

Cloudera Bug: OPSAPS-40551

Low watermark value for Memstore Flush default is incorrect

For CDH versions 5.8 and higher, the **Low Watermark for Memstore Flush** configuration parameter is associated with the HBase parameter `hbase.regionserver.global.memstore.lowerLimit`.

This value represents the fullness threshold of the memstore as a percentage of memstore capacity. The default value for this parameter was incorrectly set too low at `.38`. This can cause severe under utilization of the memstore.

The default has been corrected to be `.95`. When upgrading to a version of Cloudera Manager with this fix, if the value was previously set to the old default of `.38`, it will automatically be increased to the new default, which may cause Cloudera Manager to mark your HBase service as having a stale configuration, requiring a restart.

Additionally, if an existing **Low Watermark for Memstore Flush** configuration parameter has a value $\leq .9$, it will be flagged as a configuration warning.

Fixed in: Cloudera Manager 5.12, 5.11.1, 5.10.2, 5.9.3, 5.8.5

Cloudera Bug: OPSAPS-38468

Failed health checks because of deprecated ntpdc command

Fixed an issue where the `ntpdc` command was used in the host Clock Offset health test even if the command is deprecated for an operating system.

Cloudera Bug: OPSAPS-38268

Dynamic Resource Pool drop-down options are not visible when using Internet Explorer 11

Fixed a typo on the **Dynamic Resource Pools** page that prevents Internet Explorer from rendering the add/edit resource pool dialog box.

Cloudera Bug: OPSAPS-40522

Cluster templates don't include role level configuration

Fixed an issue with Cluster Templates where role level configuration was not getting exported. This was causing cluster to fail when trying user try to import a cluster template exported from a cluster on which HDFS HA was enabled.

Cloudera Bug: OPSAPS-31528

Graceful shutdown of Kafka brokers does not work as expected

Fixed an issue where the new **Graceful Shutdown Timeout** configuration property does not work as expected. As a result, Kafka takes an additional 30 seconds (by default) to shut down, but will still only have 30 seconds to complete its controlled shutdown, before Cloudera Manager forcibly shuts down Kafka brokers regardless of the configured timeout.

Fixed in Cloudera Manager 5.11.1.

Cloudera Bug: OPSAPS-40106.

Issues Fixed in Cloudera Manager 5.11.0

ResourceManager state store recovery may fail.

Fixed an issue where ResourceManager state store recovery may fail. The YARN service will become stale when a cluster containing a YARN service with a ZooKeeper dependency set is upgraded to Cloudera Manager 5.10.1+ or 5.11+. Restart the YARN service normally or with a rolling restart.

Cloudera Manager 5 Release Notes

Cloudera Bug: [OPSAPS-38908](#)

Cloudera Bug: OPSAPS-38908

Privilege Escalation in Cloudera Manager

Fixed an issue where a read-only Cloudera Manager user can discover the usernames of other users and elevate the privileges of another user. A user cannot elevate their own privilege.

Cloudera Bug: OPSAPS-34124

The `cloudera-server-db fast_stop` fails on Debian-based systems

Fixed an issue where the `cloudera-server-db fast_stop` command fails on non-sytemd Debian systems like Debian 7 with a command not found error.

Cloudera Bug: OPSAPS-39393

Cluster template export exports Autoconfiguration settings

Fixed an issue where the API to export cluster templates exported settings that were auto-configured. Auto-configured settings should not be exported in the cluster template.

Cloudera Bug: OPSAPS-39031

Pauses in Cloudera Manager after adding peer

Fixed an issue that caused pauses and slow performance of the Cloudera Manager Admin Console occur after creating a peer.

Fixed in Cloudera Manager 5.11

Cloudera Bug: OPSAPS-38868.

Max heap is wrong for ZooKeeper

Fixed an issue where the JVM Heap Memory Usage chart for ZooKeeper displayed the wrong value for maximum memory.

Cloudera Bug: OPSAPS-38821

Error starting the NodeManager when the `/tmp` directory is mounted as `noexec`

Fixed an issue where an error occurs when starting the NodeManager because the `/tmp` directory is mounted as `noexec`.

Cloudera Bug: OPSAPS-33053

Cloudera Manager cannot delete principals from AD when regenerating principals

Fixed an issue where generating Kerberos credentials failed when Active Directory properties like OU have a space in them or are too long to fit in a line.

Cloudera Bug: OPSAPS-37100

The Cloudera Manager Python API may experience connection errors

Python 2.7 and later enables certificate chain validation by default, and specifying a custom SSL context with an CA certificate may be required to prevent connection errors. The `ApiResource` constructor in the Cloudera Manager Python API now takes an optional `"ssl_context"` argument where a custom SSL context can be provided. This allow clients to specify the CA certificate of the API endpoint's certificate.

Cloudera Bug: OPSAPS-31699

The service `cloudera-scm-server force_start` command fails with Postgres SQL

Fixed an issue where a force start of the Cloudera Manager server failed if Cloudera Manager used PostgreSQL.

Cloudera Bug: OPSAPS-32915

Parcels cannot be removed from Cloudera Manager

Fixed an issue where parcels could not be removed from the Cloudera Manager database when the `manifest.json` file is not available in the remote repository or removed from the remote location.

Cloudera Bug: OPSAPS-34964

Service Monitor cannot retrieve Navigator Metadata Server metrics when SSL is enabled

Fixed an issue where the Service Monitor cannot retrieve Navigator Metadata Server metrics when SSL is enabled for Navigator Metadata Server.

Fixed in 5.11, 5.10.1, 5.9.2, 5.7.6

Cloudera Bug: OPSAPS-38865

Warning about suspicious non-ASCII punctuation character in KMS ACLs

When setting up the KMS ACLs for HDFS encryption, the warning "Suspicious non-ASCII punctuation character "" at character position 9118" displays. This warning can be safely ignored, and editing any KMS ACL in Cloudera Manager will make the warning disappear. This bug fix removes this warning.

Fixed in Cloudera Manager 5.11.0, 5.10.1

Cloudera Bug: OPSAPS-38670

Kafka fails when configured with Sentry and an old Kafka version

Fixed an issue that occurred when Kafka was configured to use Sentry for authorization, and Kafka was not version 2.1 or higher, which caused Kafka to fail with the following exception: `java.lang.ClassNotFoundException: org.apache.sentry.kafka.authorizer.SentryKafkaAuthorizer`.

Cloudera Bug: OPSAPS-37907

Fixed in: Cloudera Manager 5.11.0, 5.10.1

Invalid regex needs agent hard_restarted

Fixed Cloudera Manager agent problem that requires hard restart when an invalid regular expression is used to specify tables in Hive replication.

Fixed in: Cloudera Manager 5.11.0, 5.10.1, 5.9.2

Cloudera Bug: OPSAPS-38946 and OPSAPS-36974

Issue with views after BDR Hive Replication

Fixed an issue where a change to a Hive view on a source cluster was not reflected in the target cluster after Hive Replication with the Force Overwrite option selected.

Cloudera Bug: OPSAPS-39034

Sentry Database upgrades

During a CDH upgrade, the Sentry Database Upgrade step will be performed only when necessary. Previously, the Sentry Database Upgrade step always ran.

Cloudera Bug: OPSAPS-25405

Hive Replication fails when Impala is SSL enabled but Hadoop services are not

Fixed an issue where a `NullPointerException` is thrown when using Hive Replication with SSL enabled on an Impala service but not on other Hadoop services.

Cloudera Bug: OPSAPS-38700

Fixed in Cloudera Manager 5.11, 5.10.1, 5.9.2

Issues Fixed in Cloudera Manager 5.10.2

Underscores in LDAP domain names not allowed

Fixed an issue where LDAP domain names could not contain underscores. This fix affects Cloudera Manager, Hue and Cloudera Navigator.

Cloudera Bug: OPSAPS-40487

Low watermark value for Memstore Flush default is incorrect

For CDH versions 5.8 and higher, the **Low Watermark for Memstore Flush** configuration parameter is associated with the HBase parameter `hbase.regionserver.global.memstore.lowerLimit`.

This value represents the fullness threshold of the memstore as a percentage of memstore capacity. The default value for this parameter was incorrectly set too low at `.38`. This can cause severe under utilization of the memstore.

The default has been corrected to be `.95`. When upgrading to a version of Cloudera Manager with this fix, if the value was previously set to the old default of `.38`, it will automatically be increased to the new default, which may cause Cloudera Manager to mark your HBase service as having a stale configuration, requiring a restart.

Additionally, if an existing **Low Watermark for Memstore Flush** configuration parameter has a value $\leq .9$, it will be flagged as a configuration warning.

Fixed in: Cloudera Manager 5.12, 5.11.1, 5.10.2, 5.9.3, 5.8.5

Cloudera Bug: OPSAPS-38468

Heap dump files don't contain the correct process ID

Fixed an issue where if Sentry crashed with an OutOfMemory error, the generated dump file name was not unique, and therefore the file could be overwritten on subsequent occurrences of the error. This has been fixed to include the PID in the dump file name, which is the standard practice for other CDH services.

Cloudera Bug: OPSAPS-40600

CSD graceful service stop second step failure

Fixed an issue in the stop command execution for CSD services authored to use a service-level graceful shutdown. The stop command could be shown with the second step (forced kill) marked as failed when all roles were already stopped. This issue also affects shutdown of Kafka using Cloudera Manager 5.11.0 and can impact Kafka upgrades.

Fixed in: Cloudera Manager 5.11.1, 5.10.2, 5.9.3

Cloudera Bug: OPSAPS-40002

getRoles filtering is not working with Cloudera Manager API version 11 and higher

Fixed a bug that broke backwards compatibility with Cloudera Manager API version 11 (introduced with the Cloudera Manager 5.6 release) for the following endpoint:

```
/api//clusters/clusterName/services/serviceName/roles?filter=type==ROLE_TYPE
```

Cloudera Bug: OPSAPS-40184

Only use healthy HDFS/Hive hosts for launching replication jobs

BDR Replication Host Selection Policy has been updated. The process that launches and coordinates a HDFS/Hive replication job will now only run on the following hosts:

- Hosts that run any role of the HDFS/Hive Service (for HDFS or Hive replication)
- Hosts that have a Non-Gateway role
- Hosts where the health status is in the GOOD or CONCERNING state with preference given to GOOD

- Hosts that are whitelisted, if configured

Cloudera Bug: OPSAPS-40040

Dynamic Resource Pool drop-down options are not visible when using Internet Explorer 11

Fixed a typo on the **Dynamic Resource Pools** page that prevents Internet Explorer from rendering the add/edit resource pool dialog box.

Cloudera Bug: OPSAPS-40522

HBase configuration is supplied for Hive when HBase service is not selected

Fixed an issue where Cloudera Manager provided configuration for the `hive-site.xml` file even if the HBase Service setting in Hive is not selected, which could cause unnecessary errors when Hive-on-Spark attempts to connect to HBase. Cloudera Manager now correctly emits the HBase-related configuration in the `hive-site.xml` only when Hive is dependent on HBase.

This issue has been fixed in the following releases:

- CM5.8.5 and higher maintenance releases,
- CM5.9.2 and higher maintenance releases,
- CM5.10.2 and higher maintenance releases,
- CM5.11.1 and higher maintenance releases

When you upgrade Cloudera Manager from an older version to one of the fixed versions, many services may have stale configurations. You must restart all the stale services in order for them to receive the updated configuration in the `hive-site.xml` file.

Cloudera Bug: OPSAPS-39021

The `cloudera-server-db fast_stop` fails on Debian-based systems

Fixed an issue where the `cloudera-server-db fast_stop` command fails on non-systemd Debian systems like Debian 7 with a command not found error.

Cloudera Bug: OPSAPS-39393

Exception when setting `maintenanceOwners` to null

Fixed how null values for the `maintenanceOwners` parameter are handled when creating clusters with the Cloudera Manager API.

Cloudera Bug: OPSAPS-32880

Cannot upload large diagnostic bundles

Fixed an issue where large diagnostic bundles, such as ones greater than 4 GB, fail to upload.

Cloudera Bug: OPSAPS-40100

NullPointerException when accessing the configuration page for Alerts

Fixed an issue where a NullPointerException occurred when viewing the configuration page for alerts.

Fixed in Cloudera Manager 5.12, 5.11.2, 5.10.2

Cloudera Bug: OPSAPS-39296

Issues Fixed in Cloudera Manager 5.10.1

ResourceManager state store recovery may fail.

Fixed an issue where ResourceManager state store recovery may fail. The YARN service will become stale when a cluster containing a YARN service with a ZooKeeper dependency set is upgraded to Cloudera Manager 5.10.1+ or 5.11+. Restart the YARN service normally or with a rolling restart.

Cloudera Bug: [OPSAPS-38908](#)

Cloudera Bug: OPSAPS-38908

Privilege Escalation in Cloudera Manager

Fixed an issue where a read-only Cloudera Manager user can discover the usernames of other users and elevate the privileges of another user. A user cannot elevate their own privilege.

Cloudera Bug: OPSAPS-34124

Warning about suspicious non-ASCII punctuation character in KMS ACLs

When setting up the KMS ACLs for HDFS encryption, the warning "Suspicious non-ASCII punctuation character "" at character position 9118" displays. This warning can be safely ignored, and editing any KMS ACL in Cloudera Manager will make the warning disappear. This bug fix removes this warning.

Fixed in Cloudera Manager 5.11.0, 5.10.1

Cloudera Bug: OPSAPS-38670

Hive Replication fails when Impala is SSL enabled but Hadoop services are not

Fixes a bug where some Hadoop services did not recognize the Impala SSL configuration, which caused Hive replications to fail when SSL is enabled. To enable SSL, see: [Configuring TLS/SSL for HDFS, YARN and MapReduce](#).

This support also ensures that connection to Impala is successful when SSL is enabled even if Kerberos is not enabled.

Fixed in: Cloudera Manager 5.10.1, 5.9.2, 5.8.4

Cloudera Bug: OPSAPS-38700

Service Monitor cannot retrieve Navigator Metadata Server metrics when SSL is enabled

Fixed an issue where the Service Monitor cannot retrieve Navigator Metadata Server metrics when SSL is enabled for Navigator Metadata Server.

Fixed in 5.11, 5.10.1, 5.9.2, 5.7.6

Cloudera Bug: OPSAPS-38865

Spark CSD may cause issues in yarn-cluster mode

Spark client configuration has been fixed to avoid application failures in certain cases when launching applications in YARN cluster mode.

Fixed in Cloudera Manager 5.10.1, 5.9.2

Cloudera Bug: OPSAPS-39118

Invalid regex needs agent hard_restarted

Fixed Cloudera Manager agent problem that requires hard restart when an invalid regular expression is used to specify tables in Hive replication.

Fixed in: Cloudera Manager 5.11.0, 5.10.1, 5.9.2

Cloudera Bug: OPSAPS-38946 and OPSAPS-36974

Kafka fails when configured with Sentry and an old Kafka version

Fixed an issue that occurred when Kafka was configured to use Sentry for authorization, and Kafka was not version 2.1 or higher, which caused Kafka to fail with the following exception: `java.lang.ClassNotFoundException: org.apache.sentry.kafka.authorizer.SentryKafkaAuthorizer`.

Cloudera Bug: OPSAPS-37907

Fixed in: Cloudera Manager 5.11.0, 5.10.1

Hive Replication fails when Impala is SSL enabled but Hadoop services are not

Fixed an issue where a NullPointerException is thrown when using Hive Replication with SSL enabled on an Impala service but not on other Hadoop services.

Cloudera Bug: OPSAPS-38700

Fixed in Cloudera Manager 5.11, 5.10.1, 5.9.2

Issues Fixed in Cloudera Manager 5.10.0

Importing cluster templates fails

Fixes an issue where the Cluster Import command fails after updating parcel repositories and when the parameter `addRepositories=true` is included in the command and there are no pre-configured repositories in the cluster.

Cloudera Bug: OPSAPS-33059

DB Oracle client libraries cannot be found on host due to missing libaio1

On a parcels install, Hue can be set up with an Oracle Database. This requires placing required Oracle packages in a specific location. See [Hue Custom Databases](#).

Cloudera Bug: OPSAPS-34339

CM - error connecting to an Oracle DB with a Package install for HUE's DB

On a packages install, Hue can be set up with an Oracle Database and proceed past the Test Connection page in the setup wizard. This requires placing required Oracle packages in a specific location. See [Hue Custom Databases](#).

Cloudera Bug: OPSAPS-34608

Support non-public schemas with PostgreSQL

Cloudera Manager used to work with only 'public' schema in PostgreSQL. With this change, Cloudera Manager now supports custom schema names. Cloudera Manager relies on the schema search path in PostgreSQL, which can be set for a user or database. For more information, see <https://www.postgresql.org/docs/current/static/ddl-schemas.html>.

Cloudera Bug: OPSAPS-33752

Truststore password shouldn't be required

Trust store passwords are not required. This fixes a bug where some Cloudera components erroneously reported that a password was required.

Cloudera Bug: OPSAPS-38183

Server error deleting a host - Cannot delete or update a parent row: a foreign key constraint fails

Fixes a database constraint violation that occurs when you use Cloudera Manager to delete a host that has cluster-wide configurations. (Kerberos configurations, for example.)

Cloudera Bug: OPSAPS-38150

Hide unlicensed configurations instead of disabling them

Cloudera Express no longer shows configurations that requires a license to manage.

Cloudera Bug: OPSAPS-38214

Various improvements in the Pools page

Many small usability issues have been fixed in the resource pools page:

- You can now click on an input row and go directly to that input field in the edit dialog.
- The columns where you enter minimum and maximum values for Virtual cores and Memory now appear under headings **Min Resources** and **Max Resources**

- On the **Create Resource Pool** page, the **Configuration Sets** tab has been renamed to **Resource Limits**.

Cloudera Bug: OPSAPS-38133

Override the SMON client configuration so the MapReduce job does not produce compressed output

This fixes an issue where YARN utilization report may not work when MapReduce job output is specified as "Compressed" and a compression codec is used for it.

Cloudera Bug: OPSAPS-38460

Excess load on Cloudera Manager database

Fixed an issue where the load on the Cloudera Manager database increases significantly on clusters with 100-200 nodes or more and when there are host-level configuration overrides. This has been resolved by using a smaller default value for the `default_batch_fetch_size` property in the hibernate configuration.

Fixed in: Cloudera Manager 5.10.0, 5.9.2, 5.8.4, 5.7.6

Cloudera Bug: OPSAPS-37985

Dollar sign '\$' character in password results in an IllegalArgumentException

Fixed an issue where CSD-based services could not use certain special characters like '\$' without getting an exception. This is most frequently an issue for passwords.

Cloudera Bug: OPSAPS-37542

Incorrect Scheduling Policy of Resource Pool Configuration in YARN

If a user did not make any resource policy change on an existing cluster, the default scheduling policy used is FAIR, but the Cloudera Manager Admin console incorrectly displays the policy as **DRF**. This is now fixed to show **FAIR**. When the user creates new clusters, the default scheduling policy will be **DRF**.

Cloudera Bug: OPSAPS-37478

Cannot select time period in custom charts in C5.9

The quick time selection (30m, 1h, etc) on custom dashboards now work correctly.

Cloudera Bug: OPSAPS-37190

Increase the default value of Safemode Minimum DataNodes property to 1

In Cloudera Manager 5.9 and lower, the HDFS property **Safemode Minimum DataNodes** has a default value of 0. This property configures the number of DataNodes that must register with the NameNode before the NameNode exits safe mode. This property now has a default value of 1 in CDH 5.9 and higher

In an empty cluster (that is, a cluster with no HDFS data) where the property is set to 0, this has the side effect of extending the duration of startup safe mode by about 30 seconds. For non-empty clusters, this change has no visible effect. This change only applies to new CDH 5.9 and higher clusters created with Cloudera Manager 5.10 or higher. Existing CDH 5.9 clusters are not affected; pre-CDH 5.9 clusters that are upgraded to CDH 5.9 or higher are also unaffected.

Cloudera Bug: OPSAPS-36988

Turn off HSTS header in Hue Load Balancer

Only the Hue server now only generates the HSTS HTTP header. Previously, both the Hue server and Hue Load Balancer generated the HSTS HTTP header.

Cloudera Bug: OPSAPS-35536

AWS ID being used for UUID, which can cause duplicate hosts

Prevent duplicate hosts from being reported in Cloudera Manager due to use of the AWS instance ID as a unique host identifier. Cloudera Manager now uses a random number as the host unique identifier instead. This prevents a duplicate host issue when host is running on a cloud service such as AWS and the host is added using the Cloudera Manager wizard and manually added later.

Cloudera Bug: OPSAPS-35282

Cloudera Manager corrupts passwords and other attributes

Previously, some users found that '*****' were inserted in the database literally. Cloudera Manager now performs a check on this special string prevents it from being stored in the Cloudera Manager database.

Cloudera Bug: OPSAPS-34252

Database wizard error message when the database does not exist is misleading

Cloudera Manager now generates a proper error message when the database does not exist and the username and password do exist. Cloudera Manager now displays the message "Able to find the Database server, but not the specified database. Please check if the database name is correct and make sure that the user can access the database."

Cloudera Bug: OPSAPS-33915

Hive Replication: Make parameters replication on by default

Parameters of databases, tables, partitions, and indexes are replicated by default during Hive replications. You can disable this replication. See [Replication of Parameters](#).

Cloudera Bug: OPSAPS-38197

NFS Gateway daemon in HDFS needs SSL server configs

The Web server of the HDFS NFS Gateway that is used to publish metrics and view configurations is now covered by SSL protection when enabled across the HDFS service. This fixes an issue that caused a failure when starting the Web interface for the NFS gateway.

Cloudera Bug: OPSAPS-33202

CM server error - JsonMappingException

Fixed an issue where a race condition can happen when getting the log links for unhealthy roles and then causes a null pointer exception for the Cloudera Manager homepage.

Cloudera Bug: OPSAPS-32804

"Restart needed" button doesn't appear after changing the server's private key password in the KeyTrustee Server service configuration

When passwords change, the stale configuration icons displays. When you click one of these icons, the **Stale Configurations** page displays but the page does not indicate which passwords have changed.

Cloudera Bug: OPSAPS-29146

Issues Fixed in Cloudera Manager 5.9.3

Reports Manager throws `ArrayIndexOutOfBoundsException` when indexing fsimage

Fixes an issue where an `ArrayIndexOutOfBoundsException` can be thrown by Reports Manager.

Fixed in Cloudera Manager 5.12, 5.11.2, 5.10.2, 5.9.3

Cloudera Bug: OPSAPS-40914

Make Oozie Load-balancer URL mandatory when enabling Oozie HA

Fixed an issue when the **Oozie Load Balancer** field in the Oozie configuration is not set and Oozie high availability is in use (two or more Oozie Server roles are deployed). This now creates a validation error and Cloudera Manager does not let you start or restart Oozie until the problem is fixed.

Fixed in: Cloudera Manager 5.12, 5.11.2, 5.10.2, 5.9.3

Cloudera Bug: OPSAPS-39372

Allow diagnostic bundle estimation timeout to be configurable

Sometimes on a large or busy cluster, collection of diagnostic data using the **By Date Range** option can fail due to a timeout during estimation step of the diagnostic bundle collection. You can now configure both the host level estimation timeout and the overall estimation timeout using Java options. These options can be set on the Cloudera Manager Server host I in the `/etc/default/cloudera-scm-server` file by adding the following to the line that begins with `export CMF_JAVA_OPTS:`

- `-Dcom.cloudera.RoleLogEstimator.maxEstimateTimeoutSeconds=number of seconds` (If not specified, the default is 90 seconds)
- `-Dcom.cloudera.RoleLogEstimator.estimateTimeoutPerHostSeconds=number of seconds` (If not specified, default is 60 seconds)

Note:

The value of `-Dcom.cloudera.RoleLogEstimator.maxEstimateTimeoutSeconds=number of seconds` must be \geq the value of `-Dcom.cloudera.RoleLogEstimator.estimateTimeoutPerHostSeconds=number of seconds`.

Restart the Cloudera Manager server for the updated Java flags to take effect:

```
sudo service cloudera-scm-server restart
```

Fixed in: Cloudera Manager 5.12, 5.11.2, 5.10.2, 5.9.3

Cloudera Bug: OPSAPS-40987

Low watermark value for Memstore Flush default is incorrect

For CDH versions 5.8 and higher, the **Low Watermark for Memstore Flush** configuration parameter is associated with the HBase parameter `hbase.regionserver.global.memstore.lowerLimit`.

This value represents the fullness threshold of the memstore as a percentage of memstore capacity. The default value for this parameter was incorrectly set too low at `.38`. This can cause severe under utilization of the memstore.

The default has been corrected to be `.95`. When upgrading to a version of Cloudera Manager with this fix, if the value was previously set to the old default of `.38`, it will automatically be increased to the new default, which may cause Cloudera Manager to mark your HBase service as having a stale configuration, requiring a restart.

Additionally, if an existing **Low Watermark for Memstore Flush** configuration parameter has a value $\leq .9$, it will be flagged as a configuration warning.

Fixed in: Cloudera Manager 5.12, 5.11.1, 5.10.2, 5.9.3, 5.8.5

Cloudera Bug: OPSAPS-38468

Exception when setting maintenanceOwners to null

Fixed how null values for the `maintenanceOwners` parameter are handled when creating clusters with the Cloudera Manager API.

Cloudera Bug: OPSAPS-32880

CSD graceful service stop second step failure

Fixed an issue in the stop command execution for CSD services authored to use a service-level graceful shutdown. The stop command could be shown with the second step (forced kill) marked as failed when all roles were already stopped. This issue also affects shutdown of Kafka using Cloudera Manager 5.11.0 and can impact Kafka upgrades.

Fixed in: Cloudera Manager 5.11.1, 5.10.2, 5.9.3

Cloudera Bug: OPSAPS-40002

Heap dump files don't contain the correct process ID

Fixed an issue where if Sentry crashed with an OutOfMemory error, the generated dump file name was not unique, and therefore the file could be overwritten on subsequent occurrences of the error. This has been fixed to include the PID in the dump file name, which is the standard practice for other CDH services.

Cloudera Bug: OPSAPS-40600

Only use healthy HDFS/Hive hosts for launching replication jobs

BDR Replication Host Selection Policy has been updated. The process that launches and coordinates a HDFS/Hive replication job will now only run on the following hosts:

- Hosts that run any role of the HDFS/Hive Service (for HDFS or Hive replication)
- Hosts that have a Non-Gateway role
- Hosts where the health status is in the GOOD or CONCERNING state with preference given to GOOD
- Hosts that are whitelisted, if configured

Cloudera Bug: OPSAPS-40040

Process secrets no longer protected with file permissions

Fixed an issue where secret data, including passwords and other data, can be exposed in the `/var/run/cloudera-scm-agent/process-name/proc.json` or `/var/run/cloudera-scm-agent/process-name/config.zip` files because these files are world readable. See TSB-235 for more information.

Fixed in: Cloudera Manager 5.12, 5.11, 5.10.2, 5.9.3

Cloudera Bug: OPSAPS-40536

Peak Memory Usage report for Impala does not display data

Fixed an issue where the **Impala Peak Memory Usage** page in the Cluster Utilization Report did not display any data in Cloudera Manager.

Fixed in: Cloudera Manager 5.12, 5.11.2, 5.9.3

Cloudera Bug: OPSAPS-39836

Validator for `hive.metastore.server.max.message.size` can break Hive Metastore startup

The recommended value for **Max Message Size for Hive MetaStore** configuration parameter should be at least 10% of the value for the **Java Heap Size of Hive Metastore Server in Bytes** parameter, but should never exceed 2147483647B. Previously, the validator for **Max Message Size for Hive MetaStore** was showing an incorrect value in its validation message. This validator is now fixed to show the correct recommended value.

Cloudera Bug: OPSAPS-38434

`getRoles` filtering is not working with Cloudera Manager API version 11 and higher

Fixed a bug that broke backwards compatibility with Cloudera Manager API version 11 (introduced with the Cloudera Manager 5.6 release) for the following endpoint:

```
/api//clusters/clusterName/services/serviceName/roles?filter=type==ROLE_TYPE
```

Cloudera Bug: OPSAPS-40184

Issues Fixed in Cloudera Manager 5.9.2

Privilege Escalation in Cloudera Manager

Fixed an issue where a read-only Cloudera Manager user can discover the usernames of other users and elevate the privileges of another user. A user cannot elevate their own privilege.

Cloudera Bug: OPSAPS-34124

Excess load on Cloudera Manager database

Fixed an issue where the load on the Cloudera Manager database increases significantly on clusters with 100-200 nodes or more and when there are host-level configuration overrides. This has been resolved by using a smaller default value for the `default_batch_fetch_size` property in the hibernate configuration.

Fixed in: Cloudera Manager 5.10.0, 5.9.2, 5.8.4, 5.7.6

Cloudera Bug: OPSAPS-37985

Service Monitor cannot retrieve Navigator Metadata Server metrics when SSL is enabled

Fixed an issue where the Service Monitor cannot retrieve Navigator Metadata Server metrics when SSL is enabled for Navigator Metadata Server.

Fixed in 5.11, 5.10.1, 5.9.2, 5.7.6

Cloudera Bug: OPSAPS-38865

Invalid regex needs agent hard_restarted

Fixed Cloudera Manager agent problem that requires hard restart when an invalid regular expression is used to specify tables in Hive replication.

Fixed in: Cloudera Manager 5.11.0, 5.10.1, 5.9.2

Cloudera Bug: OPSAPS-38946 and OPSAPS-36974

Spark CSD may cause issues in yarn-cluster mode

Spark client configuration has been fixed to avoid application failures in certain cases when launching applications in YARN cluster mode.

Fixed in Cloudera Manager 5.10.1, 5.9.2

Cloudera Bug: OPSAPS-39118

Dollar sign '\$' character in password results in an IllegalArgumentException

Fixed an issue where CSD-based services could not use certain special characters like '\$' without getting an exception. This is most frequently an issue for passwords.

Cloudera Bug: OPSAPS-37542

Hive Replication fails when Impala is SSL enabled but Hadoop services are not

Fixed an issue where a NullPointerException is thrown when using Hive Replication with SSL enabled on an Impala service but not on other Hadoop services.

Cloudera Bug: OPSAPS-38700

Fixed in Cloudera Manager 5.11, 5.10.1, 5.9.2

Issues Fixed in Cloudera Manager 5.9.1

Cannot select time period in custom charts in C5.9

The quick time selection (30m, 1h, and so on) on custom dashboards does not work in 5.9.x.

Cloudera Bug: OPSAPS-37190

Hive table Views do not get restored from S3

When creating a Hive Replication schedule that copies Hive data from S3 and you select the **Reference Data From Cloud** option, Hive table Views are not restored correctly and result in a Null Pointer Exception when querying data from the view.

Cloudera Bug: OPSAPS-37549

Cloudera Manager blocks from HS2 enabling both LDAP and Kerberos authorization

HS2 now supports LDAP and Kerberos authentication on the same instance for CDH 5.7.0 or higher. Previously, this was considered an error.

Cloudera Bug: OPSAPS-34310

Support non-public schemas

Cloudera Manager used to work with only the `public` schema in Postgresql. With this change, Cloudera Manager now supports custom schema names. Cloudera Manager relies on the schema search path in postgresql, which can be set for a user, database, etc: See <https://www.postgresql.org/docs/current/static/ddl-schemas.html>

Cloudera Bug: OPSAPS-33752

Alert Publisher throws "unsigned 32bit value" error after long uptime

Fixes an issue where the Alert Publisher throws "unsigned 32bit value" error after long uptime. TimeTick is an extension of UnsignedInteger32 type. TimeTick represents time in 1/100 seconds. Its value range is 0 to 4294967295. Activity Monitor's uptime is a Java long type that can exceed the range of TimeTicks. Before this fix, long uptime could cause the Alert Publisher to throw the "unsigned 32bit value" error.

Cloudera Bug: OPSAPS-35564

Issues Fixed in Cloudera Manager 5.9

Configuration changes marking too many roles as stale

When upgrading to Cloudera Manager 5.9 or later, YARN will become stale due to the following properties changing to be emitted to the Resource Manager role only:

- `yarn.scheduler.fair.user-as-default-queue`
- `yarn.scheduler.fair.preemption`
- `yarn.scheduler.fair.sizebasedweight`
- `yarn.scheduler.fair.assignmultiple`
- `yarn.scheduler.fair.locality.threshold.node`
- `yarn.scheduler.fair.locality.threshold.rack`

This fixes a problem where changes to these configurations would mark too many roles as stale. You can safely ignore staleness to any role caused by the removal of these configuration parameters.

Cloudera Bug: OPSAPS-32610

Impala `load_catalog_in_background` configuration should be set to *false* by default in Cloudera Manager

Changed default value for `load_catalog_in_background` to *false*. This fixes catalog scalability issues observed in Impala since v2.2.

Cloudera Manager 5 Release Notes

Cloudera Bug: OPSAPS-35869

Oozie first run fails with custom principals

Fixed an issue in Cloudera Manager 5.8.1 where the first time Oozie is run it fails if using Kerberos custom principals.

Cloudera Bug: OPSAPS-35822

Cluster export fails when service configuration is invalid

Fixed an issue in the export cluster template code path where it was failing because of stale configuration settings in the Cloudera Manager database. This can occur when configurations are deprecated on older CDH releases.

Cloudera Bug: OPSAPS-35586

Add gateway role to Kafka and move dependencies' client configs into Kafka's client configs

Cloudera recommends that you place your Kafka host in the same logical cluster as your Sentry host. However, if you deploy Kafka as a separate logical cluster, you can deploy a dummy Sentry service on Kafka's logical cluster with an override for `Sentry-site.xml` to point to the Sentry service on first logical cluster, and then it can be turned off. This is a workaround that allows Cloudera Manager to generate the appropriate Sentry client configurations for Kafka.

Cloudera Bug: OPSAPS-35369

Sentry Upgrade command is not retrievable

If the Sentry Upgrade command fails, you can now retry the command.

Cloudera Bug: OPSAPS-35365

Impala Breakpad script does not convert exponentials into decimals and leads to errors

Fixed an issue where the Impala Breakpad script fails if you try to collect more than 10 MB of dumps from a single role.

Cloudera Bug: OPSAPS-34971

HDFS-S3: Incremental backup support

HDFS-S3 replication supports incremental backups using snapshot diffs. HDFS-S3 replication does not support incremental restore using snapshot diff.

Cloudera Bug: OPSAPS-34987

Fix css in navigation

Fixed several small issues:

1. Do not show role link again on the role instances page.
2. Do not bold the decommission state.
3. Do not use long display name for hosts; use short display name.
4. Show the role link on the role health test page.
5. Show *Today* rather than the long time label.
6. Show only month, date when the year is the same.
7. Make the icons in navigation line up.
8. Make the icons in navigation not so wide.
9. Change all line-height settings to multiples of 4.
10. Add back the border below the title.

Cloudera Bug: OPSAPS-35262

Fix sorting on the instances page

Fixed the initial sort order on the instances page.

Cloudera Bug: OPSAPS-35268

Nightly Charts are broken due to gridster refactoring

There is a permission issue on the Cluster Status page where the grid is never enabled, and on the View Page where the grid is always enabled for all users. The former change allows the user to customize the Cluster status page. The latter change ensures that users do not get errors when customizing specific view pages.

Cloudera Bug: OPSAPS-34526

Redact s3 credential properties in MR by default.

AWS S3 credentials, if specified in the job configuration by setting `fs.s3a.access.key` and `fs.s3a.secret.key`, were shown as clear text in MapReduce UIs. The credentials are now redacted by default in all MapReduce UIs.

Cloudera Bug: OPSAPS-36840

Latest Cloudera Manager Java client does not work on older Cloudera Manager

Fixed an issue in Cloudera Manager client versions 5.8, 5.8.1, and 5.8.2 where `ApiCollectDiagnosticDataArguments` was incompatible with Cloudera Manager versions lower than 5.8.

Cloudera Bug: OPSAPS-36315

Comment for command retry in the `cm_api` Python github needs to be updated

Fixed the API command documentation to include the `canRetry` attribute. Added a new method, `ApiCommand.getCanRetry()` and deprecated the method `ApiCommand.isCanRetry()`.

Cloudera Bug: OPSAPS-36009

`cm_api` changes for HDFS Cloud replication schedule args

python api changes for hdfs cloud replication.

Cloudera Bug: OPSAPS-35892

Defaults to 1st Impala service in the cluster when there are multiple Impalas

Fixed an issue that prevented the display of Impala usage on the **Cluster Utilization** page when there are two Impala services in the same cluster. The UI shows usage for the first Impala service only.

Cloudera Bug: OPSAPS-34495

Staleness check page popped up 30s ~ 60s after clicking the icon.

Fixed an issue where a stale configuration page would take a lot of time to load for a large cluster.

Cloudera Bug: OPSAPS-34497

Oozie points to older sharelib even after running sharelib install command

Fixed the Install Oozie Share Lib action so that the Oozie service is informed that there is a new shared library installed. This eliminates the need for a separate manual restart.

Cloudera Bug: OPSAPS-26825

Cloudera Manager set catalogd default jvm memory to 4G can cause out of memory error on upgrade to Cloudera Manager 5.7+

After upgrading to 5.7 or later, you might see a reduced Java heap maximum on Impala Catalog Server due to a change in its default value. Upgrading from Cloudera Manager lower than 5.7 to Cloudera Manager 5.8.2 no longer causes any effective change in the Impala Catalog Server Java Heap size.

When upgrading from Cloudera Manager 5.7 or later to Cloudera Manager 5.8.2, if the Impala Catalog Server Java Heap Size is set at the default (4GB), it is automatically changed to either 1/4 of the physical RAM on that host, or 32GB, whichever is lower. This can result in a higher or a lower heap, which could cause additional resource contention or out of memory errors, respectively.

Cloudera Bug: OPSAPS-34039

Agent uses USER env var to run everything if it is set

Cloudera Manager Server now runs services using the user ID with which that single-user mode is configured. If single-user mode is configured on the agents to use the user *cloudera-scm*, then an attempt to run Hive as the user *hive* fails.

Cloudera Bug: OPSAPS-35621

In LZO enabled clusters, the cluster utilization feature fails

YARN usage aggregation job now runs successfully on clusters where LZO compression is being used.

Cloudera Bug: OPSAPS-33356

HDFS Snapshot policy is selecting unhealthy host to run on

When selecting a role to run HDFS Snapshot command, Cloudera Manager selects a non-decommissioned host in Active status. Also, hosts in maintenance mode have a lower priority than the ones in active state.

Cloudera Bug: OPSAPS-33144

Discourage CSDs from producing client config files that pollute the root dir

For CSD development, there are now deprecation warnings in the CLI validation tool and the Maven validation plugin. These indications provide guidance for future behavior changes in the support of CSD services in Cloudera Manager. A deprecation warning is shown when applicable, but does not affect the outcome of the validation.

Cloudera Bug: OPSAPS-33510

Ensure that one-off processes cannot re-execute.

One-off requests, such as "Inspect Hosts," do not re-execute.

Cloudera Bug: OPSAPS-34255

Hive Replication Command should update copy the Serde properties correctly

Hive Replication now replicates the Serde Properties and also copies the corresponding HDFS file.

Cloudera Bug: OPSAPS-34354

Cloudera Manager complains "Unable to parse the input XML" when you enter an working XML for the "Fair Scheduler XML Advanced Configuration Snippet (Safety Valve)"

Passing a legal XML value to Fair Scheduler XML Advanced Configuration Snippet (Safety Valve) no longer causes a parsing error.

Cloudera Bug: OPSAPS-34329

If files excluded by exclusion filters are renamed, they are not replicated

Customers using Incremental HDFS replication had an issue where if an excluded file (through exclusion filters) is renamed to an included file, the new file was not copied to the destination cluster. This issue is resolved as part of this fix.

Cloudera Bug: OPSAPS-34066

Proper fix to handle parcel activation falsely succeeding when host health is failing

Fixed an issue related to the first run failing when some of the hosts are in bad health. This fix involves adding an extra stop to wait for hosts to report correct the parcel version before proceeding.

Cloudera Bug: OPSAPS-33766

Deferred cgroup removal might not be waiting at all

This fix provides some wait time before the SCM agent attempts to remove control groups (cgroups) again after initial failure.

Cloudera Bug: OPSAPS-32331

SMON should only fall back to Oozie's instrumentation endpoint if the metrics endpoint gives a 503

SMON blindly fell back to Oozie's instrumentation endpoint if it had any problems with the metrics endpoint. Now, SMON falls back only if the metrics endpoint returns a 503 error code, which is the only case it could possibly have success with instrumentation endpoint.

Cloudera Bug: OPSAPS-31988

Support bundle missing client configuration deployment logs

Client configuration deployment logs are now collected as a part of diagnostics support bundle, which were unintentionally removed in Cloudera Manager 5.3.

Cloudera Bug: OPSAPS-31377

Use concurrency option when uploading the sharelib to be faster

You can increase the number of threads used to upload the Oozie sharelib to HDFS. This significantly reduces the time it takes for this operation. This feature is available starting in CDH 5.9.0.

Cloudera Bug: OPSAPS-31078

Host inspector incorrectly warns about kernel version "2.6.32-504.16.2"

Before this fix, the host inspector incorrectly warned about kernel version "2.6.32-504.16.2" as "non-recommended"

Cloudera Bug: OPSAPS-35170

Agent orphan cleanup removes process dir from in flight process

With this fix, the preventative steps in TSB-181 are no longer required.

Cloudera Bug: OPSAPS-35294

Rolling upgrade fails if services stopped

Rolling upgrade will no longer fail if services are stopped.

Cloudera Bug: OPSAPS-34322

Redact Content from Flume configuration

Enabled redaction of sensitive information from Flume configuration.

Cloudera Bug: OPSAPS-34506

Redaction of sensitive information from diagnostic bundles at creation time

Cloudera Manager is designed to transmit certain diagnostic data (or *bundles*) to Cloudera. The Cloudera Support team uses diagnostic bundles to reproduce, debug, and address technical issues for customers. Cloudera support discovered that potentially sensitive data might be included in diagnostic bundles and transmitted to Cloudera. Notwithstanding any possible transmission, such sensitive data is not used by Cloudera for any purpose. Cloudera has taken the following actions:

- Modified Cloudera Manager so that known sensitive data is redacted from the bundles before transmission to Cloudera.
- Updated Cloudera CDH components to remove logging and output of known potentially sensitive properties and configurations.

See [Redaction of Sensitive Information from Diagnostic Bundles](#).

Cloudera Manager 5 Release Notes

Cloudera Bug: OPSAPS-34621

Huge memory leak if the HDFS File Browser UI remains open for an extended time

If the HDFS File Browser were kept open for long periods of time, it could cause a memory leak that would cause Cloudera Manager to crash. This fix addresses the issue.

Cloudera Bug: OPSAPS-35168

Evaluate impact of disabling second-level cache on performance at scale

Disabled second level hibernate cache, which was causing the cache to become "stale" under load. There is no significant difference in Cloudera Manager performance after disabling the cache.

Cloudera Bug: OPSAPS-34010

Express wizard failing to install ZooKeeper

Installing CDH using Packages on Debian 8.2 through the Cloudera Manager wizard could install the incorrect CDH binaries, leading to failures in starting the cluster. Certain packages are available in both the default repository and the Cloudera repository, which could result in the wizard using the wrong one. The Cloudera Manager wizard now ensures the correct binaries are selected. Workaround: Use the parcels format or manually install the correct packages.

Cloudera Bug: OPSAPS-36100

Empty archive files should not be created for impala role diagnostics

Support Bundles started collecting Impala minidumps bundles in Cloudera Manager 5.8.0 and higher. It was generating an empty TAR file if no bundles were found. With this fix, no empty TAR files are generated.

Cloudera Bug: OPSAPS-34887

Cloudera Manager no longer shows "this step is expected to fail" when enabling HDFS-HA

Cloudera Manager now shows the correct label when performing HA.

Cloudera Bug: OPSAPS-30777

If total_space_bytes is very large, heartbeats fail

Fixed an issue where the heartbeat fails with a host that has a mount point backed by cloud storage, such as AWS.

Cloudera Bug: OPSAPS-35742

Enabling cgroups requires "impala" group even if there is no Impala service

Fixed the presumption that any default-named group exists in hosts. YARN cgroup containers do not require the Impala user/group to be present in hosts.

Cloudera Bug: OPSAPS-35242

OOMKiller script not works for Impala Catalog

Fixed a bug where OutOfMemory errors in the Catalog Server might lead to killing multiple Java processes, including other roles on the same host.

Cloudera Bug: OPSAPS-33991

Issues Fixed in Cloudera Manager 5.8.5

Privilege Escalation in Cloudera Manager

Fixed an issue where a read-only Cloudera Manager user can discover the usernames of other users and elevate the privileges of another user. A user cannot elevate their own privilege.

Cloudera Bug: OPSAPS-34124

Use whitelist to only check known good parcels before first run

During the execution of First-Run command, the command only waits for the Cloudera Manager Agent to detect CDH parcels and does not wait for any other activated parcels. Previously, it was waiting for agents to detect all the activated parcels.

Cloudera Bug: OPSAPS-38304

HBase configuration is supplied for Hive when HBase service is not selected

Fixed an issue where Cloudera Manager provided configuration for the `hive-site.xml` file even if the HBase Service setting in Hive is not selected, which could cause unnecessary errors when Hive-on-Spark attempts to connect to HBase. Cloudera Manager now correctly emits the HBase-related configuration in the `hive-site.xml` only when Hive is dependent on HBase.

This issue has been fixed in the following releases:

- CM5.8.5 and higher maintenance releases,
- CM5.9.2 and higher maintenance releases,
- CM5.10.2 and higher maintenance releases,
- CM5.11.1 and higher maintenance releases

When you upgrade Cloudera Manager from an older version to one of the fixed versions, many services may have stale configurations. You must restart all of the stale services in order for them to receive the updated configuration in the `hive-site.xml` file.

Cloudera Bug: OPSAPS-39021

getRoles filtering is not working with Cloudera Manager API version 11 and higher

Fixed a bug that broke backwards compatibility with Cloudera Manager API version 11 (introduced with the Cloudera Manager 5.6 release) for the following endpoint:

```
/api//clusters/clusterName/services/serviceName/roles?filter=type==ROLE_TYPE
```

Cloudera Bug: OPSAPS-40184

Placement rules in DRP UI should provide option to not create sub-pools

Nested User Pools (except existingSecondaryGroup) now support `create=true|false` as a checkbox in the UI.

Cloudera Bug: OPSAPS-39625

Low watermark value for Memstore Flush default is incorrect

For CDH versions 5.8 and higher, the **Low Watermark for Memstore Flush** configuration parameter is associated with the HBase parameter `hbase.regionserver.global.memstore.lowerLimit`.

This value represents the fullness threshold of the memstore as a percentage of memstore capacity. The default value for this parameter was incorrectly set too low at `.38`. This can cause severe under utilization of the memstore.

The default has been corrected to be `.95`. When upgrading to a version of Cloudera Manager with this fix, if the value was previously set to the old default of `.38`, it will automatically be increased to the new default, which may cause Cloudera Manager to mark your HBase service as having a stale configuration, requiring a restart.

Additionally, if an existing **Low Watermark for Memstore Flush** configuration parameter has a value `<= .9`, it will be flagged as a configuration warning.

Fixed in: Cloudera Manager 5.12, 5.11.1, 5.10.2, 5.9.3, 5.8.5

Cloudera Bug: OPSAPS-38468

Issues Fixed in Cloudera Manager 5.8.4

CM server error - JsonMappingException

Fixed an issue where a race condition can happen when getting the log links for unhealthy roles and then causes a null pointer exception for the Cloudera Manager homepage.

Cloudera Bug: OPSAPS-32804

Dollar sign (\$) char in password results in IllegalArgumentException

Using special characters such as the dollar sign (\$) for passwords and other user-supplied values with CSD-based services (those added to Cloudera Manager with custom service descriptors) raised exceptions. This has been resolved.

Cloudera Bug: OPSAPS-37542

Error when distributing parcels : No such torrent

Parcel distribution can fail, returning the error message:

```
Error when distributing to host: No such torrent:parcel_name.torrent
```

Workaround: Remove the file `/opt/cloudera/parcel-cache/parcel_name.torrent` from the host.

Cloudera Bug: OPSAPS-37183

Hive Replication Command should update copy the Serde properties correctly

Hive Replication now replicates the Serde Properties and also copies the corresponding HDFS file.

Cloudera Bug: OPSAPS-34354

Hive Replication fails when Impala is SSL enabled but Hadoop services are not

Fixes a bug where some Hadoop services did not recognize the Impala SSL configuration, which caused Hive replications to fail when SSL is enabled. To enable SSL, see: [Configuring TLS/SSL for HDFS, YARN and MapReduce](#).

This support also ensures that connection to Impala is successful when SSL is enabled even if Kerberos is not enabled.

Fixed in: Cloudera Manager 5.10.1, 5.9.2, 5.8.4

Cloudera Bug: OPSAPS-38700

Excess load on Cloudera Manager database

Fixed an issue where the load on the Cloudera Manager database increases significantly on clusters with 100-200 nodes or more and when there are host-level configuration overrides. This has been resolved by using a smaller default value for the `default_batch_fetch_size` property in the hibernate configuration.

Fixed in: Cloudera Manager 5.10.0, 5.9.2, 5.8.4, 5.7.6

Cloudera Bug: OPSAPS-37985

Ability to configure the length of Impala queries that SMON keeps in memory

Lengthy queries (such as Impala DDLs) sometimes overloaded the SMON (service monitor) heap, resulting in out-of-memory exceptions (OOM). With this release, queries are limited to 10k characters by default. This setting can be adjusted using the safety valve mechanism (Advanced Configuration Snippet) in Cloudera Manager.

Cloudera Bug: OPSAPS-37053

Issues Fixed in Cloudera Manager 5.8.3

YARN historical reports by user shows pool-user entity

When Cloudera Manager manages multiple clusters, there is no per user tracking for historical applications and queries across clusters. Instead, **Historical Applications by User** and **Historical Queries by User** show applications and queries per user and pool. (A pool is associated with a specific cluster.)

Cloudera Bug: OPSAPS-34986.

If `total_space_bytes` is very large, heartbeats fail

Fixes heartbeat failure with a host that has a mount point backed by cloud storage, such as AWS.

Cloudera Bug: OPSAPS-36144.

OPSAPS-29327 Add config for `hive.metastore.server.max.message.size`

You can configure `hive.meetastore.max.message.size` using **Max Message Size for Hive MetaStore**. The default setting is 100MB. This can cause staleness during a Cloudera Manager upgrade.

Cloudera Bug: OPSAPS-34098.

CM blocks from HS2 enabling both LDAP and Kerberos authentication

HS2 now supports LDAP and Kerberos authentication on the same instance for CDH 5.7.0 and higher.

Cloudera Bug: OPSAPS-34310.

Backport OPSAPS-36100 Debian 8.2 packages `cdh` install fix to C5.8

Installing CDH using Packages on Debian 8.2 through the Cloudera Manager wizard could install the incorrect CDH binaries, leading to failures in starting the cluster. Certain packages are available in both the default repository and the Cloudera repository, which caused the installer to get confused and pick the wrong one. Cloudera Manager's wizard now ensures the correct binaries are selected.

Cloudera Bug: OPSAPS-36971.

Impala `load_catalog_in_background` config should set to "false" by default in CM

Changed default value for `load_catalog_in_background` to false. This fixes catalog scalability issues observed in Impala since v2.2.

Cloudera Bug: OPSAPS-35869.

[api] Latest CM Java client does not work on older CM

Fixed an issue in Cloudera Manager client versions 5.8, 5.8.1, and 5.8.2 where `ApiCollectDiagnosticDataArguments` was incompatible with Cloudera Manager versions lower than 5.8.

Cloudera Bug: OPSAPS-36315

Empty archive files should not be created for Impala role diagnostics

Support Bundles started collecting Impala minidump bundles with Cloudera Manager 5.8 and higher. If no bundles were found, Cloudera Manager generated an empty TAR file. With this fix, no empty TAR files are generated.

Cloudera Bug: OPSAPS-34887

OOMKiller script not works for Impala Catalog

Fixed a bug where `OutOfMemory` errors in the Catalog Server could lead to killing multiple java processes including other roles on the same host.

Cloudera Bug: OPSAPS-33991

Cloudera Manager 5 Release Notes

Sentry Upgrade command is not retrieable

If the Sentry Upgrade command fails, you can now retry the command.

Cloudera Bug: OPSAPS-35365

Support non-public schemas

Cloudera Manager used to work with only 'public' schema in PostgreSQL. With this change, Cloudera Manager supports custom schema names. Cloudera Manager relies on the schema search path in PostgreSQL, which can be set for a user, database, and so on. <https://www.postgresql.org/docs/current/static/ddl-schemas.html>

Cloudera Bug: OPSAPS-33752

Issues Fixed in Cloudera Manager 5.8.2

Improve advanced configuration snippet redaction to encompass cloud provider credentials and other access tokens

The redaction of potentially sensitive parameters in advanced configuration snippets is extended to those commonly used by the Azure Data Lake.

Cloudera Bug: OPSAPS-29523

If files excluded by exclusion filters are renamed, they are not replicated

Customers using Incremental HDFS replication had an issue where if an excluded file (through exclusion filters) is renamed to an 'included' file, the new file is still not copied to the destination cluster. This issue is resolved as part of this fix.

Cloudera Bug: OPSAPS-34066

Hive Replication Command should update copy the Serde properties correctly

Hive Replication now replicates the Serde Properties and also copies the corresponding HDFS file.

Cloudera Bug: OPSAPS-34354

Increase default Solrd watchdog Timeout value

Solr server initialization can take up to 60 secs to complete. During this time interval, Solr server does not respond to the solrd watchdog requests. This can result in solrd watchdog terminating the Solr server process. The default timeout duration for watchdog is increased to 70 secs.

Cloudera Bug: OPSAPS-34320

Add service changes YARN settings

In Cloudera Manager 5.7, adding any new service to your cluster can cause the YARN setting for `mapreduce.job.reduces` to change unexpectedly. Adding a service no longer causes this problem.

Cloudera Bug: OPSAPS-34151

OPSAPS-29327 Add config for `hive.metastore.server.max.message.size`

Hive Metastore max message size can be configured now using **Max Message Size for Hive MetaStore**. It defaults to 100MB. It can cause staleness for customers on Cloudera Manager upgrade.

Cloudera Bug: OPSAPS-34098

XSS in Kerberos activation

In lower releases, there was an XSS vulnerability on the Kerberos page. This is now fixed.

Cloudera Bug: OPSAPS-33883

Upload deployment.json fails when it contains replication info

While trying to migrate Cloudera Manager using deployment.json file with existing Hive replication, schedules used to fail. This has been fixed in this release.

Cloudera Bug: OPSAPS-33927

Cloudera Manager set cataloged default jvm memory to 4G may cause oom on upgrade to Cloudera Manager 5.7+

After upgrading to 5.7 or later, customers could see a reduced Java heap maximum on Impala Catalog Server, due to a change in its default value. Upgrading from Cloudera Manager < 5.7 to Cloudera Manager 5.8.2 no longer sees any effective change in the Impala Catalog Server Java Heap size.

Cloudera Bug: OPSAPS-34039

Oozie first run fails with custom principals

In 5.8.1, Oozie first run fails if using kerberos custom principals. This is now fixed.

Cloudera Bug: OPSAPS-35822

Hive Replication shows "Dry Run" incorrectly

The earlier known issue that running Hive Replication shows "Dry Run" in status message is fixed now.

Cloudera Bug: OPSAPS-33206

HDFS Snapshot policy is selecting unhealthy host to run on

Policy for selecting a role to run HDFS Snapshot command: We select a non-decommissioned host that is in Active status. Also, hosts in maintenance mode have a lower priority than hosts in active state.

Cloudera Bug: OPSAPS-33144

Cluster export fails when service configuration is invalid

The export cluster template code path was failing because of stale configuration in the Cloudera Manager database. Having a stale configuration in the database is possible. This could happen when configurations are deprecated on older CDH releases.

Cloudera Bug: OPSAPS-35586

Agent orphan cleanup removes process dir from in flight process

With this fix, the preventative steps in TSB-181 are no longer required.

Cloudera Bug: OPSAPS-35294

Fix CatalogServiceClient to handle TLS connections to catalogd for UDF replication

When Impala uses SSL, Cloudera supports TLS Connection to Catalog Server. Customers are able to enable replication for any Impala UDFs/Metadata (in Hive Replication).

Cloudera Bug: OPSAPS-34801

Redact Content from Flume config

Enabled redacting sensitive information from Flume configuration.

Cloudera Bug: OPSAPS-34506

Host inspector incorrectly warns about kernel version "2.6.32-504.16.2"

Host inspector incorrectly warns about kernel version "2.6.32-504.16.2" as "non-recommended."

Cloudera Bug: OPSAPS-35170

Cloudera Manager 5 Release Notes

[Impala Breakpad script does not convert exponentials into decimals and leads to errors](#)

Impala Breakpad script failure that happens when trying to collect more than 10 MB of dumps from a single role is fixed.

Cloudera Bug: OPSAPS-34971

[Oozie points to older sharelib even after running sharelib install command](#)

After an "Install Oozie Share Lib" action, the Oozie service is informed that there is a new shared lib installed. This eliminates the need for a separate manual restart.

Cloudera Bug: OPSAPS-26825

Issues Fixed in Cloudera Manager 5.8.1

[CDH upgrade from 5.7.x to 5.8.x fails when Sentry gateway role is enabled](#)

If the Sentry Gateway role is configured on any hosts of a CDH 5.7.x cluster, the upgrade process to CDH 5.8.x fails.

Upgrades to CDH 5.8.x now complete successfully.

Cloudera Bug: OPSAPS-35356

Issues Fixed in Cloudera Manager 5.8.0

[Changes to yarn.nodemanager.remote-app-log-dir not picked up from gateway](#)

YARN log aggregation did not work when `yarn.nodemanager.remote-app-log-dir` was configured to a non-default location. Now this value is emitted in YARN client configuration, ensuring clients logs go to the proper location.

This fix causes staleness.

Cloudera Bug: OPSAPS-29422

[MapReduce2 Counter Limits on Cloudera Manager's YARN page](#)

Fixed an issue where the MapReduce2 property `mapreduce.job.counters.max` was not included in the configuration for the JobHistory Server, which could cause jobs to fail if there were too many counters. This might happen despite increasing the limit configured in Cloudera Manager. The property is now included in the JobHistory Server configuration, in addition to the related property `mapreduce.job.counters.groups.max`.

This fix causes staleness.

Cloudera Bug: OPSAPS-26705

Cloudera Bug: OPSAPS-26705

[Kafka MirrorMaker unable to start due to KAFKA_HOME not being set](#)

Kafka MirrorMaker would not start when Kafka is installed using packages. This occurred because `KAFKA_HOME` was not set to the correct default when starting MirrorMaker. This issue affected Cloudera Manager 5.4.0 and higher with Kafka 1.4.0 and higher.

Cloudera Bug: OPSAPS-33293

[Kafka unable to start due to misconfigured security.inter.broker.protocol when Kerberos is enabled](#)

Kafka would not start when Kerberos is enabled and the default value of `security.inter.broker.protocol` was not changed. This occurred because Kafka tried to use the same port for `SASL_PLAINTEXT` and `PLAINTEXT`. By default, Cloudera Manager now infers the protocol based on the security settings.

This issue affected Cloudera Manager 5.5.2 and higher with Kafka 2.0.0 and higher.

Upgrading to Cloudera Manager 5.7.1 or higher upgrades currently configured values to `INFERRED` unless SSL/TLS is enabled and the values are currently either `PLAINTEXT` or `SASL_PLAINTEXT`. This does not cause any change in behavior.

Cloudera Bug: OPSAPS-31744

Child commands for deleting or adding a nameservice show stack trace

In an existing HDFS deployment with high availability, when you try to add or delete a nameservice and attempt to view the progress of the child commands, a stack trace is triggered if some of the child commands have not yet run. This fix eliminates the stack trace and informs you that the child commands have not yet been run.

Cloudera Bug: OPSAPS-33383

Setting owner of a file in Isilon fails

On Isilon systems, the owner that the file is being changed to must be present on the system. In general cases, the user is not present, so this command fails with an error message suggesting that the user is not part of the supergroup. This fix addresses the issue by not failing the command.

Cloudera Bug: OPSAPS-33145

Handle drop-recreate partition efficiently

With this change, properties of entities (database, table, partition, index) are not updated by default. You can choose to update properties by setting `REPLICATE_PARAMETERS=true` in **Hive Replication Environment Advanced Configuration Snippet (Safety Valve)**.

Cloudera Bug: OPSAPS-33954

HiveReplicationCmdArgs.update is not accessible using Cloudera Manager

In Hive replication, you can choose to update one or more of the entities `INDICES`, `PARAMETERS`, `PARTITIONS`, and `PRIVILEGES` adding the following instruction in **Hive Replication Environment Advanced Configuration Snippet (Safety Valve)**.

```
PROPERTIES_TO_UPDATE=INDICES , PARAMETERS , PARTITIONS , PRIVILEGES
```

Cloudera Bug: OPSAPS-33953

Operation log directory should be configurable and monitored in Cloudera Manager

HiveServer has two new properties for configuration of operation logging.

Property	Default
Enable HiveServer2 Operations Logging	true
HiveServer2 Operations Log Directory	<code>/var/logs/hive/operation_logs</code>

Cloudera Bug: OPSAPS-29483

Kerberos should use non-person objects when creating principals in Active Directory

You can now configure Active Directory account properties. You can use custom values for `objectClasses` to configure accounts, including non-person objects.

Cloudera Bug: OPSAPS-30301

Changes to `yarn.nodemanager.remote-app-log-dir` not picked up from gateway

YARN log aggregation did not work when `yarn.nodemanager.remote-app-log-dir` was configured to a non-default location. Now this value is emitted in YARN client configuration, ensuring clients logs go to the proper location.

Cloudera Bug: OPSAPS-29422

Key Trustee KMS should use round-robin configuration when Key Trustee server uses High Availability

If the Key Trustee server is configured with High Availability, the Key Management Service needs to use round-robin DNS.

Cloudera Bug: OPSAPS-29221

AD_ACCOUNT_PREFIX should not be required

Active Directory Account Prefix was improperly implemented as a required configuration for Security/ Kerberos. The use of this configuration is now optional.

Cloudera Bug: OPSAPS-29196

Proper fix to handle parcel activation falsely succeeding when host health is failing

Fixed an issue related to the first run failing when some of the hosts are in bad health. This fix involves adding an extra stop to wait for hosts to report the correct parcel version before proceeding.

Cloudera Bug: OPSAPS-33766

Document Kerberos + Isilon support in Disaster Recovery

BDR is now supported on Isilon (including on clusters secured with Kerberos).

Cloudera Bug: OPSAPS-33758

Separation of authentication and authorization coprocessor configs in HBase

HBase Secure Bulkload is now enabled for all CDH5.5 and higher clusters, regardless of whether Kerberos is enabled. Also fixed related issue where clusters with authentication (kerberos) but not authorization failed in Hbase-related MapReduce jobs.

Cloudera Bug: OPSAPS-33657

Cloudera Manager - BDR UI - Generate replication diagnostics data. Failed due to java.lang.NullPointerException.

Trying to collect diagnostic data for a Hive replication schedule caused a Java stack trace to be shown on the page. This fix shows an error message instead of displaying a Java stack trace.

Cloudera Bug: OPSAPS-33438

Diagnostic collection fails on a failed BDR job

Failed BDR jobs no longer report errors on "Collect diagnostic data" actions.

Cloudera Bug: OPSAPS-33474

Redact Advanced Configuration Snippets in the UI that contain secrets

Cloudera Manager 5.8 supports redaction of Advanced Configuration Snippet parameters in UI configuration pages. Redaction is based on matching keywords defined as *sensitive*, and detected within the contents of the Advanced Configuration Snippet text. Users who can edit the parameter still see the sensitive words, but users without edit privileges see only the redacted contents.

Cloudera Bug: OPSAPS-33401

Cloudera Manager - snapshot - take snapshot - needs reset of illegal character when fixed

Fixed an issue in the Take Snapshot dialog where the validation of the snapshot name could become "stuck" and prevent execution of the operation.

Cloudera Bug: OPSAPS-33464

BDR UI: Add Search back - It is difficult to find the desired replication schedule in the Cloudera Manager 5.5 UI

The Replications page provides enhanced search functionality to filter schedules by any specified text. Searches occur within any of these schedule fields: HDFS paths, database names and table names.

Cloudera Bug: OPSAPS-33171

Spark standalone does not come up if HDFS is not available

The Spark standalone service now works without an HDFS service. This requires Spark services to show up as stale and require a restart after upgrade to Cloudera Manager 5.7.1 and higher.

Cloudera Bug: OPSAPS-33509

Cloudera Manager - add hdfs nameservice - gets stack trace

In an existing HDFS High Availability setup, when the user tries to add or delete a nameservice and, in the process, attempts to get progress on the child commands, a stack trace is triggered if some of the child commands have not yet run. This fix eliminates the stack trace and informs the user that the child commands have not yet run.

Cloudera Bug: OPSAPS-33383

BDR Replication Schedule page is slow to load

Replication schedules page load performance is improved.

Cloudera Bug: OPSAPS-33125

Replication DistCp - setOwner behavior on Isilon causing failures

On Isilon systems, the owner to which the file is being changed must be present on the system. In general cases, the user is not present, so this command tends to fail with an error message suggesting that the user is not part of the supergroup. This fix addresses the issue by not failing the command.

Cloudera Bug: OPSAPS-33145

Unable to start Hue on cluster that's using Kerberos and Isilon

Hue service can now start with Isilon if Kerberos is enabled.

Cloudera Bug: OPSAPS-27441

Enable database notifications from Hive

Hive now has the property **Enable Stored Notifications in Database**. When set, Hive logs DDL notifications in Hive Metastore.

Cloudera Bug: OPSAPS-32629

The *hbase* user should be whitelisted by default in the list of allowed system users to launch YARN applications

YARN Allowed System Users now includes *hbase* by default. This is helpful when running certain tools for HBase that need to execute MapReduce jobs.

Cloudera Bug: OPSAPS-32631

Allow HDFS Balancer to login with keytab

When running an HDFS rebalance command on a kerberized cluster with a large amount of data, it could would take enough time to complete that authentication would expire and cause an error. Leveraging a new capability in HDFS, the rebalance command is now able to use a keytab file to automatically renew authentication before it expires.

Cloudera Bug: OPSAPS-32372

Cloudera Manager 5 Release Notes

Add support for delete tables and databases deleted on the source

Cloudera Manager now supports deletion of entities from a target Hive database when those entities are deleted from source Hive database during Hive incremental replication.

Cloudera Bug: OPSAPS-32625

Default MapReduce option should be YARN

The default MapReduce service for a new replication schedule is YARN.

Cloudera Bug: OPSAPS-32650

BDR Administrator cannot enable snapshots though the role says it can

BDR Administrator authority message is now more accurate: Create replication schedules and snapshot policies.

Cloudera Bug: OPSAPS-32521

Hive incremental replication enhancements

Cloudera Manager 5.8 includes Hive incremental replication support.

Cloudera Bug: OPSAPS-32366

Cloudera Manager API allows users with read-only privileges to list all Cloudera Manager users

A security bug in the Cloudera Manager API allowed users with read-only permissions to view all the existing users in Cloudera Manager. This issue is now fixed.

Cloudera Bug: OPSAPS-32916

Decide the value for TTL for DbNotifications

You can configure `Time-to-live for Database Notifications` in Hive for notifications present in the `NOTIFICATION_LOG`. The default is 2 days.

Cloudera Bug: OPSAPS-32898

Make the cluster menu sticky

Previously, the Clusters Menu expanded the first cluster by default. As the user expanded or collapsed the accordion, it remembered the configuration for the current session. When the user goes to the services, roles, or host of another cluster, it maintained the configuration of the previously expanded cluster (which might or might not match). In Cloudera Manager 5.7.1 and higher, Cloudera Manager records the last relevant cluster when the user visits a cluster, service, role or host page, and expands that cluster in the Clusters menu by default.

Cloudera Bug: OPSAPS-32850

NPE on Impala Admission Control page if Memory Limit is not set

In lower releases, if the configuration Impala Daemon Memory Limit is not set, the Impala Admission Control page throws a `NullPointerException`. This is now fixed.

Cloudera Bug: OPSAPS-33023

Change Impala service configs for admission control

Enable Impala Admission Control and **Enable Dynamic Resource Pools** are now enabled by default. Customized configuration values are preserved during upgrade.

Cloudera Bug: OPSAPS-32737

Disaster Recovery on Isilon breaks with Kerberos

BDR on Isilon storage is now supported with kerberized clusters.

Cloudera Bug: OPSAPS-32825

Breakpad Crash Reporting for Impala

Support bundles now collect "minidumps" from Impala that help to debug Impala crash issues. As part of this functionality, Cloudera Manager exposes two properties for three roles (Impalad, Catalog Server, Statestore Server).

Property	Description
Breakpad Dump Dir	This determines where the "minidumps" are temporarily available.
Max Breakpad Dump Files	This determines the maximum number of files stored in <code>dump dir</code> (this limits the amount of storage allocated to Impala dump files).

Cloudera Bug: OPSAPS-33050

s3 protocol and scheme should not be pruned during Hive metadata export

With this change, the cloud HDFS path remains as it is after replication.

Cloudera Bug: OPSAPS-32022

YARN `mapreduce.shuffle.max.connections` is a NodeManager setting and not a client setting

`mapreduce.shuffle.max.connections` was emitted to files of YARN clients instead of the NodeManager. It is now correctly emitted only for the NodeManager.

Cloudera Bug: OPSAPS-31772

Kafka unable to start due to listener misconfiguration when Kerberos is enabled

Kafka would not start when Kerberos was enabled and the `security.inter.broker.protocol` default was not changed. This occurred because Kafka would try to use the same port for SASL_PLAINTEXT and PLAINTEXT. By default, Kafka now infers the protocol based on the security settings. This issue affected Cloudera Manager 5.5.2 and higher with Kafka 2.0.0 and higher. Upgrading to Cloudera Manager 5.7.1 and higher upgrades currently configured values to INFERRED unless SSL / TLS is enabled and the values are currently either PLAINTEXT or SASL_PLAINTEXT. This does not cause any change in behavior.

Cloudera Bug: OPSAPS-31744

Chart Builder not showing graphs on IE9

In Cloudera Manager 5.7, charts would not render in the Chart Builder page on IE9. This issue is fixed in Cloudera Manager 5.8.

Cloudera Bug: OPSAPS-31561

Deb 8.2 support for Cloudera Manager

Cloudera Manager is now supported on Debian 8.2.

Cloudera Bug: OPSAPS-31296

ResourceManager would not start if NodeManager were down during the start phase of the restart cycle

All YARN roles are stopped and started together when the service stop or start command is issued with CDH 5.2 and higher. If CDH version is lower than 5.2, the previous behavior of stopping ResourceManagers before NodeManagers and starting them after NodeManagers stays the same.

Cloudera Bug: OPSAPS-30981

Default TLS keystore location for HTTPFS is on non-persistent disk

The default location for the HTTPFS TLS / SSL keystore was `/var/run/hadoop-https/.keystore`, which could be deleted upon machine reboot. Newly created clusters now have an empty default. When upgrading to Cloudera

Manager 5.7.1 or higher, the old value is maintained. There should be no disruption on upgrade, but Cloudera Manager presents a warning that the keystore is in a dangerous location. To fix this problem, move the files to a safe path on the new host, then update the configuration in Cloudera Manager to point to the new path.

Cloudera Bug: OPSAPS-27976

Active Directory principals created without AES 128/256 bit cause job failures if cluster is configured for AES

It is now possible to configure encryption types for Active Directory setups in Cloudera Manager, using a new property on the Kerberos configuration page, **Kerberos Encryption Types**. You can configure only the following 5 encryption types:

- rc4-hmac
- aes128-cts
- aes256-cts
- des-cbc-crc
- des-cbc-md5

Using other values for the encryption type causes validation of this field to fail during upgrade to CDH 5.8.

Cloudera Bug: OPSAPS-27020

MR2 counter limits in the Cloudera Manager YARN page should populate all MR2 config files

The MapReduce2 property `mapreduce.job.counters.max` was not included in the configuration for the JobHistory Server, which could cause jobs to fail if there were too many counters. This might happen despite increasing the limit configured in Cloudera Manager. The property is now included in the JobHistory Server configuration, in addition to the related property `mapreduce.job.counters.groups.max`.

Cloudera Bug: OPSAPS-26705

BDR: support use of a custom principal

Cloudera Manager now supports custom Kerberos principals for BDR.

Cloudera Bug: OPSAPS-24658

Add QueryMonitoring chart to Impala service charts

A new chart on the Impala service page shows query duration for completed Impala queries.

Cloudera Bug: OPSAPS-22909

Add symbols to Cloudera Manager generated Active Directory passwords

Cloudera Manager now allows Active Directory password complexity to be configured using a new security configuration on the UI. The following table lists the default values.

Name	Value
length	12
minLowerCaseLetters	2
minUpperCaseLetters	2
minDigits	2
minSpaces	0
minSpecialChars	0
specialChars	? . ! \$ % ^ * () - _ + = ~

You can modify these values and regenerate Active Directory credentials to create new passwords.

Cloudera Bug: OPSAPS-22853

Regenerate principals should delete from Active Directory, too

It is now possible to regenerate principals for Active Directory setups. This involves deletion of existing accounts and regeneration of new principals. Since some customers might not want to do this through Cloudera Manager, starting with Cloudera Manager 5.8 you can enable the new property `Active Directory Delete Accounts on Credential Regeneration`. Regenerating credentials with this setting enabled automatically deletes existing accounts and completes the regeneration. This setting is disabled by default. If disabled, regeneration of principals throws an error message saying that deletion of accounts is required. Cloudera Manager needs the new configuration to be set in order to delete accounts automatically.

Cloudera Bug: OPSAPS-22182

XSS in Kerberos activation

In lower releases, there was an XSS vulnerability on the Kerberos page. This is now fixed.

Cloudera Bug: OPSAPS-33883

XSS in host addition

In lower releases, there was an XSS vulnerability on the Add Hosts page. This is now fixed.

Cloudera Bug: OPSAPS-33905

XSS in Host Templates

In lower releases, there was an XSS vulnerability on the Host Templates page. This is now fixed.

Cloudera Bug: OPSAPS-33882

Make it more obvious when phone home is off

In lower releases, it was not obvious in the Send Diagnostics dialog whether data would be sent back to Cloudera. The dialog is enhanced to make this information more visible.

Cloudera Bug: OPSAPS-28674

Allow ad hoc sub-pools to be created within existing pools

Cloudera Manager supports the `nestedUserQueue` feature in the UI. You no longer have to use the safety valve to specify `nestedUserQueues`. This means you can make all jobs without specified user queues go to `root.<YOUR_POOL>.<username>` or `root.<YOUR_POOL>.<primaryGroup>` from the UI.

Cloudera Bug: OPSAPS-30156

Add an option to duplicate resource pool configs

Selecting **Clone** lets you create a new pool from the settings of an existing pool.

Cloudera Bug: OPSAPS-32471

Impala Admission Control root pool should have configurable ACLs

Impala Admission Control now supports a global way of editing ACLs.

Cloudera Bug: OPSAPS-33963

Do not create host templates when create cluster wizard is run

During cluster creation, host templates are no longer created automatically.

Cloudera Bug: OPSAPS-32659

Cloudera Manager 5 Release Notes

The modal height is not calculated correctly

In lower releases, the modal dialog is sometimes too tall. This is now fixed.

Cloudera Bug: OPSAPS-33457

new required fields Key Management Server Proxy Group created if there is more than 1 KMS instance

When adding two Key Trustee KMS roles during the initial setup wizard, sometimes these roles were assigned to different groups. The required configuration was set for some but not all of these groups, causing errors. This is now fixed.

Cloudera Bug: OPSAPS-33946

Links should not be shown on print out

When you print pages from Cloudera Manager, the printout no longer displays link URLs.

Cloudera Bug: OPSAPS-33542

Allow customization of ldap account properties for AD-Kerberos setup

The Active Directory account properties `objectClasses` and `accountExpires` are now configurable from the Kerberos Configuration UI page.

Cloudera Bug: OPSAPS-26419

Support bundle has no way to enforce that a certain time is guaranteed to be in bundle

Support bundles can now be collected for a certain time range. Users are also able to get an estimate of the bundle size before collecting the diagnostic data. Only role logs collected as a part of the support bundle are supported by this item in Cloudera Manager 5.8. This item is not available for scheduled support bundles.

Cloudera Bug: OPSAPS-23557

Fix Spark CSD to keep client config files in subdir

The Spark CSD was modified to avoid conflicts with other CSDs that depend on it, and causes the Spark service to show up as stale on upgrade to Cloudera Manager 5.7.1 and higher.

Cloudera Bug: OPSAPS-33511

Cloudera Manager Agent clears out JN data directories that leads to HDFS not restarting

On RHEL 7 class systems, certain configuration actions intended to be executed only once during enablement of HDFS HA might be re-executed when you request a system shutdown or reboot. This can result in data loss. This issue is fixed in Cloudera Manager 5.8, but a hard restart is required on RHEL 7-class systems (including Oracle and CentOS variants) for the fix to take effect. This can be performed after upgrade in a scheduled, rolling manner.

Cloudera Bug: OPSAPS-34171

Hue should not use the embedded sqlite db by default when possible

Hue now has built-in support for PostgreSQL by taking advantage of the system library `python-psycopg2`. In addition to this library, Hue also includes the system libraries listed in the following table.

System	Library
CentOS 5	Not supported
CentOS 6 and 7	postgresql-libs
Ubuntu 10.04	libpq5, python-egenix-mxdatetime and python-central
Ubuntu 12.04 and 14.04	libpq5
SLES 11 sp2	libpq5

Cloudera Bug: OPSAPS-12507

Issues Fixed in Cloudera Manager 5.7.6

The following issues are fixed in Cloudera Manager 5.7.6.

Excess load on Cloudera Manager database

Fixed an issue where the load on the Cloudera Manager database increases significantly on clusters with 100-200 nodes or more and when there are host-level configuration overrides. This has been resolved by using a smaller default value for the `default_batch_fetch_size` property in the hibernate configuration.

Fixed in: Cloudera Manager 5.10.0, 5.9.2, 5.8.4, 5.7.6

Cloudera Bug: OPSAPS-37985

Hive Replication Command should update copy the Serde properties correctly

Hive Replication now replicates the Serde Properties and also copies the corresponding HDFS file.

Cloudera Bug: OPSAPS-34354

Dollar sign (\$) char in password results in IllegalArgumentException

Using special characters such as the dollar sign (\$) for passwords and other user-supplied values with CSD-based services (those added to Cloudera Manager with custom service descriptors) raised exceptions. This has been resolved.

Cloudera Bug: OPSAPS-37542

Hive Replication fails when Impala is SSL enabled but Hadoop services are not

Fixes a bug where some Hadoop services did not recognize the Impala SSL configuration, which caused Hive replications to fail when SSL is enabled. To enable SSL, see: [Configuring TLS/SSL for HDFS, YARN and MapReduce](#).

This support also ensures that connection to Impala is successful when SSL is enabled even if Kerberos is not enabled.

Fixed in: Cloudera Manager 5.10.1, 5.9.2, 5.8.4

Cloudera Bug: OPSAPS-38700

CM server error - JsonMappingException

Fixed an issue where a race condition can happen when getting the log links for unhealthy roles and then causes a null pointer exception for the Cloudera Manager homepage.

Cloudera Bug: OPSAPS-32804

Service Monitor cannot retrieve Navigator Metadata Server metrics when SSL is enabled

Fixed an issue where the Service Monitor cannot retrieve Navigator Metadata Server metrics when SSL is enabled for Navigator Metadata Server.

Fixed in 5.11, 5.10.1, 5.9.2, 5.7.6

Cloudera Bug: OPSAPS-38865

Issues Fixed in Cloudera Manager 5.7.5

The following issues are fixed in Cloudera Manager 5.7.5.

OOMKiller script does not work for Impala Catalog

Fixed a bug where OutOfMemory errors in the Catalog Server might lead to killing multiple Java processes, including other roles on the same host.

Cloudera Bug: OPSAPS-33991

Issues Fixed in Cloudera Manager 5.7.4

The following issues are fixed in Cloudera Manager 5.7.4.

Agent orphan cleanup removes process dir from in flight process

With this fix, the preventative steps in TSB-181 are no longer required.

Cloudera Bug: OPSAPS-35294

YARN historical reports by user shows pool-user entity

When Cloudera Manager manages multiple clusters, there is no per user tracking for historical applications and queries across clusters. Instead, **Historical Applications by User** and **Historical Queries by User** show applications and queries per user and pool. (A pool is associated with a specific cluster.)

Cloudera Bug: OPSAPS-34986

Host inspector incorrectly warns about kernel version "2.6.32-504.16.2"

Host inspector no longer warns that kernel version "2.6.32-504.16.2" as "non-recommended."

Cloudera Bug: OPSAPS-35170

Fix CatalogServiceClient to handle TLS connections to catalogd for UDF replication

When Impala uses SSL, Cloudera supports TLS Connection to Catalog Server. You can enable replication for any Impala UDFs/Metadata (in Hive Replication).

Cloudera Bug: OPSAPS-34801

If total_space_bytes is really big, heartbeats fail

Fixes heartbeat failure with a host that has a mount point backed by cloud storage such as AWS.

Cloudera Bug: OPSAPS-36145

Oozie points to older sharelib even after running sharelib install command

After an "Install Oozie Share Lib" action, the Oozie service is informed that there is a new shared lib installed. This eliminates the need for a separate manual restart.

Cloudera Bug: OPSAPS-26825

Cloudera Manager blocks from HS2 enabling both LDAP and Kerberos auth

HS2 supports LDAP and Kerberos authentication on the same instance for CDH 5.7.0 or higher. Previously, this was considered an error.

Cloudera Bug: OPSAPS-34310

OOMKiller script does not work for Impala Catalog

Fixed a bug where OutOfMemory errors in the Catalog Server could lead to killing multiple java processes, including other roles on the same host.

Cloudera Bug: OPSAPS-33991

Issues Fixed in Cloudera Manager 5.7.2

Unable to start Hue on cluster that's using Kerberos and Isilon

Hue service can now start with Isilon if Kerberos is enabled.

Cloudera Bug: OPSAPS-27441

BDR UI: Add Search back - It is difficult to find the desired replication schedule in the Cloudera Manager 5.5 UI

The Replications page provides enhanced search functionality to filter schedules by any specified text. Searches occur within any of these schedule fields: HDFS paths, database names and table names.

Cloudera Bug: OPSAPS-33171

Handle drop-recreate partition efficiently

With this change, properties of entities (database, table, partition, index) are not updated by default. You can choose to update properties by setting `REPLICATE_PARAMETERS=true` in **Hive Replication Environment Advanced Configuration Snippet (Safety Valve)**.

Cloudera Bug: OPSAPS-33954

Hue `static` directory is browsable

The `static` web directory in Hue is no longer indexed and browsable when the Hue Load Balancer is used.

XSS in Kerberos activation

In lower releases, there was an XSS vulnerability on the Kerberos page. This is now fixed.

Cloudera Bug: OPSAPS-33883

XSS in host addition

In lower releases, there was an XSS vulnerability on the Add Hosts page. This is now fixed.

Cloudera Bug: OPSAPS-33905

XSS in Host Templates

In lower releases, there was an XSS vulnerability on the Host Templates page. This is now fixed.

Cloudera Bug: OPSAPS-33882

Cloudera Manager Agent clears out JN data directories that leads to HDFS not restarting

On RHEL 7 class systems, certain configuration actions intended to be executed only once during enablement of HDFS HA might be re-executed when you request a system shutdown or reboot. This can result in data loss. This issue is fixed in Cloudera Manager 5.7.2, but a hard restart is required on RHEL 7-class systems (including Oracle and CentOS variants) for the fix to take effect. This can be performed after upgrade in a scheduled, rolling manner.

Cloudera Bug: OPSAPS-34171

Separation of authentication and authorization coprocessor configs in HBase

HBase Secure Bulkload is now enabled for all CDH5.5 and higher clusters, regardless of whether Kerberos is enabled. Also fixed related issue where clusters with authentication (kerberos) but not authorization failed in Hbase-related MapReduce jobs.

Cloudera Bug: OPSAPS-33657

Adding a new service changes `mapreduce.job.reduces` setting

Adding a new service in Cloudera Manager no longer changes the YARN setting `mapreduce.job.reduces`.

Cloudera Bug: OPSAPS-34151

BDR: Hive replication status always shows "(Dry Run)"

Running a Hive replication schedule in BDR no longer displays "(Dry Run)" in the status.

BDR Replication Schedule page is slow to load

Replication schedules page load performance is improved.

Cloudera Manager 5 Release Notes

Cloudera Bug: OPSAPS-33125

HDFS Snapshot running on unavailable nodes

When selecting a host on which to run the **HDFS Snapshot** command, Cloudera Manager now excludes unavailable hosts, such as hosts in maintenance mode or decommissioned hosts.

Cloudera Bug: OPSAPS-33144

Migrating Cloudera Manager using `deployment.json` fails if replication schedules are configured

Migrating Cloudera Manager using `deployment.json` no longer fails if replication schedules are configured.

Cloudera Bug: OPSAPS-33927

Files excluded from replication are not replicated if they are renamed

If a file excluded from replication by an exclusion filter is renamed, it is now replicated properly.

Cloudera Bug: OPSAPS-34066

Issues Fixed in Cloudera Manager 5.7.1

Spark standalone does not come up if HDFS is not available

The Spark standalone service now works without an HDFS service. This requires Spark services to show up as stale and require a restart after upgrade to Cloudera Manager 5.7.1 and higher.

Cloudera Bug: OPSAPS-33509

Kafka unable to start due to listener misconfiguration when Kerberos is enabled

Kafka would not start when Kerberos was enabled and the `security.inter.broker.protocol` default was not changed. This occurred because Kafka would try to use the same port for SASL_PLAINTEXT and PLAINTEXT. By default, Kafka now infers the protocol based on the security settings. This issue affected Cloudera Manager 5.5.2 and higher with Kafka 2.0.0 and higher. Upgrading to Cloudera Manager 5.7.1 and higher upgrades currently configured values to INFERRED unless SSL / TLS is enabled and the values are currently either PLAINTEXT or SASL_PLAINTEXT. This does not cause any change in behavior.

Cloudera Bug: OPSAPS-31744

Default TLS keystore location for HTTPFS is on non-persistent disk

The default location for the HTTPFS TLS / SSL keystore was `/var/run/hadoop-httpfs/.keystore`, which could be deleted upon machine reboot. Newly created clusters now have an empty default. When upgrading to Cloudera Manager 5.7.1 or higher, the old value is maintained. There should be no disruption on upgrade, but Cloudera Manager presents a warning that the keystore is in a dangerous location. To fix this problem, move the files to a safe path on the new host, then update the configuration in Cloudera Manager to point to the new path.

Cloudera Bug: OPSAPS-27976

Fix Spark CSD to keep client config files in subdir

The Spark CSD was modified to avoid conflicts with other CSDs that depend on it, and causes the Spark service to show up as stale on upgrade to Cloudera Manager 5.7.1 and higher.

Cloudera Bug: OPSAPS-33511

Cloudera Manager HDFS usage reports do not include Inode references

Lower versions of Cloudera Manager HDFS usage reports do not include Inode references. As a result, usage reports underreported HDFS directory sizes and data used by users and groups in certain circumstances where HDFS snapshots were used.

Cloudera Bug: OPSAPS-33094

Kafka MirrorMaker unable to start due to KAFKA_HOME not being set

Kafka MirrorMaker would not start when Kafka is installed using packages. This occurred because `KAFKA_HOME` was not set to the correct default when starting MirrorMaker. This issue affected Cloudera Manager 5.4.0 and higher with Kafka 1.4.0 and higher.

Cloudera Bug: OPSAPS-33293

Authentication errors occur due to missing SAML metadata

- If you use SAML for external authentication and were on Cloudera Manager 5.5.0 and higher prior to this upgrade and if you used to notice an error screen while logging out, then this upgrade will fix that issue.
- If you use SAML for external authentication and were on Cloudera Manager 5.5.0 and higher prior to this upgrade and if you did not notice any error screen while logging out, then you will most likely see an error screen while logging out after this upgrade. In order to fix that, you can follow either of these steps:
 1. Update the metadata file in your IdP with the new file from `<Cloudera Manager Server>/saml/metadata`
 2. Change SAML Entity Alias under **Administration > Setting "clouderaManager"** to "" and restart Cloudera Manager.

Cloudera Bug: OPSAPS-33088

Child commands for deleting or adding a nameservice show stack trace

In an existing HDFS deployment with high availability, when you try to add or delete a nameservice and attempt to view the progress of the child commands, a stack trace is triggered if some of the child commands have not yet run. This fix eliminates the stack trace and informs you that the child commands have not yet been run.

Cloudera Bug: OPSAPS-33383

HiveServer2 Web UI did not use SSL when Kerberos was enabled

SSL configuration for the HiveServer2 Web UI is now used regardless of whether Kerberos is in use.

Cloudera Bug: OPSAPS-33255

Clusters menu expands to last cluster viewed

Previously, the **Clusters** menu expanded the first cluster by default, and as you expand or collapse the menu, Cloudera Manager remembers that cluster for the session. However, when you go to services, roles, or hosts of another cluster, Cloudera Manager does not remember the other cluster and shows the previously expanded cluster instead.

In release 5.7.1 and higher, Cloudera Manager remembers the last cluster viewed by a user and expands that cluster in the **Clusters** menu by default.

Cloudera Bug: OPSAPS-32850

Impala does not throw null pointer exception when memory limit is not set

If the configuration property **Impala Daemon Memory Limit** was not set, the **Impala Admission Control** page threw a null pointer exception.

Cloudera Bug: OPSAPS-33023

HDFS rolling restart fails after CDH upgrade

In previous Cloudera Manager releases, when one of a pair of highly available NameNodes was down, it was possible for rolling restart or rolling upgrade commands to fail with an error message incorrectly describing the state of the NameNode as "Busy." The error message now correctly identifies the state of the NameNode (typically "Stopped" in this situation).

Cloudera Bug: OPSAPS-33035

The Expand Range option did not work for some charts

The **Expand range to fill all values** option in **Chart Builder** now works for all charts.

Cloudera Bug: OPSAPS-33277

[Kafka unable to start due to misconfigured security.inter.broker.protocol when Kerberos is enabled](#)

Kafka would not start when Kerberos is enabled and the default value of `security.inter.broker.protocol` was not changed. This occurred because Kafka tried to use the same port for `SASL_PLAINTEXT` and `PLAINTEXT`. By default, Cloudera Manager now infers the protocol based on the security settings.

This issue affected Cloudera Manager 5.5.2 and higher with Kafka 2.0.0 and higher.

Upgrading to Cloudera Manager 5.7.1 or higher upgrades currently configured values to `INFERRED` unless SSL/TLS is enabled and the values are currently either `PLAINTEXT` or `SASL_PLAINTEXT`. This does not cause any change in behavior.

Cloudera Bug: OPSAPS-31744

[Oozie JVM heap metrics not reported in Chart Builder for some services](#)

Oozie JVM metrics are now available and display on the role page. They can also be accessed through **Chart Builder** using the `oozie_memory_heap_used` and `oozie_memory_total_max` metrics.

Cloudera Bug: OPSAPS-33006

[Spark CSD modified](#)

The Spark CSD was modified to avoid conflicts with other CSDs that depend on it. This change causes the Spark service to require a restart when upgrading to Cloudera Manager 5.7.1.

Cloudera Bug: OPSAPS-33511

[Poorly formed Advanced Configuration Snippets cause null pointer exception with diagnostic bundles](#)

Certain poorly formed Advanced Configuration Snippets could cause a Null Pointer Exception when uploading diagnostic bundles and setting up a Cloudera Manager peer.

Cloudera Bug: OPSAPS-33378

[Setting owner of a file in Isilon fails](#)

On Isilon systems, the owner that the file is being changed to must be present on the system. In general cases, the user is not present, so this command fails with an error message suggesting that the user is not part of the supergroup. This fix addresses the issue by not failing the command.

Cloudera Bug: OPSAPS-33145

[The Install Oozie ShareLib command is now visible to users with the Configurator role.](#)

Cloudera Bug: OPSAPS-33157

[Default location for TLS Keystore for HTTPFS is nonpersistent](#)

The default location for the HTTPFS TLS / SSL keystore was `/var/run/hadoop-https/.keystore`, which could be deleted when the host reboots. Newly created clusters now have an empty default instead of one that could be deleted. When upgrading to Cloudera Manager 5.7.1 or higher, the old value is maintained, so there is no disruption on upgrade. However, Cloudera Manager warns that the path is in a dangerous location. To fix this problem, move the files to a safe path on that host, and then update the configuration in Cloudera Manager to point to the new path.

Cloudera Bug: OPSAPS-27976

Collecting diagnostic bundle displayed Java stack trace

Collecting a diagnostic bundle for a Hive replication schedule caused a Java stack trace to be shown on the page. This fix shows an error message instead of throwing a Java stack trace.

Cloudera Bug: OPSAPS-33438

Unable to stop Cloudera Manager Agent on SLES 11

Fixes TSB-144.

Running the restart or stop service commands failed to stop the Agent.

Cloudera Bug: OPSAPS-33225

Error creating bean

Occasionally, some users encountered the message `Error creating bean with name 'newServiceHandlerRegistry'` in the Cloudera Manager Admin Console. This issue has been resolved.

Cloudera Bug: OPSAPS-33324

Impala JVM heap size is configurable

The JVM heap size of the Impala catalog server can be configured now using the **Java Heap Size of Catalog Server in Bytes** property. The property defaults to 4 GB, and like all memory parameters may require tuning.

Cloudera Bug: OPSAPS-26483

Issues Fixed in Cloudera Manager 5.7.0

Plain-text passwords sent to users

An authenticated user could request and receive documents that included passwords they were permitted to modify. This information was sent as plain text. Passwords are no longer included in request responses.

Cloudera Bug: OPSAPS-30757

Cloudera Manager forces Solr shutdown before operations complete

When stopping the Solr service, Cloudera Manager would forcibly stop the service after a period of time. This could result in Solr cores not coming up cleanly. Cloudera Manager now waits for all operations to complete on the Solr server before exiting.

Cloudera Bug: OPSAPS-30903

Re-enabling Kerberos fails due to duplicate roles

As part of enabling Kerberos, a role is created. Attempts to re-enable Kerberos failed because the role already existed from when Kerberos was enabled before. When Kerberos is enabled, Cloudera Manager reuses any required roles if they already exist.

Cloudera Bug: OPSAPS-30703

Processes used incorrect `HOME` variable

CDH service processes and third-party (CSD) processes used an incorrect `HOME` variable. These processes now run with the `HOME` environment variable set to the correct home directory based on the process user.

Cloudera Bug: OPSAPS-30610

Stale Kerberos configuration reported after deploying Kerberos client configuration

After making Kerberos configuration changes through **Administration > Settings > Kerberos**, and **Manage krb5.conf** is enabled, the configuration issue 'Cluster has stale Kerberos configuration' might have displayed and might not have disappeared after running **Cluster > *cluster_name* > Deploy Kerberos Client Configuration**. The deploying Kerberos

client configuration action now waits for pending staleness checks before identifying stale hosts on which to apply Kerberos configuration.

Workaround: Make a different, non-Kerberos edit to a configuration, and save that change. Revert that change immediately afterward.

Cloudera Bug: OPSAPS-30371

Time range settings on report pages are incorrect

Time range settings were incorrect. They are now set correctly on report pages.

Cloudera Bug: OPSAPS-30016

Add Service Wizard fails to set Hive on Spark performance tuning parameters

Automatic configuration for Hive on Spark performance tuning parameters did not run when adding a Hive service to an existing cluster. In the past, these tuning parameters ran when adding a cluster that contained Hive, YARN, and Spark on YARN. The rules now run as long as Hive depends on YARN in both the add service and add cluster wizards.

Cloudera Bug: OPSAPS-25460

Setting empty values for LDAP Base DN and LDAP Domain produces errors

Setting empty values for the LDAP Base DN and LDAP Domain for Impala resulted in errors. These settings are now handled without errors.

Cloudera Bug: OPSAPS-29546

Restart of deleted roles does not wait until deleted roles are identified

Restart and rolling restart commands did not always wait until all deleted roles were identified. As a result, services that had not yet been identified as requiring a restart were not restarted. Restart and rolling restart commands now wait for staleness checks to complete, if the user requests that only stale services be restarted. This avoids a race between staleness computation checking and how services are determined to be stale and thus restarted.

Cloudera Bug: OPSAPS-29190

Miscellaneous problems with the Replication user interface

This release includes several fixes to the replication user interface including the following:

- The **Last Run** column incorrectly sorted dates. Dates are now correctly sorted.
- Collecting diagnostic data for failed Hive Replication commands failed with an error. This data collection now succeeds.
- Finished schedules were shown as running. Schedules now accurately reflect their state.
- Scheduled time was incorrectly translated between browser time and server time. Scheduled time is now correctly translated.
- The **Actions** menu would be disabled while a replication schedule was running, which blocked changing future runs configurations. The **Actions** menu is now enabled for replication schedules with commands running.

Cloudera Bug: OPSAPS-29759

Misleading error occurs while deploying client configuration

The error "There is already a pending command on this entity" was shown if a command was in process for a service and an attempt is made to run the "Deploy client configuration" command. This error is no longer shown.

Cloudera Bug: OPSAPS-31461

Gathering task progress produced null pointer exceptions

Gathering progress information on a variety of tasks could result in null pointer exceptions. For example, this could occur when decommissioning a host. Progress information is now gathered as expected.

Cloudera Bug: OPSAPS-32347

User interface elements are hidden when windows are resized

Some windows could be resized so buttons were not visible. For example, this could happen with the Create Replication dialog box. The user interface now handles resizing as expected.

Cloudera Bug: OPSAPS-32060

HDFS data transfers uses 3DES despite configuration

The configuration information for using the AES/CTR/NoPadding cipher suite for HDFS data transfers was incomplete. As a result, traffic was encrypted with the much slower 3DES algorithm. The correct configuration is now included with the HDFS client.

Cloudera Bug: OPSAPS-31607

Solr keystore passwords are no longer presented in clear text

Because of Tomcat restrictions, Solr keystore passwords were sent as clear text on the machines running the service. They are now redacted.

Cloudera Bug: CDH-33626.

Removing a host from a cluster removes all Kerberos client configuration

Removing a host from a cluster automatically removed all Kerberos client configuration from any other hosts still in the cluster. Now, when one host is removed from a cluster, any Kerberos client configuration on other hosts is unaffected.

Cloudera Bug: OPSAPS-29796

Hive replication import fails to include some information

During the Hive replication import phase, schema and location information was not consistently populated. This information is now populated as expected.

Cloudera Bug: OPSAPS-31332

Restarts attempt to deploy client configuration when action is not supported

After upgrading a parcel, restart or rolling restart steps automatically attempted to deploy the client configuration, even if that was not supported by the cluster configuration. Now, client configurations are deployed only if the cluster configuration supports this action.

Cloudera Bug: OPSAPS-31483

Some pages load very slowly

Some pages, such as the **All Recent Commands** page, may take over 30 seconds to load. This process has been optimized, reducing load times.

Cloudera Bug: OPSAPS-26772

kt_renewer not automatically created when Hue is added to a Kerberos-enabled cluster

When the Hue service was added to a Kerberos-enabled cluster, a single corresponding kt_renewer was not created. The process of adding the Hue service now includes checking if a keytab renewer is required, and creating one if it is.

Cloudera Bug: OPSAPS-31795

Some jobs never run due to memory configuration

It was possible to configure the YARN NodeManager with an amount of available memory less than the amount of memory available to the YARN container. In such a case, a job might never find a NodeManager that meets the memory requirements. The system now ensures that at least one YARN container is configured with an equal or greater amount of memory than the YARN NodeManager value.

Cloudera Bug: OPSAPS-22584

Replication schedule API not compatible with older versions

Clients using the version 10 replication schedule API did not work as expected with instances of Cloudera Manager using version 11 of the API. This meant that clients from Cloudera Manager 5.4.0 and lower did not work as expected with servers running Cloudera Manager 5.5.0 and higher. Clients and servers using these different API versions now function as expected.

Cloudera Bug: OPSAPS-32504

Issues Fixed in Cloudera Manager 5.6.2

Issues Fixed in Cloudera Manager 5.6.1

Scheme and location not filled in consistently during Hive replication import

In previous releases, Hive replication import phase did not consistently fill in scheme and location information. This information is now filled in as expected.

Cloudera Bug: OPSAPS-31522

Cloudera Manager HDFS usage reports do not include Inode references

Lower versions of Cloudera Manager HDFS usage reports do not include Inode references. As a result, usage reports underreported HDFS directory sizes and data used by users and groups in certain circumstances where HDFS snapshots were used.

Cloudera Bug: OPSAPS-33094

Kafka MirrorMaker unable to start due to KAFKA_HOME not being set

Kafka MirrorMaker would not start when Kafka is installed using packages. This occurred because `KAFKA_HOME` was not set to the correct default when starting MirrorMaker. This issue affected Cloudera Manager 5.4.0 and higher with Kafka 1.4.0 and higher.

Cloudera Bug: OPSAPS-33293

kt_renewer not automatically created when Hue is added to a Kerberos-enabled cluster

When the Hue service was added to a Kerberos-enabled cluster, a single corresponding `kt_renewer` was not created. The process of adding the Hue service now includes checking if a keytab renewer is required, and creating one if it is.

Cloudera Bug: OPSAPS-31795

Authentication errors occur due to missing SAML metadata

- If you use SAML for external authentication and were on Cloudera Manager 5.5.0 and higher prior to this upgrade and if you used to notice an error screen while logging out, then this upgrade will fix that issue.
- If you use SAML for external authentication and were on Cloudera Manager 5.5.0 and higher prior to this upgrade and if you did not notice any error screen while logging out, then you will most likely see an error screen while logging out after this upgrade. In order to fix that, you can follow either of these steps:
 1. Update the metadata file in your IdP with the new file from `<Cloudera Manager Server>/saml/metadata`
 2. Change SAML Entity Alias under **Administration** > **Setting "clouderaManager"** to " and restart Cloudera Manager.

Cloudera Bug: OPSAPS-33088

Oozie JVM heap metrics not reported in Chart Builder for some services

Oozie JVM metrics are now available and display on the role page. They can also be accessed through **Chart Builder** using the `oozie_memory_heap_used` and `oozie_memory_total_max` metrics.

Cloudera Bug: OPSAPS-33006

Issues Fixed in Cloudera Manager 5.6.0

CDH upgrade fails if the GPL Extras parcel is in use

CDH and GPL Extras parcel versions must match exactly. When upgrading CDH, by default Cloudera Manager validates the dependency between the new CDH parcel and existing GPL Extras parcel. Since the dependency is not satisfied, the check returns an error and the upgrade fails.

Cloudera Bug: OPSAPS-26436

Workaround:

1. Deactivate parcel dependency checking:
 - a. Select **Administration > Settings**.
 - b. Search for **Validate Parcel Relations**.
 - c. Deselect the checkbox.
 - d. Click **Save Changes** to commit the changes.
2. Deactivate the GPL Extras parcel.
3. Download, distribute, and activate the GPL Extras parcel that matches the CDH upgrade version.
4. Upgrade CDH.
5. Reactivate parcel dependency checking.

Issues Fixed in Cloudera Manager 5.5.6

Separation of authentication and authorization coprocessor configs in HBase

HBase Secure Bulkload is now enabled for all CDH5.5 and higher clusters, regardless of whether Kerberos is enabled. Also fixed a related issue where clusters with authentication (Kerberos) but not authorization failed in HBase-related MapReduce jobs.

Cloudera Bug: OPSAPS-33657

Replications page: sort by schedule ID as default

In the Replications page, the table is now sorted by ID as a default.

Cloudera Bug: OPSAPS-33212

Hive Replication shows "Dry Run" incorrectly

Fixes an issue where running Hive Replication shows "Dry Run" in status message.

Cloudera Bug: OPSAPS-33206

HDFS Snapshot policy is selecting unhealthy host to run on

When selecting a role to run HDFS Snapshot command, Cloudera Manager now selects a non-decommissioned host in Active status. Also, hosts in maintenance mode have a lower priority than the ones in active state.

Cloudera Bug: OPSAPS-33144

Cloudera Manager no longer shows "this step is expected to fail" when enabling HDFS-HA

When enabling HDFS-HA, if the NameNode directories are empty, Cloudera Manager reports this as an error. In lower versions, it returned a message saying the failure is expected. Cloudera Manager now shows the correct message when performing HA.

Cloudera Bug: OPSAPS-30777

Cloudera Manager 5 Release Notes

Configuration for all services is marked stale during upgrade

When you upgrade to version 5.5.6 of Cloudera Manager, the client configuration for all services is marked stale. From the Cluster menu, select Deploy Client Configuration to redeploy the client configuration.

Cloudera Bug: OPSAPS-36234

Issues Fixed in Cloudera Manager 5.5.4

Cluster provisioning fails

In some cases, provisioning of a cluster may fail at the start of the process. This does not happen in all cases and is mainly noticed on RHEL 6 and especially when some hosts are reporting bad health.

Releases affected: 5.5.0-5.5.3, 5.6.0-5.6.1, 5.7.0

Releases containing the fix: 5.5.4, 5.7.1

For releases containing the fix, parcel activation and first run command now completes as expected, even when some hosts report bad health.

This issue is fixed in Cloudera Manager 5.5.4 and 5.7.1 and higher.

Cloudera bug: OPSAPS-33564

Scheme and location not filled in consistently during Hive replication import

In previous releases, Hive replication import phase did not consistently fill in scheme and location information. This information is now filled in as expected.

Cloudera Bug: OPSAPS-31522

Kafka MirrorMaker unable to start due to KAFKA_HOME not being set

Kafka MirrorMaker would not start when Kafka is installed using packages. This occurred because `KAFKA_HOME` was not set to the correct default when starting MirrorMaker. This issue affected Cloudera Manager 5.4.0 and higher with Kafka 1.4.0 and higher.

Cloudera Bug: OPSAPS-33293

Cloudera Manager HDFS usage reports do not include Inode references

Lower versions of Cloudera Manager HDFS usage reports do not include Inode references. As a result, usage reports underreported HDFS directory sizes and data used by users and groups in certain circumstances where HDFS snapshots were used.

Cloudera Bug: OPSAPS-33094

New Hive tables fail to replicate when Sentry Sync is enabled

When Sentry Sync is enabled, new Hive tables failed to replicate. Replication now occurs as expected.

Cloudera Bug: OPSAPS-33065

kt_renewer not automatically created when Hue is added to a Kerberos-enabled cluster

When the Hue service was added to a Kerberos-enabled cluster, a single corresponding `kt_renewer` was not created. The process of adding the Hue service now includes checking if a keytab renewer is required, and creating one if it is.

Cloudera Bug: OPSAPS-31795

Authentication errors occur due to missing SAML metadata

- If you use SAML for external authentication and were on Cloudera Manager 5.5.0 and higher prior to this upgrade and if you used to notice an error screen while logging out, then this upgrade will fix that issue.

- If you use SAML for external authentication and were on Cloudera Manager 5.5.0 and higher prior to this upgrade and if you did not notice any error screen while logging out, then you will most likely see an error screen while logging out after this upgrade. In order to fix that, you can follow either of these steps:
 1. Update the metadata file in your IdP with the new file from <Cloudera Manager Server>/saml/metadata
 2. Change SAML Entity Alias under **Administration** > **Setting "clouderaManager"** to "" and restart Cloudera Manager.

Cloudera Bug: OPSAPS-33088

HDFS rolling restart fails after CDH upgrade

In previous Cloudera Manager releases, when one of a pair of highly available NameNodes was down, it was possible for rolling restart or rolling upgrade commands to fail with an error message incorrectly describing the state of the NameNode as "Busy." The error message now correctly identifies the state of the NameNode (typically "Stopped" in this situation).

Cloudera Bug: OPSAPS-33035

Oozie JVM heap metrics not reported in Chart Builder for some services

Oozie JVM metrics are now available and display on the role page. They can also be accessed through **Chart Builder** using the `oozie_memory_heap_used` and `oozie_memory_total_max` metrics.

Cloudera Bug: OPSAPS-33006

Issues Fixed in Cloudera Manager 5.5.3

[Users using external LDAP authentication with no local Cloudera Manager user role explicitly set may default to the read-only role when upgrading to Cloudera Manager 5.5.2](#)

When upgrading to Cloudera Manager 5.5.2, customers who have non-read-only roles configured through LDAP, and have not explicitly set Cloudera Manager local roles, may lose their Cloudera Manager privileges set by LDAP.

Releases affected: Cloudera Manager 5.5.2

Users affected: Customers who use LDAP for Cloudera Manager user authorization and have upgraded Cloudera Manager from a version lower than 5.5.0 to Cloudera Manager 5.5.2. For example:

- **May be affected:** Install Cloudera Manager 5.3 -> Upgrade to Cloudera Manager 5.5.1 -> Upgrade to Cloudera Manager 5.5.2
- **Unaffected:** Install Cloudera Manager 5.5.1 -> Upgrade to Cloudera Manager 5.5.2

Users not affected:

- Customers who installed Cloudera Manager 5.5.0 and higher and upgraded.
- Customers who use Cloudera Manager local role authorization, regardless of upgrade path and version.

Severity: High

Action required: If you have upgraded to Cloudera Manager 5.5.2 and cannot log in with proper permissions, do the following:

1. Resolve any conflicting user authorization permissions between LDAP and Cloudera Manager local permissions.
2. Contact Cloudera Support for further instructions if you cannot resolve conflicting LDAP and Cloudera Manager user permissions.

If you have not yet upgraded to Cloudera Manager 5.5.2, and are using LDAP user authorization:

1. Before upgrading, resolve any conflicting user authorization permissions between LDAP and Cloudera Manager local permissions.
2. Upgrade to Cloudera Manager 5.5.3 or higher.

Issues Fixed in Cloudera Manager 5.5.2

Note: If you are upgrading from a previous version of Cloudera Manager, Cloudera recommends that you upgrade to version 5.5.3 or higher.

Oozie and HttpFS keystore passwords are no longer presented in clear text

Because of Tomcat restrictions, the Oozie and HttpFS keystore passwords were sent as clear text on the machines running the services. They are now hidden.

Cloudera Bug: OPSAPS-25522

Cross-site scripting vulnerability using malformed strings in the Parcel Remote URLs list

An attacker could set a malformed string in the Parcel Remote URLs list in the database and trigger the attack when a user accesses the Administration Settings page. This attack is now prevented.

Cloudera Bug: OPSAPS-30590

Starting/stopping roles for Flume instance succeeds but displays nothing in popup

In Cloudera Manager 5.5.0, running a Flume start/stop service command would succeed, but display an empty popup. This is now fixed.

Cloudera Bug: OPSAPS-31075

Role process commands missing stderr and stdout in command details

In Cloudera Manager 5.5, certain commands did not show links to `stderr` or `stdout` in the Cloudera Manager UI even if they were executed recently. These could still be found in `/var/run/cloudera-scm-agent/process/` on that host. In Cloudera Manager 5.5.2 `stderr` and `stdout` should appear as they did before.

Note that links to `stderr` and `stdout` for commands may disappear if another command is run on that role. This is expected. The logs can still be found in `/var/run/cloudera-scm-agent/process/` on that host.

Cloudera Bug: OPSAPS-30671

Updating the Hive NameNode location multiple times could lead to data corruption

Multiple updates to the Hive NameNode location could cause Hive Metastore database corruption. Issuing the same command multiple times no longer produces problems.

Cloudera Bug: OPSAPS-30155

Cloudera Manager skips NameNode logs in the diagnostic bundle

Scheduled diagnostic bundles did not include recent role logs. Diagnostic bundles collected manually (not scheduled) worked as expected. Now, scheduled diagnostic bundles include the latest NameNode logs.

Cloudera Bug: OPSAPS-30787

Kafka 2.0 fails to deploy on large clusters as `reserved.broker.max.id` defaults to 1000

Large Kafka clusters would not start when Cloudera Manager-generated broker IDs exceeded the value set by `reserved.broker.max.id`. The default value of `broker.id.generation.enable` has now been set to `false` to disable the `reserved.broker.max.id` configuration property and avoid collisions.

Cloudera Bug: OPSAPS-31128

Cloudera Manager fails to propagate HBase coprocessors to the gateway nodes

Cloudera Manager does not propagate HBase coprocessors to the gateway nodes. As a result, tools that depend on the HBase security subsystem, such as the `loadIncrementalHFiles` tool, do not use security features, even in secure environments.

Cloudera Bug: OPSAPS-28196

Workaround: Add the following properties to the **HBase Client Advanced Configuration Snippet (Safety Valve) for hbase-site.xml** and restart all HBase clients:

```
<property>
  <name>hbase.coprocessor.region.classes</name>

  <value>org.apache.hadoop.hbase.security.token.TokenProvider,org.apache.hadoop.hbase.security.access.SecureBulkLoadEndpoint</value>
</property>
```

HDFS nameservices API call returns incorrect HA role status

The HDFS nameservices API returned incorrect active/standby status information for HA roles. API calls made about roles that were active might return standby status and roles that were in standby status might return active status. Information about host statuses is now accurate.

Cloudera Bug: OPSAPS-29337

Hive requires the `hive` principal for HiveServer2 host as well as load balancer

An issue with HiveServer2 missing its principal and keytab when Hive is load-balanced has been fixed.

Cloudera Bug: OPSAPS-29881

More descriptive error message for service trying to start on a decommissioned host

Cloudera Manager now displays a more descriptive error message when it skips the "Start" command because all roles are started or decommissioned or on a decommissioned host.

Cloudera Bug: OPSAPS-25549

UI shows repeated errors when loading replications page

Issue fixed with loading the replication page when a previous replication command fails without launching a MapReduce job.

Cloudera Bug: OPSAPS-28789

Allow option for external users to be assigned roles in the local database

In Cloudera Manager 5.5, role assignments for external users was disabled, which caused upgrade issues. The fix rolls back the change but instead of using a union approach, implements the following precedence rules:

- If a user is assigned a role in Cloudera Manager, this local role is used.
- Otherwise, a user's LDAP group association determines the user role.

Cloudera Bug: OPSAPS-31181

Clean up usercache directories on migration from unsecure to secure mode

Fixes an issue that led to YARN jobs failing after migration from unsecure to secure mode.

Cloudera Bug: OPSAPS-28378

Spark REST API does not work when parcels are used

The REST API for retrieving data from a live Spark UI or from the Spark History Server has been fixed.

Cloudera Bug: OPSAPS-30919

In secure clusters, DataNode fails to start when `dfs.data.transfer.protection` is set and DataNode ports are changed to unprivileged ports

Before this fix, the only way to run the DataNode on unprivileged ports (port number > 1024) in a Kerberized cluster with DataNode Data Transfer Protection enabled, was to use single-user mode. Now this configuration works for both regular and single-user mode installs.

Both Hadoop SSL and DataNode Data Transfer Protection are still required for unprivileged DataNode ports to work in a Kerberized cluster. This configuration is supported only in CDH 5.2 and higher.

Cloudera Bug: OPSAPS-30819

New validation warning for non-recommended secure DataNode configurations in CDH 5.2 and higher

On a Kerberos-enabled cluster running CDH 5.2 and higher, there are two recommended DataNode configurations. Use SASL/TLS with DataNode Data Transfer Protection enabled to encrypt the connection, or use only privileged ports to communicate. The supported combinations of HDFS configuration properties follow:

- **Security through SASL/TLS (preferred):**
 - DataNode Data Transfer Protection - Enabled
 - Hadoop TLS/SSL - Enabled
 - DataNode Transceiver Port - Non-privileged (that is, port number \geq 1024)
 - Secure DataNode Web UI Port (TLS/SSL) - Non-privileged (that is, port number \geq 1024)
- **Security through privileged ports:**
 - DataNode Data Transfer Protection - Disabled
 - Hadoop TLS/SSL - Disabled
 - DataNode Transceiver Port - Privileged (that is, port number < 1024)
 - DataNode HTTP Web UI Port - Privileged (that is, port number < 1024)

Any configuration other than these results in a validation warning or error from Cloudera Manager. In particular, the following configuration, which is allowed by HDFS but is not recommended, results in a (dismissible) validation warning:

- **(Not Recommended) Security without enabling DataNode Data Transfer Protection:**
 - DataNode Data Transfer Protection - Disabled
 - Hadoop TLS/SSL - Enabled
 - DataNode Transceiver Port - Privileged (that is, port number < 1024)
 - Secure DataNode Web UI Port (TLS/SSL) - Non-privileged (that is, port number \geq 1024)

All configurations other than the three listed result in Cloudera Manager displaying a validation error.

Cloudera Bug: OPSAPS-31266

Sensitive environment parameters not redacted for CSDs

Passwords in environment variables for CSDs are now redacted.

Cloudera Bug: OPSAPS-29915

Update Apache Commons Collections library in Cloudera Manager due to major security vulnerability

The Apache Commons Collections library has been upgraded to 3.2.2 to fix a critical security vulnerability.

Cloudera Bug: OPSAPS-30428

Remove plaintext keystore password from `/api/v6/cm/config`

With the addition of the JVM parameter, `\-Dcom.cloudera.api.redaction=true`, sensitive configuration values are redacted from the API.

Cloudera Bug: OPSAPS-26677

JVM parameter to redact passwords now redacts the password salt and hash

When API redaction is turned on using the JVM argument `-Dcom.cloudera.api.redaction=true`, it also redacts the user's `pwHash` and `pwSalt` values. Passwords for Cloudera Manager Peers are also redacted.

Cloudera Bug: OPSAPS-31194

Oozie keystore and truststore passwords now redacted

Oozie's Java keystore and truststore passwords are no longer sent in clear text on the command line.

Cloudera Bug: OPSAPS-25523

Several Replication UI fixes

- The Replication UI **Last Run** column now sorts correctly based on dates.
- Collecting diagnostic data for failed Hive Replication commands no longer fails.
- Finished schedules are no longer shown as running when the user is watching the page.
- Scheduled time now accurately translates between browser time and server time.
- Actions menu is now enabled for replication schedules with commands running. Previously, it would be disabled while a replication schedule was running, which blocked changing the configuration for future runs.

Cloudera Bug: OPSAPS-29750

Fix Java detection

Java detection in the "Components" view for a host was fixed to account for Java versions installed using symlinks in `/usr/java` (such as `/usr/java/default`). A similar fix was made to the host inspector's Java detection logic.

Cloudera Bug: OPSAPS-31105

When Host Monitor is stopped, cluster/services status in Cloudera Manager API returns Good instead of N/A or Unknown

If the Host Monitor is down, the service details page will still be able to present non-host related health status.

Cloudera Bug: OPSAPS-30337

Issues Fixed in Cloudera Manager 5.5.1

Apache Commons Collections deserialization vulnerability

Cloudera has learned of a potential security vulnerability in a third-party library called the [Apache Commons Collections](#). This library is used in products distributed and supported by Cloudera ("Cloudera Products"), including core Apache Hadoop. The Apache Commons Collections library is also in widespread use beyond the Hadoop ecosystem. At this time, no specific attack vector for this vulnerability has been identified as present in Cloudera Products.

In an abundance of caution, we are currently in the process of incorporating a version of the Apache Commons Collections library with a fix into the Cloudera Products. In most cases, this will require coordination with the projects in the Apache community. One example of this is tracked by [HADOOP-12577](#).

The Apache Commons Collections potential security vulnerability is titled "Arbitrary remote code execution with InvokerTransformer" and is tracked by [COLLECTIONS-580](#). MITRE has not issued a CVE, but related [CVE-2015-4852](#) has been filed for the vulnerability. CERT has issued [Vulnerability Note #576313](#) for this issue.

Releases affected: CDH 5.5.0, CDH 5.4.8 and lower, CDH 5.3.8 and lower, CDH 5.2.8 and lower, CDH 5.1.7 and lower, Cloudera Manager 5.5.0, Cloudera Manager 5.4.8 and lower, Cloudera Manager 5.3.8 and lower, and Cloudera Manager 5.2.8 and lower, Cloudera Manager 5.1.6 and lower, Cloudera Manager 5.0.7 and lower, Cloudera Navigator 2.4.0, Cloudera Navigator 2.3.8 and lower.

Users affected: All

Impact: This potential vulnerability may enable an attacker to execute arbitrary code from a remote machine without requiring authentication.

Immediate action required: Upgrade to Cloudera Manager 5.5.1 and CDH 5.5.1, Cloudera Manager 5.4.9 and CDH 5.4.9, Cloudera Manager 5.3.9 and CDH 5.3.9, and Cloudera Manager 5.2.9 and CDH 5.2.9, and Cloudera Manager 5.1.7 and CDH 5.1.7, and Cloudera Manager 5.0.8 and CDH 5.0.8.

Issues Fixed in Cloudera Manager 5.5.0

[Setting the HBase WAL provider to the default in Cloudera Manager causes the RegionServer process to fail to start](#)

Setting the HBase WAL provider to the default using Cloudera manager erroneously sets the value of `hbase.wal.provider` to `default`, when it should be set to `defaultProvider`. This causes the RegionServer process to fail to start.

Cloudera Bug: OPSAPS-29598

Workaround: Do not use Cloudera Manager to set the WAL provider to the default. Instead, add the following properties to the **RegionServer Advanced Configuration Snippet (Safety Valve) for hbase-site.xml** and restart all HBase clients.

```
<property>
  <name>hbase.wal.provider</name>
  <value>defaultProvider</value>
</property>
```

[Incorrect path format causes access permission failure](#)

The file path format used in sequence file `ing was incorrect. In replications involving a large number of files and when the **Delete Policy** for the replication is set to **Delete to trash** or **Delete Permanently**, distcp uses the local file system to save the intermediate result of sequence file sorting. An incorrect path format causes access permission failure.

Cloudera Bug: OPSAPS-28859

[Out-of-memory exception for Hive replication](#)

Hive replication throws an out-of-memory exception when exporting a table with a large number of partitions.

Cloudera Bug: OPSAPS-29598

[Incorrect value emitted into hbase-site.xml](#)

When configuring an HBase WAL provider with the "HBase Default" option, Cloudera Manager emits an incorrect value into `hbase-site.xml` and HBase reports an error.

Cloudera Bug: OPSAPS-29598

[Failed replication no longer fail silently](#)

When a replication is attempted between secure and insecure clusters, the replication reports an error and fails silently.

Cloudera Bug: OPSAPS-28380

[The Replication Schedules page displays error after failed replication](#)

A dialog box that shows a Java exception displays in the Replication Schedules page after a failed replication and the page is inaccessible.

Cloudera Bug: OPSAPS-28465

[Cloudera Manager now allows you to use '/' in cluster names](#)

In previous versions, this resulted in problems during replication because '/' was treated as an URL path.

Cloudera Bug: OPSAPS-26138

HDFS replication fails because of improper snapshot directory handling

Replications fail when converting a snapshot path to a regular path when the grandparent of the source directory is snapshottable.

Cloudera Bug: OPSAPS-27232

Renewal time limits and lifetime limits are removed for Kerberos tickets

Snapshots that take longer than 30 minutes failed because the Kerberos tickets for the snapshots expired too soon . The renewal and lifetime limits have been replaced with the system default lifetime and renewal limits, instead of 30 minutes.

Cloudera Bug: OPSAPS-28189

Replication schedules fails to catch configuration errors during creation

The schedule configuration is not validated when it is created, which causes errors during replication.

Cloudera Bug: OPSAPS-11047

Audit events now include the schedule ID

The replication ID has been added to the schedule creation, update, and deletion audit events.

Cloudera Bug: OPSAPS-11534

OutOfMemory error when running HDFS replication

HDFS replication fails with an OutOfMemory exception (in `stderr.log`) when an HDFS replication job replicates a large number of files.

Cloudera Bug: OPSAPS-28858

Hive replication does not preserve user and group names for the database directory

File permissions of the database directory that maps to a Hive database are not preserved.

Cloudera Bug: OPSAPS-24742

Exception in configuration history after changing host configuration

An `IllegalStateException` is reported in the History and Rollback page after changing host configuration.

Cloudera Bug: OPSAPS-28795

Host Inspector no longer expects the impala user to be in the hdfs group

To conform to security best practices, the impala user should not be in the hdfs group.

Cloudera Bug: OPSAPS-28129

The DataNode Refresh Data Directories command fails on secure clusters

DataNode refresh failed on Kerberized clusters.

Cloudera Bug: OPSAPS-27068

Topology should only include hosts with Hadoop daemons

A topology map is created for the services HDFS, YARN, and MapReduce. In releases earlier than 5.5.0, hosts with only gateway roles for these services were also added to the topology map. This might erroneously mark many configurations as stale, requiring restarts or refreshes to resolve the staleness.

Cloudera Bug: OPSAPS-24109

Agent `host_id` property is erroneously set to hostname

Previously, attempting to set the `listening_hostname` property in the Agent `config.ini` file (which is not normally necessary) changed the Agent's host ID to use this hostname, instead of the normal value.

Cloudera Bug: OPSAPS-27991

`JAVA_HOME` override setting does not affect component list

The component list for a host is not affected by a custom `JAVA_HOME` setting.

Cloudera Bug: OPSAPS-19290

Monitoring performance issues on large, busy clusters

A number of fixes have been made to improve Service Monitor and Host Monitor performance, particularly problems manifesting as large, regular garbage-collection pauses, on large, busy clusters.

Cloudera Bug: OPSAPS-26703

`JAVA_HOME` does not get passed to Agents

Client configuration deployment fails to locate Java in the custom `JAVA_HOME` environment variable, if that is specified via host configuration.

Cloudera Bug: OPSAPS-27048

Job History Server Retaining Logs in Secure Clusters

The Job History Server fails to delete old logs from HDFS on secure clusters, with the error "Failed to specify server's Kerberos principal name."

Cloudera Bug: OPSAPS-30157

On Kerberized clusters, incorrect values reported for DataNode process metrics

The DataNode process is incorrectly monitored on Kerberized clusters.

Cloudera Bug: OPSAPS-28676

During `kt_renewer` kinit call authentication may fail

On Kerberized clusters, Cloudera Manager might periodically report monitoring failures due to authentication errors when attempting to communicate with various role web servers to collect metrics. This is due to synchronization issues between the Agent's calls to kinit and attempts to perform Kerberos authentication with the role web servers. This has been fixed by adding logic to retry requests for metrics in the Agent a number of times on authentication failures. These retries will be logged but should not result in health failures and alerts.

Cloudera Bug: OPSAPS-28469

Client configurations are incorrectly marked as stale when a host is rebooted

Rebooting a host can cause the client configurations for gateway roles on that host to be marked as stale even though they are up to date.

Cloudera Bug: OPSAPS-28568

Rolling restart fails when inheriting inappropriate JVM properties

Rolling restart inherits custom HBase RegionServer JVM properties and can fail when those properties are inappropriate for non-daemon JVMs.

Cloudera Bug: OPSAPS-28353

Clusters can fail if Java 1.6 is installed

`JAVA_HOME` is set to Java 1.6 if installed, even if version 1.8 is also installed.

Cloudera Bug: OPSAPS-28888

Start should clearly indicate when it fails due to a missing parcel

Previously a missing parcel was logged only in the Agent log. The Cloudera Manager Admin Console now indicates that a required parcel is missing when starting a role or deploying client configurations.

Cloudera Bug: OPSAPS-25589

Client configuration deployment timeout set too large for large number of hosts

The deploy client configuration timeout value was set to according to the number of hosts. This caused a problem when there are large number of hosts. The tasks to deploy client configurations are run concurrently so there was no need to wait that long. The timeout value was changed to a fixed value.

Cloudera Bug: OPSAPS-29464

Two HBase metrics charts display "No Data"

HBase IPC metrics were not collected on CDH 5.4 and higher HBase due to a metric name change.

Cloudera Bug: OPSAPS-28171

Agent operating system detection logic fixed on updated Oracle Enterprise Linux 6.x

An Oracle Enterprise Linux 6.x update to its `python-libs` unexpectedly changed the output of the Agent's operating system detection logic, which caused problems with parcel distribution and other issues.

Cloudera Bug: OPSAPS-28193

ZooKeeper `jute.maxbuffer` emitted into configuration instead of JVM arguments

The ZooKeeper `jute.maxbuffer` property was emitted into `zoo.cfg` instead of in the JVM arguments. It is now passed to the JVM through the process environment variable `ZOOKEEPER_SERVER_OPTS` and takes effect correctly.

Cloudera Bug: OPSAPS-28244

High `-Xms` set for Hive clients

`-Xms` is set equal to `-Xmx` for all Hive clients which causes the Java runtime to reserve `-Xms` memory even if the client does not need it. This particularly affects machines with low resources. The `-Xms` setting has been removed so that the Java runtime does not assign `-Xmx` memory at the start. Instead, it starts with a much lower Java heap and increases it if needed.

Cloudera Bug: OPSAPS-28972

Service autoconfiguration set Kafka memory to 0

The Kafka service was initially configured with 0 memory because the autoconfiguration rules did not respect specified units. This is now correctly set to a value between 50 and 1024 MiB depending on available memory on the host. This issue affected any third-party CSD-based services using memory parameters with units other than "bytes".

Cloudera Bug: OPSAPS-27869

Topics with a period not reporting metrics

Topics with a period (".") in the name would not show metrics in Cloudera Manager.

Sensitive information in Cloudera Manager diagnostic support bundles

Cloudera Manager is designed to transmit certain diagnostic data (or "bundles") to Cloudera. These diagnostic bundles are used by the Cloudera support team to reproduce, debug, and address technical issues for our customers. Cloudera internally discovered a potential vulnerability in this feature, which could cause any sensitive data stored as "advanced configuration snippets (ACS)" (formerly called "safety valves") to be included in diagnostic bundles and transmitted to Cloudera. Notwithstanding any possible transmission, such sensitive data is not used by Cloudera for any purpose.

Cloudera has taken the following actions: (1) Modified Cloudera Manager so that it no longer transmits advanced configuration snippets containing the sensitive data, and (2) Modified Cloudera Manager TLS/SSL configuration to increase the protection level of the encrypted communication.

Cloudera strives to follow and also help establish best practices for the protection of customer information. In this effort, we continually review and improve our security practices, infrastructure, and data-handling policies.

Users affected:

- Users storing sensitive data in advanced configuration snippets

Impact: Possible transmission of sensitive data

CVE: CVE-2015-6495

Immediate Action Required:

- Upgrade Cloudera Manager to one of the following releases: Cloudera Manager 5.5.0, 5.4.6, 5.3.7, 5.2.7, 5.1.6, 5.0.7, 4.8.6

Cloudera Management Service can fail with a large Flume configuration file

When a Flume configuration file is large, calling its Kerberos credentials with regex can cause the Cloudera Management Service to time out and fail. In addition, the Cloudera Manager Server uses 100% of the CPU and the UI hangs.

Cloudera Bug: OPSAPS-29685

Charts built on simple select statements can return partial results

Charts built on queries in the form `<select metric>` for service or role metrics might not filter entities properly and might report hitting the stream limit.

Cloudera Bug: OPSAPS-28716

Issues Fixed in Cloudera Manager 5.4.10

Scheme and location not filled in consistently during Hive replication import

In previous releases, Hive replication import phase did not consistently fill in scheme and location information. This information is now filled in as expected.

Cloudera Bug: OPSAPS-31522

Having `hive.compute.query.using.stats` enabled by default produced incorrect results for some queries that used stats only

By default, `hive.compute.query.using.stats` was enabled. This produced incorrect results for some queries that used stats only. This setting is now disabled by default.

Cloudera Bug: OPSAPS-32332

YARN jobs fail after enabling Kerberos authentication or selecting Always Use Container Executor

After Kerberos security is enabled on a cluster or Always Use Container Executor is selected, YARN jobs failed. This occurred because the contents of any previously existing YARN User Cache directory could not be overridden after security was enabled. YARN jobs now complete as expected after a change in Kerberos security or usage of Container Executor.

Cloudera Bug: OPSAPS-32050

Scheduled diagnostic bundles do not include recent role logs

Diagnostic bundles collected manually included all expected logs, but bundles collected on a schedule did not include role logs. Scheduled diagnostic bundles now include all expected logs.

Cloudera Bug: OPSAPS-30787

Issues Fixed in Cloudera Manager 5.4.9

Apache Commons Collections deserialization vulnerability

Cloudera has learned of a potential security vulnerability in a third-party library called the [Apache Commons Collections](#). This library is used in products distributed and supported by Cloudera (“Cloudera Products”), including core Apache Hadoop. The Apache Commons Collections library is also in widespread use beyond the Hadoop ecosystem. At this time, no specific attack vector for this vulnerability has been identified as present in Cloudera Products.

In an abundance of caution, we are currently in the process of incorporating a version of the Apache Commons Collections library with a fix into the Cloudera Products. In most cases, this will require coordination with the projects in the Apache community. One example of this is tracked by [HADOOP-12577](#).

The Apache Commons Collections potential security vulnerability is titled “Arbitrary remote code execution with InvokerTransformer” and is tracked by [COLLECTIONS-580](#). MITRE has not issued a CVE, but related [CVE-2015-4852](#) has been filed for the vulnerability. CERT has issued [Vulnerability Note #576313](#) for this issue.

Releases affected: CDH 5.5.0, CDH 5.4.8 and lower, CDH 5.3.8 and lower, CDH 5.2.8 and lower, CDH 5.1.7 and lower, Cloudera Manager 5.5.0, Cloudera Manager 5.4.8 and lower, Cloudera Manager 5.3.8 and lower, and Cloudera Manager 5.2.8 and lower, Cloudera Manager 5.1.6 and lower, Cloudera Manager 5.0.7 and lower, Cloudera Navigator 2.4.0, Cloudera Navigator 2.3.8 and lower.

Users affected: All

Impact: This potential vulnerability may enable an attacker to execute arbitrary code from a remote machine without requiring authentication.

Immediate action required: Upgrade to Cloudera Manager 5.5.1 and CDH 5.5.1, Cloudera Manager 5.4.9 and CDH 5.4.9, Cloudera Manager 5.3.9 and CDH 5.3.9, and Cloudera Manager 5.2.9 and CDH 5.2.9, and Cloudera Manager 5.1.7 and CDH 5.1.7, and Cloudera Manager 5.0.8 and CDH 5.0.8.

Cross-site scripting vulnerability using malformed strings in the parcel remote URL list

An attacker could set a malformed string in parameters that consist of a list of strings and trigger the attack when a user accessed the corresponding configuration page in classic layout mode. This attack is now prevented.

Cloudera Bug: OPSAPS-30590

Cross-site scripting vulnerability using malformed host template name

An attacker could set a malformed host template name in the backend database and trigger the attack when a user applies the host template. This attack is now prevented.

Cloudera Bug: OPSAPS-30443

Snapshot policies with names with special characters not handled as expected

Snapshot policies with names containing special characters such as #, \$, ?, or % were not handled as expected. These snapshot policies were not consistently found because the special characters in their names were parsed incorrectly. Snapshot policies with names containing special characters are now handled as expected.

Cloudera Bug: OPSAPS-30426

Kafka MirrorMaker fails to find messages if ZooKeeper root directory is changed

When the ZooKeeper root directory is changed, the corresponding value in ZK_QUORUM that is passed to Kafka MirrorMaker processes is not updated. In that case, MirrorMaker fails to find messages. Changes to ZooKeeper root are now propagated properly, resulting in MirrorMaker finding messages.

Cloudera Bug: OPSAPS-30197

Updating the Hive NameNode location multiple times could lead to data corruption

Multiple updates to the Hive NameNode location could cause Hive metastore database corruption. Issuing the same command multiple times no longer produces problems.

Cloudera Manager 5 Release Notes

Cloudera Bug: OPSAPS-30155

Cloudera Manager monitors subject to excessive garbage-collection workload

The Cloudera Manager Service Monitor and Cloudera Manager Host Monitor wrote aggregate timeseries data in a way that resulted in significant garbage-collection workloads. Writes are now split based on metric threshold counts, resulting in lower garbage-collection loads.

Cloudera Bug: OPSAPS-30058

Kafka MirrorMaker fails to start because of missing settings

Kafka MirrorMaker provided no defaults for Destination Broker List, Topic Whitelist, and Topic Blacklist, and no way to set these values in the wizard. These values can now be set in the wizard when adding a new instance.

Cloudera Bug: OPSAPS-29415

Cloudera Manager dry-run replication history shows unexpected values

BDR replication in dry-run mode should show the number of files that would be copied and the number of bytes those files would comprise if the same job were executed without the dry-run option. Dry-run mode showed the number of replicable files accessed up to a maximum of 1024 files and showed the total number of bytes those files comprise, up to 512 bytes per file.

The results of dry-runs now show the actual number of source files and their composite bytes that would be covered in the replication schedule. These categories are labeled replicable files and replicable bytes.

Cloudera Bug: OPSAPS-30387

Issues Fixed in Cloudera Manager 5.4.8

Clusters can fail if Java 1.6 is installed

JAVA_HOME is set to Java 1.6 if installed even if 1.8 is also installed.

Cloudera Bug: OPSAPS-28888

OutOfMemory error when running HDFS replication

HDFS replication fails with an OutOfMemory exception (in `stderr.log`) when an HDFS replication job replicates a large number of files.

Cloudera Bug: OPSAPS-28858

Cloudera Management Service can fail with a large Flume configuration file

When a Flume configuration file is large, calling its Kerberos credentials with regex can cause the Cloudera Management Service to timeout and fail. In addition, the Cloudera Manager Server uses too much CPU (100%) and the UI hangs.

Cloudera Bug: OPSAPS-29685

Client configurations are incorrectly marked as stale when a host is rebooted

Rebooting a host can cause the client configurations for gateway roles on that host to be marked as stale even though they are actually up to date.

Cloudera Bug: OPSAPS-28568

Issues Fixed in Cloudera Manager 5.4.7

Operating system detection logic for Oracle Enterprise Linux 6 breaks parcel distribution

Fixes the operating system detection logic on updated Oracle Enterprise Linux 6 systems. An Oracle update to its python-libs logic unexpectedly changed the output of the Agent's operating system detection logic, which caused problems with parcel distribution and other issues.

Cloudera Bug: OPSAPS-28193

ZooKeeper `jute.maxbuffer` property emitted into the wrong file

The ZooKeeper `jute.maxbuffer` property is emitted into `zoo.cfg` instead of in the JVM arguments. It is now passed to the JVM through the process environment variable `ZOOKEEPER_SERVER_OPTS` and takes effect correctly.

Cloudera Bug: OPSAPS-28244

Create user API call is allowed for user with insufficient permissions

Using the "create a user" API call, a user who normally could not create users is able to create a read-only user account. The API call now respects the permissions.

Cloudera Bug: OPSAPS-27539

Spark Authentication property is propagated to the wrong client configuration

Beginning with Cloudera Manager 5.4.6, the **Spark Authentication** configuration property is correctly propagated to client configurations.

Cloudera Bug: OPSAPS-27912

Agent hostname in `config.ini` is changed to wrong value

Attempting to set the `listening_hostname` property in the Agent's `config.ini` file (which is not normally necessary) changes the Agent's host ID to use this hostname, instead of the normal value. The host ID is now left unchanged, as expected.

Cloudera Bug: OPSAPS-27991

Cloudera Manager monitors the incorrect process for DataNode

On Kerberized clusters, Cloudera Manager monitors the wrong process as the DataNode. That has been fixed. For customers using Kerberized HDFS, Cloudera Manager reports incorrect statistics in some areas (memory, file descriptor, CPU usage, I/O, and networking, but not HDFS statistics). There is a small impact to health monitoring because of this issue. For customers using the stacks collection feature on a Kerberized DataNode and where `jstack` collection was enabled, this issue kills the parent `jsvc` process of the DataNode and leaves the DataNode up, but causes Cloudera Manager to report the process as dead.

Cloudera Bug: OPSAPS-28677

Issues Fixed in Cloudera Manager 5.4.6

Sensitive Information in Cloudera Manager Diagnostic Support Bundles

Cloudera Manager is designed to transmit certain diagnostic data (or "bundles") to Cloudera. These diagnostic bundles are used by the Cloudera support team to reproduce, debug, and address technical issues for our customers. Cloudera internally discovered a potential vulnerability in this feature, which could cause any sensitive data stored as "advanced configuration snippets (ACS)" (formerly called "safety valves") to be included in diagnostic bundles and transmitted to Cloudera. Notwithstanding any possible transmission, such sensitive data is not used by Cloudera for any purpose.

Cloudera has taken the following actions: (1) modified Cloudera Manager so that it no longer transmits advanced configuration snippets containing the sensitive data, and (2) modified Cloudera Manager TLS/SSL configuration to increase the protection level of the encrypted communication.

Cloudera strives to follow and also help establish best practices for the protection of customer information. In this effort, we continually review and improve our security practices, infrastructure, and data handling policies.

Users affected:

- Users storing sensitive data in advanced configuration snippets

Impact: Possible transmission of sensitive data

CVE: CVE-2015-6495

Immediate Action Required:

- Upgrade Cloudera Manager to one of the following releases: Cloudera Manager 5.4.6, 5.3.7, 5.2.7, 5.1.6, 5.0.7, 4.8.6

Issues Fixed in Cloudera Manager 5.4.5

Cancel Impala Query attempts to connect via TLS/SSL despite TLS/SSL being disabled

In Impala queries, if you select Cancel for any query, you see a small "internal error" at the top of the query list. This occurs because an attempt to connect via TLS/SSL is performed even though Impala does not have TLS/SSL enabled.

Cloudera Bug: OPSAPS-27146;

Cloudera Manager displays a spurious validation warning about the Cloudera Management Service truststore

Cloudera Manager incorrectly warns that Cloudera Management Service daemons will use HTTPS for communication with either Cloudera Manager or CDH services, even if no Cloudera Management Service truststore is in use.

Cloudera Bug: OPSAPS-27473;

Aggregation of Work attributes

Cloudera Manager now correctly aggregates Work attributes such as YARN applications or Impala query duration.

Cloudera Bug: OPSAPS-26493

Hue Solr Indexer

Cloudera Manager now creates the correct configuration required to create a collection.

Cloudera Bug: OPSAPS-22975

Cloudera Manager incorrectly reports "Not finalized" status for rolling upgrade

When performing a rolling upgrade from a version of CDH lower than 5.4 to CDH 5.4, and the HDFS rolling upgrade is finalized, Cloudera Manager incorrectly reports the status as not finalized. This is an error in reporting only and does not affect HDFS functionality.

Cloudera Bug: OPSAPS-27379

Validation errors not visible from service-level configuration pages

Validation errors and warnings were only visible when accessing the individual instance-level configuration pages. This has been fixed.

Cloudera Bug: OPSAPS-27066

Add Role Instances wizard does not work when initialized using the Cloudera Manager search box

You can now start the Add Role Instances wizard by searching for "<service name> Add Role" in the Cloudera Manager Admin Console search box.

Cloudera Bug: OPSAPS-27604

Cloudera Manager now allows you to use '/' in cluster names

In previous versions, this resulted in problems during replication because '/' was treated as an URL path.

Cloudera Bug: OPSAPS-26138

Expose HBase multi-WAL configuration properties in Cloudera Manager

The properties were added and are now being written to the `hbase-site.xml` file.

Cloudera Bug: OPSAPS-27139

Custom Kerberos principals now handled correctly during Solr startup

The Solr custom Kerberos principal is now initialized properly during Solr server startup.

Cloudera Bug: OPSAPS-27320

Added a check in the Upgrade and Kerberos wizards to make sure Spark-standalone is not enabled

Spark Standalone does not work in clusters with Kerberos authentication. Spark on YARN supports Kerberos and is recommended over Spark Standalone. Either disable Kerberos or remove Spark Standalone before upgrading.

Cloudera Bug: OPSAPS-26151

Fixed link for Reports when YARN high availability is enabled

The Reports link in HA mode would result in a 404 error.

Cloudera Bug: OPSAPS-27089

Removed bogus failure when deploying client configuration

Deploying client configuration would sometimes fail because Cloudera Manager could not locate `JAVA_HOME`. This is not a valid failure because deploying client configuration does not require Java.

Cloudera Bug: OPSAPS-27650

Added `core-site.xml` to Sentry's classpath

Previously, `core-site.xml` was only added to Sentry's configuration folder, but not the classpath.

Cloudera Bug: OPSAPS-26617

Improved memory usage in serializing objects and writing them to support bundles

Performance improvements that require less memory were made for the creation of bundles.

Cloudera Bug: OPSAPS-27405

New property to enable suppressing INFO-level log messages from NameNode

You can now use the **NameNode Block State Change Logging Threshold** property to suppress INFO-level block state change log messages from the NameNode.

Cloudera Bug: OPSAPS-26437

Improved advice for clock offset health test

The way the health of the host's NTP daemon is determined was changed recently, which caused some cases where the related health test (host clock offset) failed without a warning. Information on this change was added to Cloudera Manager.

Cloudera Bug: OPSAPS-27278

Cloudera Manager displays warning about using RHEL 6 with Transparent Huge Pages (THP)

The THP algorithm was broken in certain variants of RHEL 6.2 and above. Cloudera Manager now displays a warning if THP is enabled for all RHEL 6 and above.

Cloudera Bug: OPSAPS-27035

Agent gets no logs if the last log4j event is larger than the max-size specified

If the `byte_limit` (`max-size`) specified by Cloudera Manager during log retrieval was smaller than the last log4j event to be collected, the Agent skipped the complete event and return nothing. This behavior was modified so pick the first N bytes (`N = max-size`) are picked from the log4j event and return a partial log4j event.

Cloudera Bug: OPSAPS-26406

Agent log retrieval does not always honor timeouts

Cloudera Manager Agents no longer enter an infinite loop during log retrieval.

Cloudera Bug: OPSAPS-26404

Cloudera Manager Agent missing log messages

The default timeout for displaying log entries (`./logs/search` and `./logs/context`) has been increased to 60 seconds.

Cloudera Bug: OPSAPS-27358

Fixed cross-site scripting vulnerability

A cross-site scripting vulnerability was discovered and fixed in Cloudera Manager.

Cloudera Bug: OPSAPS-27496

New property added for ResourceManager high availability failover

The ZooKeeper session timeout property `yarn.resourcemanager.zk-timeout-ms` was added, and its default value is 1 minute.

Cloudera Bug: OPSAPS-20852

Set maximum value for YARN `mapreduce.jobhistory.max-age-ms` to 10 years

Cloudera Manager would previously display a validation error when the value was greater than 60 days.

Cloudera Bug: OPSAPS-27182

Added warning in upgrade wizard regarding dropped support for symlinks in CDH 5

This fix added a warning about removing HDFS symlinks when upgrading from CDH 4 to CDH 5.

Cloudera Bug: OPSAPS-26665

Refresh Data Directories command no longer fails on secure clusters

The `DataNodeRefreshCommand` now sets `SCM_KERBEROS_PRINCIPAL` in the environment of the command process, which causes `hdfs.sh` to do a `kinit`. Before this change, a manual `kinit` was required.

Cloudera Bug: OPSAPS-27068

New Sentry Synchronization Path Prefixes added in NameNode configuration are not enforced correctly

Any new path prefixes added in the NameNode configuration are not correctly enforced by Sentry. The ACLs are initially set correctly, however they would be reset to the old default after some time interval.

Cloudera Bug: OPSAPS-26141

Workaround: Set the following property in **Sentry Service Advanced Configuration Snippet (Safety Valve)** and **Hive Metastore Server Advanced Configuration Snippet (Safety Valve)** for `hive-site.xml`:

```
<property>
<name>sentry.hdfs.integration.path.prefixes</name>
<value>/user/hive/warehouse, ADDITIONAL_DATA_PATHS</value>
</property>
```

where `ADDITIONAL_DATA_PATHS` is a comma-separated list of HDFS paths where Hive data will be stored. The value should be the same value as `sentry.authorization-provider.hdfs-path-prefixes` set in the `hdfs-site.xml` on the NameNode.

Fixed NullPointerException on health tests' Details page

The health tests **Details** page threw a NullPointerException because it was referring to a deprecated metric name.

Cloudera Bug: OPSAPS-27065

Improved Service Monitor Canary check to see if HTable is disabled

Without this check, Service Monitor would fail due to too many ZooKeeper connection messages leaking into the Service Monitor log. This resulted in resource and allocation pressures on the Service Monitor.

Cloudera Bug: OPSAPS-27318

Cloudera Manager no longer retains unnecessary references to HTables

Retaining too many unnecessary references to HTable was using up too much memory, especially when working with a large number of tables.

Cloudera Bug: OPSAPS-27319

Sqoop 2 failure in Kerberized clusters fixed

Cloudera Manager was using the wrong authentication package and picking up the wrong configuration properties for Sqoop 2 authentication with Kerberos.

Cloudera Bug: OPSAPS-27297

Fixed Solr server startup error

The Solr server would not start due to insufficient space for the shared memory file.

Cloudera Bug: OPSAPS-27158

Added HBase Canary security configuration properties

Enabling the HBase canary on a secure cluster would fail. The new properties now let Cloudera Manager specify the canary's Kerberos principal and keytab in the `hbase-site.xml` deployed at the RegionServers.

Cloudera Bug: OPSAPS-26468

Issues Fixed in Cloudera Manager 5.4.3

Improve Impala queries coordinator node metrics handling

For Impala queries that returned very few rows, Cloudera Manager could fail to report information such as HDFS I/O metrics on the **Impala Query Monitoring** and **Query Detail** pages. The discrepancy was typically relatively small because those queries often did very little work.

Cloudera Bug: OPSAPS-26531, OPSAPS-26533

Performance issues when changing configurations on HDFS

Fixed a performance issue where HDFS configuration pages responded slowly.

Cloudera Bug: OPSAPS-27171

Typo in Cloudera Manager metrics reference

The word "Concerning" was misspelled in many metrics reference pages.

Cloudera Bug: OPSAPS-26957

Issues with Navigator field `audit_log_max_file_size`

The log4j appender changed from `RollingFileAppender` to `RollingFileWithoutDeleteAppender`.

Cloudera Bug: OPSAPS-26978

Cloudera Manager 5 Release Notes

The Isilon client configuration `core-site.xml` file does not contain proxy users

The parameters are available in the Cloudera Manager Admin Console, but the configurations are not emitted in the `core-site.xml` file.

Cloudera bug: OPSAPS-26816

Solr gateway role should not have a `log4j.properties` advanced configuration snippet

The Solr gateway role does not have a `log4j.properties` file.

Cloudera bug: OPSAPS-26858

The Cloudera Manager Agent `force_start`'s hard stop commands did not set all invariants

This resulted in NPE being reported in Cloudera Manager logs when accessing active and recent command operations.

Cloudera bug: OPSAPS-26864

Configuration staleness icons appear to be enabled for users in read-only role

When moused over, the icons change to a hand indicating that they are active. However, users in the read-only role cannot act on changed configurations.

Cloudera bug: OPSAPS-26897

Setting `yarn.resourcemanager.am.max-retries` throws error

Observed when setting the Maximum Number of Attempts for MapReduce Jobs and then setting ApplicationMaster Maximum Attempts, which also sets `yarn.resourcemanager.am.max-retries`.

Cloudera bug: OPSAPS-26936

Cloudera Manager reports the wrong value for Impala bytes read from cache

Instead of cached bytes it reported the value of short circuit bytes.

Cloudera bug: OPSAPS-26938

Fixed cross-site scripting vulnerabilities

A variety of possible cross-site scripting vulnerabilities have been fixed.

Cloudera bugs: OPSAPS-26765, OPSAPS-26798, OPSAPS-26835, OPSAPS-26836, OPSAPS-26878, OPSAPS-26880, OPSAPS-25959

Location of Number of rows drop-down changed

On pages where multiple rows display, the drop-down menu where users select the number of rows to display on a page now appears at the bottom of all lists.

Cloudera bug: OPSAPS-26956

Minimum allowed value change for YARN property

The **Max Shuffle Connections** property now allows a value of 0, which indicates no limit on the number of connections.

Cloudera bug: OPSAPS-26953

Upgrade error

A bug was fixed that prevented upgrades from CDH 4.7.1 to CDH 5.4.3.

Cloudera bug: OPSAPS-27119

Change to Parcels page

On the Parcels page, the first cluster in the list is now automatically selected by default.

Cloudera bug: OPSAPS-27045

All Password Input Fields do not allow auto complete

All password input fields in Cloudera Manager do not allow auto complete.

Cloudera bug: OPSAPS-26927

TLS Keystore Configuration Error

It is no longer possible to delete the values of the **Path to TLS Keystore File** and **Keystore Password** properties and save them while the **Use TLS Encryption for Admin Console** property is enabled.

Cloudera bug: OPSAPS-26888

Host configuration properties and Agent restart messages

Some host configuration properties no longer incorrectly state that an Agent restart is required.

Cloudera bug: OPSAPS-26808

More detailed error messages for failed role migration

If there is a failure validating the NameNode or JournalNode data directories while migrating roles, Cloudera Manager now displays detailed error information, including error codes.

Cloudera bug: OPSAPS-26803

New property to configure Oozie shared library upload timeout

To prevent timeouts due to slow disks or networks, a new Oozie property, **Oozie Upload ShareLib Command Timeout**, has been added to set the timeout.

Cloudera bug: OPSAPS-26782

New Cluster-Wide Configuration Pages

The following new Cluster-Wide configuration pages have been added:

- Databases
- Local Data Directories
- Local Data Files
- Navigator Settings
- Service Dependencies

To access these pages in Cloudera Manager, select **Cluster > Cluster Name > Configuration**.

Cloudera bug: OPSAPS-26730

Naming of Health Tests

The names of some Health Tests have changed to use consistent capitalization.

Cloudera bug: OPSAPS-26690

Impala Monitoring Queries for Per-node peak memory

Impala queries that report per-node peak memory were incorrect when the value is zero.

Cloudera bug: OPSAPS-26721

Enable Hive on Spark Property

The description of the **Enable Hive on Spark** property has been updated to remind the user that the **Enable Spark on YARN** property must also be selected.

Cloudera bug: OPSAPS-26560

Cloudera Manager 5 Release Notes

Role Trigger property in Flume

Setting a value for the Flume **Role Triggers** property no longer causes validation warnings.

Cloudera bug: OPSAPS-26743

Restart of Service Monitor leaves files that can fill the disk

Restarts of the Service Monitor no longer leave extraneous copies of files that unnecessarily take up disk space.

Cloudera bug: OPSAPS-26660

HiveServer 2 properties omit Java options

Setting any of the following properties no longer causes Java options to be omitted:

- **Allow URIs in Database Policy File**
- **HiveServer2 TLS/SSL Certificate Trust Store File**
- **HiveServer2 TLS/SSL Certificate Trust Store Password**

Cloudera bug: OPSAPS-26657

CDH Parcel distribution reports HTTP 503 errors

Cloudera Manager no longer displays HTTP 503 errors during distribution of the CDH parcel to a large cluster.

Cloudera bug: OPSAPS-26627

Diagnostic bundle reports incorrect status for SELinux

Diagnostic bundles sometimes reported SELinux as disabled when it was enabled. The bundle now reports the correct status.

Cloudera bug: OPSAPS-26608

Hue configuration warnings do not link to correct page

On the Cloudera Manager page that displays Hue configuration issues, the links now take the user to the correct page where the user can correct the configuration.

Cloudera bug: OPSAPS-26600

Date display in Cloudera Manager log viewer

The month and date have been added before the time value in logs displayed in Cloudera Manager.

Cloudera bug: OPSAPS-26599

Disabling Hive Metastore Canary Test

When you disable the Hive Metastore health test by deselecting the **Hive Metastore Canary Health** property, the Hive Canary is now also disabled.

Cloudera bug: OPSAPS-26588

Agent failure when TLS 1.0 is disabled

If TLS 1.0 is disabled, the Agent now tries to negotiate the connection using TLS 1.1 or TLS 1.2.

Cloudera bug: OPSAPS-26584

Slowness when displaying details of a stale configuration

The details page now displays more quickly when a user clicks on the Stale Configuration icon.

Cloudera bug: OPSAPS-26537

Slowness observed when accessing replication page in Cloudera Manager

When you access the replication page in Cloudera Manager, the page responds slowly due to a large number of replication history records. The number of displayed historical records has been changed from 100 to 20.

Cloudera Bug: OPSAPS-26529;

Log Searches for Cloudera Manager Server

Searching the Cloudera Manager Server logs now works as expected.

Cloudera bug: OPSAPS-26470

Failed TLS Configuration and Cloudera Manager Restart

If the TLS configuration has errors, Cloudera Manager now falls back to non-TLS operation when restarting.

Cloudera bug: OPSAPS-27104

New headers added

New headers have been added to Cloudera Manager HTTP response headers to protect against vulnerabilities.

Cloudera bug: OPSAPS-25847

Hive Logging property restored

The `Enable Explain Logging (hive.log.explain.output)` property was removed in an earlier release and is now included in the configurations.

Cloudera bug: OPSAPS-25857

Hive Metastore Update NameNodes Command

A 150 second timeout was removed from the Update Hive Metastore NameNodes command to prevent timeouts on deployments that use Hive extensively.

Cloudera bug: OPSAPS-26056

Kafka Parcel Installation

Cloudera Manager now correctly detects the Kafka version for parcel installation.

Cloudera bug: OPSAPS-26071

Agent restart failure

In a condition where an Agent restart was required due to a Hive configuration change and a subsequent disk failure, the Agent now restarts as expected.

Cloudera bug: OPSAPS-26172

Error message wording

Some Cloudera Manager error messages referred to Cloudera Manager as "CM". These messages now use the full name "Cloudera Manager".

Cloudera bug: OPSAPS-26191

Oozie metrics failures

Retrieval of Oozie metrics sometimes fails due to timeout issues which are now resolved.

Cloudera bug: OPSAPS-26242

NameNode Role Migration Failures

When a NameNode role migration fails due to the destination role data directories being non-empty or having incorrect permissions, you no longer need to complete the migration manually. An error message displays and you can now correct the problem and re-run the command.

Cloudera bug: OPSAPS-26265

AWS S3 HBase configuration property renamed to Amazon S3

Several configuration properties for HBase have been renamed from AWS S3 to Amazon S3, in order to use the correct product name.

Cloudera bug: OPSAPS-23343

NodeManager Host Resources page display for the NodeManager Recovery Directory

The NodeManager Recovery Directory now displays on the NodeManager host resources page.

Cloudera bug: OPSAPS-23916

Host Inspector page now includes link to Show Inspector Results

The Host Inspector page now displays a link to a page that displays detailed results.

Cloudera bug: OPSAPS-24642

Initialization Script Improvements

The Cloudera Manager Agent initialization script now checks correctly for running processes.

Cloudera bug: OPSAPS-24941

Default Value for Hue parameter changed

The default value for the Hue `cherry_server_threads` property has been changed from 10 to 50.

Cloudera bug: OPSAPS-25030

Express Installation Wizard Package Installation Page CDH Version

The Express Installation Wizard Package installation page no longer allows the user to proceed without selecting a CDH version.

Cloudera bug: OPSAPS-25722

Host Component page display

The Host Component page now displays the package version for the KMS Trustee Key Provider.

Cloudera bug: OPSAPS-25692

Installation Wizard hangs during package installation

The Installation Wizard hangs during a CDH package installation and the status displays as "Acquiring Installation Lock". A bug was fixed where the Agent incorrectly failed to release a lock until the Agent is restarted.

Cloudera bug: OPSAPS-22894

Minimum allocation violation not caught by Cloudera Manager

NodeManager did not start because Cloudera Manager did not correctly validate memory and CPU settings against their minimum values.

Cloudera bug: OPSAPS-17157

Impala core dump directories are now configurable

Three new properties that specify the location of core dump directories have been added to the Impala configurations:

- Catalog Server Core Dump Directory
- Impala Daemon Core Dump Directory
- StateStore Core Dump Directory

Cloudera bug: OPSAPS-21743

Typo in Sqoop DB path suffix (SqoopParams.DERBY_SUFFIX)

Sqoop 2 appears to lose data when upgrading to CDH 5.4. This is due to Cloudera Manager erroneously configuring the Derby path with "reposito" instead of "repository". The correct path name is now used.

Cloudera Bug: OPSAPS-26649.

Agent fails when retrieving log files with very long messages

When searching or retrieving large log files using the Agent, the Agent no longer consumes near 100% CPU until it is restarted. This can also happen then the collect host statistics command is issued.

Cloudera bug: OPSAPS-25854

Automated Solr TLS/SSL configuration may fail silently

Cloudera Manager 5.4.1 offers simplified TLS/SSL configuration for Solr. This process uses a `solrctl` command to configure the `urlSchemeSolr` cluster property. The `solrctl` command produces the same results as the Solr REST API call `/solr/admin/collections?action=CLUSTERPROP&name=urlScheme&val=https`. For example, the call might appear as:

```
https://example.com:8983/solr/admin/collections?action=CLUSTERPROP&name=urlScheme&val=https
```

Cloudera Manager automatically executes this command during Solr service startup. If this command fails, the Solr service startup now reports an error.

Cloudera Bug: OPSAPS-26563

Removing the default value of a property fails

For example, when you access the **Automatically Downloaded Parcels** property on the following page: **Home > Administration > Settings** and remove the default `CDH` value, the following error message displays: "Could not find config to delete with template name: `parcel_autodownload_products`". This error has been fixed.

Cloudera bug: OPSAPS-26591

Issues Fixed in Cloudera Manager 5.4.1

distcp default configuration memory settings overwrite MapReduce settings

Replication used for backup and disaster recovery does not correctly set the MapReduce Java options, and you cannot configure them. In release 5.4.1, Cloudera Manager uses the MapReduce gateway configuration to determine the Java options for replication jobs. Replication job settings cannot be configured independently of MapReduce gateway configuration. See [Backup and disaster recovery replication does not set MapReduce Java options](#) on page 2541.

Oozie high availability plug-in is now configured by Cloudera Manager

In CDH 5.4.0, Oozie added a new HA plugin that allows all of the Oozie servers to synchronize their Job ID assignments and prevent collisions. Cloudera Manager 5.4.0 did not configure this new plugin; Cloudera Manager 5.4.1 now does so.

Cloudera Bug: OPSAPS-25778

HDFS read throughput Impala query monitoring property is misleading

The `hbase_bytes_read_per_second` and `hdfs_bytes_read_per_second` Impala query properties have been renamed to `hbase_scanner_average_bytes_read_per_second` and `hdfs_scanner_average_bytes_read_per_second` to more accurately reflect that these properties return the average throughput of the query's HBase and HDFS scanner threads, respectively. The previous names and descriptions indicated that these properties were the query's total HBase and HDFS throughput, which was not accurate.

Cloudera Bug: OPSAPS-26140

Enabling wildcarding in a secure environment causes NameNode to fail to start

In a secure cluster, if you use a wildcard for the NameNode's RPC or HTTP bind address, the NameNode fails to start. For example, `dfs.namenode.http-address` must be a real, routable address and port, not `0.0.0.0.port`. In Cloudera Manager, the "Bind NameNode to Wildcard Address" property must not be enabled. This should affect you only if you are running a secure cluster and your NameNode needs to bind to multiple local addresses.

Cloudera Bug: CDH-9991, OPSAPS-14577

Bug: HDFS-4448

Workaround: Disable the "Bind NameNode to Wildcard Address" property found on the Configuration tab for the NameNode role group.

Support for adding Hue with high availability

The Express and Add Service wizards now allow users to define multiple Hue service roles. If Kerberos is enabled, a co-located KT Renewer role is automatically added for each Hue server row.

Cloudera Bug: OPSAPS-21639

Parameter validation fails with more than one Hue role

When you add a second Hue role to a cluster, the error message "Failed parameter validation" displays.

Cloudera Bug: OPSAPS-25336

Cross-site scripting vulnerabilities

Various cross-site scripting vulnerabilities were fixed.

Cloudera Bug: OPSAPS-25809

Clicking the "Revert to default" icon stores the default value as a user-defined value in the new configuration pages

Cloudera Manager 5.4.1 fixes an issue in which saving an empty configuration value causes the value to be replaced by the default value. The empty value is now saved instead of the default value.

Cloudera Bug: OPSAPS-26340

Spurious validation warning and missing validations when multiple Hue Server roles are present

When multiple Hue Server roles are created for a single Hue Service, Cloudera Manager displays a spurious validation warning for Hue with the label "Failed parameter validation." The Cloudera Manager Server log may also contain exception messages of the form:

```
2015-03-30 17:15:45,077 WARN
ActionablesProvider-0:com.cloudera.cmf.service.ServiceModelValidatorImpl:
Parameter validation failed java.lang.IllegalArgumentException: There is more than one
role with roletype: HUE_SERVER [...] {
```

These messages do not correspond to actual validation warnings and can be ignored. However, some validations normally performed are skipped when this spurious warning is generated, and should be done manually. Specifically, if Hue's authentication mechanism is set to LDAP, the following configuration should be validated:

1. The Hue **LDAP URL** property must be set.

2. For CDH 4.4 and lower, set one (but not both) of the following two Hue properties: **NT Domain** or **LDAP Username Pattern**.
3. For CDH 4.5 and higher, if the Hue property **Use Search Bind Authentication** is selected, exactly one of the two Hue properties **NT Domain** and **LDAP Username Pattern** must be set, as described in step 2 above.

Cloudera Bug: OPSAPS-25336

Logging of command unavailable message improved

When a command is unavailable, the error messages are now more descriptive.

Cloudera Bug: OPSAPS-26384

Client configuration logs no longer deleted by the Agent

If the Agent fails to deploy a new client configuration, the client log file is no longer deleted by the agent. The Agent saves the log file and appends new log entries to the saved log file.

Cloudera Bug: OPSAPS-26148

HDFS role migration requires certain HDFS roles to be running

Before using the Migrate Roles wizard to migrate HDFS roles, you must ensure that the following HDFS roles are running as described:

- A majority of the JournalNodes in the JournalNode quorum must be running. With a quorum size of three JournalNodes, for example, at least two JournalNodes must be running. The JournalNode on the source host need not be running, as long as a majority of all JournalNodes are running.
- When migrating a NameNode and co-located Failover Controller, the other Failover Controller (that is, the one that is not on the source host) must be running. This is true whether or not a co-located JournalNode is being migrated as well, in addition to the NameNode and Failover Controller.
- When migrating a JournalNode by itself, at least one NameNode / Failover Controller co-located pair must be running.

Cloudera Bug: OPSAPS-25870, OPSAPS-25878

HDFS role migration requires automatic failover to be enabled

Migration of HDFS NameNode, JournalNode, and Failover Controller roles through the Migrate Roles wizard is only supported when HDFS automatic failover is enabled. Otherwise, it causes a state in which both NameNodes are in standby mode.

Cloudera Bug: OPSAPS-25806, OPSAPS-25822

HDFS/Hive replication fails when replicating to target cluster that runs CDH 4 and has Kerberos enabled

Cloudera Bug: OPSAPS-25945

Workaround: None.

Issues Fixed in Cloudera Manager 5.4.0

Proxy Configuration in Single User Mode is Fixed

In single user mode, all services are using the same user to proxy other users in an unsecure cluster, which is the user that is running all the CDH processes on the cluster. To restrict that user so that it can proxy other users from only certain hosts and only certain groups, configure the **YARN Proxy User Hosts** and **YARN Proxy User Groups** properties in the HDFS service. The setting here supersedes all other proxy user configurations in single user mode.

Cloudera Bug: OPSAPS-25518

The Parcels page allows access to the patch release notes

Clicking the icon with an "i" in a blue circle next to a parcel shows the release notes.

Cloudera Bug: OPSAPS-25481

Monitoring Fails on Impala Catalog Server with TLS/SSL Enabled

When enabling TLS/SSL for Impala web servers (`webserver_certificate_file`), Cloudera Manager does not emit `use_ssl` in the `cloudera-monitor.properties` file for the Catalog Server. Other services (Impala Daemon and StateStore) are configured correctly. This causes monitoring to fail for the Catalog Server even though it is working as expected.

Cloudera Bug: OPSAPS-25469

Default Value Changed for `hive.exec.reducers.bytes.per.reducer`

To improve performance, the default value for the `hive.exec.reducers.bytes.per.reducer` property has been changed from 1 GB to 64 MB. If this value has been customized, the customized value is retained during an upgrade. If the old default of 1 GB was not changed, the value will be updated to 64MB during an upgrade.

Cloudera Bug: OPSAPS-24883

Issues Fixed in Cloudera Manager 5.3.10

Scheme and location not filled in consistently during Hive replication import

In previous releases, Hive replication import phase did not consistently fill in scheme and location information. This information is now filled in as expected.

Cloudera Bug: OPSAPS-31522

YARN jobs fail after enabling Kerberos authentication or selecting Always Use Container Executor

After Kerberos security is enabled on a cluster or Always Use Container Executor is selected, YARN jobs failed. This occurred because the contents of any previously existing YARN User Cache directory could not be overridden after security was enabled. YARN jobs now complete as expected after a change in Kerberos security or usage of Container Executor.

Cloudera Bug: OPSAPS-32050

Issues Fixed in Cloudera Manager 5.3.9

Apache Commons Collections deserialization vulnerability

Cloudera has learned of a potential security vulnerability in a third-party library called the [Apache Commons Collections](#). This library is used in products distributed and supported by Cloudera (“Cloudera Products”), including core Apache Hadoop. The Apache Commons Collections library is also in widespread use beyond the Hadoop ecosystem. At this time, no specific attack vector for this vulnerability has been identified as present in Cloudera Products.

In an abundance of caution, we are currently in the process of incorporating a version of the Apache Commons Collections library with a fix into the Cloudera Products. In most cases, this will require coordination with the projects in the Apache community. One example of this is tracked by [HADOOP-12577](#).

The Apache Commons Collections potential security vulnerability is titled “Arbitrary remote code execution with InvokerTransformer” and is tracked by [COLLECTIONS-580](#). MITRE has not issued a CVE, but related [CVE-2015-4852](#) has been filed for the vulnerability. CERT has issued [Vulnerability Note #576313](#) for this issue.

Releases affected: CDH 5.5.0, CDH 5.4.8 and lower, CDH 5.3.8 and lower, CDH 5.2.8 and lower, CDH 5.1.7 and lower, Cloudera Manager 5.5.0, Cloudera Manager 5.4.8 and lower, Cloudera Manager 5.3.8 and lower, and Cloudera Manager 5.2.8 and lower, Cloudera Manager 5.1.6 and lower, Cloudera Manager 5.0.7 and lower, Cloudera Navigator 2.4.0, Cloudera Navigator 2.3.8 and lower.

Users affected: All

Impact: This potential vulnerability may enable an attacker to execute arbitrary code from a remote machine without requiring authentication.

Immediate action required: Upgrade to Cloudera Manager 5.5.1 and CDH 5.5.1, Cloudera Manager 5.4.9 and CDH 5.4.9, Cloudera Manager 5.3.9 and CDH 5.3.9, and Cloudera Manager 5.2.9 and CDH 5.2.9, and Cloudera Manager 5.1.7 and CDH 5.1.7, and Cloudera Manager 5.0.8 and CDH 5.0.8.

Cloudera Manager monitors subject to excessive garbage-collection workload

The Cloudera Manager Service Monitor and Cloudera Manager Host Monitor wrote aggregate timeseries data in a way that resulted in significant garbage-collection workloads. Writes are now split based on metric threshold counts, resulting in lower garbage-collection loads.

Cloudera Bug: OPSAPS-30058

Cloudera Manager dry-run replication history shows unexpected values

BDR replication in dry-run mode should show the number of files that would be copied and the number of bytes those files would comprise if the same job were executed without the dry-run option. Dry-run mode showed the number of replicable files accessed up to a maximum of 1024 files and showed the total number of bytes those files comprise, up to 512 bytes per file.

The results of dry-runs now show the actual number of source files and their composite bytes that would be covered in the replication schedule. These categories are labeled replicable files and replicable bytes.

Cloudera Bug: OPSAPS-30387

Updating the Hive NameNode location multiple times could lead to data corruption

Multiple updates to the Hive NameNode location could cause Hive metastore database corruption. Issuing the same command multiple times no longer produces problems.

Cloudera Bug: OPSAPS-30155

Issues Fixed in Cloudera Manager 5.3.8

Rolling Restart fails when inheriting inappropriate JVM properties

Rolling Restart inherits custom HBase RegionServer JVM properties and can fail when those properties are inappropriate for non-daemon JVMs.

Cloudera Bug: OPSAPS-28353

Exception thrown when viewing host configuration change

When ConfigContext is initialized to both cluster and host, it defaults to cluster. If the context is a host, this can cause the ConfigTableUtil class to throw an IllegalStateException.

Cloudera Bug: OPSAPS-28795

Issues Fixed in Cloudera Manager 5.3.7

Sensitive Information in Cloudera Manager Diagnostic Support Bundles

Cloudera Manager is designed to transmit certain diagnostic data (or “bundles”) to Cloudera. These diagnostic bundles are used by the Cloudera support team to reproduce, debug, and address technical issues for our customers. Cloudera internally discovered a potential vulnerability in this feature, which could cause any sensitive data stored as “advanced configuration snippets (ACS)” (formerly called “safety valves”) to be included in diagnostic bundles and transmitted to Cloudera. Notwithstanding any possible transmission, such sensitive data is not used by Cloudera for any purpose.

Cloudera has taken the following actions: (1) modified Cloudera Manager so that it no longer transmits advanced configuration snippets containing the sensitive data, and (2) modified Cloudera Manager TLS/SSL configuration to increase the protection level of the encrypted communication.

Cloudera strives to follow and also help establish best practices for the protection of customer information. In this effort, we continually review and improve our security practices, infrastructure, and data handling policies.

Users affected:

- Users storing sensitive data in advanced configuration snippets

Severity: High

Impact: Possible transmission of sensitive data

CVE: CVE-2015-6495

Immediate Action Required:

- Upgrade Cloudera Manager to one of the following releases: Cloudera Manager 5.4.6, 5.3.7, 5.2.7, 5.1.6, 5.0.7, 4.8.6

Issues Fixed in Cloudera Manager 5.3.6

[Cloudera Manager reports the wrong value for Impala bytes read from cache](#)

Instead of cached bytes, it reported the value of short-circuit bytes.

Cloudera Bug: OPSAPS-26938

[Cancel Impala Query attempts to connect via TLS/SSL despite TLS/SSL being disabled](#)

In Impala queries, if you select Cancel for any query, you get a small "internal error" at the top of the query list. This is because an attempt to connect via TLS/SSL is done even though Impala does not have TLS/SSL enabled.

Cloudera Bug: OPSAPS-27146

[The Cloudera Manager displays a spurious validation warning about the Cloudera Management Service truststore](#)

Cloudera Manager incorrectly warns that Cloudera Management Service daemons will use HTTPS for communication with either Cloudera Manager or CDH services even if no Cloudera Management Service truststore is in use.

Cloudera Bug: OPSAPS-27473

Issues Fixed in Cloudera Manager 5.3.4

[Slowness observed when accessing replication page in Cloudera Manager](#)

When you access the replication page in Cloudera Manager, the page responds slowly due to a large number of replication history records. The number of displayed historical records has been changed from 100 to 20.

Cloudera Bug: OPSAPS-26529

[Cloudera Manager overwrites the krb5.conf file after disabling management by Cloudera Manager](#)

When a cluster has been configured to enable Kerberos by clicking the **Manage krb5.conf through Cloudera Manager** button, Cloudera Manager writes out a `krb5.conf` file. If a user subsequently disables this feature by disabling the **Manage krb5.conf through Cloudera Manager** option and then restarting Cloudera Manager and the Agent, Cloudera Manager overwrites the existing `krb5.conf` file.

Cloudera Bug: OPSAPS-25282

[Header injection vulnerability in internal logging call](#)

An internal call to a servlet with a malformed logger name created information that could be used in a cross-site scripting attack.

Cloudera Bug: OPSAPS-26487

[Graph for "Total Containers Running Across NodeManagers" displays high values](#)

The graph **Total Containers Running Across NodeManagers**, which displays on the YARN status page, displayed incorrect high values.

Cloudera Bug: OPSAPS-26247

Clicking the "Revert to default" icon stores the default value as a user-defined value in the new configuration pages

Saving an empty configuration value causes the value to be replaced by the default value. The empty value is now saved instead of the default value.

Cloudera Bug: OPSAPS-26340

Some Operational Reports do not return results

The following reports do not return results:

- Overpopulated Directories
- Large Directories
- Custom Reports where the **Replication** parameter is set to 0.

Cloudera Bug: OPSAPS-26178

Xalan has been upgraded to version 2.7.2

To address a vulnerability identified by [CVE-2014-0107](#), Xalan has been updated to version 2.7.2.

Cloudera Bug: OPSAPS-26408

Setting threshold values of -1 or -2 not accepted in new configuration layout pages

When you set threshold values in various properties, you could not select **Specify** and then enter -1 to indicate "Any" or -2 to indicate "Never". You can now enter -1 or -2.

Cloudera Bug: OPSAPS-26066

Rolling upgrade arguments are reversed

The following arguments for rolling upgrade are reversed:

- Sleep seconds
- Failure threshold

Cloudera Bug: OPSAPS-26158

Issues Fixed in Cloudera Manager 5.3.3

hive.metastore.client.socket.timeout default value changed to 60

The default value of the **hive.metastore.client.socket.timeout** property has changed to 60 seconds.

Cloudera Bug: OPSAPS-25270

TLS/SSL Enablement property name changes

The property **hadoop.ssl.enabled** is deprecated. Cloudera Manager has been updated to use either **dfs.http.policy** or **yarn.http.policy** properties instead.

Cloudera Bug: OPSAPS-24985

Changing the Service Monitor Client Config Overrides property requires restart

Cloudera Manager no longer requires you to restart your cluster after changing the **Service Monitor Client Config Overrides** property for a service.

Cloudera Bug: OPSAPS-25272

Cluster name changed from specified name to "cluster" after upgrade

After updating to a new release, Cloudera Manager replaces the specified cluster name with `cluster`. Cloudera Manager now uses the correct cluster name.

Cloudera Manager 5 Release Notes

Cloudera Bug: OPSAPS-25279

Configuration without `host_id` in upgrade DDL causes upgrade problems

A client configuration row in the database DDL did not set `host_id`, causing upgrade problems. Cloudera Manager now catches this condition before upgrading.

Cloudera Bug: OPSAPS-25321

`hive.log.explain.output` property is hidden

The property `hive.log.explain.output` is known to create instability of Cloudera Manager Agents in some specific circumstances, especially when the hive queries generate extremely large EXPLAIN outputs. Therefore, the property has been hidden from the Cloudera Manager configuration screens. You can still configure the property through the use of advanced configuration snippets.

Cloudera Bug: OPSAPS-25852

Slow staleness calculation can lead to ZooKeeper data loss when new servers are added

In Cloudera Manager 5.x, starting new ZooKeeper Servers shortly after adding them can cause ZooKeeper data loss when the number of new servers exceeds the number of old servers.

Cloudera Bug: OPSAPS-25966

Spark and Spark (standalone) services fail to start if you upgrade to CDH 5.2.x parcels from an older CDH package

Spark and Spark standalone services fail to start if you upgrade to CDH 5.2.x parcels from an older CDH package.

Workaround: After upgrading rest of the services, uninstall the old CDH packages, and then start the Spark service.

Cloudera Bug: OPSAPS-24005

Deploy client configuration across cluster after upgrade from Cloudera Manager 4.x to 5.3

Following a 4.x -> 5.3 upgrade, you must deploy client configuration across the entire cluster before deleting any gateway roles, any services, or any hosts. Otherwise the existing 4.x client configurations may be left registered and orphaned on the hosts where they were deployed, requiring you to manually intervene to delete them.

Cloudera Bug: OPSAPS-24279

Oozie health bad when Oozie is HA, cluster is kerberized, and Cloudera Manager and CDH are upgraded

Oozie health will go bad if high availability is enabled in a kerberized cluster with Cloudera Manager 5.0 and CDH 5.0 and Cloudera Manager and CDH are then upgraded to 5.1 or higher.

Cloudera Bug: OPSAPS-23872

Workaround: Disable Oozie HA and then re-enable HA again.

HDFS/Hive replication fails when replicating to target cluster that runs CDH 4.0 and has Kerberos enabled

Cloudera Bug: OPSAPS-25945

Workaround: None.

Issues Fixed in Cloudera Manager 5.3.2

The Review Changes page sometimes hangs

The **Review Changes** page hangs due to the inability to handle the "File missing" scenario.

Cloudera Bug: OPSAPS-24872

High volume of TGT events against AD server with "bad token" messages

A fix has been made to how Kerberos credential caching is handled by management services, resulting in a reduction in the number of Kerberos Ticket Granting Ticket (TGT) requests from the cluster to a KDC. This would have been noticed as "Bad Token" messages being seen in high volume in KDC logging and unnecessarily causing re-authentication by management services.

Cloudera Bug: OPSAPS-24800

Accumulo missing `kinit` when running with Kerberos

Cloudera Manager is unable to run Accumulo when `hostname` command does not return FQDN of hosts.

Cloudera Bug: OPSAPS-24792

HiveServer2 leaks threads when using impersonation

For CDH 5.3 and higher, Cloudera Manager will configure HiveServer2 to use the HDFS cache even when impersonation is on. For earlier CDH, there were bugs with the cache when impersonation was in use, so it is still disabled.

Cloudera Bug: OPSAPS-24751

Deploying client configurations fails if there are dead hosts present in the cluster

If there are hosts in the cluster where the Cloudera Manager agent heartbeat is not working, then deploying client configurations does not work. Starting with Cloudera Manager 5.3.2, such hosts are ignored while deploying client configurations. When the issues with the host are fixed, Cloudera Manager will show those hosts as having stale client configurations, at which point you can redeploy them.

Cloudera Bug: OPSAPS-24748

Health test monitors free space available on the wrong filesystem

The Cloudera Manager Health Test to monitor free space available for the Cloudera Manager Agent's process directory monitors space on the wrong filesystem. It should monitor the `tmpfs` that the Cloudera Manager Agent creates, but instead monitors the Cloudera Manager Agent working directory.

Cloudera Bug: OPSAPS-24733

Starting ZooKeeper Servers from Service or Instance page fails

Stopped ZooKeeper servers cannot be started from the Service or Instance page, but only from the Role page of the server using the `start` action for the role.

Cloudera Bug: OPSAPS-24725

Flume Metrics page does not render agent metrics

Starting in Cloudera Manager 5.3, some or all Flume component data was missing from the Flume Metrics Details page.

Cloudera Bug: OPSAPS-24525

Broken link to help pages on Chart Builder page

The help icon (question mark) on the Chart Builder page returns a 404 error.

Cloudera Bug: OPSAPS-24424

Import MapReduce configurations to YARN now handles NodeManager vcores and memory

Running the wizard to import MapReduce configurations to YARN will now populate `yarn.nodemanager.resource.cpu-vcores` and `yarn.nodemanager.resource.memory-mb` correctly based on equivalent MapReduce configuration.

Cloudera Bug: OPSAPS-21540; KI added Cloudera Manager5.1.0

Issues Fixed in Cloudera Manager 5.3.1

Deploy client configuration across cluster after upgrade from Cloudera Manager 4.x to 5.3

Following a 4.x -> 5.3 upgrade, you must deploy client configuration across the entire cluster before deleting any gateway roles, any services, or any hosts. Otherwise the existing 4.x client configurations may be left registered and orphaned on the hosts where they were deployed, requiring you to manually intervene to delete them.

Cloudera Bug: OPSAPS-24279

Deploy client configuration across cluster after upgrade from Cloudera Manager 4.x to 5.3

Following a 4.x -> 5.3 upgrade, you must deploy client configuration across the entire cluster before deleting any gateway roles, any services, or any hosts. Otherwise the existing 4.x client configurations may be left registered and orphaned on the hosts where they were deployed, requiring you to manually intervene to delete them.

Cloudera Bug: OPSAPS-24279

Oozie health bad when Oozie is HA, cluster is kerberized, and Cloudera Manager and CDH are upgraded

Oozie health will go bad if high availability is enabled in a kerberized cluster with Cloudera Manager 5.0 and CDH 5.0 and Cloudera Manager and CDH are then upgraded to 5.1 or higher.

Cloudera Bug: OPSAPS-2387

Workaround: Disable Oozie HA and then re-enable HA again.

Deploy client configuration no longer fails after 60 seconds

When configuring a gateway role on a host that already contains a role of the same type—for example, an HDFS gateway on a DataNode—the deploy client configuration command no longer fails after 60 seconds.

Cloudera Bug: OPSAPS-24426

service cloudera-scm-server force_start now works

Cloudera Bug: OPSAPS-24489

After deleting services, the Cloudera Manager Server log no longer contains foreign key constraint failure exceptions

Cloudera Bug: OPSAPS-24377

When using Isilon, Cloudera Manager now sets `mapred_submit_replication` correctly

When EMC Isilon storage is used, there is no DataNode, so you cannot set `mapred_submit_replication` to a number smaller than or equal to the number of DataNodes in the network. Cloudera Manager now does the following when setting `mapred_submit_replication`:

- If using HDFS, sets to a minimum of 1 and issues a warning when greater than the number of DataNodes
- If using Isilon, sets to 1 and does not check against the number of DataNodes

Cloudera Bug: OPSAPS-24391

The Cloudera Manager Agent now sets the file descriptor `ulimit` correctly on Ubuntu

Cloudera Bug: OPSAPS-24416

During upgrade, bootstrapping the standby NameNode step no longer fails with standby NameNode connection refused when connecting to active NameNode

Cloudera Bug: OPSAPS-24074

Deploy `krb5.conf` now also deploys it on hosts with Cloudera Management Service roles

Cloudera Bug: OPSAPS-21329

Cloudera Manager allows upgrades to unknown CDH maintenance releases

Cloudera Manager 5.3.0 supports any CDH release less than or equal to 5.3, even if the release did not exist when Cloudera Manager 5.3.0 was released. For packages, you cannot currently use the upgrade wizard to upgrade to such a release. This release adds a custom CDH field for the package case, where you can type in a version that did not exist at the time of the Cloudera Manager release.

Cloudera Bug: OPSAPS-24355

impalad memory limit units error in EnableLlamaRMCommand

The EnableLlamaRMCommand sets the value of the impalad memory limit to equal the NM container memory value. But the latter is in MB, and the former is in bytes. Previously, the command did not perform the conversion; this has been fixed.

Running MapReduce v2 jobs are now visible using the Application Master view

In the Application view, selecting **Application Master** for a MRv2 job previously resulted in no action.

Deleting services no longer results in foreign key constraint exceptions

The Cloudera Manager Server log previously showed several foreign key constraint exceptions that were associated with deleted services. This has been fixed.

HiveServer2 keystore and LDAP group mapping passwords are no longer exposed in client configuration files

The HiveServer2 keystore password and LDAP group mapping passwords were emitted into the client configuration files. This exposed the passwords in plain text in a world-readable file. This has been fixed.

Cloudera Bug: OPSAPS-24442, OPSAPS-24469

A cross-site scripting vulnerability in Cloudera Management Service web UIs fixed

Cloudera Bug: OPSAPS-24080

The high availability wizard now sets the HDFS dependency on ZooKeeper

Cloudera Bug: OPSAPS-24420

Workaround: Before enabling high availability, do the following:

1. Create and start a ZooKeeper service if one does not exist.
2. Go to the HDFS service.
3. Click the **Configuration** tab.
4. Select **HDFS Service-Wide**.
5. Select **Category > Main**.
6. Locate the **ZooKeeper Service** property or search for it by typing its name in the Search box. Select the ZooKeeper service you created.

To apply this configuration property to other role groups as needed, edit the value for the appropriate role group. See [Modifying Configuration Properties Using Cloudera Manager](#).

7. Click **Save Changes** to commit the changes.

BDR no longer assumes superuser is common if clusters have the same realm

If source and destination clusters are in the same Kerberos realm, Cloudera Manager assumed that superuser of the destination is also the superuser on the source cluster. However, HDFS can be configured so that this is not the case.

Cloudera Bug: OPSAPS-24417

Issues Fixed in Cloudera Manager 5.3.0

Setting the default umask in HDFS fails in new configuration layout

Setting the default umask in the HDFS configuration section to 002 in the new configuration layout displays an error: "Could not parse: Default Umask : Could not parse parameter 'dfs_umaskmode'. Was expecting an octal value with a leading 0. Input: 2", preventing the change from being submitted.

Cloudera Bug: OPSAPS-24340

Workaround: Submit the change using the classic configuration layout.

Spark and Spark (standalone) services fail to start if you upgrade to CDH 5.2.x parcels from an older CDH package

Spark and Spark standalone services fail to start if you upgrade to CDH 5.2.x parcels from an older CDH package.

Workaround: After upgrading rest of the services, uninstall the old CDH packages, and then start the Spark service.

Cloudera Bug: OPSAPS-24005

Fixed MapReduce Usage by User reports when using an Oracle database backend

Setting the default umask in HDFS fails in new configuration layout

Setting the default umask in the HDFS configuration section to 002 in the new configuration layout displays an error: "Could not parse: Default Umask : Could not parse parameter 'dfs_umaskmode'. Was expecting an octal value with a leading 0. Input: 2", preventing the change from being submitted.

Workaround: Submit the change using the classic configuration layout.

Cloudera Bug: OPSAPS-24340

Enabling Integrated Resource Management for Impala sets Impala Daemon Memory Limit Incorrectly

The Enable Integrated Resource Management command for Impala (available from the **Actions** pull-down menu on the Impala service page) sets the Impala Daemon Memory Limit to an unusably small value. This can cause Impala queries to fail.

Workaround 1: Upgrade to Cloudera Manager 5.3.

Workaround 2:

1. Run the Enable Integrated Resource Management wizard up to the **Restart Cluster** step. Do not click **Restart Now**.
2. Click on the **leave this wizard** link to exit the wizard without restarting the cluster.
3. Go to the YARN service page. Click **Configuration**, expand the category **NodeManager Default Group**, and click **Resource Management**.
4. Note the value of the Container Memory property.
5. Go to the Impala service page and click **Configuration**. Type `impala daemon memory limit` into the search box.
6. Set the value of the Impala Daemon Memory Limit property to the value noted in step 4 above.
7. Restart the cluster.

Cloudera Bug: OPSAPS-24255

Rolling restart and upgrade of Oozie fails if there is a single Oozie server

Rolling restart and upgrade of Oozie fails if there is only a single Oozie server. Cloudera Manager will show the error message "There is already a pending command on this role."

Workaround: If you have a single Oozie server, do a normal restart.

Cloudera Bug: OPSAPS-23954

Allow "Started but crashed" processes to be restarted by a Start command

In Cloudera Manager 5.3, it is now possible to restart a crashed process with the **Start** command and not just the **Restart** command.

Cloudera Bug: OPSAPS-23567

Add dependency from Agent to Daemons package to yum

In Cloudera Manager 5.3, an explicit dependency has been added from the Agent package to the Daemons package so that upgrading Cloudera Manager 5.2.0 or later to Cloudera Manager 5.3 causes the agent to be upgraded as well. Previously, the Cloudera Manager installer always installed both packages, but this is now enforced at the package dependency level as well.

Cloudera Bug: OPSAPS-24079

Issues Fixed in Cloudera Manager 5.2.8

Apache Commons Collections deserialization vulnerability

Cloudera has learned of a potential security vulnerability in a third-party library called the [Apache Commons Collections](#). MITRE has not issued a CVE, but related [CVE-2015-4852](#) has been filed for the vulnerability. CERT has issued [Vulnerability Note #576313](#) for this issue.

Releases affected: CDH 5.5.0, CDH 5.4.8 and lower, CDH 5.3.8 and lower, CDH 5.2.8 and lower, CDH 5.1.7 and lower, Cloudera Manager 5.5.0, Cloudera Manager 5.4.8 and lower, Cloudera Manager 5.3.8 and lower, and Cloudera Manager 5.2.8 and lower, Cloudera Manager 5.1.6 and lower, Cloudera Manager 5.0.7 and lower, Cloudera Navigator 2.4.0, Cloudera Navigator 2.3.8 and lower.

Users affected: All

Impact: This potential vulnerability may enable an attacker to execute arbitrary code from a remote machine without requiring authentication.

Immediate action required: Upgrade to Cloudera Manager 5.5.1 and CDH 5.5.1, Cloudera Manager 5.4.9 and CDH 5.4.9, Cloudera Manager 5.3.9 and CDH 5.3.9, and Cloudera Manager 5.2.9 and CDH 5.2.9, and Cloudera Manager 5.1.7 and CDH 5.1.7, and Cloudera Manager 5.0.8 and CDH 5.0.8.

Issues Fixed in Cloudera Manager 5.2.7

Sensitive Information in Cloudera Manager Diagnostic Support Bundles

Cloudera Manager is designed to transmit certain diagnostic data (or "bundles") to Cloudera. These diagnostic bundles are used by the Cloudera support team to reproduce, debug, and address technical issues for our customers. Cloudera internally discovered a potential vulnerability in this feature, which could cause any sensitive data stored as "advanced configuration snippets (ACS)" (formerly called "safety valves") to be included in diagnostic bundles and transmitted to Cloudera. Notwithstanding any possible transmission, such sensitive data is not used by Cloudera for any purpose.

Cloudera has taken the following actions: (1) modified Cloudera Manager so that it no longer transmits advanced configuration snippets containing the sensitive data, and (2) modified Cloudera Manager TLS/SSL configuration to increase the protection level of the encrypted communication.

Cloudera strives to follow and also help establish best practices for the protection of customer information. In this effort, we continually review and improve our security practices, infrastructure, and data handling policies.

Users affected:

- Users storing sensitive data in advanced configuration snippets

Severity: High

Impact: Possible transmission of sensitive data

CVE: CVE-2015-6495

Immediate Action Required:

- Upgrade Cloudera Manager to one of the following releases: Cloudera Manager 5.4.6, 5.3.7, 5.2.7, 5.1.6, 5.0.7, 4.8.6

Issues Fixed in Cloudera Manager 5.2.6

[Cloudera Manager Agent may become slow or get stuck when responding to commands and when sending heartbeats to Cloudera Manager Server](#)

This issue can occur when Cloudera Navigator auditing is turned on. The auditing code reads audit logs and sends them to the Audit Server. It acquires a lock to protect the list of roles being audited. The same list is also modified by the Cloudera Manager Agent's main thread when a role is started or stopped. If the Audit thread takes too much time to send audits to the Audit Server (which can happen if there is backlog of audit logs), it starves the main Agent thread. This causes the main Agent thread to not send heartbeats and to not respond to commands from the Cloudera Manager Server.

Cloudera Bug: TSB-60

[Problems restarting the NameNode](#)

The NameNode would not restart due to a blocked thread that was processing audit events.

Cloudera Bug: OPSAPS-26129

[Cloudera Manager reports the wrong value for Impala bytes read from cache](#)

Instead of cached bytes, it reported the value of short-circuit bytes.

Cloudera Bug: OPSAPS-26938

[Directory operational reports do not return results](#)

The following reports now return results:

- Overpopulated Directories
- Large Directories
- Custom reports where **Replication= 0**

Cloudera Bug: OPSAPS-26178

[Cloudera Manager uses Xalan 2.7.2](#)

The version of Xalan used in Cloudera Manager has been upgraded to version 2.7.2 to address a possible vulnerability.

Cloudera Bug: CDH-27059

[Cluster name changed to "cluster" after upgrade](#)

After upgrading CDH, the display name of the cluster no longer changes to "cluster".

Cloudera Bug: OPSAPS-25279

[Cloudera Manager monitors the wrong directory for space threshold warnings](#)

Cloudera Manager was monitoring the disk space thresholds using the `/var/run/cloudera-scm-agent` directory. Cloudera Manager now monitors the correct directory: `/var/run/cloudera-scm-agent/process`.

Cloudera Bug: OPSAPS-24529

Default timeout value for the Hive MetaStore changed to 60 seconds

The default value in the Hive **Service Monitor Client Config Overrides** property for the `hive.metastore.client.socket.timeout` property is now 60.

Cloudera Bug: OPSAPS-24346

Changing client configuration overrides

Changes made to client configuration overrides did not take effect until the service was restarted.

Cloudera Bug: OPSAPS-25194

Issues Fixed in Cloudera Manager 5.2.5

Slow staleness calculation can lead to ZooKeeper data loss when new servers are added

In Cloudera Manager 5, starting new ZooKeeper Servers shortly after adding them can cause ZooKeeper data loss when the number of new servers exceeds the number of old servers.

Cloudera Bug: OPSAPS-25966

Permissions set incorrectly on YARN Keytab files

Permissions on YARN Keytab files for NodeManager were set incorrectly to allow read access to any user.

Cloudera Bug: OPSAPS-25390, TSB-48

Issues Fixed in Cloudera Manager 5.2.2

Impalad memory limit units error in EnableLlamaRMCommand has been fixed

The EnableLlamaRMCommand sets the value of the impalad memory limit to equal the NM container memory value. But the latter is in MB, and the former is in bytes. Previously, the command did not perform the conversion; this has been fixed.

Fixed MapReduce Usage by User reports when using an Oracle database backend

HiveServer2 keystore and LDAP group mapping passwords are no longer exposed in client configuration files

The HiveServer2 keystore password and LDAP group mapping passwords were emitted into the client configuration files. This exposed the passwords in plain text in a world-readable file. This has been fixed.

Cloudera Bug: OPSAPS-24442, OPSAPS-24469

Running MapReduce v2 jobs are now visible using the Application Master view

In the Application view, selecting **Application Master** for a MRv2 job previously resulted in no action.

Deleting services no longer results in foreign key constraint exceptions

The Cloudera Manager Server log previously showed several foreign key constraint exceptions that were associated with deleted services. This has been fixed.

Issues Fixed in Cloudera Manager 5.2.1

“POODLE” vulnerability on TLS/SSL enabled ports

The POODLE (Padding Oracle On Downgraded Legacy Encryption) attack takes advantage of a cryptographic flaw in the obsolete TLS/SSLv3 protocol, after first forcing the use of that protocol. The only solution is to disable TLS/SSLv3 entirely. This requires changes across a wide variety of components of CDH and Cloudera Manager in 5.2.0 and all earlier versions. Cloudera Manager 5.2.1 provides these changes for Cloudera Manager 5.2.0 deployments. All Cloudera

Cloudera Manager 5 Release Notes

Manager 5.2.0 users should upgrade to 5.2.1 as soon as possible. For more information, see the [Cloudera Security Bulletin](#).

Can use the log4j advanced configuration snippet to override the default audit logging configuration even if not using Navigator

In Cloudera Manager 5.2.0 only, it was not possible to use the log4j advanced configuration snippet to override the default audit logging configuration when Navigator was not being used.

Cloudera Bug: OPSAPS-23864

Cloudera Manager now collects metrics for CDH 5.0 DataNodes and NameNodes

A number of NameNode and DataNode charts show no data and a number of NameNode and DataNode health checks show unknown results. Metric collection for CDH 5.1 roles is unaffected.

Cloudera Bug: OPSAPS-23363

Workaround: None.

The Reports Manager and Event Server Thrift servers no longer crash on HTTP requests

HTTP queries against the Reports Manager and Event Server Thrift server would earlier cause it to crash with out-of-memory exception.

Cloudera Bug: OPSAPS-23160

Replication commands now use the correct JAVA_HOME if an override has been provided for it

ZooKeeper connection leaks from HBase clients in Service Monitor have been fixed

When a parcel is activated, user home directories are now created with umask 022 instead of using the "useradd" default 077

Cloudera Bug: OPSAPS-23680

Issues Fixed in Cloudera Manager 5.2.0

Bug in openssl-1.0.1e-15 disrupts TLS/SSL communication between Cloudera Manager Agents and CDH services

This issue was observed in TLS/SSL-enabled clusters running CentOS 6.4 and 6.5, where the Cloudera Manager Agent failed when trying to communicate with CDH services. You can see the bug report [here](#).

Cloudera Bug: OPSAPS-23324

Workaround: Upgrade to `openssl-1.0.1e-16.el6_5.7.x86_64`.

Alternatives database points to client configurations of deleted service

In the past, if you created a service, deployed its client configurations, and then deleted that service, the client configurations lived in the alternative database, with a possibly high priority, until cleaned up manually. Now, for a given "alternatives path" (for example `/etc/hadoop/conf`) if there exist both "live" client configurations (ones that would be pushed out with deploy client configurations for active services) and ones that have been "orphaned" client configurations (the service they correspond to has been deleted), the orphaned ones will be removed from the alternatives database. In other words, to trigger cleanup of client configurations associated with a deleted service you must create a service to replace it.

Cloudera Bug: OPSAPS-13336

The YARN property ApplicationMaster Max Retries has no effect in CDH 5

The issue arises because `yarn.resourcemanager.am.max-retries` was replaced with `yarn.resourcemanager.am.max-attempts`.

Cloudera Bug: OPSAPS-21797

Workaround:

1. Add the following to **ResourceManager Advanced Configuration Snippet for yarn-site.xml**, replacing *MAX_ATTEMPTS* with the desired maximum number of attempts:

```
<property>
<name>yarn.resourcemanager.am.max-attempts</name><value>MAX_ATTEMPTS</value>
</property>
```

2. Restart the ResourceManager(s) to pick up the change.

The Spark History Server does not start when Kerberos authentication is enabled.

The Spark History Server does not start when managed by a Cloudera Manager 5.1 instance when Kerberos authentication is enabled.

Workaround:

1. Go to the Spark service.
2. Expand the **Service-Wide > Advanced** category.
3. Add the following configuration to the **History Server Environment Advanced Configuration Snippet** property:

```
SPARK_HISTORY_OPTS=-Dspark.history.kerberos.enabled=true \
-Dspark.history.kerberos.principal=principal \
-Dspark.history.kerberos.keytab=keytab
```

where *principal* is the name of the Kerberos principal to use for the History Server, and *keytab* is the path to the principal's keytab file on the local filesystem of the host running the History Server.

Cloudera Bug: CDH-19867

Hive replication issue with TLS enabled

Hive replication will fail when the source Cloudera Manager instance has TLS enabled, even though the required certificates have been added to the target Cloudera Manager's trust store.

Cloudera Bug: OPSAPS-22159

Workaround: Add the required Certificate Authority or self-signed certificates to the default Java trust store, which is typically a copy of the cacerts file named `jssecacerts` in the `$JAVA_HOME/jre/lib/security/` path of your installed JDK. Use `keytool` to import your private CA certificates into the `jssecacert` file.

The Spark Upload Jar command fails in a secure cluster

The Spark **Upload Jar** command fails in a secure cluster.

Cloudera Bug: OPSAPS-19856

Workaround: To run Spark on YARN, manually upload the Spark assembly jar to HDFS `/user/spark/share/lib`. The Spark assembly jar is located on the local filesystem, typically in `/usr/lib/spark/assembly/lib` or `/opt/cloudera/parcels/CDH/lib/spark/assembly/lib`.

Clients of the JobHistory Server Admin Interface Require Advanced Configuration Snippet

Clients of the JobHistory server administrative interface, such as the `mapred hsadmin` tool, may fail to connect to the server when run on hosts other than the one where the JobHistory server is running.

Cloudera Bug: OPSAPS-20347

Workaround: Add the following to both the **MapReduce Client Advanced Configuration Snippet for mapred-site.xml** and the **Cluster-wide Advanced Configuration Snippet for core-site.xml**, replacing `JOBHISTORY_SERVER_HOST` with the hostname of your JobHistory server:

```
<property>
<name>mapreduce.history.admin.address</name>
<value>JOBHISTORY_SERVER_HOST:10033</value>
</property>
```

Issues Fixed in Cloudera Manager 5.1.7

Apache Commons Collections deserialization vulnerability

Cloudera has learned of a potential security vulnerability in a third-party library called the [Apache Commons Collections](#). This library is used in products distributed and supported by Cloudera (“Cloudera Products”), including core Apache Hadoop. The Apache Commons Collections library is also in widespread use beyond the Hadoop ecosystem. At this time, no specific attack vector for this vulnerability has been identified as present in Cloudera Products.

In an abundance of caution, we are currently in the process of incorporating a version of the Apache Commons Collections library with a fix into the Cloudera Products. In most cases, this will require coordination with the projects in the Apache community. One example of this is tracked by [HADOOP-12577](#).

The Apache Commons Collections potential security vulnerability is titled “Arbitrary remote code execution with InvokerTransformer” and is tracked by [COLLECTIONS-580](#). MITRE has not issued a CVE, but related [CVE-2015-4852](#) has been filed for the vulnerability. CERT has issued [Vulnerability Note #576313](#) for this issue.

Releases affected: CDH 5.5.0, CDH 5.4.8 and lower, CDH 5.3.8 and lower, CDH 5.2.8 and lower, CDH 5.1.7 and lower, Cloudera Manager 5.5.0, Cloudera Manager 5.4.8 and lower, Cloudera Manager 5.3.8 and lower, and Cloudera Manager 5.2.8 and lower, Cloudera Manager 5.1.6 and lower, Cloudera Manager 5.0.7 and lower, Cloudera Navigator 2.4.0, Cloudera Navigator 2.3.8 and lower.

Users affected: All

Impact: This potential vulnerability may enable an attacker to execute arbitrary code from a remote machine without requiring authentication.

Immediate action required: Upgrade to Cloudera Manager 5.5.1 and CDH 5.5.1, Cloudera Manager 5.4.9 and CDH 5.4.9, Cloudera Manager 5.3.9 and CDH 5.3.9, and Cloudera Manager 5.2.9 and CDH 5.2.9, and Cloudera Manager 5.1.7 and CDH 5.1.7, and Cloudera Manager 5.0.8 and CDH 5.0.8.

Issues Fixed in Cloudera Manager 5.1.6

Sensitive Information in Cloudera Manager Diagnostic Support Bundles

Cloudera Manager is designed to transmit certain diagnostic data (or “bundles”) to Cloudera. These diagnostic bundles are used by the Cloudera support team to reproduce, debug, and address technical issues for our customers. Cloudera internally discovered a potential vulnerability in this feature, which could cause any sensitive data stored as “advanced configuration snippets (ACS)” (formerly called “safety valves”) to be included in diagnostic bundles and transmitted to Cloudera. Notwithstanding any possible transmission, such sensitive data is not used by Cloudera for any purpose.

Cloudera has taken the following actions: (1) modified Cloudera Manager so that it no longer transmits advanced configuration snippets containing the sensitive data, and (2) modified Cloudera Manager TLS/SSL configuration to increase the protection level of the encrypted communication.

Cloudera strives to follow and also help establish best practices for the protection of customer information. In this effort, we continually review and improve our security practices, infrastructure, and data handling policies.

Users affected:

- Users storing sensitive data in advanced configuration snippets

Severity: High

Impact: Possible transmission of sensitive data

CVE: CVE-2015-6495

Immediate Action Required:

- Upgrade Cloudera Manager to one of the following releases: Cloudera Manager 5.4.6, 5.3.7, 5.2.7, 5.1.6, 5.0.7, 4.8.6

[Cloudera Manager Agent may become slow or get stuck when responding to commands and when sending heartbeats to Cloudera Manager Server](#)

This issue can occur when Cloudera Navigator auditing is turned on. The auditing code reads audit logs and sends them to the Audit Server. It acquires a lock to protect the list of roles being audited. The same list is also modified by the Cloudera Manager Agent's main thread when a role is started or stopped. If the Audit thread takes too much time to send audits to the Audit Server (which can happen if there is backlog of audit logs), it starves the main Agent thread. This causes the main Agent thread to not send heartbeats and to not respond to commands from the Cloudera Manager Server.

Fixed Issues in Cloudera Manager 5.1.5

[Slow staleness calculation can lead to ZooKeeper data loss when new servers are added](#)

In Cloudera Manager 5, starting new ZooKeeper Servers shortly after adding them can cause ZooKeeper data loss when the number of new servers exceeds the number of old servers.

Cloudera Bug: OPSAPS-25966

[Permissions set incorrectly on YARN Keytab files](#)

Permissions on YARN Keytab files for NodeManager were set incorrectly to allow read access to any user.

Cloudera Bug: OPSAPS-25390, TSB-48

Fixed Issues in Cloudera Manager 5.1.4

["POODLE" vulnerability on TLS/SSL enabled ports](#)

The POODLE (Padding Oracle On Downgraded Legacy Encryption) attack takes advantage of a cryptographic flaw in the obsolete TLS/SSLv3 protocol, after first forcing the use of that protocol. The only solution is to disable TLS/SSLv3 entirely. This requires changes across a wide variety of components of CDH and Cloudera Manager. Cloudera Manager 5.1.4 provides these changes for Cloudera Manager 5.1.x deployments. All Cloudera Manager 5.1.x users should upgrade to 5.1.4 as soon as possible. For more information, see the [Cloudera Security Bulletin](#).

Issues Fixed in Cloudera Manager 5.1.3

[Improved speed and heap usage when deleting hosts on cluster with long history](#)

Speed and heap usage have been improved when deleting hosts on clusters that have been running for a long time.

[When there are multiple clusters, each cluster's topology files and validation for legal topology is limited to hosts in that cluster](#)

When there are multiple clusters, each cluster's topology files and validation for legal topology is limited to hosts in that cluster. Most commands will now fail up front if the cluster's topology is invalid.

[The size of the statement cache has been reduced for Oracle databases](#)

For users of Oracle databases, the size of the statement cache has been reduced to help with memory consumption.

[Improvements to memory usage of "cluster diagnostics collection" for large clusters.](#)

Memory usage of "cluster diagnostics collection" has been improved for large clusters.

Issues Fixed in Cloudera Manager 5.1.2

If a NodeManager that is used as ApplicationMaster is decommissioned, YARN jobs will hang

Cloudera Bug: OPSAPS-21797

Jobs can hang on NodeManager decommission due to a race condition when continuous scheduling is enabled.

Workaround:

1. Go to the YARN service.
2. Expand the **ResourceManager Default Group > Resource Management** category.
3. Uncheck the **Enable Fair Scheduler Continuous Scheduling** checkbox.
4. Click **Save Changes** to commit the changes.
5. Restart the YARN service.

Could not find a healthy host with CDH 5 on it to create HiveServer2 error during upgrade

When upgrading from CDH 4 to CDH 5, if no parcel is active then the error message "Could not find a healthy host with CDH5 on it to create HiveServer2" displays. This can happen when transitioning from packages to parcels, or if you explicitly deactivate the CDH 4 parcel (which is not necessary) before upgrade.

Workaround: Wait 30 seconds and retry the upgrade.

Cloudera Bug: OPSAPS-21942

AWS installation wizard requires Java 7u45 to be installed on Cloudera Manager Server host

Cloudera Manager 5.1 installs Java 7u55 by default. However, the AWS installation wizard does not work with Java 7u55 due to a bug in the jClouds version packaged with Cloudera Manager.

Workaround:

1. Stop the Cloudera Manager Server.

```
sudo service cloudera-scm-server stop
```

2. Uninstall Java 7u55 from the Cloudera Manager Server host.
3. Install Java 7u45 (which you can download from <http://www.oracle.com/technetwork/java/javase/downloads/java-archive-downloads-javase7-521261.html#jdk-7u45-oth-JPR>) on the Cloudera Manager Server host.
4. Start the Cloudera Manager Server.

```
sudo service cloudera-scm-server start
```

5. Run the AWS installation wizard.

Note: Due to a bug in Java 7u45 (http://bugs.java.com/bugdatabase/view_bug.do?bug_id=8014618), TLS/SSL connections between the Cloudera Manager Server and Cloudera Manager Agents and between the Cloudera Management Service and CDH processes break intermittently. If you do not have TLS/SSL enabled on your cluster, there is no impact.

Cloudera Bug: OPSAPS-21855

The YARN property ApplicationMaster Max Retries has no effect in CDH 5

The issue arises because `yarn.resourcemanager.am.max-retries` was replaced with `yarn.resourcemanager.am.max-attempts`.

Cloudera Bug: [OPSAPS-21797](#); KI added Cloudera Manager 5.1.0

Workaround:

1. Add the following to **ResourceManager Advanced Configuration Snippet for yarn-site.xml**, replacing `MAX_ATTEMPTS` with the desired maximum number of attempts:

```
<property>
<name>yarn.resourcemanager.am.max-attempts</name><value>MAX_ATTEMPTS</value>
</property>
```

2. Restart the ResourceManager(s) to pick up the change.

(BDR) Replications can be affected by other replications or commands running at the same time

Replications can be affected by other replications or commands running at the same time, causing replications to fail unexpectedly or even be silently skipped sometimes. When this occurs, a `StaleObjectException` is logged to the Cloudera Manager logs. This is known to occur even with as few as four replications starting at the same time.

Cloudera Bug: OPSAPS-21918

Issues Fixed in Cloudera Manager 5.1.1

Checking "Install Java Unlimited Strength Encryption Policy Files" During Add Cluster or Add/Upgrade Host Wizard on RPM based distributions if JDK 7 or above is pre-installed will cause Cloudera Manager and CDH to fail

If you have manually installed Oracle's official JDK 7 or 8 rpm on a host (or hosts), and check the **Install Java Unlimited Strength Encryption Policy Files** checkbox in the Add Cluster or Add Host wizard when installing Cloudera Manager on that host (or hosts), or when upgrading Cloudera Manager to 5.1, Cloudera Manager installs JDK 6 policy files, which will prevent any Java programs from running against that JDK. Additionally, if this situation does apply, Cloudera Manager/CDH will also choose that particular Java as the default to run against, meaning that Cloudera Manager/CDH fail to start, throwing the following message in logs: `Caused by: java.lang.SecurityException: The jurisdiction policy files are not signed by a trusted signer!`.

Workaround: Do not select the **Install Java Unlimited Strength Encryption Policy Files** checkbox during the aforementioned wizards. Instead download and install them manually, following the instructions on Oracle's website.

- JDK 7 Instructions: <http://www.oracle.com/technetwork/java/javase/downloads/jce-7-download-432124.html>
- JDK 8 Instructions: <http://www.oracle.com/technetwork/java/javase/downloads/jce8-download-2133166.html>

Note:

To return to the default limited strength files, reinstall the original Oracle rpm:

- `yum -y yum reinstall jdk`
- `zypper -zypper in -f jdk`
- `rpm -rpm -iv --replacepkgs filename`, where *filename* is `jdk-7u65-linux-x64.rpm` or `jdk-8u11-linux-x64.rpm`

Cloudera Bug: OPSAPS-21914

Issues Fixed in Cloudera Manager 5.1.0

Important: Cloudera Manager 5.1.0 is no longer available for download from the Cloudera website or from `archive.cloudera.com` due to the JCE policy file issue described in the [Issues Fixed in Cloudera Manager 5.1.1](#) on page 2675 section of the Release Notes. The download URL at `archive.cloudera.com` for Cloudera Manager 5.1.0 now forwards to Cloudera Manager 5.1.1 for the RPM-based distributions for Linux RHEL and SLES.

Changes to property for `yarn.nodemanager.remote-app-log-dir` are not included in the JobHistory Server `yarn-site.xml` and Gateway `yarn-site.xml`

When "Remote App Log Directory" is changed in YARN configuration, the property `yarn.nodemanager.remote-app-log-dir` are not included in the JobHistory Server `yarn-site.xml` and Gateway `yarn-site.xml`.

Cloudera Bug: [OPSAPS-20906](#); KI added Cloudera Manager 5.0.1

Workaround: Set **JobHistory Server Advanced Configuration Snippet (Safety Valve) for yarn-site.xml** and **YARN Client Advanced Configuration Snippet (Safety Valve) for yarn-site.xml** to:

```
<property>
<name>yarn.nodemanager.remote-app-log-dir</name>
<value>/path/to/logs</value>
</property>
```

Secure CDH 4.1 clusters have Hue and Impala share the same Hive

In a secure CDH 4.1 cluster, Hue and Impala cannot share the same Hive instance. If "Bypass Hive Metastore Server" is disabled on the Hive service, then Hue will not be able to talk to Hive. Conversely, if "Bypass Hive Metastore" enabled on the Hive service, then Impala will have a validation error.

Cloudera Bug: OPSAPS-20482

Severity: High

Workaround: Upgrade to CDH 4.2.

The command history has an option to select the number of commands, but does not always return the number you request

Cloudera Bug: OPSAPS-17243

Workaround: None.

Hue does not support YARN ResourceManager High Availability

Cloudera Bug: OPSAPS-18473

Workaround: Configure the Hue Server to point to the active ResourceManager:

1. Go to the Hue service.
2. Click the **Configuration** tab.
3. Select **Scope > Hue or Hue Service-Wide**.
4. Select **Category > Advanced**.
5. Locate the **Hue Server Advanced Configuration Snippet (Safety Valve) for hue_safety_valve_server.ini** property or search for it by typing its name in the Search box.
6. In the **Hue Server Advanced Configuration Snippet for hue_safety_valve_server.ini** field, add the following:

```
[hadoop]
[[ yarn_clusters ]]
[[[default]]]
resourcemanager_host=<hostname of active ResourceManager>
resourcemanager_api_url=http://<hostname of active resource manager>:<web port of active resource manager>
proxy_api_url=http://<hostname of active resource manager>:<web port of active resource manager>
```

The default web port of Resource Manager is 8088.

7. Click **Save Changes** to have these configurations take effect.
8. Restart the Hue service.

Cloudera Manager does not support encrypted shuffle.

Encrypted shuffle has been introduced in CDH 4.1, but it is not currently possible to enable it through Cloudera Manager.

Cloudera Bug: OPSAPS-8480

Severity: Medium

Workaround: None.

[Hive CLI does not work in CDH 4 when "Bypass Hive Metastore Server" is enabled](#)

Hive CLI does not work in CDH 4 when "Bypass Hive Metastore Server" is enabled.

Cloudera Bug: OPSAPS-20721

Workaround: Configure Hive and disable the "Bypass Hive Metastore Server" option.

Alternatively, an approach can be taken that will cause the "Hive Auxiliary JARs Directory" to not work, but will enable basic Hive commands to work. Add the following to "Gateway Client Environment Advanced Configuration Snippet for `hive-env.sh`," then re-deploy the Hive client configuration:

```
HIVE_AUX_JARS_PATH="
AUX_CLASSPATH=/usr/share/java/mysql-connector-java.jar:/usr/share/java/oracle-connector-java.jar:$(find
/usr/share/cmf/lib/postgresql-jdbc.jar 2> /dev/null | tail -n 1)
```

[Incorrect Absolute Path to topology.py in Downloaded YARN Client Configuration](#)

The downloaded client configuration for YARN includes the `topology.py` script. The location of this script is given by the `net.topology.script.file.name` property in `core-site.xml`. But the `core-site.xml` file downloaded with the client configuration has an incorrect absolute path to `/etc/hadoop/...` for `topology.py`. This can cause clients that run against this configuration to fail (including Spark clients run in `yarn-client` mode, as well as YARN clients).

Cloudera Bug: OPSAPS-20337

Workaround: Edit `core-site.xml` to change the value of the `net.topology.script.file.name` property to the path where the downloaded copy of `topology.py` is located. This property must be set to an absolute path.

[search_bind_authentication for Hue is not included in .ini file](#)

When `search_bind_authentication` is set to `false`, Cloudera Manager does not include it in `hue.ini`.

Cloudera Bug: OPSAPS-20926

Workaround: Add the following to the Hue Service Advanced Configuration Snippet (Safety Valve) for `hue_safety_valve.ini`:

```
[desktop]
[[ldap]]
search_bind_authentication=false
```

[Erroneous warning displayed on the HBase configuration page on CDH 4.1 in Cloudera Manager 5.0.0](#)

An erroneous "Failed parameter validation" warning is displayed on the HBase configuration page on CDH 4.1 in Cloudera Manager 5.0.0

Severity: Low

Cloudera Bug: OPSAPS-20310

Workaround: Use CDH4.2 or higher, or ignore the warning.

[Host recommissioning and decommissioning should occur independently](#)

In large clusters, when problems appear with a host or role, administrators may choose to decommission the host or role to fix it and then recommission the host or role to put it back in production. Decommissioning, especially host

decommissioning, is slow, hence the importance of parallelization, so that host recommissioning can be initiated before decommissioning is done.

Cloudera Bug: OPSAPS-19055

Fixed Issues in Cloudera Manager 5.0.8

Apache Commons Collections deserialization vulnerability

Cloudera has learned of a potential security vulnerability in a third-party library called the [Apache Commons Collections](#). This library is used in products distributed and supported by Cloudera (“Cloudera Products”), including core Apache Hadoop. The Apache Commons Collections library is also in widespread use beyond the Hadoop ecosystem. At this time, no specific attack vector for this vulnerability has been identified as present in Cloudera Products.

In an abundance of caution, we are currently in the process of incorporating a version of the Apache Commons Collections library with a fix into the Cloudera Products. In most cases, this will require coordination with the projects in the Apache community. One example of this is tracked by [HADOOP-12577](#).

The Apache Commons Collections potential security vulnerability is titled “Arbitrary remote code execution with InvokerTransformer” and is tracked by [COLLECTIONS-580](#). MITRE has not issued a CVE, but related [CVE-2015-4852](#) has been filed for the vulnerability. CERT has issued [Vulnerability Note #576313](#) for this issue.

Releases affected: CDH 5.5.0, CDH 5.4.8 and lower, CDH 5.3.8 and lower, CDH 5.2.8 and lower, CDH 5.1.7 and lower, Cloudera Manager 5.5.0, Cloudera Manager 5.4.8 and lower, Cloudera Manager 5.3.8 and lower, and Cloudera Manager 5.2.8 and lower, Cloudera Manager 5.1.6 and lower, Cloudera Manager 5.0.7 and lower, Cloudera Navigator 2.4.0, Cloudera Navigator 2.3.8 and lower.

Users affected: All

Impact: This potential vulnerability may enable an attacker to execute arbitrary code from a remote machine without requiring authentication.

Immediate action required: Upgrade to Cloudera Manager 5.5.1 and CDH 5.5.1, Cloudera Manager 5.4.9 and CDH 5.4.9, Cloudera Manager 5.3.9 and CDH 5.3.9, and Cloudera Manager 5.2.9 and CDH 5.2.9, and Cloudera Manager 5.1.7 and CDH 5.1.7, and Cloudera Manager 5.0.8 and CDH 5.0.8.

Fixed Issues in Cloudera Manager 5.0.7

Sensitive Information in Cloudera Manager Diagnostic Support Bundles

Cloudera Manager is designed to transmit certain diagnostic data (or “bundles”) to Cloudera. These diagnostic bundles are used by the Cloudera support team to reproduce, debug, and address technical issues for our customers. Cloudera internally discovered a potential vulnerability in this feature, which could cause any sensitive data stored as “advanced configuration snippets (ACS)” (formerly called “safety valves”) to be included in diagnostic bundles and transmitted to Cloudera. Notwithstanding any possible transmission, such sensitive data is not used by Cloudera for any purpose.

Cloudera has taken the following actions: (1) modified Cloudera Manager so that it no longer transmits advanced configuration snippets containing the sensitive data, and (2) modified Cloudera Manager TLS/SSL configuration to increase the protection level of the encrypted communication.

Cloudera strives to follow and also help establish best practices for the protection of customer information. In this effort, we continually review and improve our security practices, infrastructure, and data handling policies.

Users affected:

- Users storing sensitive data in advanced configuration snippets

Severity: High

Impact: Possible transmission of sensitive data

CVE: CVE-2015-6495

Immediate Action Required:

- Upgrade Cloudera Manager to one of the following releases: Cloudera Manager 5.4.6, 5.3.7, 5.2.7, 5.1.6, 5.0.7, 4.8.6

Cloudera Manager Agent may become slow or get stuck when responding to commands and when sending heartbeats to Cloudera Manager Server

This issue can occur when Cloudera Navigator auditing is turned on. The auditing code reads audit logs and sends them to the Audit Server. It acquires a lock to protect the list of roles being audited. The same list is also modified by the Cloudera Manager Agent's main thread when a role is started or stopped. If the Audit thread takes too much time to send audits to the Audit Server (which can happen if there is backlog of audit logs), it starves the main Agent thread. This causes the main Agent thread to not send heartbeats and to not respond to commands from the Cloudera Manager Server.

Fixed Issues in Cloudera Manager 5.0.6

Slow staleness calculation can lead to ZooKeeper data loss when new servers are added

In Cloudera Manager 5, starting new ZooKeeper Servers shortly after adding them can cause ZooKeeper data loss when the number of new servers exceeds the number of old servers.

Cloudera Bug: OPSAPS-25966

Fixed Issues in Cloudera Manager 5.0.5

“POODLE” vulnerability on TLS/SSL enabled ports

The POODLE (Padding Oracle On Downgraded Legacy Encryption) attack takes advantage of a cryptographic flaw in the obsolete TLS/SSLv3 protocol, after first forcing the use of that protocol. The only solution is to disable TLS/SSLv3 entirely. This requires changes across a wide variety of components of CDH and Cloudera Manager. Cloudera Manager 5.0.5 provides these changes for Cloudera Manager 5.0.x deployments. All Cloudera Manager 5.0.x users should upgrade to 5.0.5 as soon as possible. For more information, see the [Cloudera Security Bulletin](#).

Issues Fixed in Cloudera Manager 5.0.2

Cloudera Manager Impala Query Monitoring does not work with Impala 1.3.1

Impala 1.3.1 contains changes to the runtime profile format that break the Cloudera Manager Query Monitoring feature. This leads to exceptions in the Cloudera Manager Service Monitor logs, and Impala queries no longer appear in the Cloudera Manager UI or API. The issue affects Cloudera Manager 5.0 and 4.6 - 4.8.2.

Cloudera Bug: [OPSAPS-20744](#); KI added Cloudera Manager 5.0.1

Workaround: None. The issue will be fixed in Cloudera Manager 4.8.3 and Cloudera Manager 5.0.1. To avoid the Service Monitor exceptions, turn off the Cloudera Manager Query Monitoring feature by going to **Impala Daemon > Monitoring** and setting the Query Monitoring Period to 0 seconds. Note that the Impala Daemons must be restarted when changing this setting, and the setting must be restored once the fix is deployed to turn the query monitoring feature back on. Impala queries will then appear again in Cloudera Manager's Impala query monitoring feature.

Issues Fixed in Cloudera Manager 5.0.1

Upgrade from Cloudera Manager 5.0.0 beta 1 or beta 2 to Cloudera Manager 5.0.0 requires assistance from Cloudera Support

Contact Cloudera Support before upgrading from Cloudera Manager 5.0.0 beta 1 or beta 2 to Cloudera Manager 5.0.0.

Cloudera Bug: OPSAPS-19894

Workaround: Contact Cloudera Support.

Failure of HDFS Replication between clusters with YARN

HDFS replication between clusters in different Kerberos realms fails when using YARN if the target cluster is CDH 5.

Cloudera Bug: OPSAPS-19930

Workaround: Use MapReduce (MRv1) instead of YARN.

If installing CDH 4 packages, the Impala 1.3.0 option does not work because Impala 1.3 is not yet released for CDH 4.

If installing CDH 4 packages, the Impala 1.3.0 option listed in the install wizard does not work because Impala 1.3.0 is not yet released for CDH 4.

Cloudera Bug: OPSAPS-20406

Workaround: Install using parcels (where the unreleased version of Impala does not appear), or select a different version of Impala when installing with packages.

When updating dynamic resource pools, Cloudera Manager updates roles but may fail to update role information displayed in the UI

When updating dynamic resource pools, Cloudera Manager automatically refreshes the affected roles, but they sometimes get marked incorrectly as running with outdated configurations and requiring a refresh.

Cloudera Bug: OPSAPS-19863

Workaround: Invoke the **Refresh Cluster** command from the cluster actions drop-down menu.

Upgrade of secure cluster requires installation of JCE policy files

When upgrading a secure cluster via Cloudera Manager, the upgrade initially fails due to the JDK not having Java Cryptography Extension (JCE) unlimited strength policy files. This is because Cloudera Manager installs a copy of the Java 7 JDK during the upgrade, which does not include the unlimited strength policy files. To ensure that unlimited strength functionality continues to work, install the unlimited strength JCE policy files immediately after completing the Cloudera Manager Upgrade Wizard and before taking any other actions in Cloudera Manager.

Cloudera Bug: OPSAPS-18641

Workaround: Install the unlimited strength JCE policy files immediately after completing the Cloudera Manager Upgrade Wizard and before taking any other action in Cloudera Manager.

The Details page for MapReduce jobs displays the wrong id for YARN-based replications

The **Details** link for MapReduce jobs is wrong for YARN-based replications.

Cloudera Bug: OPSAPS-19874

Workaround: Find the job id in the link and then go to the **YARN Applications** page and look for the job there.

Reset non-default HDFS File Block Storage Location Timeout value after upgrade from CDH 4 to CDH 5

During an upgrade from CDH 4 to CDH 5, if the HDFS File Block Storage Locations Timeout was previously set to a custom value, it will now be set to 10 seconds or the custom value, whichever is higher. This is required for Impala to start in CDH 5, and any value under 10 seconds is now a validation error. This configuration is only emitted for Impala and no services should be adversely impacted.

Cloudera Bug: OPSAPS-20515

Workaround: None.

HDFS NFS gateway works only on RHEL and similar systems

HDFS NFS gateway works as shipped ("out of the box") only on RHEL-compatible systems, but not on SLES, Ubuntu, or Debian. Because of a bug in native versions of `portmap/rpcbind`, the HDFS NFS gateway does not work out of the box on SLES, Ubuntu, or Debian systems when CDH has been installed from the command-line, using packages. It does work on supported versions of RHEL-compatible systems on which `rpcbind-0.2.0-10.el6` or later is installed, and it does work if you use Cloudera Manager to install CDH, or if you start the gateway as root.

Bug: [731542](#) (Red Hat), [823364](#) (SLES), [594880](#) (Debian)

Workarounds and caveats:

- On Red Hat and similar systems, make sure `rpcbind-0.2.0-10.el6` or later is installed.
- On SLES, Debian, and Ubuntu systems, do one of the following:
 - Install CDH using Cloudera Manager; *or*
 - As of CDH 5.1, start the NFS gateway as root; *or*
 - [Start the NFS gateway without using packages](#); *or*
 - You can use the gateway by running `rpcbind` in insecure mode, using the `-i` option, but keep in mind that this allows anyone from a remote host to bind to the portmap.

Sensitive configuration values exposed in Cloudera Manager

Certain configuration values that are stored in Cloudera Manager are considered sensitive, such as database passwords. These configuration values should be inaccessible to non-administrator users, and this is enforced in the Cloudera Manager Administration Console. However, these configuration values are not redacted when they are read through the API, possibly making them accessible to users who should not have such access.

Cloudera Bug: OPSAPS-20782

Gateway role configurations not respected when deploying client configurations

Gateway configurations set for gateway role groups other than the default one or at the role level were not being respected.

Cloudera Bug: OPSAPS-9853

Documentation reflects requirement to enable at least Level 1 encryption before enabling Kerberos authentication

Cloudera Security documentation now indicates that before enabling Kerberos authentication you should first enable at least Level 1 encryption.

HDFS NFS gateway does not work on all Cloudera-supported platforms

The NFS gateway cannot be started on some Cloudera-supported platforms.

Cloudera Bug: OPSAPS-19957

Workaround: None. Fixed in Cloudera Manager 5.0.1.

Replace `YARN_HOME` with `HADOOP_YARN_HOME` during upgrade

If `yarn.application.classpath` was set to a non-default value on a CDH 4 cluster, and that cluster is upgraded to CDH 5, the classpath is not updated to reflect that `$YARN_HOME` was replaced with `$HADOOP_YARN_HOME`. This will cause YARN jobs to fail.

Cloudera Bug: OPSAPS-20348

Workaround: Reset `yarn.application.classpath` to the default, then re-apply your classpath customizations if needed.

Insufficient password hashing in Cloudera Manager

In versions of Cloudera Manager earlier than 4.8.3 and earlier than 5.0.1, user passwords are only hashed once. Passwords should be hashed multiple times to increase the cost of dictionary based attacks, where an attacker tries many candidate passwords to find a match. The issue only affects user accounts that are stored in the Cloudera Manager database. User accounts that are managed externally (for example, with LDAP or Active Directory) are not affected.

In addition, because of this issue, Cloudera Manager 4.8.3 cannot be upgraded to Cloudera Manager 5.0.0. Cloudera Manager 4.8.3 must be upgraded to 5.0.1 or later.

Cloudera Bug: OPSAPS-20537

Workaround: Upgrade to Cloudera Manager 5.0.1.

Cloudera Manager 5 Release Notes

Upgrade to Cloudera Manager 5.0.0 from SLES older than Service Pack 3 with PostgreSQL older than 8.4 fails

Upgrading to Cloudera Manager 5.0.0 from SUSE Linux Enterprise Server (SLES) older than Service Pack 3 will fail if the embedded PostgreSQL database is in use and the installed version of PostgreSQL is less than 8.4.

Cloudera Bug: OPSAPS-20696

Workaround: Either migrate away from the embedded PostgreSQL database (use MySQL or Oracle) or upgrade PostgreSQL to 8.4 or greater.

MR1 to MR2 import fails on a secure cluster

When running the MR1 to MR2 import on a secure cluster, YARN jobs will fail to find `container-executor.cfg`.

Cloudera Bug: OPSAPS-18657

Workaround: Restart YARN after the import.

After upgrade from CDH 4 to CDH 5, Oozie is missing workflow extension schemas

After an upgrade from CDH 4 to CDH 5, Oozie does not pick up the new workflow extension schemas automatically. User will need to update `oozie.service.SchemaService.wf.ext.schemas` manually and add the schemas added in CDH 5: `shell-action-0.3.xsd`, `sqoop-action-0.4.xsd`, `distcp-action-0.2.xsd`, `oozie-sla-0.1.xsd`, `oozie-sla-0.2.xsd`. Note: None of the existing jobs will be affected by this bug, only new workflows that require new schemas.

Cloudera Bug: OPSAPS-20246

Workaround: Add the new workflow extension schemas to Oozie manually by editing `oozie.service.SchemaService.wf.ext.schemas`.

Issues Fixed in Cloudera Manager 5.0.0

HDFS replication does not work from CDH 5 to CDH 4 with different realms

HDFS replication does not work from CDH 5 to CDH 4 with different realms. This is because authentication fails for services in a non-default realm via the WebHdfs API due to a JDK bug. This has been fixed in JDK6-u34 (b03)) and in JDK7.

Cloudera Bug: OPSAPS-2017

Workaround: Use JDK 7 or upgrade JDK6 to at least version u34.

The Sqoop Upgrade command in Cloudera Manager may report success even when the upgrade fails

Cloudera Bug: CDH-17316

Workaround: Do one of the following:

- 1. Click the Sqoop service and then the **Instances** tab.
- 2. Click the Sqoop server role then the **Commands** tab.
- 3. Click the **stdout** link and scan for the Sqoop Upgrade command.
- In the All Recent Commands page, select the **stdout** link for latest Sqoop Upgrade command.

Verify that the upgrade did not fail.

Cannot restore a snapshot of a deleted HBase table

If you take a snapshot of an HBase table, and then delete that table in HBase, you will not be able to restore the snapshot.

Cloudera Bug: OPSAPS-16881

Severity: Med

Workaround: Use the "Restore As" command to recreate the table in HBase.

Stop dependent HBase services before enabling HDFS Automatic Failover.

When enabling HDFS Automatic Failover, you need to first stop any dependent HBase services. The Automatic Failover configuration workflow restarts both NameNodes, which could cause HBase to become unavailable.

Cloudera Bug: OPSAPS-9645

Severity: Medium

New schema extensions have been introduced for Oozie in CDH 4.1

In CDH 4.1, Oozie introduced new versions for Hive, Sqoop and workflow schema. To use them, you must add the new schema extensions to the Oozie SchemaService Workflow Extension Schemas configuration property in Cloudera Manager.

Cloudera Bug: OPSAPS-10021

Severity: Low

Workaround: In Cloudera Manager, do the following:

1. Go to the CDH 4 **Oozie** service page.
2. Go to the **Configuration** tab, **View and Edit**.
3. Search for "Oozie Schema". This should show the **Oozie SchemaService Workflow Extension Schemas** property.
4. Add the following to the **Oozie SchemaService Workflow Extension Schemas** property:

```
shell-action-0.2.xsd
hive-action-0.3.xsd
sqoop-action-0.3.xsd
```

5. Save these changes.

YARN Resource Scheduler user FairScheduler rather than FIFO.

Cloudera Manager 5.0.0 sets the default YARN Resource Scheduler to FairScheduler. If a cluster was previously running YARN with the FIFO scheduler, it will be changed to FairScheduler next time YARN restarts. The FairScheduler is only supported with CDH4.2.1 and later, and older clusters may hit failures and need to manually change the scheduler to FIFO or CapacityScheduler.

Cloudera Bug: OPSAPS-13335

Severity: Medium

Workaround: For clusters running CDH 4 prior to CDH 4.2.1:

1. Go the YARN service Configuration page
2. Search for "scheduler.class"
3. Click in the Value field and select the schedule you want to use.
4. Save your changes and restart YARN to update your configurations.

Resource Pools Summary is incorrect if time range is too large.

The Resource Pools Summary does not show correct information if the Time Range selector is set to show 6 hours or more.

Cloudera Bug: OPSAPS-16018

Severity: Medium

Workaround: None.

When running the MR1 to MR2 import on a secure cluster, YARN jobs will fail to find `container-executor.cfg`

Cloudera Bug: OPSAPS-18657

Workaround: Restart YARN after the import steps finish. This causes the file to be created under the YARN configuration path, and the jobs now work.

When upgrading to Cloudera Manager 5.0.0, the "Dynamic Resource Pools" page is not accessible

When upgrading to Cloudera Manager 5.0.0, users will not be able to directly access the "Dynamic Resource Pools" page. Instead, they will be presented with a dialog saying that the Fair Scheduler XML Advanced Configuration Snippet is set.

Cloudera Bug: OPSAPS-18768

Workaround:

1. Go to the YARN service.
2. Click the **Configuration** tab.
3. Select **Scope** > **Resource Manager or YARN Service-Wide**.
4. Select **Category** > **Advanced**.
5. Locate the **Fair Scheduler XML Advanced Configuration Snippet** property or search for it by typing its name in the Search box.
6. Copy the value of the **Fair Scheduler XML Advanced Configuration Snippet** into a file.
7. Clear the value of **Fair Scheduler XML Advanced Configuration Snippet**.
8. Recreate the desired Fair Scheduler allocations in the **Dynamic Resource Pools** page, using the saved file for reference.

New Cloudera Enterprise licensing is not reflected in the wizard and license page

Cloudera Bug: OPSAPS-18241

Workaround: None.

The AWS Cloud wizard fails to install Spark due to missing roles

Cloudera Bug: OPSAPS-18937

Workaround: Do one of the following:

- Use the Installation wizard.
- Open a new window, click the Spark service, click on the **Instances** tab, click **Add**, add all required roles to Spark. Once the roles are successfully added, click the **Retry** button in the Installation wizard.

Spark on YARN requires manual configuration

Spark on YARN requires the following manual configuration to work correctly: modify the YARN Application Classpath by adding `/etc/hadoop/conf`, making it the very first entry.

Cloudera Bug: OPSAPS-19788

Workaround: Add `/etc/hadoop/conf` as the first entry in the YARN Application classpath.

Monitoring works with Solr and Sentry only after configuration updates

Cloudera Manager monitoring does not work out of the box with Solr and Sentry on Cloudera Manager 5. The Solr service is in Bad health, and all Solr Servers have a failing "Solr Server API Liveness" health check.

Cloudera Bug: OPSAPS-18152

Severity: Medium

Workaround: Complete the configuration steps below:

1. Create "HTTP" user and group on all machines in the cluster (with `useradd 'HTTP'` on RHEL-type systems).
2. The instructions that follow this step assume there is no existing Solr Sentry policy file in use. In that case, first create the policy file on `/tmp` and then copy it over to the appropriate location in HDFS that Solr Servers check.

If there is already a Solr Sentry policy in use, it must be modified to add the following `[group] / [role]` entries for 'HTTP'. Create a file (for example, `/tmp/cm-authz-solr-sentry-policy.ini`) with the following contents:

```
[groups]
HTTP = HTTP
[roles]
HTTP = collection = admin->action=query
```

3. Copy this file to the location for the "Sentry Global Policy File" for Solr. The associated config name for this location is `sentry.solr.provider.resource`, and you can see the current value by navigating to the **Sentry** sub-category in the **Service Wide** configuration editing workflow in the Cloudera Manager UI. The default value for this entry is `/user/solr/sentry/sentry-provider.ini`. This refers to a path in HDFS.

4. Check if you have entries in HDFS for the parent(s) directory:

```
sudo -u hdfs hadoop fs -ls /user
```

5. You may need to create the appropriate parent directories if they are not present. For example:

```
sudo -u hdfs hadoop fs -mkdir /user/solr/sentry
```

6. After ensuring the parent directory is present, copy the file created in step 2 to this location, as follows:

```
sudo -u hdfs hadoop fs -put /tmp/cm-authz-solr-sentry-policy.ini
/user/solr/sentry/sentry-provider.ini
```

7. Ensure that this file is owned/readable by the solr user (this is what the Solr Server runs as):

```
sudo -u hdfs hadoop fs -chown solr /user/solr/sentry/sentry-provider.ini
```

8. Restart the Solr service. If both Kerberos and Sentry are being enabled for Solr, the MGMT services also need to be restarted. The Solr Server liveness health checks should clear up once SMON has had a chance to contact the servers and retrieve metrics.

Out-of-memory errors may occur when using the Reports Manager

Out-of-memory errors may occur when using the Cloudera Manager Reports Manager.

Cloudera Bug: OPSAPS-19980

Workaround: Set the value of the "Java Heap Size of Reports Manager" property to at least the size of the HDFS filesystem image (`fsimage`) and restart the Reports Manager.

Applying license key using Internet Explorer 9 and Safari fails

Cloudera Manager is designed to work with IE 9 and above and Safari. However the file upload widget used to upload a license currently does not work with IE 9 or Safari. Therefore, installing an enterprise license does not work.

Cloudera Bug: OPSAPS-17223

Workaround: Use another supported browser.

Issues Fixed in Cloudera Manager 5.0.0 Beta 2

The Sqoop Upgrade command in Cloudera Manager may report success even when the upgrade fails

Cloudera Bug: OPSAPS-18924

Workaround: Do one of the following:

- 1. Click the Sqoop service and then the **Instances** tab.
- 2. Click the Sqoop server role then the **Commands** tab.
- 3. Click the **stdout** link and scan for the Sqoop Upgrade command.

- In the All Recent Commands page, select the **stdout** link for latest Sqoop Upgrade command.

Verify that the upgrade did not fail.

The HDFS Canary Test is disabled for secured CDH 5 services.

Due to a bug in Hadoop's handling of multiple RPC clients with distinct configurations within a single process with Kerberos security enabled, Cloudera Manager will disable the HDFS canary test when security is enabled so as to prevent interference with Cloudera Manager's MapReduce monitoring functionality.

Cloudera Bug: OPSAPS-16537

Severity: Medium

Workaround: None

Not all monitoring configurations are migrated from MR1 to MR2.

When MapReduce v1 configurations are imported for use by YARN (MR2), not all of the monitoring configuration values are currently migrated. Users may need to reconfigure custom values for properties such as thresholds.

Cloudera Bug: OPSAPS-16211

Severity: Medium

Workaround: Manually reconfigure any missing property values.

"Access Denied" may appear for some features after adding a license or starting a trial.

After starting a 60-day trial or installing a license for Enterprise Edition, you may see an "access denied" message when attempting to access certain Enterprise Edition-only features such as the Reports Manager. You need to log out of the Admin Console and log back in to access these features.

Cloudera Bug: OPSAPS-16686

Severity: Low

Workaround: Log out of the Admin Console and log in again.

Hue must set impersonation on when using Impala with impersonation.

When using Impala with impersonation, the `impersonation_enabled` flag must be present and configured in the `hue.ini` file. If impersonation is enabled in Impala (in other words, if Impala is using Sentry) then this flag must be set **true**. If Impala is not using impersonation, it should be set **false** (the default).

Cloudera Bug: OPSAPS-16011

Workaround: Set advanced configuration snippet value for `hue.ini` as follows:

1. Go to the **Hue Service Configuration Advanced Configuration Snippet for `hue_safety_valve.ini`** under the Hue service Configuration settings, **Service-Wide > Advanced** category.
2. Add the following, then uncomment the setting and set the value True or False as appropriate:

```
#####  
# Settings to configure Impala  
#####  
  
[impala]  
....  
# Turn on/off impersonation mechanism when talking to Impala  
## impersonation_enabled=False
```

Cloudera Manager Server may fail to start when upgrading using a PostgreSQL database.

If you're upgrading to Cloudera Manager 5.0.0 beta 1 and you're using a PostgreSQL database, the Cloudera Manager Server may fail to start with a message similar to the following:

```
ERROR [main:dbutil.JavaRunner@57] Exception while executing
com.cloudera.cmf.model.migration.MigrateConfigRevisions
java.lang.RuntimeException: java.sql.SQLException: Batch entry <xxx> insert into REVISIONS
(REVISION_ID, OPTIMISTIC_LOCK_VERSION, USER_ID, TIMESTAMP, MESSAGE) values (...)
was aborted. Call getNextException to see the cause.
```

Cloudera Bug: OPSAPS-16971

Workaround: Use `psql` to connect directly to the server's database and issue the following SQL command:

```
alter table REVISIONS alter column MESSAGE type varchar(1048576);
```

After that, your Cloudera Manager server should start up normally.

Issues Fixed in Cloudera Manager 5.0.0 Beta 1

After an upgrade from Cloudera Manager 4.6.3 to 4.7, Impala does not start.

After an upgrade from Cloudera Manager 4.6.3 to 4.7 when Navigator is used, Impala will fail to start because the Audit Log Directory property has not been set by the upgrade procedure.

Cloudera Bug: OPSAPS-15333; added with Cloudera Manager 4.7.0

Severity: Low.

Workaround: Manually set the property to `/var/log/impalad/audit`.

Cloudera Navigator Data Management Release Notes

These release notes provide information about new features, changed features, resolved issues, and known issues (with workarounds when possible) for Cloudera Navigator Data Management component:

New Features and Changes in Cloudera Navigator Data Management

These two sections on this page describe what's new and what has changed in each Cloudera Navigator release:

- [New Features in Cloudera Navigator](#) on page 2688
- [Changed Features in Cloudera Navigator](#) on page 2709

New Features in Cloudera Navigator

The following sections describe what's new in each Cloudera Navigator release.

What's New in Cloudera Navigator 2.15.2

There are no new features in Cloudera Navigator 2.15.2. See [Issues Fixed in Cloudera Navigator 2.15.2](#) on page 2735. See also [Known Issues and Workarounds in Cloudera Navigator Data Management](#) on page 2714 for all known issues to date.

What's New in Cloudera Navigator 2.15.1

In addition to several new features and [changes to existing features](#) listed below, this release also includes several resolved issues. See [Issues Fixed in Cloudera Navigator 2.15.1](#) on page 2736 for details. See also [Known Issues and Workarounds in Cloudera Navigator Data Management](#) on page 2714 for all known issues to date.

- [New default audit extraction filters](#)
- [Improved HDFS metadata extraction performance](#)
- [Improved metadata purge performance](#)
- [New Cloudera Manager health alerts for Navigator Metadata Server](#)
- [New audit events for Fine Grained Privileges and Ownership](#)

New features include:

- **Improvements to audit extraction filters**

This release introduces changes to default HDFS audit filters to better focus the collection of audit events. The following rules were added or updated:

- All HDFS denied access events are accepted. Previously, HDFS denied access events from filtered users and filtered HDFS directories were not recorded.
- HDFS events from the Hive, Spark, and Impala staging directories are discarded. HDFS events from the following job history directories are also discarded:
 - `/user/history/done_intermediate`
 - `/user/spark/applicationHistory`
 - `/user/spark/spark2ApplicationHistory`
- All HDFS delete and rename operations from directories that are not already filtered are accepted.

In addition at the end of the filter list, Cloudera Manager provides a rule that filters events from HDFS `getFileinfo` operations. By default, this filter rule has no affect. Cloudera recommends that you change this rule to **Discard** to stop capturing events for this HDFS operation that indicates access to file *metadata* but does not indicate access to file *data*. This change alone may provide up to 30% reduction in HDFS audit data size.

When upgrading to this release, you may not see the new filters if you have customized your HDFS audit filters previously:

- If HDFS filters have been changed from the default, the new filters will NOT take effect.
- If HDFS filters have not been changed from the default, the new filters will take effect.

To review the recommended filters and determine further optimizations for your system's requirements, see [Recommended Audit Filters](#) and [Reviewing Default Audit Filters](#).

- **Improved HDFS metadata extraction performance**

Previously, Navigator processing for HDFS metadata extraction could take long enough that Navigator could not finish indexing the `fsimage` before the edit log was checkpointed into a new `fsimage`. This caused extraction to get stuck in a loop of always parsing the `fsimage` in bulk extraction mode (slow) rather than moving into incremental extraction from the edit log (fast). This release includes changes that allow Navigator to avoid this "bulk extraction loop" therefore reducing the duration of HDFS extraction by as much as half for the initial extraction. This change improves the performance of subsequent extractions significantly, both by making it much more likely that extraction will be incremental and from additional performance improvements in this fix.

- **Improved metadata purge performance**

This release includes changes that significantly reduce the time required to complete purging for HDFS entities and relations. The purge behavior is changed such that HDFS entities are not included in the purge if they are referenced as an endpoint in a data flow lineage relation.

- **New Cloudera Manager health alerts for Navigator Metadata Server**

This release includes new checks for Navigator Metadata Server health. If the checks fail, they trigger a health alert in Cloudera Manager for the Navigator Metadata Server. The checks include "Solr Element Count Threshold" and "Solr Relation Count Threshold". These checks trigger an alert if documents in Navigator Metadata Server's embedded Solr collection are threatening to exceed the maximum allowed number for either the element core or the relation core. Typically, if either of these alerts trigger, Navigator has encountered a problem that produces more relations than it should. The triggers let you know that this is happening while it can be addressed efficiently.

- **New audit events for Fine Grained Privileges and Ownership**

Navigator Audit Server receives audit events from Sentry, Hive, and Impala that are produced when a user changes ownership for a database, table, or view. For more information, see Sentry's [Object Ownership](#).

What's New in Cloudera Navigator 2.14.2

There are no new features in Cloudera Navigator 2.14.2.

What's New in Cloudera Navigator 2.14.1

There are no new features in Cloudera Navigator 2.14.1.

Note: This version of Cloudera Navigator has a class-compatibility issue that can cause the Navigator Metadata Server to not start; the problem and work-around are described in [Known Issues](#).

What's New in Cloudera Navigator 2.14.0

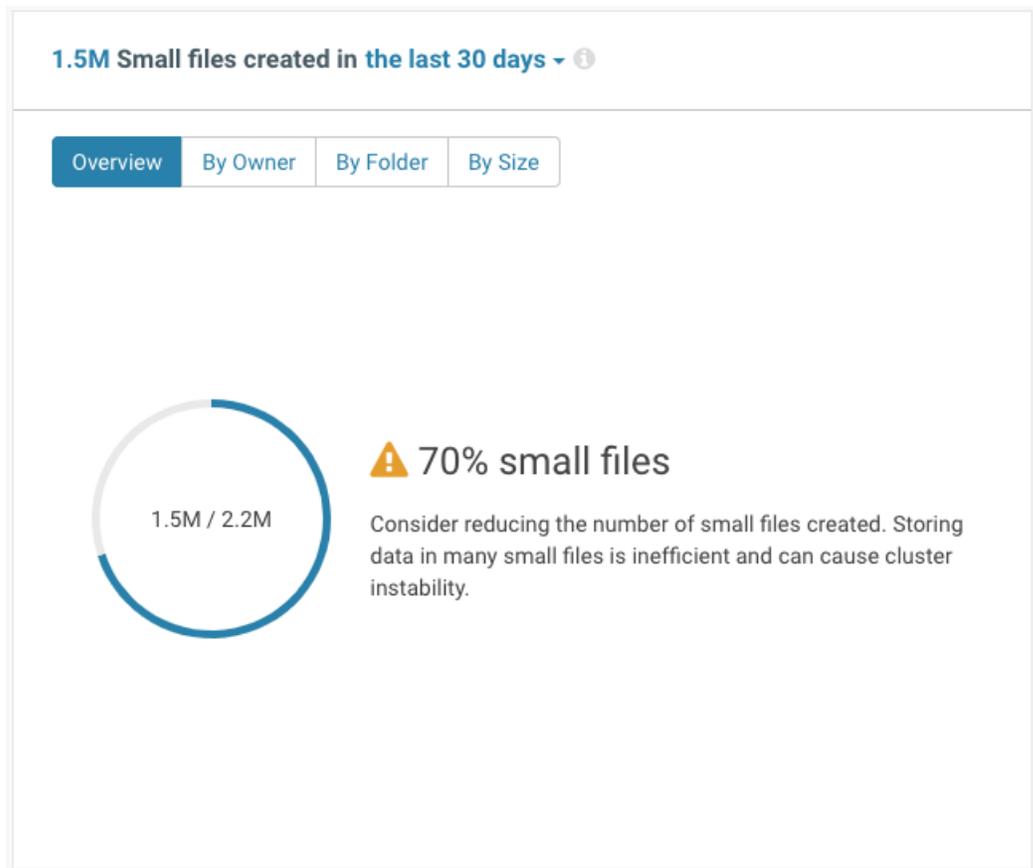

In addition to several new features and [changes to existing features](#) listed below, this release also includes several resolved issues. See [Issues Fixed in Cloudera Navigator 2.14.0](#) on page 2744 for details. See also [Known Issues and Workarounds in Cloudera Navigator Data Management](#) on page 2714 for all known issues to date.

- [Dashboard widget for small files](#)
- [Dashboard widget for active users](#)
- [Preventing concurrent logins](#)

New features include:

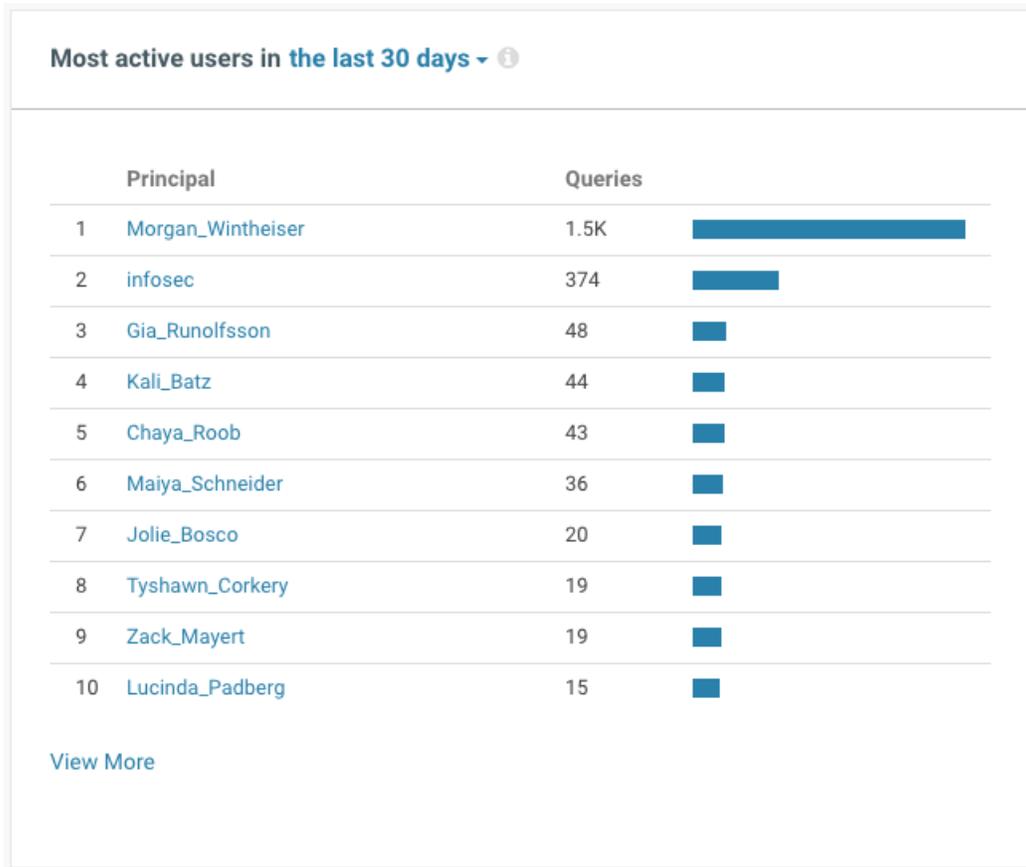

- **Dashboard widget for small files**

Small files can be a performance problem on a Hadoop cluster, particularly when table partitions are assembled from many small files. The Navigator dashboard now provides widgets that visualize the presence of small files based on the files' owner, location, and size. An overview section shows the fraction of small files to large files in the cluster, including a warning if the fraction of small files to larger files exceeds 50%. This metric identifies "small files" as being smaller than 256 KiB.

- **Dashboard widget for active users**

This release includes an additional Navigator dashboard widget that shows the active users by query. The metric includes all Hive and Impala query operation executions.

- **Preventing concurrent logins**

An option is now available to limit the number of simultaneous sessions authenticated against the same user name. The property `nav.max.concurrent.sessions` takes an integer value as a limit; set the value to -1 (default) to turn off the limit. To change the default behavior, in Cloudera Manager, add the property with a new value to the "Navigator Metadata Server Advanced Configuration Snippet (Safety Valve) for cloudera-navigator.properties." Restart the Navigator Metadata Server to apply the change.

What's New in Cloudera Navigator 2.13.4

There are no new features in Cloudera Navigator 2.13.4.

What's New in Cloudera Navigator 2.13.2

In addition to the new features listed below, this release also includes changes and resolved issues. See [What's Changed in Cloudera Navigator 2.13.2](#) on page 2710 for changes, [Issues Fixed in Cloudera Navigator 2.13.2](#) on page 2748 for resolved issues and [Known Issues and Workarounds in Cloudera Navigator Data Management](#) on page 2714 for known issues.

The new feature is:

- **Preventing concurrent logins**

An option is now available to limit the number of simultaneous sessions authenticated against the same user name. The property `nav.max.concurrent.sessions` takes an integer value as a limit; set the value to -1 (default) to turn off the limit. To change the default behavior, in Cloudera Manager, add the property with a new value to the "Navigator Metadata Server Advanced Configuration Snippet (Safety Valve) for cloudera-navigator.properties." Restart the Navigator Metadata Server to apply the change.

Cloudera Navigator Data Management Release Notes

What's New in Cloudera Navigator 2.13.1

This release of Cloudera Navigator includes no new features or fixed issues. See [Known Issues and Workarounds in Cloudera Navigator Data Management](#) on page 2714 for known issues.

What's New in Cloudera Navigator 2.13.0

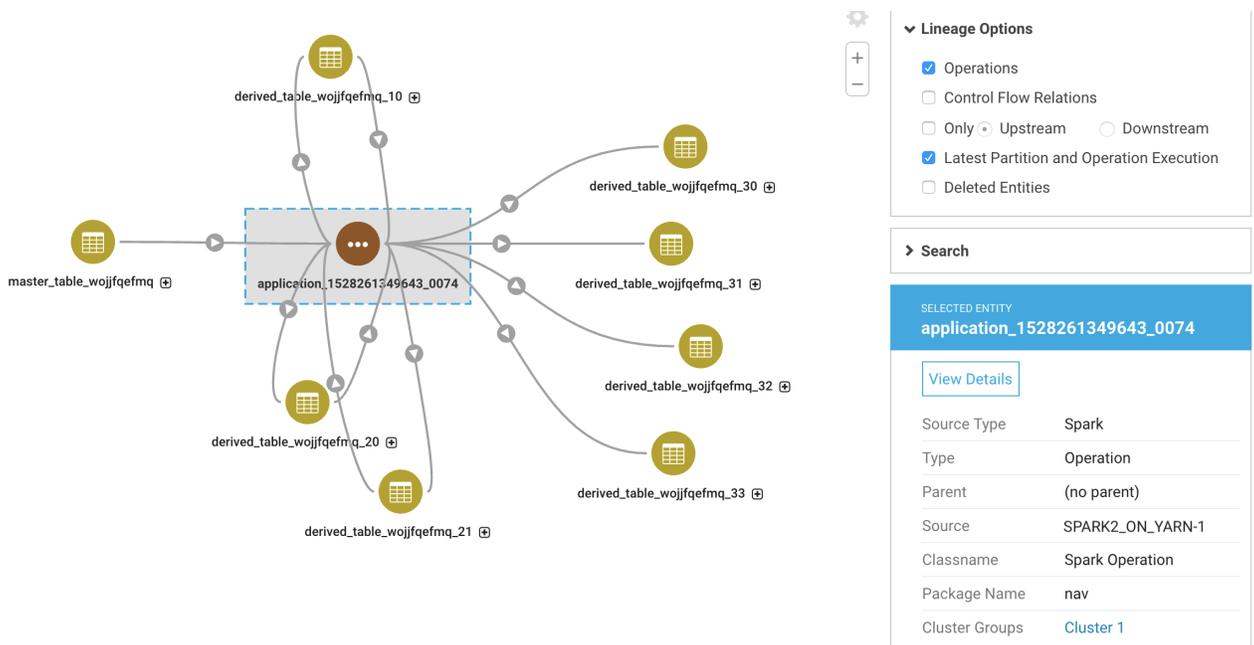

In addition to several new features and [changes to existing features](#) listed below, this release also includes several resolved issues. See [Issues Fixed in Cloudera Navigator 2.13.0](#) on page 2749 for details. See also [Known Issues and Workarounds in Cloudera Navigator Data Management](#) on page 2714 for all known issues to date.

- [Spark2 operations supported in search and lineage](#)
- [Improved Hive extraction performance](#)
- [Group by helps explore connections among search results](#)
- [User interface improvements](#)
- [Audit Event filtering with "Not Like"](#)

New features include:

- **Spark2 operations supported in search and lineage**

This release introduces support for Spark2 operations and operation executions in Navigator metadata management, including search and lineage. Navigator extracts metadata for Spark2 events and generates lineage relations using that information. Spark operations and operation executions appear in Navigator with source type "Spark" and source names that start with "SPARK2_ON_YARN".

All the features of Spark 1 are available for Spark 2, starting with Spark 2 version 2.3.

At this time, lineage for Spark2 is not supported on Altus clusters.

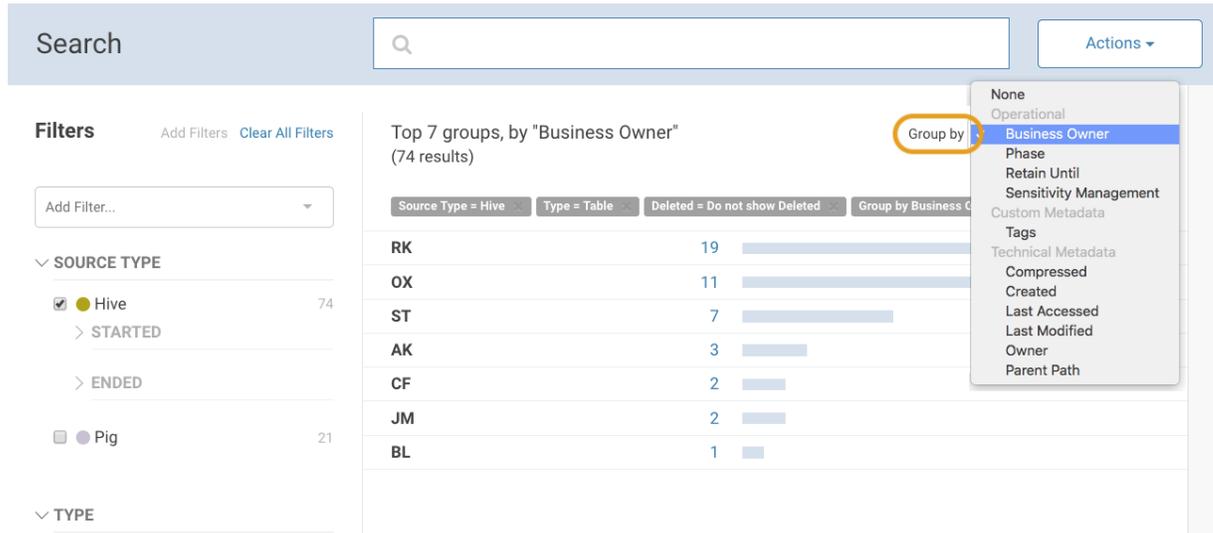

- **Improved Hive extraction performance**

This release includes two areas of performance improvement for Hive metadata extraction:

- **Partitions:** Metadata extraction performance for Hive partitions is considerably improved.
- **Incremental extraction:** Metadata extraction through the Hive Metadata Server (HMS) now only extracts new and changed metadata; the result is more frequent extractions for Hive metadata reducing lag-time for users and significantly less load on HMS.

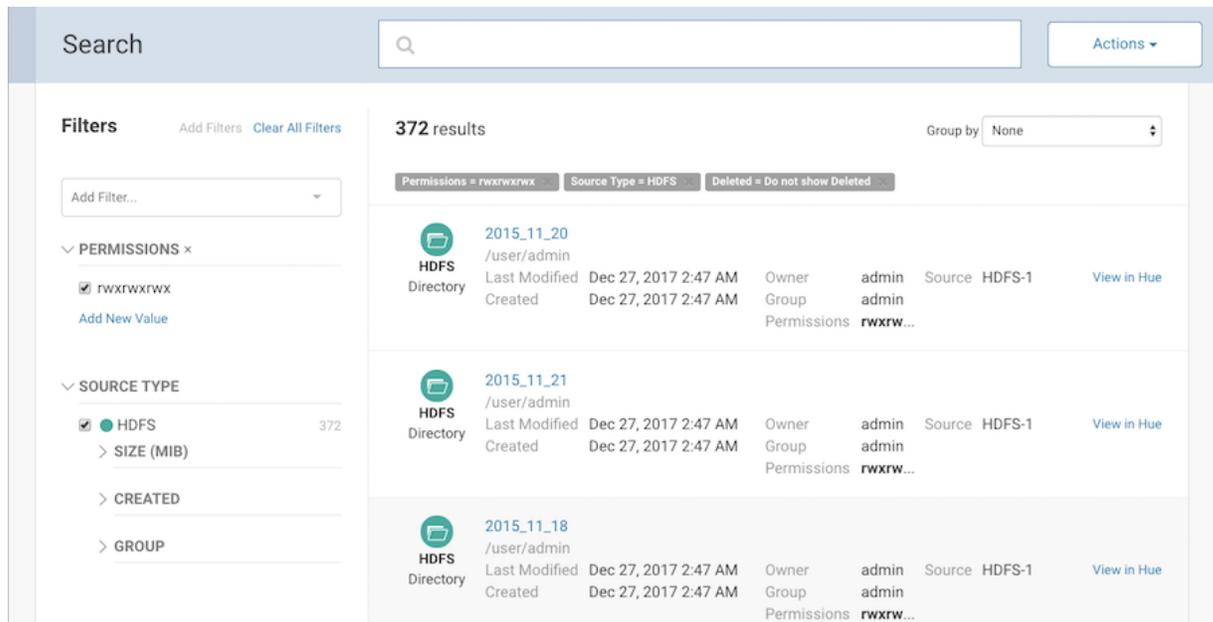

- **Group by helps explore connections among search results**

Metadata searches in Navigator now include the ability to group search results by common properties. Group by lets you use technical, managed, and custom metadata to quickly identify small files, active SQL users, table-creation trends, and other data aggregation trends revealed by metadata properties.

- **User interface improvements**

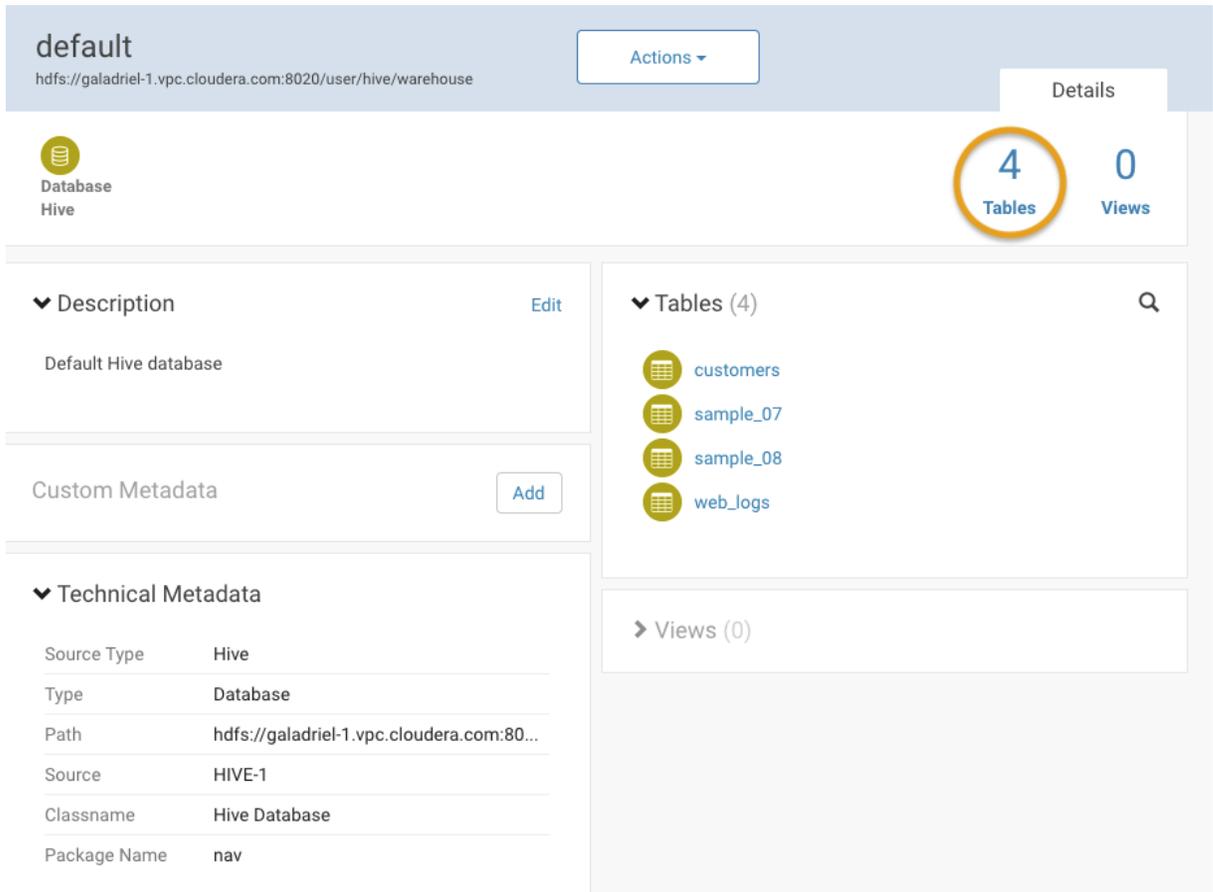

This release includes an improved layout for search results so they are easier to read and understand.

Also, the Navigator console includes some display changes to make detail screens easier to read:

- Tags are now included in the Custom Metadata group.
- Description, Managed Metadata, and Custom Metadata now always show above Technical Metadata, even if the sections are empty.

In addition, on the detail page for a database entity, clicking the table count summary statistic now takes you to search results listing the tables in the database.

- **Audit Event filtering with "Not Like"**

The Audit Events list now allows filtering using the "not like" operator in addition to "like", "equals", and "not equals". Use this operator to remove events from the list based on a partial match such as part of an IP address.

What's New in Cloudera Navigator 2.12.3

In addition to the new feature listed below, this release also includes a change and several resolved issues. See [What's Changed in Cloudera Navigator 2.12.3](#) on page 2710 for changes, [Issues Fixed in Cloudera Navigator 2.12.3](#) on page 2751 for resolved issues and [Known Issues and Workarounds in Cloudera Navigator Data Management](#) on page 2714 for known issues.

The new feature is:

- **Preventing concurrent logins**

An option is now available to limit the number of simultaneous sessions authenticated against the same user name. The property `nav.max.concurrent.sessions` takes an integer value as a limit; set the value to -1 (default) to turn off the limit. To change the default behavior, in Cloudera Manager, add the property with a new value to the "Navigator Metadata Server Advanced Configuration Snippet (Safety Valve) for cloudera-navigator.properties." Restart the Navigator Metadata Server to apply the change.

What's New in Cloudera Navigator 2.12.1

In addition to the new features listed below, this release also includes several resolved issues. See [Issues Fixed in Cloudera Navigator 2.12.1](#) on page 2751 for details. See also [Known Issues and Workarounds in Cloudera Navigator Data Management](#) on page 2714 for all known issues to date.

- [Improved performance for extracting Hive metadata from the HiveServer2 metastore](#)

New features include:

- **Improved performance for extracting Hive metadata from the HiveServer2 metastore.**

This release includes an optimization for extracting metadata for Hive partitions that considerably improves the extraction performance.

What's New in Cloudera Navigator 2.12.0

In addition to several new features and [changes to existing features](#) listed below, this release also includes several resolved issues. See [Issues Fixed in Cloudera Navigator 2.12.0](#) on page 2753 for details. See also [Known Issues and Workarounds in Cloudera Navigator Data Management](#) on page 2714 for all known issues to date.

- [Custom extraction filters for improved performance and reduced storage consumption](#)
- [Support for TLS/SSL for Navigator Audit Server](#)
- [Cloudera Navigator console enhancements and new features](#)

New features include:

- **New custom filters for more selective extraction also help reduce storage consumption.**

Administrators can now create custom blacklists (and whitelists) to specifically exclude (or include) HDFS and Amazon S3 entities during the extraction process. The result is faster extraction—collect only what you really want—and less consumption by Cloudera Navigator on storage media. Users with the Cloudera Manager Full Administrator or Navigator Administrator user roles can configure the settings using the Cloudera Manager Admin Console. The entity filters for HDFS and for Amazon S3 buckets are independently configurable. As shown below, one or more HDFS paths can be blacklisted, while one or more S3 buckets can be whitelisted or blacklisted. The example shows an HDFS path that will be excluded from the extraction process, and two Amazon S3 buckets that will explicitly included in the extraction process (with all other S3 buckets disregarded).

HDFS Filter Enable nav.filter.hdfs.enable	<input checked="" type="checkbox"/> Navigator Metadata Server Default Group ↻
HDFS Filter Blacklist nav.filter.hdfs.blacklist	Navigator Metadata Server Default Group ↻ <input type="text" value="/path-to-exclude"/> <input type="button" value="="/> <input type="button" value="+"/>
S3 Filter Enable nav.filter.s3.enable	<input checked="" type="checkbox"/> Navigator Metadata Server Default Group ↻
S3 Filter Default Action nav.filter.s3.default.action	Navigator Metadata Server Default Group ↻ <input type="radio"/> ACCEPT <input checked="" type="radio"/> DISCARD
S3 Filter list nav.filter.s3.list	Navigator Metadata Server Default Group ↻ <input type="text" value="bucket-one-to-include"/> <input type="button" value="="/> <input type="button" value="+"/> <input type="text" value="bucket-two-to-include"/> <input type="button" value="="/> <input type="button" value="+"/>

Rather than hard-coding paths, regular expressions can be used. For example, to exclude all the files and directories under `/tmp`, include the blacklist filter:

```
/tmp(?:/.*)?
```

Cloudera Navigator Data Management Release Notes

Unlike the HDFS filter which functions solely as a blacklist to exclude specified HDFS paths from the extraction process, the S3 Filter list serves as a blacklist or whitelist for the extraction process, depending on the S3 Filter Default Action specified as follows:

- **ACCEPT**—The buckets listed are blacklisted from the extraction process. The extraction process filters out nothing (accepts everything) but ignores the buckets specified in the S3 Filter list.
- **DISCARD**—The extraction process filters out (discards) everything, collecting only from the buckets specified in the S3 Filter list.

Important: When **Discard** is selected as the **S3 Filter Default Action**, be sure to add buckets for extraction to the **S3 Filter list**. Selecting Discard without identifying any buckets in the S3 Filter list results in no data being extracted.

- **TLS/SSL supported by Navigator Audit Server data collection for enhanced security.**

The Navigator Audit Server can now be configured to use TLS/SSL to encrypt communications over HTTP (HTTPS) and from RPC client-server processes (for example, Clouder Manager Agent process used to transmit audit data to the server). As with Navigator Metadata Server, TLS/SSL for Navigator Metadata Server is configured using the Cloudera Manager Admin Console.

- **Cloudera Navigator console new visual element renderings (selectors, icons, fonts, and the like).**

New renderings in the Cloudera Navigator console include the following:

- [New date-and-time selector for Dashboard.](#)
- [New property \(Database\) displays in lineage for tables.](#)
- [New button for SQL copy-and-paste to clipboard for Query Text.](#)
- [New SQL query text formatting for ease of viewing and use.](#)
- [New Feedback button for Google Analytics.](#)

- **New date-and-time selector for Data Stewardship Dashboard.**

The Cloudera Navigator console (**Analytics > Data Stewardship > Dashboard**) now has full date and range picker rather than the drop-down period selector of prior releases. The activity summary number also now shows the sum of events over the given time period (rather than the last point on the graph as was in prior releases), and the time period displays in the graph.

The screenshot displays the 'Data Stewardship Analytics' dashboard. The 'Activity Summary' section shows 'Tables Created' as 122 and 'Partitions Created' as 28. A date range picker is open, showing a calendar for August and September 2017. The selected range is 'Aug 29, 2017 - Sep 28, 2017'. The calendar shows the dates 29 and 28 highlighted. The dashboard also features several line graphs representing activity over time.

- **Lineage for tables now includes database in Selected Entity.**

In previous releases, the Database, Parent, and other fetched properties displayed on the details page, but not when selected in a lineage graph. In this release, databases are now shown in the Selected Entity box in lineage diagrams when tables are selected.

- **Search results display more quickly in Cloudera Navigator console.**

Counts for selected entities are now being cached for faster Search display. After the initial search for any selected Filter, the facet counts for each facet are populated and the results are cached and refreshed at regular intervals. Thanks to this caching, the Cloudera Navigator console is much more responsive for searching. The larger the cluster, the more noticeable the improvement.

- **Improved formatting of SQL query text for ease of viewing and use.**

The information pop-up for Query Text (on the Details for a selected entity) includes better use of white space and other formatting improvements for enhanced readability. (The screenshot below is based on simple sample code that does not show many of the new and improved visual cues for SQL syntax).

The screenshot displays the 'Technical Metadata' section for a Hive query. The metadata table includes fields like Source Type (Hive), Parent (no parent), Query Text (create table sales_by_region as SE...), Inputs (SALESDATA), Outputs (SALES_BY_REGION), Source (HIVE-1), Classname (Hive Query), Package Name (nav), and Cluster Groups (Cluster 1). A 'Query Text' pop-up is overlaid on the right, showing the SQL query: `create table sales_by_region as SELECT s_neighbor, sum(s_price) as Price FROM salesdata GROUP BY s_neighbor`. The pop-up also features a copy-to-clipboard icon in its top right corner. Below the pop-up, the 'Operation Executions (1)' section is partially visible, showing 'Outputs (1)' and a 'Feedback' button on the far right.

- **New button to copy SQL to clipboard now available for Query Text.**

The Query Text pop-up now includes a new copy-to-clipboard button that lets SQL users quickly copy the SQL text displayed in the pop-up to the clipboard for subsequent use elsewhere. As shown in the screenshot above, the location of this button is in the upper right-hand corner of the Query Text pop-up.

Note: Only browsers that support copy-to-clipboard functionality can display this new button. Older browsers that cannot copy-to-clipboard do not display the new button.

- **User feedback module available.**

When Analytics is enabled (Navigator Metadata Server set to **Allow Usage Data Collection**), a **Feedback** button becomes enabled for the Cloudera Navigator console (right-hand side, vertical orientation—see [screenshot above](#)) that lets users log actions and send feedback.

See [What's Changed in Cloudera Navigator 2.12.0](#) on page 2710 for other changes in this release.

What's New in Cloudera Navigator 2.11.2

This release of Cloudera Navigator data management includes no new features. See [Issues Fixed in Cloudera Navigator 2.11.2](#) on page 2754 for resolved issues and see [Known Issues and Workarounds in Cloudera Navigator Data Management](#) on page 2714 for known issues.

What's New in Cloudera Navigator 2.11.1

In addition to support for clusters deployed to Amazon Web Services (AWS) using Cloudera Altus, this release of Cloudera Navigator data management includes some [Issues Fixed in Cloudera Navigator 2.11.1](#) on page 2755 resolved issues. See [Known Issues and Workarounds in Cloudera Navigator Data Management](#) on page 2714 for known issues and workarounds.

- **Obtain metadata and lineage from Altus transient clusters.**

Cloudera Navigator can now extract Hive and MapReduce metadata and lineage from transient clusters deployed to AWS using Cloudera Altus. Entities from clusters instantiated by Cloudera Altus users can be seen in lineage diagrams in a centralized Cloudera Navigator instance running on a persistent or long-running Cloudera Manager cluster.

This new feature is supported with new properties and attributes displayed in the Cloudera Navigator console, to distinguish **long-running** from **Altus** clusters and to distinguish among transient clusters. For example, the **Cluster Group** property identifies all clusters that have been created using the same Altus Environment Name and Altus Cluster name. The **Cluster Instance** distinguishes each instance in the same group from the others, so that metadata and lineage extracted from transient clusters over time can be identified. Here is a summary of new Source Type and Type attributes for clusters:

- Source Type: Cluster
- Cluster-*name* (Cluster Group)
- Deployment Type: Long-running, Altus
- Classname: Cluster Group, Cluster Instance
- Cluster Template, Cluster Instance (Classname)

Entities extracted and their labels as seen in the Cloudera Navigator console include the following:

Entity	Label
altusAwsRegion	Altus AWS Region
altusClusterCrn	Altus Cluster CRN

Entity	Label
altusClusterType	Altus Cluster Type
altusComputeWorkerInstanceType	Altus Compute Worker Instance Type
altusEnvCrn	Altus Env CRN
altusWorkerInstanceType	Altus Worker Instance Type

The **CRN** is the Cloudera Resource Name created and use by Cloudera Altus to manage resources. All nodes in a Cloudera Altus launched cluster have the same CRN.

What's New in Cloudera Navigator 2.11.0

In addition to the new features and the [changes](#) listed below, this release resolves some issues. See [Issues Fixed in Cloudera Navigator 2.11.0](#) on page 2755.

- **Automated Purge feature enabled by default.**

The Purge feature is enabled by default in this release. It uses the default settings shown in the table below unless these settings are changed using the Cloudera Navigator console using the [new Purge Settings](#) tab.

Note: If you enabled the Purge mechanism in a prior release using the Advanced Configuration Snippet (Safety Valve), you should remove it after upgrading to this release. See [What's Changed in Cloudera Navigator 2.11.0](#) on page 2711 for details.

Property	Default	Usage note
How often	Weekly	The Purge process runs automatically each week on the day and time specified.
Day	Saturday	Select a day for the purge that will have minimal impact to your user community.
Time	12 Midnight	Select a time that will have minimal impact on production.
Maximum purge duration	12 hours	Set the amount of time you want to allow for the Purge process to run. The process will not run beyond your specified duration even if it has not completed the purge. Entities purged to that point remain purged. No other Cloudera Navigator operations can occur during the Purge process.
Purge entities deleted more than*	60 days	Select the number of days after entity deletion that will elapse until the purge process removes it. A setting of 60 day purges entities deleted over 61 days ago but retains entities deleted within the last 60 days.
Purge SELECT operations*	Enabled.	Hive and Impala SELECT operations older than the number of days specified in the Only Purge SELECT operations older than* setting are purged.
Only Purge SELECT operations older than*	60 days	The purge will include only those SELECT operations older than this specified number of days.

- **Scalability enhancement for Hive and Impala query execution.**

Heavy Hive and Impala usage can consume lots of storage for similar queries in the Cloudera Navigator data directory (Solr repository). Specifically, because each query can produce (query * query(parts)) entities, a large number of complex queries can result in thousands (or millions) of entities, impeding the lineage tracing process.

To reduce the number of entities created, this release of Cloudera Navigator includes an improved internal query compiler that takes advantage of the fact that many queries vary only by the value of literals. The compiler de-duplicates query executions by dropping the literals when possible and using anonymous queries (using ? rather than literal) instead.

Note: Literals are anonymized in metadata and lineage but remain as literals in audit events subject to your specified audit log redaction policy.

- **Enhancements to Cloudera Navigator console to support new or improved features:**

- **New Administration page for Purge Settings.** Purge Settings is a new tab in the Cloudera Navigator console that lets you schedule weekly Purge operations to remove deleted and stale entities from the Navigator Metadata Server. The Purge is enabled and runs automatically using the [default schedule settings listed in the table](#). Change as needed:

1. Log in to the Cloudera Navigator console.
2. Select **Administration > Purge Settings**.

See [Managing Metadata Storage with Purge](#) in the [Cloudera Navigator Data Management](#) guide for details.

- **Data Stewardship Dashboard.** The Data Stewardship Dashboard now displays:

- Counts of S3 and HDFS objects
- Counts of encrypted and unencrypted objects
- Correct timezone (the server's timezone) despite any differences between timezone of client system displaying the Dashboard and the server

- **Managed Metadata allows deleting namespaces.** The Managed Metadata page now provides a **Manage Namespaces** button that lists namespaces and lets you delete them from the system.

1. Log in to the Cloudera Navigator console.
2. Select **Administration > Managed Metadata**.
3. Click the **Manage Namespaces** button.
4. Click an empty namespace from the list and select **Delete** from the Actions selector.

- **Metadata and lineage extraction from Isilon OneFS.** Dell EMC Isilon OneFS and Cloudera Navigator are now fully integrated, enabling Cloudera Navigator to extract metadata and lineage from clusters that use this advanced storage technology.
- **New configuration setting available for multiple Hue instances behind external load balancers.**

Cloudera Navigator has supported Hue integration (since Cloudera Navigator 2.1 release) by providing links to the appropriate Hue tool in Search results, which open the [Hue interface to the entity](#).

However, for multiple Hue instances deployed behind external load-balancers such as in certain [Hue high availability configurations](#), the links are properly generated only if the host name of the external load-balancer is set as the preferred URL, by configuring the Advanced Configuration Property (Safety Valve) as detailed in the following steps:

1. Log in to Cloudera Manager Admin Console using an account with Full Administrator privileges.
2. Select **Clusters > Cloudera Management Service**.
3. Click the **Configuration** tab.
4. Under filter Scope, click **Navigator Metadata Server**.
5. Under the Category filter, click **Advanced**.
6. Scroll to the property **Navigator Metadata Server Advanced Configuration Snippet (Safety Valve) for cloudera-navigator.properties**.

7. Set the `nav.hue.preferred_baseurl.{clusterName}` to the fully-qualified domain name of your Hue load-balancer using this format:

```
nav.hue.preferred_baseurl.{clusterName}=hue-load-balancer.example.com
```

For example, if a load-balancer for multiple Hue services is setup on host `hue_lb_nginx.example.com`, the entry would be as follows:

Navigator Metadata Server
Advanced Configuration
Snippet (Safety Valve) for
cloudera-
navigator.properties

Navigator Metadata Server Default Group

```
nav.hue.preferred_baseurl.myCluster=https://hue_lb.example.com:8889
```

8. Click **Save**.
 9. Restart the Navigator Metadata Server role. Links to Hue will now be properly created and available in the Search results lists in the Cloudera Navigator console.
- **Hue download operations (EXPORT, DOWNLOAD) included in audit data.** Download and export operations from Hue are now collected by Navigator Audit Server. The Audit Event includes the following details:

```
{ "username": "username", "impersonator": "hue", "eventTime": epoch-time-int,
  "operationText": "User username exported to HDFS destination: path/here/filename",
  "service": "service-name", "url": "/service-name-result-path", "allowed": true,
  "operation": "EXPORT", "ipAddress": client-ip-address }
{
```

What's New in Cloudera Navigator 2.10.2

This release of Cloudera Navigator data management includes no new features. See [Issues Fixed in Cloudera Navigator 2.10.2](#) on page 2757 for resolved issues and see [Known Issues and Workarounds in Cloudera Navigator Data Management](#) on page 2714 for known issues.

What's New in Cloudera Navigator 2.10.1

This release of Cloudera Navigator data management includes no new features. See [Issues Fixed in Cloudera Navigator 2.10.1](#) on page 2758 for resolved issues and see [Known Issues and Workarounds in Cloudera Navigator Data Management](#) on page 2714 for known issues.

What's New in Cloudera Navigator 2.10.0

In addition to these new features and [the changes listed below](#), several issues have been resolved in this release. See [Issues Fixed in Cloudera Navigator 2.10.0](#) on page 2759.

- **Data Stewardship Dashboard.** The Data Stewardship Dashboard is fully supported and enabled by default in this release. Originally introduced in Cloudera Navigator 2.9 but disabled by default, the Data Stewardship Dashboard displays summary activity about data entities—tables created, tables altered, databases created, SQL queries started, for example. The time frame for the summary is selectable using the Dashboard's trend widget (daily, weekly, monthly, quarterly) to instantly adjust the overall picture of your data. Displayed below the summary results are more detailed views of the data, ranked by count and listing details for the entities as captured by the Navigator Metadata Server. For example, top files by size lists the top 10 files by file name, path, file size, with graphical bar chart rendering for easy visual comparison.
- **Data Explorer.** The Data Explorer is an interactive companion to the Data Stewardship Dashboard for viewing and comparing selected data sources over time in terms of averages or trends. Users can select any of the various data sources (databases created, tables created, tables altered, and so on), select chart tools (average, trendline), and select a time period over which to render the data.

Note: To use the Data Stewardship Dashboard and the Data Explorer, select **Analytics > Data Stewardship** from the Cloudera Navigator menu. See [Data Stewardship Dashboard](#) for details.

- **Spark (Spark 1.6) Lineage Support.** The collection mechanism for Spark job lineage has been enhanced to capture Spark application execution—input data, output data, and column-level when possible for each invocation of spark-submit. In addition, lineage for Spark jobs is now collected automatically. Support for this capability in the prior release required manual configuration using a safety valve (advanced configuration snippet). Currently, support is for Spark 1.6 (not Spark 2) and lineage is collected for data read and written using Spark Dataframes and SparkSQL only (RDDs not yet supported). See [Known Issues and Workarounds in Cloudera Navigator Data Management](#) on page 2714 for other limitations.
- **Integration with Navigator for Hue for metadata discovery.** Search and tag partitions, databases, views, tables, columns. This capability must be enabled. See [How to Enable and Use Navigator in Hue](#) for details.
- **Improved logging for Amazon S3 data.** Navigator Server logs now capture information (INFO) about Amazon S3 buckets from which the server is both collecting and not collecting metadata. This enhancement can facilitate better root cause analysis for issues that may arise.

What's New in Cloudera Navigator 2.9.2

This release has no new features. However, some issues have been resolved. See [Issues Fixed in Cloudera Navigator 2.9.2](#) on page 2760 for details. See [Known Issues and Workarounds in Cloudera Navigator Data Management](#) on page 2714 for current listing of all known issues and workarounds.

What's New in Cloudera Navigator 2.9.1

A number of issues have been fixed. See [Issues Fixed in Cloudera Navigator 2.9.1](#) on page 2761.

What's New in Cloudera Navigator 2.9.0

- Navigator can now extract technical metadata from data stored on Amazon S3. You can filter results based on the S3 source type and other related S3 properties. See [Navigator and S3](#).
- Solr indexing has been optimized to improve search speed and reduce memory requirements. When Cloudera Navigator is started after an upgrade, you will see a message indicating upgrade progress. See [Upgrading the Cloudera Navigator Management Component](#).
- Managed metadata properties editing has been enhanced. Properties can now be individually viewed, updated, or deleted. Deleted properties are still available from the Administration page and can be restored until they are purged and permanently removed.
- Policy editor has been enhanced:
 - All types of managed metadata can be assigned (text, number, Boolean, date, and enumeration) instead of only text.
 - UI support for managed metadata assignment has been added.
 - Managed metadata assignments can now be multi-valued.
- Auditing health check - You can configure an auditing pipeline health check to verify that auditing is working and is not silently down. See [Verifying that Auditing Is Running](#).
- You can now specify which columns to export when you export an audit report.
- The overall look and feel of the user interface for Cloudera Navigator has been updated.
- Navigator Data Stewardship dashboard - Cloudera Navigator 2.9 introduces the Data Stewardship dashboard, which provides "at-a-glance" information and metrics to help you understand the state of the data and data usage. The dashboard displays information about table, file, and database activity, operations and operation executions, and other information captured by the Navigator Metadata Server. The dashboard is currently unsupported. See [Data Stewardship Dashboard](#).

What's New in Cloudera Navigator 2.8.3

This release of Cloudera Navigator data management includes no new features. See [Issues Fixed in Cloudera Navigator 2.8.3](#) on page 2762 for resolved issues and see [Known Issues and Workarounds in Cloudera Navigator Data Management](#) on page 2714 for known issues.

What's New in Cloudera Navigator 2.8.2

There are no new features or fixed issues in this release.

What's New in Cloudera Navigator 2.8.1

A number of issues have been fixed. See [Issues Fixed in Cloudera Navigator 2.8.1](#) on page 2763.

What's New in Cloudera Navigator 2.8.0

- Support for purging metadata for Hive and Impala SELECT queries, and for YARN, Sqoop, and Pig operations has been added. See [Purging Metadata for HDFS Entities, Hive and Impala Select Queries, and YARN, Sqoop, and Pig Operations](#).
- A new user role that allows editing custom metadata—**Custom Metadata Administrator**—has been added. Grant this role to end users so they can tag their data sets with custom metadata without giving them permission to edit managed metadata. See [User Roles](#).
- You can configure display of inputs and outputs in the entity Details page. See [Enabling Inputs and Outputs to Display](#).

A number of issues have been fixed. See [Issues Fixed in Cloudera Navigator 2.8.0](#) on page 2763.

What's New in Cloudera Navigator 2.7.5

There are no new features or fixed issues in this release.

What's New in Cloudera Navigator 2.7.4

There are no new features or fixed issues in this release.

What's New in Cloudera Navigator 2.7.3

An issue has been fixed. See [Issues Fixed in Cloudera Navigator 2.7.3](#) on page 2764.

What's New in Cloudera Navigator 2.7.2

A number of issues have been fixed. See [Issues Fixed in Cloudera Navigator 2.7.2](#) on page 2764.

What's New in Cloudera Navigator 2.7.1

An issue has been fixed. See [Issues Fixed in Cloudera Navigator 2.7.1](#) on page 2765.

What's New in Cloudera Navigator 2.7.0

- **Platform enhancements**
 - Added support for assigning managed metadata through policies. Only single-valued managed metadata of type Text is currently supported. See [Using Policies to Automate Metadata Tagging](#).
 - Added support for purging physical operations corresponding to logical operations. See [Performing Actions on Entities](#).
- **Cross Site Request Forgery (CSRF)** protection is enabled by default. If you currently use cookies for authentication in API requests with a non-GET method (for example, the POST method), you must also obtain CSRF tokens for the request, or disable CSRF protection.

You can disable CSRF protection by setting `nav.disable_api_csrf_security=true`.

Cloudera Navigator Data Management Release Notes

A number of issues have been fixed. See [Issues Fixed in Cloudera Navigator 2.7.0](#) on page 2765

What's New in Cloudera Navigator 2.6.6

There are no new features or fixed issues.

What's New in Cloudera Navigator 2.6.5

A number of issues have been fixed. See [Issues Fixed in Cloudera Navigator 2.6.5](#) on page 2768

What's New in Cloudera Navigator 2.6.4

There are no new features or fixed issues.

What's New in Cloudera Navigator 2.6.3

There are no new features or fixed issues.

What's New in Cloudera Navigator 2.6.2

A number of issues have been fixed. See [Issues Fixed in Cloudera Navigator 2.6.2](#) on page 2768.

What's New in Cloudera Navigator 2.6.1

A number of issues have been fixed. See [Issues Fixed in Cloudera Navigator 2.6.1](#) on page 2769.

What's New in Cloudera Navigator 2.6.0

- **Platform enhancements**

- Added support for defining new types of business metadata.
- Enhanced entity details with type-specific information and behavior.
- Added support for filtering lineage.
- Added support for purging the metadata store.
- Added support for securing audit messages sent to Kafka.

A number of issues have been fixed. See [Issues Fixed in Cloudera Navigator 2.6.0](#) on page 2771.

What's New in Cloudera Navigator 2.5.1

Note: In the Cloudera Navigator 2.5.1 release, there are no new features or fixed issues.

What's New in Cloudera Navigator 2.5.0

An issue has been fixed. See [Issues Fixed in Cloudera Navigator 2.5.0](#) on page 2772.

What's new in Cloudera Navigator 2.4.6

Note: In the Cloudera Navigator 2.4.6 release, there are no new features or fixed issues.

What's New in Cloudera Navigator 2.4.4

Several issues have been fixed. See [Issues Fixed in Cloudera Navigator 2.4.4](#) on page 2772.

What's New in Cloudera Navigator 2.4.3

Note: In the Cloudera Navigator 2.4.3 release, there are no new features or fixed issues.

What's New in Cloudera Navigator 2.4.2

Note: If you are upgrading from a previous version of Cloudera Navigator, Cloudera recommends that you upgrade to version 2.4.3 or higher.

A number of issues have been fixed. See [Issues Fixed in Cloudera Navigator 2.4.2](#) on page 2772.

What's New in Cloudera Navigator 2.4.1

An issue has been fixed. See [Issues Fixed in Cloudera Navigator 2.4.1](#) on page 2774.

What's New in Cloudera Navigator 2.4.0

- **Platform enhancements**

- New entity details page.
- HDFS metadata and audit analytics.
- Command actions, integrated with policies and search, for archiving and purging files.
- Redesigned policies page for scalability.
- Publishing of audit events to Kafka topics. Kafka audit event publishing does not support authorization and Cloudera does not recommend its use in production.
- Navigator SDK for metadata and lineage augmentation.
- Significant scale improvements. Large lineage graphs render faster and consume less memory.

- **Expanded service coverage**

- Hive metadata: support for extended attributes.
- Hive on Spark metadata and lineage.

Important: Like Spark metadata and lineage, Hive on Spark metadata and lineage is not supported or recommended for production use. By default it is disabled. To try this feature, use it in a test environment until Cloudera resolves currently existing issues and limitations to make it ready for production use.

- Oozie metadata and lineage added support for the `hive2` action, which Cloudera recommends that you use in preference to the `hive` action.
- Hue auditing (CDH 5.5.0 and higher): added login and logout, user and group events.
- Cloudera Manager auditing: login and logout events.
- Navigator Metadata Server auditing: successful and failed login events.
- Added filtering of audit events for Sentry, Solr, Impala, and Navigator Metadata Server.

Also see [What's New in Cloudera Manager 5.5.0](#) on page 2495.

What's New in Cloudera Navigator 2.3.10

Note: In the Cloudera Navigator 2.3.10 release, there are no new features or fixed issues.

Cloudera Navigator Data Management Release Notes

What's New in Cloudera Navigator 2.3.9

An issue has been fixed. See [Issues Fixed in Cloudera Navigator 2.3.9](#) on page 2776.

What's New in Cloudera Navigator 2.3.8

Several issues have been fixed. See [Issues Fixed in Cloudera Navigator 2.3.8](#) on page 2777.

Note: In the Cloudera Navigator 2.3.5, 2.3.6, and 2.3.7 releases, there are no new features or fixed issues.

Note: Although there is a CDH 5.4.4 release, there is no synchronous Cloudera Navigator 2.3.4 release.

What's New in Cloudera Navigator 2.3.3

Several issues have been fixed. See [Issues Fixed in Cloudera Navigator 2.3.3](#) on page 2777.

Note: Although there is a CDH 5.4.2 release, there is no synchronous Cloudera Navigator 2.3.2 release.

What's New in Cloudera Navigator 2.3.1

- Navigator self audit events have been enhanced with additional information such as the names of audit reports and policies
- Performance and stability improvements

Also, a number of issues have been fixed. See [Issues Fixed in Cloudera Navigator 2.3.1](#) on page 2778.

What's New in Cloudera Navigator 2.3.0

- **Platform enhancements**
 - Redesigned metadata search provides autocomplete, enhanced filtering, and saving searches.
 - Added support for SAML for single sign-on.
- **Expanded service coverage**
 - Added Impala (CDH 5.4 and higher) metadata and lineage
 - Added Cloudera Search (CDH 5.4 and higher) auditing
 - Added auditing for Navigator Metadata Server activity, such as audit views, metadata searches, and policy editing
 - Added support for inferring the schema of HDFS Avro and Parquet entities
 - Added Spark (CDH 5.4 and higher) metadata and lineage.

Important: Spark metadata and lineage is not supported or recommended for production use. By default it is disabled. To try this feature, use it in a test environment until Cloudera resolves currently existing issues and limitations to make it ready for production use.

What's New in Cloudera Navigator 2.2.10

Note: In the Cloudera Navigator 2.2.10 release, there are no new features or fixed issues.

What's New in Cloudera Navigator 2.2.9

An issue has been fixed. See [Issues Fixed in Cloudera Navigator 2.2.9](#) on page 2779.

Note: Cloudera Navigator releases 2.2.6, 2.2.7, and 2.2.8 have no new features or fixed issues.

Note: Although CDH has a 5.3.5 release, Cloudera Navigator does not have a release for 2.2.5.

What's New in Cloudera Navigator 2.2.4

An issue has been fixed. See [Issues Fixed in Cloudera Navigator 2.2.4](#) on page 2779.

What's New in Cloudera Navigator 2.2.3

An issue has been fixed. See [Issues Fixed in Cloudera Navigator 2.2.3](#) on page 2779.

What's New in Cloudera Navigator 2.2.2

An issue has been fixed. See [Issues Fixed in Cloudera Navigator 2.2.2](#) on page 2780.

What's New in Cloudera Navigator 2.2.1

A number of issues have been fixed. See [Issues Fixed in Cloudera Navigator 2.2.1](#) on page 2780.

What's New in Cloudera Navigator 2.2.0

- **Policies** are generally available and are always enabled. Policy properties now support Java expressions.
- **Search** - Search functionality now includes autocomplete.

What's New in Cloudera Navigator 2.1.6

An issue has been fixed. See [Issues Fixed in Cloudera Navigator 2.1.6](#) on page 2780.

What's New in Cloudera Navigator 2.1.5

A number of issues have been fixed. See [Issues Fixed in Cloudera Navigator 2.1.6](#) on page 2780.

What's New in Cloudera Navigator 2.1.4

An issue has been fixed. See [Issues Fixed in Cloudera Navigator 2.1.4](#) on page 2781.

Note: There was no Cloudera Navigator 2.1.3 release.

What's New in Cloudera Navigator 2.1.2

A number of issues have been fixed. See [Issues Fixed in Cloudera Navigator 2.1.2](#) on page 2781.

What's New in Cloudera Navigator 2.1.1

A number of issues have been fixed. See [Issues Fixed in Cloudera Navigator 2.1.1](#) on page 2782.

What's New in Cloudera Navigator 2.1.0

- **Auditing Component**
 - New tab in the Cloudera Navigator console (the user interface) featuring saved audit reports. The Cloudera Navigator auditing user interface is no longer available from Cloudera Manager. Instead, auditing is integrated with lineage, discovery, and the policy engine. The Cloudera Navigator console is hosted by the Navigator Metadata Server, which is now required for the auditing component.

Cloudera Navigator Data Management Release Notes

- Sentry auditing now includes Sentry commands issued from Impala.

- **Metadata Component**

- Search results include links to the appropriate Hue browser tool for type:

Type	Hue tool
HDFS directories and files	File Browser
Hive database and tables	Hive Metastore (HMS) Manager
MapReduce, YARN, Pig	Job Browser

- **Policies** - support rules for modifying metadata and sending notifications when entities are extracted.

Note: Policies is a beta feature that is disabled by default.

- **Security**

- **Role-Based Access Control** - support assigning groups to roles that constrain access to Navigator features
- **Authentication** - LDAP and Active Directory authentication of Navigator users
- **TLS/SSL** - enable TLS/SSL for encrypted communication

- **API**

- Version changed to v3
- Supports auditing and policies

What's New in Cloudera Navigator 2.0.5

An issue was fixed. See [Issues Fixed in Cloudera Navigator 2.0.5](#) on page 2782.

Note: There is no Cloudera Navigator 2.0.4 release.

What's New in Cloudera Navigator 2.0.3

A number of issues have been fixed. See [Issues Fixed in Cloudera Navigator 2.0.3](#) on page 2782.

What's New in Cloudera Navigator 2.0.2

An issue was fixed. See [Issues Fixed in Cloudera Navigator 2.0.2](#) on page 2782.

What's New in Cloudera Navigator 2.0.1

- Masking of personally identifiable information (PII) in query strings that appear in audit events and lineage. Enabled by default.
- REST API support for registering custom metadata for entities before they appear in Navigator.

A number of issues have been fixed. See [Issues Fixed in Cloudera Navigator 2.0.1](#) on page 2782.

What's New in Cloudera Navigator 2.0.0

- **Auditing Component**

- Added support for auditing the Sentry service
- Added support for publishing audit logs to syslog

- **Metadata Component**

- Newly designed Query Builder with faceted filtering
 - Simplified Pig lineage
 - Added support for Sqoop and Oozie lineage
 - Many performance and stability improvements
- **Security** - includes Navigator Encrypt and Navigator Key Trustee, formerly known as Gazzang zNcrypt and Gazzang zTrustee. These features provide enterprise-grade encryption and key management. For information on these features, see the [Cloudera Security Datasheet](#) and contact your account team.

Changed Features in Cloudera Navigator

The sections below describe changes to functionality, if any, for each Cloudera Navigator release.

What's Changed in Cloudera Navigator 2.15.2

This maintenance release of Cloudera Navigator data management includes no changed features. See [Issues Fixed in Cloudera Navigator 2.15.2](#) on page 2735 for resolved issues and see [Known Issues and Workarounds in Cloudera Navigator Data Management](#) for known issues.

What's Changed in Cloudera Navigator 2.15.1

- New Default HDFS audit filters

This release changes the default behavior of HDFS audit event collection ONLY for new installations or upgraded installation if the HDFS audit event filters had not been changed from original default settings.

For more information, see [New Default HDFS audit filters](#) in the What's New section.

- HDFS Analytics disabled by default

The HDFS Analytics available in the Navigator console is now disabled by default. To enable the HDFS Analytics, set the following properties in the Cloudera Management Service configuration:

1. Set `navigator.analytics.enabled` to be true in the **Navigator Audit Server Advanced Configuration Snippet (Safety Valve) for cloudera-navigator.properties**.
2. Set `nav.analytics.audit.enabled` to be true in the **Navigator Metadata Server Advanced Configuration Snippet (Safety Valve) for cloudera-navigator.properties**.

What's Changed in Cloudera Navigator 2.14.2

This maintenance release of Cloudera Navigator data management includes no changed features. See [Issues Fixed in Cloudera Navigator 2.14.2](#) on page 2740 for resolved issues and see [Known Issues and Workarounds in Cloudera Navigator Data Management](#) for known issues.

What's Changed in Cloudera Navigator 2.14.1

This maintenance release of Cloudera Navigator data management includes no changed features. See [Issues Fixed in Cloudera Navigator 2.14.1](#) on page 2742 for resolved issues and see [Known Issues and Workarounds in Cloudera Navigator Data Management](#) for known issues.

What's Changed in Cloudera Navigator 2.14.0

- **Name and description lengths increased**

This release increases the number of characters available to store entity names and descriptions:

- Name length was 40 characters and is now 500.
- Description length was 500 and is now not limited.

The Navigator console limits manual entry of these values to 40 and 500 characters, so if you edit existing metadata for an entity, you won't be able to save changes if the text is longer than the console limits.

Cloudera Navigator Data Management Release Notes

What's Changed in Cloudera Navigator 2.13.2

- **Name and description lengths increased**

This release increases the number of characters available to store entity names and descriptions:

- Name length was 40 characters and is now 500.
- Description length was 500 and is now not limited.

The Navigator console limits manual entry of these values to 40 and 500 characters, so if you edit existing metadata for an entity, you won't be able to save changes if the text is longer than the console limits.

What's Changed in Cloudera Navigator 2.13.0

- **Changes to Navigator roles and privileges.**

Along with enhancing the metadata management capabilities of Navigator, the Navigator roles and the privileges they describe have changed. The new role names and privileges are described in [User Roles and Privileges Reference](#). One specific change is that the privilege for editing the name and description metadata for Navigator entities is now part of the Managed and Custom Metadata Editor role. Users with that role or the Full Administrator role can add and update entity names and descriptions in the Navigator console.

- **Changes to managed metadata administration.**

The **Administration Managed Metadata** page now shows warnings when properties exist without being associated with entity types. Also, when you add a regular expressions to validate text-type values for managed metadata, the regular expressions are now tested interactively.

What's Changed in Cloudera Navigator 2.12.3

- **Name and description lengths increased**

This release increases the number of characters available to store entity names and descriptions when created or updated through the API:

- Name length was 40 characters and is now 500.
- Description length was 500 and is now not limited.

The Navigator console limits manual entry of these values to 40 and 500 characters, so if you edit existing metadata for an entity, you won't be able to save changes if the text is longer than the console limits.

What's Changed in Cloudera Navigator 2.12.0

- As of Cloudera Manager 5.13, there is a significant change in the volume of HDFS audits that Navigator collects. Cloudera Manager Backup and Disaster Recovery (BDR) feature includes HDFS replication jobs. Previously the jobs used "run as" user to return the access control list (ACL) from the source files; as of 5.13, it uses the source clusters' HDFS principal to get the source file ACL. The change improves the BDR performance but also means that audits that were previously collected for a specific user/owner are now collected for the HDFS principal. If the increase of audits causes problems, consider changing the HDFS audit filter to add HDFS principal to bypass the additional audit records.

- **Deleted entities no longer display by default on Search.**

The Cloudera Navigator console displayed both deleted and non-deleted entities by default (Search did not have a filter for Deleted entities). The default non-filtered Search now shows only non-deleted entities prior to any filtering and a new facet lets user filter out Deleted entities from results or find only Deleted entities.

▼ DELETED	
<input type="radio"/> Show all	1,770
<input checked="" type="radio"/> Do not show Deleted	1,344
<input type="radio"/> Show Deleted only	426

- **Changes to Purge schedule settings.**

Labels and descriptions for the configurable purge options have been clarified. Cloudera Navigator's configurable Purge operation covers operation executions as well as SELECT operations. The labeling and text has been changed to more accurately describe the functionality. The new labels and descriptions are shown below:

Property	Default	Range of selectable values and usage note
Purge HDFS entities deleted more than*	60 days	Select 1 day through 10 days, 20 days through 100 days (in 10-day increments), 150 days, 365 days. These are the number of days after entity deletion that elapse until the purge process removes it. For example, a setting of 1 day purges entities deleted before yesterday but retains entities deleted yesterday.
Purge SELECT operations*	Enabled	Hive and Impala SELECT operations older than days specified in Only Purge SELECT operations older than will be purged.
Purge operations older than*	60 days	Select 10 days through 100 days (10-day increments), 150 days, 365 days. Yarn, Sqoop, and Pig operations older than the specified date will be purged. If Purge SELECT Operations is enabled, Hive and Impala SELECT operations older than the specified date will also be purged.

What's Changed in Cloudera Navigator 2.11.1

This maintenance release of Cloudera Navigator data management includes no changed features. See [Issues Fixed in Cloudera Navigator 2.11.1](#) on page 2755 for resolved issues and see [Known Issues and Workarounds in Cloudera Navigator Data Management](#) for known issues.

What's Changed in Cloudera Navigator 2.11.0

- **Automated Purge function supplants safety valve setting used in prior releases.** The Administration tab of the Cloudera Navigator console now includes a [Purge Settings](#) page for scheduling the Purge process according to your specifications. If your current system has an Advanced Configuration Snippet (Safety Valve) for `nav.maintenance.purge.schedule` set for a cron job to run purge, you can remove the setting. It will be ignored by the schedule set using the Cloudera Navigator console.

To remove the purge schedule setting from safety valve (if it exists):

1. Log in to Cloudera Manager Admin Console.
2. Select **Clusters > Cloudera Management Service**.
3. Under Scope filter, click **Navigator Metadata Server**.
4. Under Category filter, click **Advanced**.
5. Scroll to the **Navigator Metadata Server Advanced Configuration Snippet (Safety Valve) for cloudera-navigator.properties**. If a property named `nav.maintenance.purge.schedule` exists and has been set to a cron schedule, remove it. It will be ignored by the schedule set using the Cloudera Navigator console.

What's Changed in Cloudera Navigator 2.10.2

This release of Cloudera Navigator data management includes no changed features. See [Issues Fixed in Cloudera Navigator 2.10.2](#) on page 2757 for resolved issues and see [Known Issues and Workarounds in Cloudera Navigator Data Management](#) for known issues.

Cloudera Navigator Data Management Release Notes

What's Changed in Cloudera Navigator 2.10.1

This release of Cloudera Navigator data management includes no changed features. See [Issues Fixed in Cloudera Navigator 2.10.1](#) on page 2758 for resolved issues and see [Known Issues and Workarounds in Cloudera Navigator Data Management](#) for known issues.

What's Changed in Cloudera Navigator 2.10.0

- **Cloudera Navigator Data Stewardship Analytics (Data Stewardship Dashboard) is now fully enabled.** See [Data Stewardship Dashboard](#) (above) for details.
- **Configurable aggregation scheme for metrics.** Every 120 minutes, an internal task runs to extract, transform, and load various counts collected by Navigator to derive metrics and populate the Data Stewardship Dashboard with values. By default, data is aggregated for a 1-day time period.

Note: Prior to Navigator 2.10, the internal ETL task ran every 5 minutes and aggregated 7 days worth of data.

However, the window can be changed by setting the Advanced Configuration Snippet (Safety Valve). The values for new partitions, new tables, and new files depend on the value for this window.

Safety Valve	Description
<code>nav.dashboard.etl.maxDataSetSize=1</code>	Cloudera Manager 5.11/Navigator 2.10 (and later): Default window size is 1 (1 day) Cloudera Manager 5.10/Navigator 2.9 (and prior): Default window size is 7 days
<code>nav.dashboard.etl.include.hdfs=true</code>	Enables the Access Denied field on the Dashboard to display values.

By default, the aggregated Access Denied metric is not populated but you can enable its display by setting the safety valve. To add this safety valve to your system, or to change the default window for the aggregation calculation:

1. Log in to Cloudera Manager Admin Console.
2. Navigate to Cloudera Management Service and then select Navigator Metadata Server (under Scope filter).
3. Click **Configuration** and then click **Service Configuration**.
4. Scroll to the **Navigator Metadata Server Advanced Configuration Snippet (Safety Valve) for cloudera-navigator.properties**.
5. Enter one or both safety valves into the field as needed. For example:

```
nav.dashboard.etl.maxDataSetSize=3
nav.dashboard.etl.include.hdfs=true
```

What's Changed in Cloudera Navigator 2.9.2

This release of Cloudera Navigator data management includes no changed features. See [Issues Fixed in Cloudera Navigator 2.9.2](#) on page 2760 for resolved issues and see [Known Issues and Workarounds in Cloudera Navigator Data Management](#) for known issues.

What's Changed in Cloudera Navigator 2.9.1

This release of Cloudera Navigator data management includes no changed features. See [Issues Fixed in Cloudera Navigator 2.9.1](#) on page 2761 for resolved issues and see [Known Issues and Workarounds in Cloudera Navigator Data Management](#) for known issues.

What's Changed in Cloudera Navigator 2.9.0

Name and description fields, which were previously in custom metadata, have been moved to managed metadata.

What's Changed in Cloudera Navigator 2.8.3

This release of Cloudera Navigator data management includes no changed features. See [Issues Fixed in Cloudera Navigator 2.8.3](#) on page 2762 for resolved issues and see [Known Issues and Workarounds in Cloudera Navigator Data Management](#) for known issues.

What's Changed in Cloudera Navigator 2.7.0

- **Improvement (reduction) to index size by removal of certain types of relations.**

Until now, Cloudera Navigator captured the underlying MapReduce and YARN operations for Hive, Sqoop, and Pig operations, and stored them as physical operations. In this release, previously captured physical operations, operation executions, and associated relations are removed during purge because they were not used in lineage. The upgrade process now starts with Navigator removing the logical-physical relations to operations and operation executions, the relations themselves, their physical endpoints, and any relations connected to those physical endpoints. The end result is improved scalability.

What's Changed in Cloudera Navigator 2.6.0

- Queries generated using filters now use the [Lucene Query Parser](#) , + , - Boolean operator syntax.
- Hive on Spark metadata extraction is now supported.
- The Navigator Metadata Server requires 192 MiB of Java PermGen space instead of 128 MiB. The value of this internal setting used by the JDK is increased automatically when upgrading to Cloudera Manager 5.7 (Cloudera Navigator 2.6).

What's Changed in Cloudera Navigator 2.4.0

- Cloudera Navigator no longer supports JDK 1.6.
- In the Administration tab, after roles have been assigned to at least one group, **Groups with Navigator Roles** is the default selection.

What's Changed in Cloudera Navigator 2.3.3

- In the Search UI, facet values with the count of 0 are not displayed.

What's Changed in Cloudera Navigator 2.3.0

- The PII masking regular expression is superseded by log file redaction in CDH 5.4.

What's Changed in Cloudera Navigator 2.2.0

- **Metadata Component** - Policies created with Cloudera Navigator 2.1 (containing the Beta version policy engine) are not retained when upgrading to Cloudera Navigator 2.2.

What's Changed in Cloudera Navigator 2.1.0

- **Auditing Component**
 - HDFS audit events generated by the `impala` user are discarded by default.

What's Changed in Cloudera Navigator 2.0.1

- **Metadata Component**
 - The REST API version changed to v2.

What's Changed in Cloudera Navigator 2.0.0

- **Auditing Component**

- HDFS audit events generated by the `solr` user are discarded by default.

Known Issues and Workarounds in Cloudera Navigator Data Management

The sections below provide information about current known issues in Cloudera Navigator data management component.

Access, Login, or Cloudera Navigator Console Issues

Navigator Metadata Server fails to start with `InvalidClassException`, local class incompatible

Navigator Metadata Server fails to start (red status in Cloudera Manager) and the Metadata Server log includes the following exception:

```
2018-09-06 10:38:20,786 WARN jndi [main]:
java.io.InvalidClassException: com.mchange.v2.c3p0.WrapperConnectionPoolDataSource;
local class incompatible: stream classdesc serialVersionUID = 7806429541739165290, local
class serialVersionUID = -7086951306718003710
```

Even if Navigator Metadata Server starts once, it may encounter this problem at a later time, depending on which JAR file is loaded.

Workaround: See Knowledge Base Article [Navigator Metadata Server fails to start with "local class incompatible" error](#)

Affects version: Cloudera Manager version 5.15.1 (Navigator 2.14.1)

Fixed version: Cloudera Manager version 5.15.2 (Navigator 2.14.2)

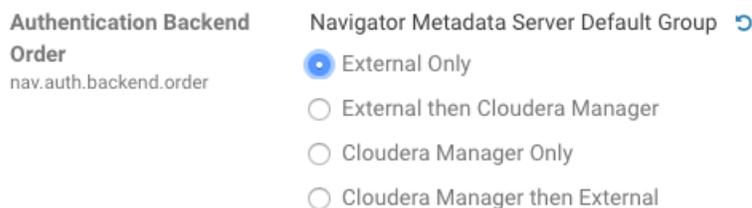

Cloudera Issue: NAV-6724, TSB-342

SAML authentication fails with "Cloudera Manager Only" setting

With the following combination of Cloudera Manager configuration properties set, authentication to Navigator fails:

- Authentication Backend Order: Cloudera Manager Only
- External Authentication Type: SAML

To configure Navigator for SAML authentication, use an Authentication Backend Order other than "Cloudera Manager Only".

Cloudera Issue: NAV-6211

Cloudera Navigator console page display blocked

The Roboto font used in some of the Cloudera Navigator console text is transparently loaded by the console from Google CDN (content delivery network) <https://fonts.googleapis.com/> and <https://fonts.gstatic.com>. If the network environment prevents access to and from these paths, the Cloudera Navigator console cannot load the font, the page hangs, and the console becomes unusable.

Workaround: The workaround depends on the network environment:

- For environments that limit access to and from the public internet, modify the firewall configuration to allow traffic from <https://fonts.googleapis.com/> and <https://fonts.gstatic.com>.

- For environments that restrict access and do not want to allow traffic from the font CDN, modify the firewall configuration to reject access attempts immediately.
- For environments with no DNS access to the public internet, the only workarounds are to obtain the Roboto font and install locally, or hosting your own internal font CDN with fonts from <https://fonts.googleapis.com/> and <https://fonts.gstatic.com> obtained from another network.

Affects version: Cloudera Manager 5.11.1, 5.10.2, 5.10.1, 5.10.0 (Navigator 2.10.1, 2.9.2, 2.9.1, 2.9.0)

Fixed in version: Cloudera Manager 5.12.0, 5.11.2 (Navigator 2.11.0, 2.10.2)

Cloudera Issues: NAV-4871, NAV-4866

Unlimited description through API only

As of Cloudera Manager version 5.15.0 and 5.14.2, name values can be as long as 500 characters and description values are unlimited. However, the Navigator console limits manual entry of the name to 40 characters and descriptions to 500 characters. When you edit the existing metadata for an entity, if the text is longer than the console limits, you won't be able to save changes to the text.

Fixed in version: Cloudera Manager 5.15.0, 5.14.2, 5.13.3 (Navigator 2.14.0, 2.13.2, 2.12.3)

Cloudera Issue: NAV-6228

Internet Explorer 11 document mode issue

When using Microsoft Internet Explorer 11 to access the Cloudera Navigator console, the login page does not display properly due to an issue with that browser's Compatibility View and certain document modes (see the [Microsoft Technet article](#) for details). As of Cloudera Navigator 2.10.1, a warning prompt now displays if the Internet Explorer's document mode is set to IE7 or lower, to alert you to the issue, but prior releases display a blank page rather than the login page.

Workaround: Open the Compatibility View Settings (under the Internet Explorer options menu) and remove the setting for the domain or website. Or use another browser to access the Cloudera Navigator console. Supported browsers include Mozilla Firefox, Google Chrome, or Microsoft Edge.

Affects version: Cloudera Manager 5.11.0, 5.10.x (Navigator 2.10.0, 2.9.x)

Fixed in version: Cloudera Manager 5.11.1 (Navigator 2.10.1)

Cloudera Issues: NAV-3743, NAV-4381

Error message ("not authorized") when logging in

The Cloudera Navigator console saves the state of the last URL accessed when you log out, and opens the same page at your next login. If two different users log in to Navigator using the same browser tab, the state of the first user applies to the second. If the second user does not have permissions to that section of the page, that user receives an error message.

Workaround: Close the browser tab and log in on a new tab. The state is cleared, and the access error message does not appear.

Affects version: Cloudera Manager 5.8.x, 5.7.x (Navigator 2.9.x, 2.8.x)

Fixed in version: Cloudera Manager 5.11 (Navigator 2.10)

Cloudera Issue: NAV-3425

Console doesn't come up, NAV_EXTRACTOR_STATUS doesn't exist

Libraries included in the Navigator release for Cloudera Manager 5.13 were named such that the upgrade marked the schema with the wrong Navigator version. The result is that schema changes between the original version and the final upgrade version are not run. If your Navigator upgrade encounters this problem, the Navigator console does not come up and you'll see the following error in the Navigator Metadata Server log:

```
Table 'nav_meta_user.NAV_EXTRACTOR_STATUS' doesn't exist
```

Cloudera Navigator Data Management Release Notes

Affects version: Cloudera Manager 5.15.0, 5.14.0, 5.13.1, 5.13.0, 5.12.1, 5.12.0 (Navigator 2.14.0, 2.13.0, 2.12.1, 2.12.0, 2.11.1, 2.11.0)

Fixed in version: Cloudera Manager 5.15.1 (Navigator 2.14.1)

Cloudera Issue: NAV-6213

Cloudera Manager Configuration Issues

Adding a blank audit filter removes filter configuration property

In Cloudera Manager, when adding an empty rule to a service's Audit Event Filter and then saving the change, all existing audit event filters are lost. The filter configuration property is removed from Cloudera Manager's list of configuration properties. Reverting the change in the History and Rollback does not restore the previous filters nor reproduce the filter property.

Affected versions: All Cloudera Navigator versions

Fixed in version: N/A

Cloudera Issue: NAV-6096

Overriding safety valve settings disables audit and lineage features

Customers or third party applications such as Unravel may require that `hive.exec.post.hooks` is configured in a HiveServer2 safety valve. Cloudera Manager will comment out the `hive.exec.post.hooks` value that is configured if audit or lineage is enabled for Hive. The safety valve content shows the commented code:

```
<!-- 'hive.exec.post.hooks', originally set to  
'com.cloudera.navigator.audit.hive.HiveExecHookContext,org.apache.hadoop.hive.ql.hooks.LineageLogger'  
(non-final), is overridden below by a safety valve-->
```

This automated change disables Navigator's auditing and lineage features without notification.

Workaround: To fix this problem, manually merge the original HiveServer2 safety valve content for `hive.exec.post.hooks` with the new value. For example, in the case of Unravel, the new safety valve would look like the following:

```
<property>  
  <name>hive.exec.post.hooks</name>  
  
<value>com.unraveldata.flowhive.hook.HivePostHook,com.cloudera.navigator.audit.hive.HiveExecHookContext,org.apache.hadoop.hive.ql.hooks.LineageLogger</value>  
  
  <description>for Unravel, from unraveldata.com</description>  
</property>
```

Cloudera Issue: NAV-5331

Cloudera Manager audit events case-sensitive when using PostgreSQL

When Cloudera Manager and Navigator Audit Server are installed using PostgreSQL databases, the behavior of queries run from the Navigator console is different between the two databases. The result is that Cloudera Manager events are returned only if the query values match the case of the event values as they are stored in the Cloudera Manager database.

For example, use "HiveReplicationCommand" instead of `HIVEREPLICATIONCOMMAND` as it appears in the Audit log.

Cloudera Issue: NAV-6141

Multi-Cluster Environments

Extractors not working in multi-cluster environment

When Navigator Metadata Server is started with a fresh storage directory on versions 5.12.0 or later, extractors are not working when a single Cloudera Manager is managing multiple clusters.

Affects version: Cloudera Manager 5.15.0, 5.14.3, 5.14.2, 5.14.1, 5.14.0, 5.13.1, 5.13.0, 5.12.1, 5.12.0 (Navigator 2.14.0, 2.13.3, 2.13.2, 2.13.1, 2.13.0, 2.12.1, 2.12.0, 2.11.1, 2.11.0)

Fixed in version: Cloudera Manager 5.16.1, 5.15.1, 5.14.4 (Navigator 2.15.1, 2.14.1, 2.13.4)

Cloudera Issue: NAV-6145

Cloudera Navigator is not supported in installations in multi-cluster environments for Cloudera Manager versions 5.12.0, 5.12.1, and 5.13.0

Navigator is not able to uniquely identify more than one cluster in installations of Cloudera Manager that support multiple clusters. This problem only occurs for Cloudera Manager deployments of version 5.12.0, 5.12.1, or 5.13.0. Avoid multi-cluster installations with these releases. This problem does not affect single cluster deployments or Altus clusters.

Affects version: Cloudera Manager 5.13.0, 5.12.1, 5.12.0 (Navigator 2.12.0, 2.11.1, 2.11.0)

Fixed in version: Cloudera Manager 5.14.0, 5.13.1, 5.12.2 (Navigator 2.13.0, 2.12.1, 2.11.2)

Cloudera Issue: NAV-5615

Table-to-HDFS links not established when Navigator supports multiple, high-availability clusters

When Navigator extracts metadata for multiple clusters and when the clusters are configured for high availability operation, Navigator does not correctly link tables to their HDFS backing data. The result is that lineage between Hive tables and their physical data are not created. In addition, some Hive table metadata that is derived from the backing files is not available.

You may see errors in the log such as the following:

```
2018-02-19 09:01:32,999 ERROR com.cloudera.nav.persist.impl.CompositeLinker
[CDHExecutor-0-CDHUrlClassLoader@01010d7e]: Internal error while
linking.java.lang.IllegalArgumentException: expected one element but was:
<com.cloudera.nav.core.model.Source@b22e68ba, com.cloudera.nav.core.model.Source@5b1bac2c>
```

Affects version: Cloudera Manager 5.13.x, 5.12.x (Navigator 2.12.x, 2.11.x)

Fixed in version: Cloudera Manager 5.14.0 (Navigator 2.13.0)

Cloudera Issue: NAV-5749

AWS and Amazon S3

Update AWS Credentials from the same AWS account

After configuring Cloudera Navigator with a specific set of AWS Credentials for Amazon S3, any future changes to the credentials (for example, if you rotate credentials on a regular basis) must be for the same AWS account (IAM user). Changing the AWS Credentials to those of a different IAM user results in errors from the Amazon Simple Queue Service (used transparently by Cloudera Navigator).

Workaround: If a new key is provided to Cloudera Navigator, the key must belong to the same AWS account as the prior key.

Affects version: Cloudera Manager 5.10 and later (Navigator 2.9)

Cloudera Issues: NAV-3990

Unnamed folders on Amazon S3 not extracted

Unnamed folders on Amazon S3 are not extracted by Navigator, but the content of the folders is extracted. For example, a top-level folder the top level folder in the bucket has no name (for example, `/bucket//folder/file`), it is extracted as `/bucket/folder/file`.

Affects version: Cloudera Manager 5.10 and later (Navigator 2.9)

Cloudera Issue: NAV-3981

Cloudera Navigator Data Management Release Notes

Implicit folders are not marked as deleted

If an implicit folder is deleted in Amazon S3, it does not appear as deleted in Cloudera Navigator console.

Workaround: To prevent folders deleted from Amazon S3 from appearing in Navigator Search results, include `implicit:false` in the search query.

Affects version: Cloudera Manager 5.10 and later (Navigator 2.9)

Cloudera Issue: NAV-3802

Extraction delayed while Amazon S3 inconsistent

Inconsistencies that occur in AWS (for example, due to eventual consistency) can delay Navigator extraction of metadata and lineage from Amazon S3. When Cloudera Navigator detects an inconsistency, extraction may stop until the inconsistency is resolved in AWS. Cloudera Navigator will retry at the next scheduled extraction.

Affects version: Cloudera Manager 5.10 and later (Navigator 2.9)

Cloudera Issue: NAV-4028

Microsoft Azure

Less Secure Credentials Protection Policy can expose Azure credentials in audit logs

When you use Cloudera Manager to configure the ADLS Connector service using the Less Secure option for the Credentials Protection Policy, it is possible for Hive audit logs to include Microsoft Azure credentials. If you are using Navigator Audit Server, these credentials may appear in audit reports. To mitigate this problem, make sure that access to Hive logs is appropriately controlled and that Navigator users with Auditing Viewer roles are cleared to have access to the Hive credentials.

Fixed in version: Cloudera Manager 5.16.1, 5.15.1, 5.14.2 (Navigator 2.15.1, 2.14.1, 2.13.2)

Cloudera Issues: NAV-5861, CDH-56241

Data Stewardship Dashboard

Counts displayed in Dashboard and Search may differ

Counts for databases, tables, views, and other entities displayed in Cloudera Navigator Dashboard can differ from Search values for the same objects. The Dashboard displays data from the Navigator Audit Server, which contains actual counts captured continuously. On the other hand, Search (Solr) returns data that has been periodically extracted from HMS (Hive Metadata Server). Tables, databases, views, or other objects created or destroyed between extracts are not reflected in values displayed by Search (Solr), but they are contained in the audit data displayed in the Dashboard.

Fixed in version: Cloudera Manager 5.11.0 (Navigator 2.10.0)

Cloudera Issue: NAV-4192

Tables Populated count reflects INSERT and UPDATE statements

The Tables Populated display widget in the Data Stewardship Dashboard reflects the number of times that a table has been loaded with data, such as through INSERT and UPDATE statements—not the number of unique tables loaded. For example, a single table to which data is added (through 6 INSERT statements) and that has also had 4 UPDATE statements submitted in the same period would report Tables Populated as 10.

Cloudera Issue: NAV-3886

Search and Managed Metadata

Managed metadata property values hidden

Property values are not visible when the property is defined with multivalued enabled and the type was any numeric type.

Affects version: Cloudera Manager 5.14.1, 5.14.0 (Navigator 2.13.1, 2.13.0)

Fixed in version: Cloudera Manager 5.15.0, 5.14.2 (Navigator 2.14.0, 2.13.2)

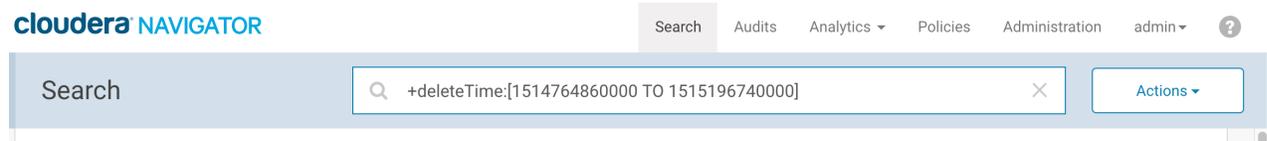

Cloudera Issue: NAV-5899

Incorrect operation of the Search filter for "Deleted Time"

The Deleted Time search filter does not produce expected results for filtering entities.

Workaround: Specify the delete time range as timestamps in UNIX epoch in milliseconds. For example, to search for entities deleted between January 1, 2017 00:01:00 UTC and January 5, 2017 23:59:00 UTC, enter the following search string in the search box:

```
+deleteTime:[1514764860000 TO 1515196740000]
```

Fixed in version: Cloudera Manager 5.14.0 and 5.13.1 (Navigator 2.13.0 and 2.12.1)

Cloudera Issue: NAV-1168

Hive, Hue, Impala, Pig

Hive lineage missing

Because of race conditions within a single JDBC session, Navigator may not show lineage when Hive queries run in parallel within the same session. Hive maintains lineage per session and it clears all lineage information from the session when a query completes. The result is that any query that does not generate lineage will clear the lineage for any other queries that are running in parallel. It can occur for any JDBC clients, such as Hue. Hue uses same session to run user queries and background refresh queries. If you are using JDBC to connect to Hive and you issue concurrent queries using a single JDBC connection, you may encounter this issue.

Affects version: Cloudera Manager 5.12.0 and later (Navigator 2.14.0)

Fixed in version: Cloudera Manager 6.0.0 (Navigator 6.0.0)

Cloudera Issue: CDH-55693

Hive Operations and Cloudera Navigator Support Matrix

The table below lists Hive DDL and DML statements and whether Cloudera Navigator supports the operation with metadata and lineage extraction.

Hive operations	Cloudera Navigator Support	Comment
Abort	⊘	Operation does not generate data flow.
Alter Table/Partition/Column	✓	Known Issue: NAV-5365. ALTER TABLE RENAME TO does not create query entity. ALTER TABLE CHANGE column name does not create query entity.
Create Table	✓	
Create/Drop Macro	⊘	Operation does not generate data flow.
Create/Drop/Alter Index	⊘	Operation does not generate data flow.

Hive operations	Cloudera Navigator Support	Comment
Create/Drop/Alter View	⊘	Operation does not generate data flow.
Create/Drop/Alter/Use Database	⊘	Operation does not generate data flow.
Create/Drop/Grant/Revoke Roles and Privileges	⊘	Operation does not generate data flow.
Create/Drop/Reload Function	⊘	Operation does not generate data flow.
DELETE	⊘	Requires ACID support. Hive ACID not supported.
Describe	⊘	Operation does not generate data flow.
Drop/Truncate Table	⊘	
EXPORT	⊘	Known Issue. . External tables can be exported to HDFS but Cloudera Navigator does not create a query entity for the EXPORT.
IMPORT	⊘	Known Issue. . External tables can be imported from HDFS but Cloudera Navigator does not create a query entity for the IMPORT.
INSERT data into Hive Tables from queries	✔	
INSERT data into the file system from queries	✔	
INSERT values into tables from SQL	✔	
LOAD	⊘	Known Issue. . LOADING a CSV from HDFS into an existing Hive table does not generate lineage.
MERGE	⊘	Requires ACID support. Hive ACID not supported.
MSCK REPAIR	⊘	Tables track their respective partitions. Queries to create or repair partitions using MSCK are not captured as query entities.
Show	⊘	Operation does not generate data flow.
UPDATE	⊘	Requires ACID support. Hive ACID not supported.

Missing Impala audit events for database-level operations

Impala audit events at the database level are incorrectly recorded, making it seem like they are missing from the Navigator audit data.

Fixed in version: Cloudera Manager 5.14.2, 5.13.2, 5.12.3, and 5.11.3 (Navigator 2.13.2, 2.12.2, 2.11.3, and 2.10.3)

Cloudera Issue: NAV-5648

Impala and Hive audit events fail to be captured when one audit event includes 4-byte characters, such as an emoji

This problem applies when the Navigator Audit Server database is a MySQL database configured to use the "UTF8" character set.

When a query includes an emoji or other Unicode supplementary-plane character that is encoded as four bytes in UTF-8, Navigator Audit Server fails to process the event and any following events from the same service.

Workaround: There are work-arounds for this problem; contact Cloudera Technical Support for details.

Cloudera Issue: NAV-4845

Multi-cluster support for Hive lineage

When there were multiple Hive MetaStore (HMS) sources associated with a single Hive service, the method Navigator used to determine the source was not accurate, resulting in Impala and Spark extractors creating lineage relations that referred to the wrong sources and cross-cluster lineage relations were not generated.

Affects version: Cloudera Manager 5.14.x, 5.13.x, 5.12.x (Navigator 2.13.x, 2.12.x, 2.11.x)

Fixed in version: Cloudera Manager 5.15.0 (Navigator 2.14.0)

Cloudera Issue: NAV-5859

Hive service configuration in auditing component

For Hive services, the auditing component does not support the "Shutdown" option for the "Queue Policy" property.

Severity: Low

Workaround: None.

Cloudera Issue: OPSAPS-11537

Hue service audit log and Unknown IP address

The IP address in a Hue service audit log displays as "unknown".

Severity: Low

Workaround: None.

Cloudera Issue: OPSAPS-11986

Changing auditing configuration for Hive or Hue requires restart

Whenever a change is made to a Hive service's audit configuration, Beeswax must be restarted so that the Hue service audit log can reflect the change.

Severity: Low

Workaround: None.

Cloudera Issue: OPSAPS-12274

Viewing Navigator tags in Hue overloads Metadata Server heap

When viewing Cloudera Navigator tags through Hue, Navigator uses more memory than usual and does not release the memory after logging out of Hue. Eventually, the calls between Hue and Navigator will occupy the majority of the heap space allocated to Navigator Metadata Server.

To work around this problem you may need to restart the Navigator Metadata Server periodically to clear the heap usage.

Affects version: Cloudera Manager 5.11.x and later (Navigator 2.10.x)

Cloudera Issue: NAV-4326

Hue links are missing from Navigator console

The links to Hue from entities in the Navigator console are not generated. Each time the console attempts to show a link, the Navigator Metadata Server log includes an error similar to the following:

```
10:05:32.539 AM ERROR HueUtility  
[qtp778450792-57]: Unable to get Hue link from CM.
```

```
java.lang.LinkageError: loader constraint violation: when resolving method
"com.cloudera.nav.server.NavOptions.getPreferredBaseURLForCluster(Ljava/lang/String;)Lcom/google/common/base/Optional;"
the class loader (instance of org/eclipse/jetty/webapp/WebAppClassLoader) of the current
class, com/cloudera/nav/utils/HueUtility, and the class loader (instance of
sun/misc/Launcher$AppClassLoader) for resolved class, com/cloudera/nav/server/NavOptions,
have different Class objects for the type
ter(Ljava/lang/String;)Lcom/google/common/base/Optional; used in the signature{
```

Affects version: Cloudera Manager 5.9.0 and later (Navigator 2.8.0)

Fixed in version: Cloudera Manager 5.13.0 and 5.12.1 (Navigator 2.12.0, 2.11.1)

Severity: Low

Workaround: None.

Cloudera Issue: NAV-4756

Lineage not generated for Pig operations on Hive tables using HCatalog loader

When accessing a Hive table using Pig, lineage is generated in Navigator when using physical file loads, such as:

```
A = LOAD '/user/hive/warehouse/navigator_demo.db/salesdata';
B = LIMIT A 16;
STORE B INTO '/user/hive/warehouse/navigator_demo.db/salesdata_sample_file' using
PigStorage ('');
```

However, when accessing the Hive table using the HCatalog load, lineage for the Pig operation is not generated when browsing the source table lineage. Such as:

```
A = LOAD 'navigator_demo.salesdata' using org.apache.hive.hcatalog.pig.HCatLoader();
B = LIMIT A 16;
STORE B INTO 'navigator_demo.salesdata_sample_hcatalog' using
org.apache.hive.hcatalog.pig.HCatStorer();
```

Cloudera Issue: NAV-3411

HiveServer1 and Hive CLI support deprecated

Cloudera Navigator requires HiveServer2 for complete governance Hive queries. Cloudera Navigator does not capture audit events for queries that are run on HiveServer1/Hive CLI, and lineage is not captured for certain types of operations that are run on HiveServer1.

[HiveServer1 and Hive CLI are deprecated in CDH 5](#). If you use Cloudera Navigator to capture auditing, lineage, and metadata for Hive operations, upgrade to HiveServer2 if you have not done so already.

Cloudera Issue: TSB-185

Navigator Audit Server

Cloudera Manager role name change causes audit events to not be captured

When the role name for a Cloudera Manager service changes, it can cause the Navigator Audit Server to not process the events for that service. You can identify this problem by reviewing the contents of the write-ahead log (*_audit_wal) for the service. This log includes the list of audit log files that are queued to be sent to Navigator. The name of the audit log files includes the service name and the role name; if you see that the structure of the audit log file names have changed at some point, it may be that the name change is preventing the audit server from processing the audits. You can find the *_audit_wal file among the log files for the service. For example, the Hive Server2 *_audit_wal file is typically in the following location on the node where the service is running:

```
/var/log/hive/audit/hiveserver2*_audit_wal
```

Workaround: To restart audit event processing for the service:

1. Remove the *_audit_wal file for the service.

2. Move all audit log files that include the older role name out of the `audit` directory.
3. [Restart the Cloudera Manager agent](#) for that service.

The Navigator audit plugin will recreate the `*audit_wal` file from the remaining audit log files and Navigator Audit Server will collect the audit events.

Cloudera Issues: NAV-6126, NAV-6205

Logging Threshold setting is not honored

The value for Navigator Audit Server Logging Threshold found in Cloudera Manager is not honored. Instead, messages are logged at trace level and displayed at DEBUG syslog level. This configuration property is set in **Cloudera Management Service > Configuration > Navigator Audit Server**.

Affects version: Cloudera Manager 5.12.x and later (Navigator 2.11.x)

Cloudera Issue: NAV-3737

Audit reports download option shows incorrect API version

The API version is not correct in the Cloudera Navigator download option for audit reports.

Cloudera Issue: NAV-3699

Publishing to Kafka fails after upgrade

This issue affects only those Cloudera Navigator instances that publish events to Kafka, and only when upgrading from Cloudera Manager 5.11 to Cloudera Manager 5.11.1.

After upgrading to a new release of Cloudera Manager, Cloudera Navigator Audit Server fails to publish to Kafka. The log (`cloudera-scm-server.log`) contains errors such as the following:

```
kafka.network.InvalidRequestException: Error getting request for apiKey: 3 and apiVersion:
 2
at kafka.network.RequestChannel$Request.liftedTree2$1(RequestChannel.scala:95)
at kafka.network.RequestChannel$Request.<init>(RequestChannel.scala:87)
at
kafka.network.Processor$$anonfun$processCompletedReceives$1.apply(SocketServer.scala:488)
at
kafka.network.Processor$$anonfun$processCompletedReceives$1.apply(SocketServer.scala:483)
at scala.collection.Iterator$class.foreach(Iterator.scala:893)
at scala.collection.AbstractIterator.foreach(Iterator.scala:1336)
. . .
```

The issue is due to upgraded Kafka client jar files that conflict with the logging (log4j) infrastructure.

Workaround:

1. Open a browser and navigate to the Cloudera Kafka client and log4j repositories:
 - [Kafka clients](#)
 - [Kafka log4j appenders](#)
2. Download the version of the Kafka jar files that is compatible with your Cloudera Navigator Audit Server. For example, for Cloudera Manager 5.11.0/Cloudera Navigator 2.10.0, download:
 - [kafka-clients-0.9.0-kafka-2.0.0.jar](#) (634.16 KB)
 - [kafka-log4j-appender-0.9.0-kafka-2.0.0.jar](#) (8.47 KB)
3. On the host system running the Navigator Audit Server, remove the symbolic links to the Kafka client jar files located in the `/usr/share/cmf/cloudera-navigator-audit-server` directory. The symlinks are defined as follows:
 - `kafka-log4j-appender-0.10.1.0.jar -> ../common_jars/kafka-log4j-appender-0.10.1.0.jar`

Cloudera Navigator Data Management Release Notes

- kafka-clients-0.10.1.0.jar -> ../common_jars/kafka-clients-0.10.1.0.jar

```
rm kafka-log4j-appender-0.10.1.0.jar
rm kafka-clients-0.10.1.0.jar
```

4. Move the downloaded .jar files to the /usr/share/cmf/cloudera-navigator-audit-server path.
5. Log in to the Cloudera Manager Admin Console.
6. Restart Navigator Audit Server.

Affects version: Cloudera Manager 5.11.1 and later (Navigator 2.10.1)

Cloudera Issue: NAV-5042

Pending audit events may be lost after role migration

Pending and deleted audit events may be lost during role migration. Pending audit events are those events that have not yet transferred from a source node through the Cloudera Navigator plug-in for the respective role to the Navigator Audit Server. If the Navigator Audit Server is unreachable due to network issues or other issues, the pending audits—which should automatically transfer at the conclusion of the role migration—may be lost.

Workaround: Before migrating a role to a different node:

- Check the state of the Navigator Audit Server (using Cloudera Manager Admin Console).
- Proceed with the role migration only if Navigator Audit Server is running.

Cloudera Issue: NAV-1006

Audit CSV has extra columns and is missing some data

Audit details exported as CSV files do not contain Sentry data. In addition, some of the column names display twice (Operation Text, Database Name, Object Type, for example), although the actual details display only of the duplicate columns.

Workaround: Export audits to JSON format to obtain Sentry data.

Cloudera Issue: NAV-708

Navigator Metadata Server

Navigator Metadata Server fails to start with InvalidClassException, local class incompatible

Navigator Metadata Server fails to start (red status in Cloudera Manager) and the Metadata Server log includes the following exception:

```
2018-09-06 10:38:20,786 WARN jndi [main]:
java.io.InvalidClassException: com.mchange.v2.c3p0.WrapperConnectionPoolDataSource;
local class incompatible: stream classdesc serialVersionUID = 7806429541739165290, local
class serialVersionUID = -7086951306718003710
```

Even if Navigator Metadata Server starts once, it may encounter this problem at a later time, depending on which JAR file is loaded.

Workaround: See Knowledge Base Article [Navigator Metadata Server fails to start with "local class incompatible" error](#)

Affects version: Cloudera Manager version 5.15.1 (Navigator 2.14.1)

Fixed version: Cloudera Manager version 5.15.2 (Navigator 2.14.2)

Cloudera Issue: NAV-6724, TSB-342

Navigator does not mark HDFS entities as deleted when in bulk extraction takes too long to complete

In large HDFS deployments, the `fsimage` takes a long time to index. When an HDFS checkpoint occurs, it creates a new `fsimage`. However if the previous `fsimage` is still in the process of being indexed, Navigator cannot use the incremental changes found in the `inotify` stream because it refers to the newly created `fsimage`.

When this happens, Navigator attempts to start indexing the newer `fsimage`, creating a loop where Navigator can never take advantage of the more efficient change processing through `inotify`. The immediate fallout of this delay is that no HDFS entities deleted in the cluster are marked as deleted in Navigator.

Fixed in version: Cloudera Manager 5.16.1 (2.15.1)

Cloudera Issue: NAV-6456

ClassCastException in Navigator Metadata Server log

When a Hive view is created, then dropped, and then subsequently recreated as a table with the same name as that of the original view, the Hive extraction process shows this exception in Navigator Metadata Server logs:

```
java.lang.ClassCastException: com.cloudera.nav.hive.model.HView cannot be cast to
com.cloudera.nav.hive.model.HTable
```

Affects version: Cloudera Manager 5.14.0 and later (Navigator 2.13.0)

Fixed in version: Cloudera Manager 5.16.1, 5.15.2 (2.15.1, 2.14.2)

Cloudera Issue: NAV-5939

Navigator cannot use PostgreSQL 10.x

Navigator Metadata Server will not work with PostgreSQL versions 10.x. This version incompatibility will result in a message similar to this:

```
2018-08-06 00:00:22,899 WARN com.mchange.v2.async.ThreadPoolAsynchronousRunner [Timer-1]:
com.mchange.v2.async.ThreadPoolAsynchronousRunner$DeadlockDetector@6544a122 - APPARENT
DEADLOCK!!! Creating emergency threads for unassigned pending tasks!
```

Products affected: Cloudera Navigator using PostgreSQL as the database for Navigator Metadata Server

Releases affected: Cloudera Navigator as packaged with Cloudera Manager versions 5.15.0 and 5.15.1.

Users affected: Installations using Cloudera Navigator using PostgreSQL as the database for Navigator Audit Server and Navigator Metadata Server

Severity (Low/Medium/High): High

Impact: Navigator Metadata Server does not function with PostgreSQL database version 10 and above.

Immediate action required: Do not upgrade the Navigator Metadata Server database to PostgreSQL 10.x (allow the Navigator Metadata Server database to remain on a previous working version of PostgreSQL) or upgrade to future Cloudera Manager release where the issue is fixed.

Affects version: Cloudera Manager 5.15.1, 5.15.0 (2.14.1, 2.14.0)

Fixed in version: Cloudera Manager 5.16.1, 5.15.2 (2.15.1, 2.14.2)

Cloudera Issue: DOCS-3686, TSB-334

Navigator Embedded Solr can reach its limit on number of documents it can store

Navigator Metadata Server extracts HDFS entities by performing a one-time bulk extraction and then switching to incremental extraction. In Cloudera Manager releases 5.10.0, 5.10.1 and 5.11.0 (Navigator releases 2.9.0, 2.9.1, and 2.10.0), a problem causes HDFS bulk extraction to be run more than one time, resulting in duplicate relations created

for HDFS. Over time, embedded Solr runs out of document IDs that it can assign to new relations and fails with following error:

```
"Caused by: java.lang.IllegalArgumentException: Too many documents, composite IndexReaders cannot exceed 2147483519"
```

When this happens, Navigator stops any more extraction of data as no new documents can be added to Solr.

The workaround is to upgrade to Cloudera Manager releases 5.10.2, 5.11.1, or 5.12.x (Navigator 2.9.2, 2.10.1, 2.11.x) or later where this issue is fixed. In addition, see [Repairing metadata in the storage directory after upgrading](#).

Important: If you are running Cloudera Navigator in Cloudera Manager 5.10.0, 5.10.1, or 5.11.0, plan your upgrade as soon as possible even if you haven't yet encountered this error. Recovery after encountering the failure increases your risk of losing user-provided metadata. If you aren't able to upgrade immediately, be sure to [backup](#) your Navigator Metadata Server storage directory and database regularly.

Affects version: Cloudera Manager 5.11.0, 5.10.1, 5.10.0 (2.10.0, 2.9.1, 2.9.0)

Fixed in version: Cloudera Manager 5.12.0, 5.11.1, 5.10.2 (Navigator 2.11.0, 2.10.1, 2.9.2)

Cloudera Issue: NAV-5600

"Lineage Diagram is limited to 3000 entities" Error

Navigator caps the number of lineage parents that could be used at one time, however this cap included relations with second level parents (columns). The Navigator Metadata Server log includes an error such as "Lineage Diagram is limited to 3000 entities".

Work-around: Set `nav.capacity.max_nodes_limit=1000` in the Cloudera Manager configuration **Navigator Metadata Server Advanced Configuration Snippet (Safety Valve) for cloudera-navigator.properties**. Restart Navigator Metadata Server role and check the lineage. The 1000 value assumes that the lineage only touches max of 1000 tables.

Affects version: Cloudera Manager 5.10.0 and later (Navigator 2.9.0)

Fixed in version: Cloudera Manager 5.16.1, 5.15.1, 5.14.4 (Navigator 2.15.1, 2.14.1, 2.13.4)

Cloudera Issue: NAV-6371

Lineage relations are missing for some views with "EndPoint2 must not be null or empty" error

Lineage relations are missing for some views and the Navigator Metadata Server log includes errors with a stack trace that looks something like this:

```
2017-10-25 19:00:40,780 ERROR com.cloudera.nav.persist.impl.CompositeLinker [CDHExecutor-0-CDHUrlClassLoader@381e3]: Internal error while linking. java.lang.IllegalStateException: EndPoint2 must not be null or empty
```

Note that the exception is "EndPoint2 must not be null or empty". If you see errors that don't exactly match this exception, see one of the following similar errors:

- [Log includes the error "EndPoint1 must not be null"](#) on page 2727
- [Log includes the error "EndPoint2 EntityType must not be null unless unlinked"](#) on page 2727

While Navigator is determining lineage relations, it found a relation that was created with the target entity missing, hence Endpoint2 is null. This situation can occur when a Hive view is altered without changing the columns extracted from the source table, such as when the name or other table metadata on the view is changed. For example, the following operation would produce the error:

```
alter view customers_sales_sw set tblproperties("region"="southwest");
```

This problem can occur in Navigator Metadata Server versions 2.9.0, 2.9.1, 2.9.2, 2.10.0, 2.10.1, 2.10.2, 2.11.0, and 2.11.1. These versions correspond to the following Cloudera Manager versions: 5.10.0, 5.10.1, 5.10.2, 5.11.0, 5.11.1, 5.11.2, 5.12.0, and 5.12.1.

Eventually you'll want to upgrade away from an affected Navigator version. If you aren't able to upgrade right away, you can ignore this error with the consequences that your logs are noisy and fill up more quickly. See the Knowledge Base article [EndPoint2 must not be null or empty](#) for more information.

Affects version: Cloudera Manager 5.12.1, 5.11.1 (Navigator 2.11.1, 2.10.1)

Fixed in version: Cloudera Manager 5.13.x, 5.12.2, 5.11.2 (Navigator 2.12.x, 2.11.2, 2.10.2)

Cloudera Issue: NAV-5661, KB-713

Log includes the error "EndPoint1 must not be null"

The following error may appear in the Navigator Metadata Server log:

```
2017-10-17 13:00:23,007 ERROR com.cloudera.nav.hive.extractor.AbstractHiveExtractor
[CDHExecutor-0-CDHUrlClassLoader@14784b7b]: Unable to parse hive view query *: EndPoint1
must not be null or empty
java.lang.IllegalStateException: EndPoint1 must not be null or empty
```

This error occurs because the Hive pull extraction for creating a Hive view produces an incorrect lineage relationship for the Hive view. However, Navigator also receives information for the view creation through the push extractor, which correctly produces the lineage relation. You can safely ignore this error. Note that it is distinct from [Lineage relations are missing for some views with "Endpoint2 must not be null or empty" error](#) on page 2726.

Affects version: Cloudera Manager 5.10.x and later (Navigator 2.9.x)

Cloudera Issue: NAV-4224

Log includes the error "EndPoint2 EntityType must not be null unless unlinked"

The following error may appear in the Navigator Metadata Server log:

```
2017-10-26 15:48:27,440 INFO com.cloudera.nav.hdfs.extractor.HdfsOperationHandler
[CDHExecutor-0-CDHUrlClassLoader@3eca0c78]: Unable to process rename for path
/hbase/data/default/img/f6572262455416bff42f92fd2b0e75c0/.tmp/lcc1af7b0f784572
b821980f6b4c5adc: can't find source information.
2017-10-26 15:48:27,440 ERROR com.cloudera.nav.hdfs.client.InotifyClient
[CDHExecutor-0-CDHUrlClassLoader@3eca0c78]: Error handling event (txid: 2020059072):

784572b821980f6b4c5adc to
/hbase/data/default/img/f6572262455416bff42f92fd2b0e75c0/D/lcc1af7b0f784572b821980f6b4c5adc
at time 1509049550134
java.lang.IllegalStateException: EndPoint2 EntityType must not be null unless unlinked
at com.google.common.base.Preconditions.checkState(Preconditions.java:149)
at com.cloudera.nav.core.model.Relation.validate(Relation.java:287)
```

This error occurs when HDFS files are renamed and the new name is affected by an exclusion filter. The only consequence of the problem is noise in the log. Note that it is distinct from [Lineage relations are missing for some views with "Endpoint2 must not be null or empty" error](#) on page 2726.

This problem prevents new lineage information from being added to existing and new Hive entities.

Affects version: Cloudera Manager 5.7.x and later (Navigator 2.6.x)

Fixed in version: Cloudera Manager 5.14.x (Navigator 2.13.x)

Cloudera Issue: NAV-4654

Table-to-HDFS links not established when Navigator supports multiple, high-availability clusters

When Navigator extracts metadata for multiple clusters and when the clusters are configured for high availability operation, Navigator does not correctly link tables to their HDFS backing data. The result is that lineage between Hive

Cloudera Navigator Data Management Release Notes

tables and their physical data are not created. In addition, some Hive table metadata that is derived from the backing files is not available.

You may see errors in the log such as the following:

```
2018-02-19 09:01:32,999 ERROR com.cloudera.nav.persist.impl.CompositeLinker
[CDHExecutor-0-CDHUrlClassLoader@01010d7e]: Internal error while
linking.java.lang.IllegalArgumentException: expected one element but was:
<com.cloudera.nav.core.model.Source@b22e68ba, com.cloudera.nav.core.model.Source@5b1bac2c>
```

Affects version: Cloudera Manager 5.13.x, 5.12.x (Navigator 2.12.x, 2.11.x)

Fixed in version: Cloudera Manager 5.14.0 (Navigator 2.13.0)

Cloudera Issue: NAV-5749

Purging Deleted Properties shows "Bad Request" error when viewing Hive entity details

After upgrading to Navigator 2.11.0 (Cloudera Manager 5.12.0) and later versions (to Navigator 2.13.0), removing deleted managed metadata properties with the "Purge deleted Properties" command causes a mismatch between the Solr schema and the data stored for entities. (**Administration > Managed Metadata**).

Properties

See the [documentation](#) before creating or modifying properties.

Search Class or Property

Name	Status	Type	Classes	Multivalued	Actions
Nav_5982	Deleted	Enumeration	Oozie Workflow, Oozie Workflow Instance	No	Actions ▾

The result is that the Navigator console shows the error "Bad Request" when displaying details for Hive entities such as databases, tables, or fields.

When this problem occurs, the Navigator Metadata Server log will include a message such as the following:

```
[CDHExecutor-0-CDHUrlClassLoader@62d310e8]: Internal error while linking.
java.lang.IllegalArgumentException: java.lang.ClassCastException@2f145bbc
```

To avoid this problem, do not purge deleted properties; allow these properties to stay in the list of properties.

Affects version: Cloudera Manager 5.12.0 and later (Navigator 2.11.0)

Fixed in version: Cloudera Manager 5.15.0, 5.14.2, 5.13.3 (Navigator 2.14.0, 2.13.2, 2.12.3)

Cloudera Issue: NAV-5982

Metadata Server log file and spurious error messages

Certain configurations of OS and database (such as PostgreSQL and Ubuntu Linux) may raise spurious error messages regarding non-existent files. Such messages can be safely disregarded, such as this example:

```
Error: [main]: PWC6351: In TLD scanning, the
supplied resource file:/usr/share/java/oracle-connector-java.jar does not
exist.
```

Affects version: Cloudera Manager 5.9.x, 5.8.1 (Navigator 2.8.x, 2.7.1)

Fixed in version: Cloudera Manager 5.10.0 (2.9.0)

Cloudera Issue: NAV-698

Purge

Fail to Purge Hive and Impala Select Operations

In some cases, purge code makes large query requests to solr. In those cases, it can fail with the following error followed by a stack trace:

```
2018-09-22 23:39:55,736 ERROR
com.cloudera.nav.maintenance.purge.hiveandimpala.PurgeHiveOrImpalaSelectOperations
[scheduler_Worker-2]: Failed to purge operations for
DELETE_HIVE_AND_IMPALA_SELECT_OPERATIONS with error
    org.apache.solr.client.solrj.impl.HttpSolrServer$RemoteSolrException: Expected
    mime type application/octet-stream but got application/xml.
```

Work-around: To work around this problem, lower the batch size for Navigator commits to its Solr collection by changing the value of `nav.solr.commit_batch_size` to be lower.

Affects version: Cloudera Manager 5.12.0 (Navigator 2.11) and later

Cloudera Issue: NAV-6789

Purge operation leaves Kite errors in log

Navigator Metadata Server attempts to handle Kite datasets even though Kite datasets are no longer supported. This problem may affect operations such as metadata purge. If you encounter Kite dataset errors such as the following, you need to manually disable Kite dataset extraction.

```
2018-09-23 16:10:43,678 ERROR com.cloudera.nav.hdfs.datasets.KiteDatasetReader
[hdfs-reader-1]: Dataset expected but not found at
/staging/example/.temp/job_1537417909723_0201/mr/job_1537417909723_0201org.kitesdk.data.DatasetNotFoundException:
Descriptor location does not exist
```

To disable Kite dataset extraction, set the following Navigator Metadata Server property in Cloudera Manager, in the **Navigator Metadata Server Advanced Configuration Snippet (Safety Valve) for cloudera-navigator.properties**:

```
nav.extractor.hdfs.datasets.enabled=false
```

Affects version: Cloudera Manager 5.14.0 (Navigator 2.13) and later

Cloudera Issue: NAV-6965

The flag for disabling purge is ignored in the UI

The **Administration > Purge Settings >** page may show scheduled purge operations even if the `nav.purge.enabled` property is set to false. The displayed purge operations will not run.

Affects version: Cloudera Manager 5.14.0, 5.14.1 (Navigator 2.13.1, 2.13.0)

Fixed in version: Cloudera Manager 5.14.2 (Navigator 2.13.2)

Cloudera Issue: NAV-5966

Policy specifications and cluster names affect purge

Policies cannot use cluster names in queries. Cluster name is a derived attribute and cannot be used as-is.

Workaround: When setting move actions for Cloudera Navigator, if there is only one cluster known to the Navigator instance, remove the `clusterName` clause.

If there is more than one cluster known to the Navigator instance, replace `clusterName` with `sourceId`. To get the `sourceId`, issue a query in this format:

```
curl '<nav-url>/api/v9/entities/?query=type%3Asource&limit=100&offset=0'
```

Use the identity of the matching HDFS service for this cluster as the `sourceId`.

Cloudera Issue: NAV-3288

Spark

Spark Lineage Limitations and Requirements

Spark lineage diagrams are supported in the following releases:

- Spark 2.3 as of Cloudera Manager 5.14.0 (Navigator 2.13.0)
- Spark 1.6 as of Cloudera Manager 5.11.0 (Navigator 2.10.0)

Lineage is not available for Spark when Cloudera Manager is running in single user mode. In addition to these requirements, Spark lineage has the following limitations:

- Lineage is produced only for data that is read/written and processed using the Dataframe and SparkSQL APIs. Lineage is not available for data that is read/written or processed using Spark's RDD APIs.
- Lineage information is not produced for calls to aggregation functions such as `groupBy()`.
- The default lineage directory for Spark on Yarn is `/var/log/spark/lineage`. No process or user should write files to this directory—doing so can cause agent failures. In addition, changing the Spark on Yarn lineage directory has no effect: the default remains `/var/log/spark/lineage`.

Cloudera Issue: OPSAPS-39589

Navigator doesn't recognize local files in Spark jobs

Spark jobs can use files on the local filesystem as job inputs or outputs. Navigator, however, only supports HFDS, Hive, and S3 assets as job inputs or outputs. When Navigator extracts metadata from Spark and encounters a local source type, the metadata is discarded and the following error appears in the Navigator Metadata Server log:

```
2018-10-11 12:14:26,192 WARN com.cloudera.nav.api.ApiExceptionMapper
[qtp1574898980-23815]: Unexpected exception.
    java.lang.RuntimeException: Source LOCAL isn't supported for Spark Lineage
```

Affected Versions: Cloudera Manager 5.11 and later (Navigator 2.10)

Fixed in version: Cloudera Manager 5.16.2 (Navigator 2.15.2) Note that the fix does not provide support for extracting metadata for local files for Spark jobs; it prevents the error.

Cloudera Issue: NAV-6811

Too many open files on the Navigator Metadata Server Spark agent

You've encountered this problem if lineage isn't being created for Spark operations and the Cloudera Manager Agent logs include the error:

```
OSError: [Errno 24] Too many open files: '/var/log/spark/lineage'
```

Work-around:

To remove the bottleneck of files and continue processing:

1. From a terminal, login to the host with the issue.
2. [Stop the Cloudera Manager agent.](#)

If the file descriptor limit is hit, the agent is likely to fail to start anyway.

3. Navigate to the Spark lineage directory, by default `/var/log/spark/lineage`.

The directory will contain thousands of files.

4. Move enough files out of this directory to bring count of files within the file descriptor limit.
5. [Start the Cloudera Manager Agent.](#)

The agent will start processing files within few minutes. After successfully processing, the agent will delete the processed files. At the end there will fewer than 10 files present in the directory.

6. Move the files that were moved out back in the directory.

The next set of files will be processed.

Affects version: Cloudera Manager 5.12.1 and later (Navigator 2.11.1)

Fixed in version: Cloudera Manager 5.16.1, 5.15.1, 5.14.4 (Navigator 2.15.1, 2.14.1, 2.13.4)

Cloudera Issue: NAV-6396

Extracting Spark operation produced error message "Solr Manager can be used by only one thread"

When extracting Spark operations, the following error appears in the Navigator Metadata Server log:

```
2018-02-20 09:37:27,869 ERROR com.cloudera.nav.pushextractor.spark.SparkPushExtractor
[qtp937744315-126]: com.cloudera.nav.pushextractor.spark.SparkPushExtractor Error
extracting Spark operation.java.lang.IllegalStateException: Solr Manager can be used by
only one thread.
```

This error does not have consequences for Navigator handling Spark operations.

Affects version: Cloudera Manager 5.14.1, 5.14.0, 5.13.1, 5.13.0, 5.12.x (Navigator 2.13.1, 2.13.0, 2.12.1, 2.12.0, 2.11.x)

Fixed in version: Cloudera Manager 5.15.0, 5.14.2, 5.13.3 (Navigator 2.14.0, 2.13.2, 2.12.3)

Cloudera Issue: NAV-4991

Spark lineage not shown in Navigator for HDFS HA

When HDFS is configured for high availability, Spark lineage doesn't show in Navigator. In these cases, the log includes index out of bounds exceptions such as the following:

```
com.cloudera.nav.pushextractor.spark.SparkPushExtractor Error extracting Spark operation.
java.lang.ArrayIndexOutOfBoundsException
```

Affects version: Cloudera Manager 5.13.0, 5.12.1, 5.12.0, 5.11.x, 5.10.x, 5.9.x (Navigator 2.12.0, 2.11.1, 2.11.0, 2.10.x, 2.9.x, 2.8.x)

Fixed in version: Cloudera Manager 5.14.0, 5.13.1, 5.12.2 (Navigator 2.13.0, 2.12.1, 2.11.2)

Cloudera Issue: NAV-4874

Spark extractor enabled using safety valve deprecated

The Spark extractor included prior to CDH 5.11 and enabled by setting the safety valve, `nav.spark.extraction.enable=true` is being deprecated, and could be removed completely in a future release. If you are upgrading to CDH 5.11 from a deployment that had configured this safety valve, be sure to remove the setting when you upgrade.

Upgrade Issues and Limitations

Issues and limitations matrix by release

Before upgrading Cloudera Navigator, review these version-specific release notes:

Upgrade		Limitations, requirements, preliminary tasks
From...	To...	
2.14 (and lower)	2.15.1 (and higher)	The default filters set for auditing HDFS changed in Cloudera Manager 5.16.1 (Navigator 2.15.1). If you've updated your HDFS audit filters from previous defaults, the new filters are not applied. Whether or not the filters are changed in your upgrade process,

Upgrade		Limitations, requirements, preliminary tasks
From...	To...	
		we recommend that you review your HDFS audit filters to ensure you are collecting the audit events that add value in your environment. See Improvements to Audit Filters for more information.
2.10 (and lower)	2.11.0, 2.11.1, 2.12.0	When using Navigator in multi-cluster environments, avoid upgrading to Cloudera Manager deployments of version 5.12.0, 5.12.1, or 5.13.0 due to a known problem where Navigator does not recognize more than one cluster. Instead, upgrade to Cloudera Manager release 5.12.2, 5.13.1, or 5.14.0 (Navigator 2.11.2, 2.12.1, or 2.13.0). See Cloudera Navigator is not supported in installations in multi-cluster environments for Cloudera Manager versions 5.12.0, 5.12.1, and 5.13.0 on page 2717 for more details. This problem does not affect single cluster deployments or Altus clusters.
2.8 (and lower)	2.9.0, 2.9.1, 2.10.0	Avoid upgrading to Cloudera Manager releases 5.10.0, 5.10.1 and 5.11.0 (Navigator releases 2.9.0, 2.9.1, and 2.10.0) due to the known problem causing the storage directory to fill beyond its capacity. The workaround is to upgrade to Cloudera Manager release 5.10.2, 5.11.1, or 5.12.x (Navigator 2.9.2, 2.10.1, 2.11.x) or later, where this issue is fixed. See Navigator Embedded Solr can reach its limit on number of documents it can store on page 2725 if you are already running one of these releases.
2.10	2.10.1	Upgrading Cloudera Manager 5.11.0 (Cloudera Navigator 2.10) to Cloudera Manager 5.11.1 (Cloudera Navigator 2.10.1) results in failures by Navigator Audit Server to publish to Kafka. See Publishing to Kafka fails after upgrade on page 2723 for details and a workaround.
2.9 (and higher)	2.10 (and higher)	As described later in this table, upgrading across Cloudera Manager 5.10 (Cloudera Navigator 2.9) involved a significant metadata change and therefore the upgrade was very slow. Upgrades between Cloudera Manager 5.10 and later releases do not have a metadata change and the Navigator upgrade is quick.
2.8 (and lower)	2.9 (and higher)	Upgrading to Cloudera Navigator 2.9 and higher (Cloudera Manager 5.10 and higher) can take a significant amount of time, depending on the size of the datadir. Before starting to upgrade to Cloudera Manager 5.10 (which automatically starts the upgrade to Cloudera Navigator 2.9), see Upgrading Cloudera Navigator Can be Extremely Slow on page 2733. Briefly, in this release Solr indexing has been optimized to improve search speed. When the upgrade process completes and Cloudera Navigator services re-start, the Solr indexing upgrade automatically begins. No other actions can be performed until Solr indexing completes (progress message display during this process).
2.6 (and lower)	Any	The Cloudera Navigator Metadata Server requires an upgrade of data in the storage directory. See Upgrading Cloudera Navigator for details.
2.4.0, 2.4.1	2.4.2	After upgrading, requires manual modification to the HDFS extractor state file to change status of UNDELETE taskTypes from SUCCEEDED to FAILED. This manual process is required only for these specific releases listed. See Issues Fixed in Cloudera Navigator 2.4.2 for details.
Any	2.4 – 2.6	Cloudera Navigator 2.4 – 2.6 do not support JDK 1.6, so upgrade any instances of JDK 1.6 to JDK 1.7 or 1.8 before upgrading to these releases. See Step 2: Install Java Development Kit for details.
2.1	2.2	Cloudera Navigator 2.1 used the beta version of the Navigator Metadata Server policy engine. Policies created using that version are not retained during the upgrade.
2.0 (and lower)	2.1 (and higher)	The upgrade wizard for this upgrade path adds the Navigator Metadata Server to the Cloudera Manager cluster. The Navigator Metadata Server is new, and is not the same as the existing Navigator Audit Server database.

Upgrade		Limitations, requirements, preliminary tasks
From...	To...	
1.2	2.0	Cloudera Navigator 1.2 and Cloudera Navigator 2.0 have reached EOL (end of life) status and are no longer supported. There is no wizard for this upgrade path. Cloudera Navigator 2.0 required a clean install. The Navigator 1.2 Navigator Metadata Server was a beta release included with Cloudera Manager 5.0. The 1.2 version of the Navigator Metadata Server role must be removed before the cluster can be upgraded to Cloudera Navigator 2.0 (the roles are not compatible).

Upgrading Cloudera Navigator Can be Extremely Slow

Upgrading a cluster running Cloudera Navigator to Cloudera Manager 5.10 (or higher) can be extremely slow due to an internal change made to the Solr schema in Cloudera Navigator 2.9. A Solr instance is embedded in Cloudera Navigator and supports its Search capabilities. The Solr schema used by Cloudera Navigator has been modified in the 2.9 release to use datatype `long` rather than `string` for an internal `id` field. This change makes Cloudera Navigator far more robust and scalable over the long term.

However, the upgrade process itself can take a significantly long time because the existing Solr documents—the indexed and searchable data structures used by Solr that are contained in the Cloudera Navigator storage directory—are migrated to the new schema. This change to the Solr schema affects only those Cloudera Navigator deployments that use the metadata and lineage features.

Note: Cloudera Navigator deployments that use only the auditing features of the product—not metadata or lineage—are not affected by this issue.

The upgrade process for Cloudera Navigator starts automatically at the end of the Cloudera Manager upgrade, and the migration to the new schema occurs automatically as part of that upgrade process. The amount of time that administrators should allow for this process depends on the quantity stored at the Navigator Metadata Server Storage Dir (`nav.data.dir`, or simply "datadir") location as listed here:

Metadata and lineage usage	Description
None	Deployments that use Cloudera Navigator audit capability only —without metadata or lineage—do not have the issue. Backup the Navigator Metadata Server datadir and then delete it before upgrading.
datadir < 60 GB	Deployments with relatively small Navigator Metadata Server data directories may take 1 to 2 days for the upgrade process to complete. See the Workaround for steps to take before upgrading to Cloudera Manager 5.10 to possibly reduce the upgrade time.
datadir > 60 GB	Deployments with relatively large Navigator Metadata Server data directories may take several days for the upgrade process to complete. See the Workaround for steps to take before upgrading to Cloudera Manager 5.10 to possibly reduce the upgrade time.

Workaround: To reduce the time required for upgrading the Navigator Metadata Server data directories for deployments currently running Cloudera Navigator 2.8 that uses its metadata and lineage features, consider removing unneeded entries from the metadata before the upgrade. The Navigator Purge feature allows you to remove metadata for deleted entities and for entities and operations older than a specified date. For more information on what metadata you can remove with Purge, see [Managing Metadata Storage with Purge](#).

Run purge before starting the Cloudera Manager upgrade (to Cloudera Manager 5.10), following the steps below.

Warning: These steps may mitigate but do not fully resolve the issue. Follow these steps **before** starting the Cloudera Manager upgrade to **Cloudera Manager 5.10** for any Cloudera Manager 5.9 cluster that currently uses the Cloudera Navigator metadata and lineage features.

Cloudera Navigator Data Management Release Notes

- Check the Navigator Metadata Server storage directory size. The path is `/var/lib/cloudera-scm-navigator` (default) unless configured otherwise. If you need to check the setting:
 - Log in to Cloudera Manager Admin Console.
 - Select **Clusters > Cloudera Management Service**.
 - Click **Configuration** and then click the **Navigator Metadata Server** Scope filter:

Navigator Metadata Server	Navigator Metadata Server (node-1)
Storage Dir	<code>/var/lib/cloudera-scm-navigator</code>
<code>nav.data.dir</code>	

- Confirm that the cluster uses the default configuration, or make a note of the location specified and the node name.
- Check the size of the actual directory contents. The following example shows a freshly installed system and so it is virtually empty.

```
[root@node-1 ~]# cd /var/lib/cloudera-scm-navigator
[root@node-1 cloudera-scm-navigator]# ls -l
total 12
drwxr-x--- 2 cloudera-scm cloudera-scm 113 Jul 12 06:56 diagnosticData
drwxr-x--- 2 cloudera-scm cloudera-scm 4096 Jul 12 09:16 extractorState
-rw-r----- 1 cloudera-scm cloudera-scm 36 Jul 12 05:54 instance.uuid
drwxr-x--- 4 cloudera-scm cloudera-scm 60 Jul 12 04:18 solr
drwxr-x--- 7 cloudera-scm cloudera-scm 4096 Jul 12 07:26 temp
[root@node-1 cloudera-scm-navigator]# cd solr
[root@node-1 solr]# ls -l
total 4
drwxr-x--- 4 cloudera-scm cloudera-scm 28 Jul 12 05:56 nav_elements
drwxr-x--- 4 cloudera-scm cloudera-scm 28 Jul 12 05:56 nav_relations
-rw-r----- 1 cloudera-scm cloudera-scm 450 Jul 6 16:13 solr.xml
[root@node-1 solr]#
```

- Back up the contents of the directory. Use Cloudera Manager BDR or your preferred method.
- Schedule a purge process as described in [Scheduling the Purge Process](#).

Note: Users and processes cannot access Cloudera Navigator while purge is running.

Set options to purge metadata for deleted HDFS entities and any operations.

- Check the storage directory size again. If needed, re-run the purge with a shorter time span to retain metadata. If the storage directory consumption cannot be reduced below 60GB, do not start the Cloudera Manager upgrade. Instead, contact [Cloudera support](#) to help you with this upgrade.

Cloudera Issue: NAV-5046

Upgrade Limitation (Navigator 1.2 to Navigator 2)

Moving from Cloudera Navigator 1.2 (part of Cloudera Manager 5.0) to Cloudera Navigator 2 requires a fresh install of Cloudera Navigator 2: The beta release of the Navigator Metadata Server included with Cloudera Navigator 1.2 cannot be upgraded. The summary of the process is as follows:

- Delete the Navigator Metadata Server role.
- Remove the content of the Navigator Metadata Server storage directory.
- Add the Navigator Metadata Server role as detailed in [Adding the Navigator Metadata Server Role](#).
- Clear the cache for any browsers that connected to the 1.2 release of Navigator Metadata Server, to avoid errors caused by stale data.

Fixed in version: Navigator 2.0.1

Cloudera Issue: NAV-654

Issues Fixed in Cloudera Navigator Data Management

The following sections describe the issues fixed in each Cloudera Navigator release.

Issues Fixed in Cloudera Navigator 2.15.2

Apache Commons File Upload Vulnerability

The `commons-fileupload` package used by Navigator has been upgraded to 1.3.3 to resolve a security vulnerability indicated by [CVE-2016-3092](#).

Cloudera Issue: NAV-7099

Navigator Metadata Server purge jobs might not run if there were policies configured

Navigator Metadata Server purge could produce messages such as "Checking if maintenance is running" and then failed to run during the available window. This problem occurred when a scheduled purge job waits for extraction tasks to finish but while waiting, a policy job starts, preventing the purge job from running. In this release, policy jobs will not be triggered if purge jobs are scheduled and waiting to start.

Cloudera Issue: NAV-7037

Navigator Metadata Server shows many duplicate lineage relations

Under some circumstances, Navigator Metadata Server created invalid operation to operation execution relations. This caused errors when displaying the lineage in the Navigator console. Also, the metadata purge could not delete the invalid relations. This problem is fixed in this release.

Cloudera Issue: NAV-7035

International characters in tag names

Navigator tags now support UNICODE characters beyond ASCII. Only ASCII text can be used in the name of a user-defined or managed property. Property values can include international characters.

Cloudera Issue: NAV-7011

Reduction in the amount of memory used by Navigator Metadata Server

This release includes changes that improve how Navigator Metadata Server uses memory, reducing the overall heap required.

Cloudera Issue: NAV-6958

Display of purge history was not sorted

The Navigator console content showing the history of purge jobs is now sorted by time in descending order.

Cloudera Issue: NAV-6916

Navigator doesn't recognize local files in Spark jobs

Spark jobs can use files on the local filesystem as job inputs or outputs. Navigator only supports HFDS, Hive, and S3 assets as job inputs or outputs. While local source files are still not supported, this fix produces improves how local source types are handled when extracting metadata from Spark jobs.

Cloudera Issue: NAV-6811

Cloudera Navigator Data Management Release Notes

Agent log files not deleted when Spark1 and Spark2 shared a node

Navigator did not show all lineage information when Spark1 and Spark2 are installed together and Spark roles overlap on a node. Spark agent logs were not processed, potentially leaving thousands of files in the Spark agent logs directory. This problem is fixed in this release.

Cloudera Issue: OPSAPS-49579 and NAV-6662

Navigator Audit Server "CannotSendRequest" error resolved

When an error occurred in the audit pipeline, it was possible that not all components in the Navigator Audit Server recovered fully. One symptom of such a failure is the "CannotSendRequest" error in the Navigator Audit Server log. This problem is fixed in this release.

Cloudera Issue: NAV-6321

Issues Fixed in Cloudera Navigator 2.15.1

Tables that have been deleted in Hive still appear in Navigator

Navigator metadata extraction from Hive uses an extractor state to keep track of the Hive entities committed to the Navigator Metadata Server data storage in Solr. In some cases, such as when the extractor state file is deleted or when Navigator Metadata Server is shut down during extraction from Hive, the extractor state no longer represents the state of the Hive extraction. When this happens, there may be entities listed in Navigator that are not accounted for in the extractor state. When this happens, Navigator no longer updates the Hive entities that are in Solr but not in the extractor state.

This release includes a check to make sure that the extractor state is synchronized with the content of Hive entities in Solr. To enable the check, set the following property in the Cloudera Management Service property **Navigator Metadata Server Advanced Configuration Snippet (Safety Valve)**:

```
nav.extractor.hive.validate_state=true
```

Cloudera Issue: NAV-6745

Navigator Metadata Server purge did not run at the scheduled time

Navigator stored the time for the scheduled purge as a UTC value; however, the value was read by the scheduler as local time. The purge would run later than the expected time by the number of timezones that local time was different from UTC.

Cloudera Issue: NAV-6700

Navigator Metadata Server runs out of memory during purge operations

One of the steps in the process of purging deleted entities from Navigator involves rebuilding lineage relations when one end of the relation included a deleted entity that was to be purged. This process had an issue that produced lineage relations with duplicate endpoint IDs and caused Navigator Metadata Server to stop. The problem has been resolved in this release.

Cloudera Issue: NAV-6675

The Swagger "Try it out" option for the /audits API fails

Using the interactive Navigator API for the `/audits` endpoint failed with the error:

```
No serializer found for class sun.net.www.protocol.http.HttpURLConnection$HttpInputStream and no properties discovered to create BeanSerializer (to avoid exception, disable SerializationConfig.SerializationFeature.FAIL_ON_EMPTY_BEANS) )
```

Also, the documentation accompanying the audit API says a selector is `table` but selector is actually `table_name`.

Workaround: Changing the `limit` to a value less than 10000.

Cloudera Issue: NAV-6664

Support for PostgreSQL 10

Navigator Audit Server and Navigator Metadata Server released in Cloudera Manager 5.15.0 and 5.15.1 did not support PostgreSQL version 10.x.

Cloudera Issue: NAV-6619

Pre-registration was not working for Hive entities

Pre-registration of Hive entities (Htable, HColumn, or HDatabase) fails causing exceptions in the logs such as:

```
java.lang.ClassCastException: com.cloudera.nav.core.model.GenericEntity cannot be cast
to com.cloudera.nav.hive.model.HTable
```

Cloudera Issues: NAV-6608

Navigator Metadata Server has high CPU usage, linking taking too long after Spark extraction

In some cases, Navigator Metadata Server processing requires an extraordinary amount of memory for longer than expected while extracting and linking metadata when Spark extractions are enabled. A symptom of the problem is a flood of Navigator Metadata Server log messages such as:

```
Finished linking relation with id: <id>
```

This change removes duplicate relations from SPARK data flow relations.

Cloudera Issue: NAV-6591

Reduced noise of logging for SparkLinker

The Navigator Metadata Server logs included too much logging detail at the INFO level coming from the linking process that runs against Spark entities. Many of the log entries were moved to DEBUG.

Cloudera Issue: NAV-6560

Upgrading Navigator from Cloudera Manager versions 5.7 and earlier to could lose data when very long text was truncated

Data was truncated if it could not fit field size of 32K characters. This could affect query text among other fields. This fix makes sure that data is preserved.

Cloudera Issue: NAV-6552

Incorrect behavior for lineage from metadata extracted using earlier Navigator releases

When storage directories contain metadata that was extracted before Navigator 2.6, there could be incorrect values for Source Type and Entity Type and missing values for `internalType`, which cause exceptions in the Navigator Metadata Server log and incorrect behavior when creating lineage relations. This change fixes the issue for most cases. Rare cases may require additional metadata changes.

Cloudera Issue: NAV-6514

Navigator does not mark HDFS entities as deleted when in bulk extraction takes too long to complete

In large HDFS deployments, the `fsimage` takes a long time to index. When an HDFS checkpoint occurs, it creates a new `fsimage`. However if the previous `fsimage` is still in the process of being indexed, Navigator cannot use the incremental changes found in the `inotify` stream because it refers to the newly created `fsimage`.

Cloudera Navigator Data Management Release Notes

When this happens, Navigator attempts to start indexing the newer `fsimage`, creating a loop where Navigator can never take advantage of the more efficient change processing through `inotify`. The immediate fallout of this delay is that no HDFS entities deleted in the cluster are marked as deleted in Navigator.

Cloudera Issue: NAV-6456

Missing Audit Events

Audit events were not sorting correctly, causing the audit listing to exclude some events expected in a given time range. This problem is fixed in this release.

Cloudera Issue: NAV-6413

Corrected Metadata Extraction from YARN-run Hive Query

Hive Job Extractor is used to capture Hive queries launched using Hive CLI. The extractor is scheduled by YARN, so the "service type" passed to the extractor is of type YARN. The conflict between the YARN-generated source ID and Hive as the source caused Navigator issues. This change properly manages the Hive CLI query metadata with the YARN service type.

Cloudera Issue: NAV-6409

Too many open files on the Navigator Metadata Server Spark agent

Lineage wasn't being created for Spark operations and the Cloudera Manager Agent logs included the error:

```
OSError: [Errno 24] Too many open files: '/var/log/spark/lineage'
```

Cloudera Issue: NAV-6396

TLS truststore password encrypted

In previous releases, when Cloudera Manager starts Navigator Metadata Server role, it passes trust store password un-encrypted. In this release, when configured to use TLS, the truststore password is encrypted when passed between Cloudera Manager and Navigator.

Cloudera Issue: NAV-6382

"Lineage Diagram is limited to 3000 entities" Error

Navigator capped the number of lineage parents that could be used at one time, however this cap included relations with second level parents (columns). The Navigator Metadata Server log includes an error such as "Lineage Diagram is limited to 3000 entities".

Cloudera Issue: NAV-6371

Malformed requests don't reveal information

Navigator Metadata Server inadvertently disclosed more information than necessary when it responded to malformed requests. In this release, no information is revealed without the call successfully authenticating.

Cloudera Issue: NAV-6346

Navigator Console Handles Increased Property Limits

The Navigator Metadata Server was recently updated to support property names of length up to 500 and no limit on the description field. (See [Name and description lengths increased](#)). In this release, the Navigator console has been modified to handle the increased limits in all contexts.

Cloudera Issue: NAV-6331

Improved Console Editing for Float and Double Property Types

Previously, managed properties defined as `float` or `double` required a decimal point in stored values; this problem is resolved in this release.

Cloudera Issue: NAV-6291

Automated clean-up when Navigator Metadata Server Storage Directory is Cleared

When Navigator Metadata Server role starts, it now checks if the Solr storage directory is empty or not. If it is empty, this check resets the ordinal numbers and starts a new Navigator maintenance history record.

Cloudera Issue: NAV-6267

Linking fails with NullPointerException

Navigator linking failed with errors similar to the following:

```
ERROR org.apache.solr.core.SolrCore [qtp1200906406-61]:
      java.lang.NullPointerException
```

```
ERROR com.cloudera.nav.persist.impl.CompositeLinker
[CDHExecutor-0-CDHUrlClassLoader@23e992bf]: Internal error while linking.
java.lang.NullPointerException
```

Navigator was creating new sources when an exception occurred and it wasn't able to locate the existing source. This release properly handles the original exception and logs the issue clearly.

Cloudera Issue: NAV-6229

Multiple Cluster Extractor Failure

When Navigator Metadata Server is started with a fresh storage directory on Cloudera Manager versions 5.12.0 or later, extractors were not working when a single Cloudera Manager is managing multiple clusters. This problem is fixed in this release.

Cloudera Issue: NAV-6145

Web Server and Platform Version Disclosure Removed

This release includes a change to omit the server and platform versions from the web server response header.

Cloudera Issue: NAV-6019

Security headers improved with Cache-Control

This release includes Cache-Control cookie headers with the setting "no-cache" to ensure that no browser content is cached. Navigator Metadata Server, the web server for the Navigator console, already uses the no-cache Cache-Control header for API interactions. This change extends the security coverage to additional content such as JavaScript.

Cloudera Issue: NAV-6018

ClassCastException in Navigator Metadata Server log

When a Hive view is created, then dropped, and then subsequently recreated as a table with the same name as that of the original view, the Hive extraction process shows this exception in Navigator Metadata Server logs:

```
java.lang.ClassCastException: com.cloudera.nav.hive.model.HView cannot be cast to
com.cloudera.nav.hive.model.HTable
```

Cloudera Issue: NAV-5939

Cloudera Navigator Data Management Release Notes

Less Secure Credentials Protection Policy could expose Azure credentials in audit logs

When you use Cloudera Manager to configure the ADLS Connector service using the Less Secure option for the Credentials Protection Policy, it was possible for Hive audit logs to include Microsoft Azure credentials. If you are using Navigator Audit Server, these credentials could appear in audit reports.

This issue is fixed in this release.

Cloudera Issues: NAV-5861, CDH-56241

API Error when Adding an Audit Filter in Navigator Console (Oracle)

When Navigator Audit Server database is Oracle and when adding Source or Destination filter in the Navigator console Audit page, Navigator returned an API Error. The Navigator Metadata Server log (for the console) included this error:

```
Caused by: java.sql.SQLException: ORA-00932: inconsistent datatypes: expected  
- got CLOB
```

Cloudera Issue: NAV-3582

Issues Fixed in Cloudera Navigator 2.14.2

Connection timeout increased in Navigator Audit Server to avoid broken pipe errors

This release of Navigator increases the connection idle time for the connection between Navigator Audit Server and each Cloudera Manager agent that sends audits to Navigator from audited services. This change will help avoid audit pipeline "broken pipe" errors that can occur when increased load on the audit server node causes Navigator Audit Server not to respond quickly enough.

Cloudera Issue: NAV-6796

Navigator Metadata Server failed to start with `InvalidClassException`, local class incompatible

Navigator Metadata Server failed to start (red status in Cloudera Manager) and the Metadata Server log included the following exception:

```
2018-09-06 10:38:20,786 WARN jndi [main]:  
java.io.InvalidClassException: com.mchange.v2.c3p0.WrapperConnectionPoolDataSource;  
local class incompatible: stream classdesc serialVersionUID = 7806429541739165290, local  
class serialVersionUID = -7086951306718003710
```

Even if Navigator Metadata Server started once, it may encounter this problem at a later time, depending on which JAR file is loaded.

Workaround: See Knowledge Base Article [Navigator Metadata Server fails to start with "local class incompatible" error](#)

Affects version: Cloudera Manager version 5.15.1 (Navigator 2.14.1)

Cloudera Issue: NAV-6724

Navigator Metadata Server purge did not run at the scheduled time

Navigator stored the time for the scheduled purge as a UTC value; however, the value was read by the scheduler as local time. The purge would run later than the expected time by the number of timezones that local time was different from UTC.

Cloudera Issue: NAV-6700

Support for PostgreSQL 10

Navigator Audit Server and Navigator Metadata Server released in Cloudera Manager 5.15.0 and 5.15.1 did not support PostgreSQL version 10.x.

Cloudera Issue: NAV-6619

Navigator Metadata Server has high CPU usage, linking taking too long after Spark extraction

In some cases, Navigator Metadata Server processing requires an extraordinary amount of memory for longer than expected while extracting and linking metadata when Spark (Spark 1 or Spark 2) extractions are enabled. A symptom of the problem is a flood of Navigator Metadata Server log messages such as:

```
Finished linking relation with id: <id>
```

This change removes duplicate relations from SPARK data flow relations.

Cloudera Issue: NAV-6591

ClassCastException in Navigator Metadata Server log

When a Hive view is created, then dropped, and then subsequently recreated as a table with the same name as that of the original view, the Hive extraction process shows this exception in Navigator Metadata Server logs:

```
java.lang.ClassCastException: com.cloudera.nav.hive.model.HView cannot be cast to
com.cloudera.nav.hive.model.HTable
```

Cloudera Issue: NAV-5939

Authentication fails with javax.naming.PartialResultException when using LDAP

Previously, if Navigator Metadata Server is configured with **External Authentication Type** "LDAP" and the LDAP server is Active Directory, when the **LDAP Group Search Base** property is configured with the root of the directory tree, authentication fails in the UI with `Incorrect username or password`.

Navigator Metadata Server logs show the following exception:

```
2018-10-24 12:21:04,619 ERROR com.cloudera.nav.auth.DelegatingNavAuthProvider
[qtpl989132530-59]: External Authentication Service threw exception during authentication
process.
org.springframework.ldap.PartialResultException: Unprocessed Continuation Reference(s);
nested exception is javax.naming.PartialResultException: Unprocessed Continuation
Reference(s); remaining name 'DC=ad,DC=sec,DC=example,DC=com'
```

There were two common workarounds for this problem: use the Global Catalog or configure a more specific location in the directory tree for the **LDAP Group Search Base**. In this release, the root-level **LDAP Group Search Base** is correctly evaluated and no work-around is required. If you have configured one of these workarounds, you can keep the configuration as is with no change of behavior.

Affected version: Cloudera Manager 5.13.x (Navigator 2.12.x)

Cloudera Issue: NAV-5669

Issues Fixed in Cloudera Navigator 2.14.1

"GenericEntity cannot be cast" Exception

When storage directories contain metadata that was extracted before Navigator 2.6, there could be incorrect values for `Source Type` and `Entity Type` and missing values for `internalType`, which cause exceptions in the Navigator Metadata Server log and incorrect behavior when creating lineage relations. Exceptions were similar to the following:

```
java.lang.ClassCastException: com.cloudera.nav.core.model.GenericEntity cannot be cast to com.cloudera.nav.hive.model.HQuery
```

```
java.lang.ClassCastException: com.cloudera.nav.core.model.GenericEntity cannot be cast to com.cloudera.nav.impala.model.ImpalaQuery
```

This change fixes the issue for most of the cases. Rare cases may require additional metadata changes.

Cloudera Issue: NAV-6514

Missing Audit Events

Audit events were not sorting correctly, causing the audit listing to exclude some events expected in a given time range. This problem is fixed in this release.

Cloudera Issue: NAV-6413

Corrected Metadata Extraction from YARN-run Hive Query

Hive Job Extractor is used to capture Hive queries launched using Hive CLI. The extractor is scheduled by YARN, so the "service type" passed to the extractor is of type YARN. The conflict between the YARN-generated source ID and Hive as the source caused Navigator issues. This change properly manages the Hive CLI query metadata with the YARN service type.

Cloudera Issue: NAV-6409

Too many open files on the Navigator Metadata Server Spark agent

Lineage wasn't being created for Spark operations and the Cloudera Manager Agent logs included the error:

```
OSError: [Errno 24] Too many open files: '/var/log/spark/lineage'
```

Cloudera Issue: NAV-6396

Trust Store password encrypted

In previous releases, when Cloudera Manager starts Navigator Metadata Server role, it passed trust store passwords un-encrypted. In this release, when configured to use TLS, the trust store password is encrypted when passed between Cloudera Manager and Navigator.

"Lineage Diagram is limited to 3000 entities" Error

Navigator capped the number of lineage parents that could be used at one time, however this cap included relations with second level parents (columns). The Navigator Metadata Server log includes an error such as "Lineage Diagram is limited to 3000 entities".

Cloudera Issue: NAV-6371

Navigator Console Handles Increased Property Limits

The Navigator Metadata Server was recently updated to support property names of length up to 500 and no limit on the description field. (See [Name and description lengths increased](#)). In this release, the Navigator console has been modified to handle the increased limits in all contexts.

Cloudera Issue: NAV-6331

Improved Console Editing for Float and Double Property Types

Previously, managed properties defined as `float` or `double` required a decimal point in stored values; this problem is resolved in this release.

Cloudera Issue: NAV-6291

Automated clean-up when Navigator Metadata Server Storage Directory is Cleared

When Navigator Metadata Server role starts, it now checks if the Solr storage directory is empty or not. If it is empty, this check resets the ordinal numbers and starts a new Navigator maintenance history record.

Cloudera Issue: NAV-6267

Linking fails with NullPointerException

Navigator linking failed with errors similar to the following:

```
ERROR org.apache.solr.core.SolrCore [qtp1200906406-61]:
    java.lang.NullPointerException
```

```
ERROR com.cloudera.nav.persist.impl.CompositeLinker
[CDHExecutor-0-CDHUrlClassLoader@23e992bf]: Internal error while linking.
java.lang.NullPointerException
```

Navigator was creating new sources when an exception occurred and it wasn't able to locate the existing source. This release properly handles the original exception and logs the issue clearly.

Cloudera Issue: NAV-6229

Multiple Cluster Extractor Failure

When Navigator Metadata Server is started with a fresh storage directory on Cloudera Manager versions 5.12.0 or later, extractors were not working when a single Cloudera Manager is managing multiple clusters. This problem is fixed in this release.

Cloudera Issue: NAV-6145

HDFS metadata extraction performance improvement

Navigator processing for HDFS metadata extraction can take long enough that Navigator cannot finish indexing the `fsimage` before the edit log is checkpointed into a new `fsimage`. This causes extraction to get stuck in a loop of always parsing the `fsimage` in bulk extraction mode (which is slow) rather than moving into incremental extraction from the edit log. This release includes changes that allow Navigator to avoid the bulk extraction loop, therefore reducing the duration of HDFS extraction by as much as half for the initial extraction; performance of subsequent extractions can improve significantly, benefiting both by moving to incremental extraction and by improvements in this fix.

Cloudera Issue: NAV-6033

Web Server and Platform Version Disclosure Removed

This release includes a change to omit the server and platform versions from the web server response header.

Cloudera Issue: NAV-6019

Cloudera Navigator Data Management Release Notes

Pre-registration of Hive/Impala Queries

Previously, it was not possible to pre-register data asset entities by calling the POST /entities API. This change allows application developers to pre-register operations by exposing the method used to generate the operation source IDs.

The Navigator SDK includes an example of pre-registering entities in the `CustomHiveLineageCreator.java` source file.

Cloudera Issue: NAV-5940

Less Secure Credentials Protection Policy could expose Azure credentials in audit logs

When you use Cloudera Manager to configure the ADLS Connector service using the Less Secure option for the Credentials Protection Policy, it was possible for Hive audit logs to include Microsoft Azure credentials. If you are using Navigator Audit Server, these credentials could appear in audit reports.

This issue is fixed in this release.

Cloudera Issues: NAV-5861, CDH-56241

API Error when Adding an Audit Filter in Navigator Console (Oracle)

When Navigator Audit Server database is Oracle and when adding filters that use Source, Destination, Operation Text, Resource Path, or Status properties in the Navigator console Audit page, Navigator returned an API Error. The Navigator Metadata Server log (for the console) included this error:

```
Caused by: java.sql.SQLException: ORA-00932: inconsistent datatypes: expected  
- got CLOB
```

This problem is fixed in this release.

Cloudera Issue: NAV-3582

Issues Fixed in Cloudera Navigator 2.14.0

Console doesn't come up, NAV_EXTRACTOR_STATUS doesn't exist

Libraries included in the Navigator release for Cloudera Manager 5.13 were named such that the upgrade marked the schema with the wrong Navigator version. The result is that schema changes between the original version and the final upgrade version are not run. If your Navigator upgrade encounters this problem, the Navigator console does not come up and you'll see the following error in the Navigator Metadata Server log:

```
Table 'nav_meta_user.NAV_EXTRACTOR_STATUS' doesn't exist
```

Cloudera Issue: NAV-6213

Error dialog block developer mode on IE 11

When using Microsoft Internet Explorer version 11 with developer-mode turned on, an error dialog appeared in the Navigator console that made it difficult to use the console. The error also appeared in the IE 11 developer console.

Cloudera Issue: NAV-6181

Extractors not working in multi-cluster environment

When Navigator Metadata Server is started with a fresh storage directory on versions 5.12.0 or later, extractors were not working when a single Cloudera Manager is managing multiple clusters.

Cloudera Issue: NAV-6145

Security headers improved with Cache-Control

This release includes Cache-Control cookie headers with the setting "no-cache" to ensure that no browser content is cached. Navigator Metadata Server, the web server for the Navigator console, already uses the no-cache Cache-Control header for API interactions. This change extends the security coverage to additional content such as JavaScript.

Cloudera Issue: NAV-6018

Purging Deleted Properties shows "Bad Request" error when viewing Hive entity details

After upgrading to Navigator 2.11.0 (Cloudera Manager 5.12.0) and later versions (to Navigator 2.13.0), removing deleted managed metadata properties with the "Purge deleted Properties" command caused a mismatch between the Solr schema and the data stored for entities. (**Administration > Managed Metadata**).

The result was that the Navigator console shows the error "Bad Request" when displaying details for Hive entities such as databases, tables, or fields.

When this problem occurs, the Navigator Metadata Server log included a message such as the following:

```
[CDHExecutor-0-CDHUrlClassLoader@62d310e8]: Internal error while linking.  
java.lang.IllegalArgumentException: java.lang.ClassCastException@2f145bbc
```

Cloudera Issue: NAV-5982

Console description improved for Purge cutoff time

The Navigator Purge Settings page indicated that the purge operation would end at the time specified. However, the specified time is used to stop *new* purge tasks from starting. *Currently running* purge tasks may continue to run after the specified end time. The text in the console has been changed to properly reflect the fact that purge tasks may continue to run past the time limit.

Cloudera Issue: NAV-5967

Managed metadata property values hidden

Property values were not visible when the property is defined with multivalued enabled and the type was any numeric type.

Cloudera Issue: NAV-5899

Less Secure Credentials Protection Policy could expose Azure credentials in audit logs

When you use Cloudera Manager to configure the ADLS Connector service using the Less Secure option for the Credentials Protection Policy, it was possible for Hive audit logs to include Microsoft Azure credentials. If you are using Navigator Audit Server, these credentials could appear in audit reports.

This issue is fixed in this release.

Cloudera Issues: NAV-5861, CDH-56241

Multi-cluster support for Hive lineage

When there were multiple Hive MetaStore (HMS) sources associated with a single Hive service, the method Navigator used to determine the source was not accurate, resulting in Impala and Spark extractors creating lineage relations that referred to the wrong sources and cross-cluster lineage relations were not generated.

Cloudera Issue: NAV-5859

Cloudera Navigator Data Management Release Notes

Extracting Spark operation produced error message "Solr Manager can be used by only one thread"

When extracting Spark operations, the following error appeared in the Navigator Metadata Server log:

```
2018-02-20 09:37:27,869 ERROR com.cloudera.nav.pushextractor.spark.SparkPushExtractor [qtp937744315-126]: com.cloudera.nav.pushextractor.spark.SparkPushExtractor Error extracting Spark operation.java.lang.IllegalStateException: Solr Manager can be used by only one thread.
```

This error does not have consequences for Navigator handling Spark operations.

Cloudera Issue: NAV-4991

Issues Fixed in Cloudera Navigator 2.13.4

"GenericEntity cannot be cast" Exception

When storage directories contain metadata that was extracted before Navigator 2.6, there could be incorrect values for `Source Type` and `Entity Type` and missing values for `internalType`, which cause exceptions in the Navigator Metadata Server log and incorrect behavior when creating lineage relations. Exceptions were similar to the following:

```
java.lang.ClassCastException: com.cloudera.nav.core.model.GenericEntity cannot be cast to com.cloudera.nav.hive.model.HQuery
```

```
java.lang.ClassCastException: com.cloudera.nav.core.model.GenericEntity cannot be cast to com.cloudera.nav.impala.model.ImpalaQuery
```

This change fixes the issue for most of the cases. Rare cases may require additional metadata changes.

Cloudera Issue: NAV-6514

Missing Audit Events

Audit events were not sorting correctly, causing the audit listing to exclude some events expected in a given time range. This problem is fixed in this release.

Cloudera Issue: NAV-6413

Corrected Metadata Extraction from YARN-run Hive Query

Hive Job Extractor is used to capture Hive queries launched using Hive CLI. The extractor is scheduled by YARN, so the "service type" passed to the extractor is of type YARN. The conflict between the YARN-generated source ID and Hive as the source caused Navigator issues. This change properly manages the Hive CLI query metadata with the YARN service type.

Cloudera Issue: NAV-6409

Too many open files on the Navigator Metadata Server Spark agent

Lineage wasn't being created for Spark operations and the Cloudera Manager Agent logs included the error:

```
OSError: [Errno 24] Too many open files: '/var/log/spark/lineage'
```

Cloudera Issue: NAV-6396

"Lineage Diagram is limited to 3000 entities" Error

Navigator capped the number of lineage parents that could be used at one time, however this cap included relations with second level parents (columns). The Navigator Metadata Server log includes an error such as "Lineage Diagram is limited to 3000 entities".

Cloudera Issue: NAV-6371**Navigator Console Handles Increased Property Limits**

The Navigator Metadata Server was recently updated to support property names of length up to 500 and no limit on the description field. (See [Name and description lengths increased](#)). In this release, the Navigator console has been modified to handle the increased limits in all contexts.

Cloudera Issue: NAV-6331**Improved Console Editing for Float and Double Property Types**

Previously, managed properties defined as `float` or `double` required a decimal point in stored values; this problem is resolved in this release.

Cloudera Issue: NAV-6291**Automated clean-up when Navigator Metadata Server Storage Directory is Cleared**

When Navigator Metadata Server role starts, it now checks if the Solr storage directory is empty or not. If it is empty, this check resets the ordinal numbers and starts a new Navigator maintenance history record.

Cloudera Issue: NAV-6267**Linking fails with NullPointerException**

Navigator linking failed with errors similar to the following:

```
ERROR org.apache.solr.core.SolrCore [qtp1200906406-61]:
    java.lang.NullPointerException
```

```
ERROR com.cloudera.nav.persist.impl.CompositeLinker
[CDHExecutor-0-CDHUrlClassLoader@23e992bf]: Internal error while linking.
java.lang.NullPointerException
```

Navigator was creating new sources when an exception occurred and it wasn't able to locate the existing source. This release properly handles the original exception and logs the issue clearly.

Cloudera Issue: NAV-6229**Multiple Cluster Extractor Failure**

When Navigator Metadata Server is started with a fresh storage directory on Cloudera Manager versions 5.12.0 or later, extractors were not working when a single Cloudera Manager is managing multiple clusters. This problem is fixed in this release.

Cloudera Issue: NAV-6145**Web Server and Platform Version Disclosure Removed**

This release includes a change to omit the server and platform versions from the web server response header.

Cloudera Issue: NAV-6019**Pre-registration of Hive/Impala Queries**

Previously, it was not possible to pre-register data asset entities by calling the `POST /entities` API. This change allows application developers to pre-register operations by exposing the method used to generate the operation source IDs.

The Navigator SDK includes an example of pre-registering entities in the `CustomHiveLineageCreator.java` source file.

Cloudera Issue: NAV-5940

Issues Fixed in Cloudera Navigator 2.13.3

There were no issues fixed in Cloudera Navigator 2.13.3.

Issues Fixed in Cloudera Navigator 2.13.2

Purging Deleted Properties shows "Bad Request" error when viewing Hive entity details

After upgrading to Navigator 2.11.0 (Cloudera Manager 5.12.0) and later versions (to Navigator 2.13.0), removing deleted managed metadata properties with the "Purge deleted Properties" command caused a mismatch between the Solr schema and the data stored for entities. (**Administration > Managed Metadata**).

The result was that the Navigator console shows the error "Bad Request" when displaying details for Hive entities such as databases, tables, or fields.

When this problem occurs, the Navigator Metadata Server log included a message such as the following:

```
[CDHExecutor-0-CDHUrlClassLoader@62d310e8]: Internal error while linking.  
java.lang.IllegalArgumentException: java.lang.ClassCastException@2f145bbc
```

Cloudera Issue: NAV-5982

Console description improved for Purge cutoff time

The Navigator Purge Settings page indicated that the purge operation would end at the time specified. However, the specified time is used to stop *new* purge tasks from starting. *Currently running* purge tasks may continue to run after the specified end time. The text in the console has been changed to properly reflect the fact that purge tasks may continue to run past the time limit.

Cloudera Issue: NAV-5967

The flag for disabling purge was ignored in the UI

The **Administration > Purge Settings** page could show scheduled purge operations even if the `nav.purge.enabled` property was set to false. The displayed purge operations would not run.

This issue has been resolved.

Cloudera Issue: NAV-5966

Managed metadata property values hidden

Property values were not visible when the property is defined with `multivalued` enabled and the type was any numeric type.

Cloudera Issue: NAV-5899

Less Secure Credentials Protection Policy could expose Azure credentials in audit logs

When you use Cloudera Manager to configure the ADLS Connector service using the Less Secure option for the Credentials Protection Policy, it was possible for Hive audit logs to include Microsoft Azure credentials. If you are using Navigator Audit Server, these credentials could appear in audit reports.

This issue is fixed in this release.

Cloudera Issues: NAV-5861, CDH-56241

Missing Impala audit events for database-level operations

Impala audit events at the database level were incorrectly recorded, making it seem like they are missing from the Navigator audit data.

This issue is fixed in this release.

Cloudera Issue: NAV-5648

Extracting Spark operation produced error message "Solr Manager can be used by only one thread"

When extracting Spark operations, the following error appeared in the Navigator Metadata Server log:

```
2018-02-20 09:37:27,869 ERROR com.cloudera.nav.pushextractor.spark.SparkPushExtractor
[qtp937744315-126]: com.cloudera.nav.pushextractor.spark.SparkPushExtractor Error
extracting Spark operation.java.lang.IllegalStateException: Solr Manager can be used by
only one thread.
```

This error does not have consequences for Navigator handling Spark operations.

Cloudera Issue: NAV-4991**Issues Fixed in Cloudera Navigator 2.13.1**

There were no issues fixed in Cloudera Navigator 2.13.1.

Issues Fixed in Cloudera Navigator 2.13.0

Log includes the error "EndPoint2 EntityType must not be null unless unlinked"

The following error appeared in the Navigator Metadata Server log:

```
2017-10-26 15:48:27,440 INFO com.cloudera.nav.hdfs.extractor.HdfsOperationHandler
[CDHExecutor-0-CDHUrlClassLoader@3eca0c78]: Unable to process rename for path

at com.google.common.base.Preconditions.checkState(Preconditions.java:149)
at com.cloudera.nav.core.model.Relation.validate(Relation.java:287)
```

This error occurred when HDFS files are renamed and the new name is affected by an exclusion filter. The only consequence of the problem is noise in the log.

If you are not able to upgrade, you can ignore the error.

Cloudera Issue: NAV-4654**Multi-cluster support**

Navigator was not able to uniquely identify more than one cluster in installations of Cloudera Manager that supported multiple clusters. This problem only occurs for Cloudera Manager deployments of version 5.12.0, 5.12.1 or 5.13.0. This problem does not affect single cluster deployments or Altus clusters.

This issue has been resolved. The upgrade process to this release of Cloudera Manager resolves the problem.

Note: If your multi-cluster installation is configured for high-availability, you will see exceptions thrown by Navigator while linking HDFS entities. This is a known issue for Cloudera Manager 5.12.0, 5.12.1, 5.13.0 and 5.13.1 releases.

Cloudera Issue: NAV-5615

Cloudera Navigator Data Management Release Notes

Table-to-HDFS links not established when Navigator supported multiple, high-availability clusters

When Navigator extracted metadata for multiple clusters and when the clusters were configured for high availability operation, Navigator did not correctly link tables to their HDFS backing data. The result was that lineage between Hive tables and their physical data were not created. In addition, some Hive table metadata that was derived from the backing files was not available.

You could see errors in the log such as the following:

```
2018-02-19 09:01:32,999 ERROR com.cloudera.nav.persist.impl.CompositeLinker
[CDHExecutor-0-CDHUrlClassLoader@01010d7e]: Internal error while
linking.java.lang.IllegalArgumentException: expected one element but was:
<com.cloudera.nav.core.model.Source@b22e68ba, com.cloudera.nav.core.model.Source@5b1bac2c>
```

This issue has been resolved.

Cloudera Issue: NAV-5749

Difficult to know how long Navigator upgrade would take

The upgrade process for Navigator now includes messages to show the estimated time remaining at each upgrade step.

Cloudera Issue: NAV-5639

Not all services were included in log messages during purge operation

The log messages produced during a purge operation are now consistent across sources; they all include counts for the number of entities removed.

Cloudera Issue: NAV-3389

Technical metadata for Hive table partitions was cut off

This release provides a "Show more" link in table detail pages when the list of partition columns doesn't fit in the window.

Cloudera Issue: NAV-4840

Audits Dashboard showed incorrect time period

In certain cases the dashboard link for "Accesses Denied" would not open the correct time period on the Audits page.

This issue has been resolved.

Cloudera Issue: NAV-5689

Duplicate values could be added to dynamic facets

Values added to a dynamic facet were not properly validated. This release includes validation so duplicate values cannot be included in a facet.

Cloudera Issue: NAV-5572

Spark lineage not shown in Navigator for HDFS HA

When HDFS is configured for high availability, Spark lineage didn't show in Navigator. In these cases, the log includes index out of bounds exceptions such as the following:

```
com.cloudera.nav.pushextractor.spark.SparkPushExtractor Error extracting Spark operation.
java.lang.ArrayIndexOutOfBoundsException
```

This issue has been resolved.

Cloudera Issue: NAV-4874

Issues Fixed in Cloudera Navigator 2.12.3

Purging Deleted Properties shows "Bad Request" error when viewing Hive entity details

After upgrading to Navigator 2.11.0 (Cloudera Manager 5.12.0) and later versions (to Navigator 2.13.0), removing deleted managed metadata properties with the "Purge deleted Properties" command caused a mismatch between the Solr schema and the data stored for entities. (**Administration > Managed Metadata**).

The result was that the Navigator console shows the error "Bad Request" when displaying details for Hive entities such as databases, tables, or fields.

When this problem occurs, the Navigator Metadata Server log included a message such as the following:

```
[CDHExecutor-0-CDHUrlClassLoader@62d310e8]: Internal error while linking.
java.lang.IllegalArgumentException: java.lang.ClassCastException@2f145bbc
```

Cloudera Issue: NAV-5982

Extracting Spark operation produced error message "Solr Manager can be used by only one thread"

When extracting Spark operations, the following error appeared in the Navigator Metadata Server log:

```
2018-02-20 09:37:27,869 ERROR com.cloudera.nav.pushextractor.spark.SparkPushExtractor
[qtp937744315-126]: com.cloudera.nav.pushextractor.spark.SparkPushExtractor Error
extracting Spark operation.java.lang.IllegalStateException: Solr Manager can be used by
only one thread.
```

This error does not have consequences for Navigator handling Spark operations.

Cloudera Issue: NAV-4991

Issues Fixed in Cloudera Navigator 2.12.2

Missing Impala audit events for database-level operations

Impala audit events at the database level were incorrectly recorded, making it seem like they were missing from the Navigator audit data.

This issue has been resolved.

Cloudera Issue: NAV-5648

Issues Fixed in Cloudera Navigator 2.12.1

Tags disappeared on secure cluster when a change caused HDFS bulk extraction to run a second time.

When Navigator HDFS extraction occurs for the first time, Navigator performs a bulk extraction. Subsequent bulk extractions should refresh only the changed metadata. However, in previous releases, Navigator extraction refreshed all metadata rather than building on the existing metadata. The result was that tags added before the first bulk extraction were missing after the second bulk extraction. This problem only occurs when some change happens on the cluster to trigger the second bulk extraction, such as resetting the HDFS `inotify` stream in an Isilon-backed cluster.

This issue has been resolved.

Cloudera Issue: NAV-5620

Cloudera Navigator Data Management Release Notes

Multi-cluster support

Navigator was not able to uniquely identify more than one cluster in installations of Cloudera Manager that supported multiple clusters. This problem only occurs for Cloudera Manager deployments of version 5.12.0, 5.12.1 or 5.13.0. This problem does not affect single cluster deployments or Altus clusters.

This issue has been resolved. The upgrade process to this release of Cloudera Manager resolves the problem.

Note: If your multi-cluster installation is configured for high-availability, you will see exceptions thrown by Navigator while linking HDFS entities. This is a known issue for Cloudera Manager 5.12.0, 5.12.1, 5.13.0 and 5.13.1 releases.

Cloudera Issue: NAV-5615

Navigator did not show metadata content for Isilon

Navigator failed to show file system results in a secure cluster backed by a non-HDFS file system, such as EMC Isilon.

This issue has been resolved.

Cloudera Issue: NAV-5375

Incorrect operation of the Search filter for "Deleted Time"

The Deleted Time search filter did not produce expected results for filtering entities.

This issue has been resolved.

Cloudera Issue: NAV-1168

Support for multiple metadata filters with the same name, different namespaces

Multiple managed metadata filters with same name but different namespaces could not be added as filters to search.

This issue has been resolved.

Cloudera Issue: NAV-5429

User-defined relations did not highlight appropriately in lineage diagrams

In Navigator lineage diagrams, when you highlight a path, all relations that aren't in the highlighted path fade. However, in previous releases, user-defined relations in lineage pictures did not fade when they were not in the highlighted path.

This issue has been resolved.

Cloudera Issue: NAV-5574

Spark lineage not shown in Navigator for HDFS HA

When HDFS is configured for high availability, Spark lineage didn't show in Navigator. In these cases, the log includes index out of bounds exceptions such as the following:

```
com.cloudera.nav.pushextractor.spark.SparkPushExtractor Error extracting Spark operation.  
java.lang.ArrayIndexOutOfBoundsException
```

This issue has been resolved.

Cloudera Issue: NAV-4874

Issues Fixed in Cloudera Navigator 2.12.0

Lineage relations were missing for some views with "Endpoint2 must not be null or empty" error

Lineage relations were missing for some views and the Navigator Metadata Server log includes errors with a stack trace that looks similar to the following:

```
2017-10-25 19:00:40,780 ERROR com.cloudera.nav.persist.impl.CompositeLinker
[CDHExecutor-0-CDHUrlClassLoader@381e3]: Internal error while linking.
java.lang.IllegalStateException: EndPoint2 must not be null or empty
```

While Navigator determined lineage relations, it found a relation that was created with the target entity missing, hence "Endpoint2 is null." This situation can occur when a Hive view is altered without changing the columns extracted from the source table, such as when the name or other table metadata on the view is changed. For example, the following operation would produce the error:

```
alter view customers_sales_sw set tblproperties("region"="southwest");
```

This problem can occur in Navigator Metadata Server versions 2.9.0, 2.9.1, 2.9.2, 2.10.0, 2.10.1, 2.10.2, 2.11.0, and 2.11.1. These versions correspond to the following Cloudera Manager versions: 5.10.0, 5.10.1, 5.10.2, 5.11.0, 5.11.1, 5.11.2, 5.12.0, and 5.12.1.

This problem prevents new lineage information from being added to existing and new Hive entities. See the Knowledge Base article [EndPoint2 must not be null or empty](#) for more information.

Cloudera Issue: NAV-5661

Limitation on editing certain managed metadata properties

Managed metadata properties (without class associations) that were added using the Navigator API could not be edited after the fact through the Cloudera Navigator console.

This issue has been resolved.

Cloudera Issue: NAV-5363

Hue links were missing from Navigator console

The links to Hue from entities in the Navigator console were not generated. Each time the console attempted to show a link, the Navigator Metadata Server log included an error similar to the following:

```
10:05:32.539 AM ERROR HueUtility
[qtp778450792-57]: Unable to get Hue link from CM.
java.lang.LinkageError: loader constraint violation: when resolving method
"com.cloudera.nav.server.NavOptions.getPreferredBaseHueURLForCluster(Ljava/lang/String;)Lcom/google/common/base/Optional;"
the class loader (instance of org/eclipse/jetty/webapp/WebAppClassLoader) of the current
class, com/cloudera/nav/utils/HueUtility, and the class loader (instance of
sun/misc/Launcher$AppClassLoader) for resolved class, com/cloudera/nav/server/NavOptions,
have different Class objects for the type
ter(Ljava/lang/String;)Lcom/google/common/base/Optional; used in the signature{
```

This issue has been resolved.

Cloudera Issue: NAV-4756

Issues Fixed in Cloudera Navigator 2.11.2

Lineage relations were missing for some views with "Endpoint2 must not be null or empty" error

Lineage relations were missing for some views and the Navigator Metadata Server log includes errors with a stack trace that looks similar to the following:

```
2017-10-25 19:00:40,780 ERROR com.cloudera.nav.persist.impl.CompositeLinker
[CDHExecutor-0-CDHUrlClassLoader@381e3]: Internal error while linking.
java.lang.IllegalStateException: EndPoint2 must not be null or empty
```

While Navigator determined lineage relations, it found a relation that was created with the target entity missing, hence "Endpoint2 is null." This situation can occur when a Hive view is altered without changing the columns extracted from the source table, such as when the name or other table metadata on the view is changed. For example, the following operation would produce the error:

```
alter view customers_sales_sw set tblproperties("region"="southwest");
```

This problem can occur in Navigator Metadata Server versions 2.9.0, 2.9.1, 2.9.2, 2.10.0, 2.10.1, 2.10.2, 2.11.0, and 2.11.1. These versions correspond to the following Cloudera Manager versions: 5.10.0, 5.10.1, 5.10.2, 5.11.0, 5.11.1, 5.11.2, 5.12.0, and 5.12.1.

This problem prevents new lineage information from being added to existing and new Hive entities. See the Knowledge Base article [EndPoint2 must not be null or empty](#) for more information.

Cloudera Issue: NAV-5661

Multi-cluster support

Navigator was not able to uniquely identify more than one cluster in installations of Cloudera Manager that supported multiple clusters. This problem only occurs for Cloudera Manager deployments of version 5.12.0, 5.12.1 or 5.13.0. This problem does not affect single cluster deployments or Altus clusters.

This issue has been resolved. The upgrade process to this release of Cloudera Manager resolves the problem.

Note: If your multi-cluster installation is configured for high-availability, you will see exceptions thrown by Navigator while linking HDFS entities. This is a known issue for Cloudera Manager 5.12.0, 5.12.1, 5.13.0 and 5.13.1 releases.

Cloudera Issue: NAV-5615

Navigator did not show metadata content for Isilon

Navigator failed to show file system results in a secure cluster backed by a non-HDFS file system, such as EMC Isilon.

This issue has been resolved.

Cloudera Issue: NAV-5375

Spark lineage not shown in Navigator for HDFS HA

When HDFS is configured for high availability, Spark lineage didn't show in Navigator. In these cases, the log includes index out of bounds exceptions such as the following:

```
com.cloudera.nav.pushextractor.spark.SparkPushExtractor Error extracting Spark operation.
java.lang.ArrayIndexOutOfBoundsException
```

This issue has been resolved.

Cloudera Issue: NAV-4874

Issues Fixed in Cloudera Navigator 2.11.1

Navigator Audit Server build version not available

Navigator Audit Server and Navigator Metadata Server have different build versions and numbers. Navigator Metadata Server build information has always been available in the system logs and on the About page of the Cloudera Navigator console. Build information may be needed by Cloudera support to troubleshoot issues.

This issue has been resolved. With this release, Navigator Audit Server also records its build information in its log files.

Cloudera Issue: NAV-5167

Hue links were missing from Navigator console

The links to Hue from entities in the Navigator console were not generated. Each time the console attempted to show a link, the Navigator Metadata Server log included an error similar to the following:

```
10:05:32.539 AM ERROR HueUtility
[qtp778450792-57]: Unable to get Hue link from CM.
java.lang.LinkageError: loader constraint violation: when resolving method
"com.cloudera.nav.server.NavOptions.getPreferredBaseHueURLForCluster(Ljava/lang/String;)Lcom/google/common/base/Optional;"
the class loader (instance of org/eclipse/jetty/webapp/WebAppClassLoader) of the current
class, com/cloudera/nav/utils/HueUtility, and the class loader (instance of
sun/misc/Launcher$AppClassLoader) for resolved class, com/cloudera/nav/server/NavOptions,
have different Class objects for the type
ter(Ljava/lang/String;)Lcom/google/common/base/Optional; used in the signature{
```

This issue has been resolved.

Cloudera Issue: NAV-4756

Issues Fixed in Cloudera Navigator 2.11.0

Navigator Embedded Solr could reach its limit on number of documents it could store

Navigator Metadata Server extracts HDFS entities by performing a one-time bulk extraction and then switching to incremental extraction. In previous releases, a problem caused HDFS bulk extraction to be run more than one time, resulting in duplicate relations created for HDFS. Over time, embedded Solr runs out of document IDs that it can assign to new relations and fails with following error:

```
Caused by: java.lang.IllegalArgumentException: Too many documents, composite IndexReaders
cannot exceed 2147483519
```

When this happened, Navigator stopped any more extraction of data as no new documents can be added to Solr.

In addition, see [Repairing metadata in the storage directory after upgrading](#).

Fixed in Cloudera Navigator 2.9.2, 2.10.1, 2.11.0

Cloudera Issue: NAV-5600

Solr error message (immense term in queryText field) during upgrade

In some cases, Navigator Metadata Server failed to start after upgrading to Cloudera Navigator 2.10 and displayed messages similar to the following (only relevant details shown):

```
2017-07-01 14:27:27,905 ERROR org.apache.solr.servlet.SolrDispatchFilter
[qtp300983713-60]: null:org.apache.solr.common.SolrException:
Exception writing document id 0c02400d332854fa44a352235b42857c to the index;
. . .
Caused by: java.lang.IllegalArgumentException: Document contains at least one
immense term in field="queryText" (whose UTF8 encoding is longer than the max
```

```
length 32766)
. . .
```

This issue was caused by the underlying Java library that was writing Solr documents (index and searchable entities) during the upgrade. Special characters, such as carriage returns (ASCII 32) were being mishandled and generating more characters than the source element.

This issue has been resolved in this release. The `BinaryRequestWriter`, which was already being used to write relations, is now being used to handle elements.

Cloudera Issue: NAV-4655

Harmless (but abundant) error messages cause frequent log roll-over

An error message was being generated needlessly by Cloudera Navigator when filtering by source. The error could have been ignored but it was being logged and causing logs to roll-over too quickly.

```
2017-06-23 10:58:32,967 ERROR com.cloudera.nav.hdfs.client.InotifyClient
[CDHExecutor-0-CDHUrlClassLoader@5177874]: Error handling event (txid: 1627074917):
Renamed /hbase/data/default/ECDS_PROD1_PARTY_RELATED/ccefb... to
/hbase/archive/data/default/ECDS_PROD1_PARTY_RELATED/cbdka... at time 1493302572987
```

This issue has been resolved in this release. Internally, the logging mechanism has been improved so that it uses a more robust approach to logging, the `ThrottlingLogger` utility class.

Cloudera Issue: NAV-4654

Disk space issue for Navigator Audit Server instances backed by Oracle

Cloudera Navigator deployments using Oracle database as the backing store for Navigator Audit Server were consuming lots of disk space for example, by the `NAV_FILE_INFO_STAGING`. The issue was caused by an unclosed connection and is related to the connection issue discussed in [Navigator Audit Server \(Analytics\) table locking issue \(HDFS activity loader\)](#) on page 2757. However, this issue is specific to Oracle-backed Cloudera Navigator instances.

This issue has been resolved in this release. The connections to Oracle database are now handled properly.

Cloudera Issue: NAV-4467

Audit pipeline test and Oracle error (ORA-24816) issue

Executing queries of a certain size (4000 bytes) in some cases (for example, Impala) would disrupt the Audit Pipeline test thereby registering bad health on the Impalad (Impala daemon) and the Navigator Audit Server logging the following Oracle database error:

```
[1911239784@NavigatorServer-4858]: SQL Error: 24816, SQLState: 99999
[1911239784@NavigatorServer-4858]: ORA-24816: Expanded non LONG bind data
supplied after actual LONG or LOB column...
```

This issue was caused by bind value length potentially greater than 4000 bytes followed by binding for LOB or LONG.

This issue has been resolved in this release. Navigator Audit Server now properly handles the order of the binds needed by Oracle databases.

Cloudera Issue: NAV-4194

Navigator Audit Server (Analytics) table locking issue (HDFS activity loader)

Executing multiple statements sometimes resulted in a mismatch between the connection used to execute the statement and the connection used for the commit. The mismatch would result in the server throwing an error message such as the following:

```
[AnalyticsStagingService]: Could not load HDFS activity data for analytics
org.springframework.dao.CannotAcquireLockException: StatementCallback; SQL
[TRUNCATE TABLE NAV_FILE_INFO_STAGING]...
```

This issue has been resolved in this release. The same connection is now used to execute queries and for commits.

Fixed in Cloudera Navigator 2.8.3, 2.9.2, 2.10.1, 2.11.0

Cloudera Issue: NAV-4026

Invoking auth/group API with invalid role generates NPE and BAD_REQUEST Error

Invoking the `auth/group` endpoint with an invalid role as one of the user-provided parameters causes the server to throw an NPE (null pointer exception), resulting in response from server of HTTP 500 (Internal Server Error).

This issue has been resolved in this release. The server code now checks for this condition (avoiding NPE) and replies with HTTP 400 (BAD_REQUEST) instead.

Cloudera Issue: NAV-3910

Bulk extraction being triggered can result in orphaned relations

In some cases, HDFS bulk extraction was being triggered due to an error in incremental extraction. Specifically, Cloudera Navigator was resetting the long identity of HDFS elements resulting in orphaned relations. This issue has been resolved. A new background task looks for and repairs all orphaned relations.

Fixed in Cloudera Navigator 2.9.2, 2.10.1, 2.11

Cloudera Bug: NAV-4479

Issues Fixed in Cloudera Navigator 2.10.2

Lineage relations were missing for some views with "Endpoint2 must not be null or empty" error

Lineage relations were missing for some views and the Navigator Metadata Server log includes errors with a stack trace that looks similar to the following:

```
2017-10-25 19:00:40,780 ERROR com.cloudera.nav.persist.impl.CompositeLinker
[CDHExecutor-0-CDHUrlClassLoader@381e3]: Internal error while linking.
java.lang.IllegalStateException: EndPoint2 must not be null or empty
```

While Navigator determined lineage relations, it found a relation that was created with the target entity missing, hence "Endpoint2 is null." This situation can occur when a Hive view is altered without changing the columns extracted from the source table, such as when the name or other table metadata on the view is changed. For example, the following operation would produce the error:

```
alter view customers_sales_sw set tblproperties("region"="southwest");
```

This problem can occur in Navigator Metadata Server versions 2.9.0, 2.9.1, 2.9.2, 2.10.0, 2.10.1, 2.10.2, 2.11.0, and 2.11.1. These versions correspond to the following Cloudera Manager versions: 5.10.0, 5.10.1, 5.10.2, 5.11.0, 5.11.1, 5.11.2, 5.12.0, and 5.12.1.

This problem prevents new lineage information from being added to existing and new Hive entities. See the Knowledge Base article [EndPoint2 must not be null or empty](#) for more information.

Cloudera Issue: NAV-5661

Cloudera Navigator Data Management Release Notes

SqoopJobExtractor failures for certain SQL constructs

Certain types of SQL queries that generated sub-operations did not retrieve and display lineage for columns, emitting errors in the Cloudera Navigator console and SQLParserException errors in the Navigator Metadata Server log. For example:

```
...Extractor com.cloudera.nav.sqoop.extractor.SqoopJobExtractor failed for
job_1456104915937_0874
java.lang.RuntimeException: com.akiban.sql.parser.SQLParserException: Encountered " "("
"( "" at line1, column 53.
Was expecting one of: "cs" ...
```

The root cause of this issue is that the open source parser (akiban) cannot parse certain queries that result in sub-operations, specifically those resulting from Sqoop query IMPORT statements. This issue applies to Sqoop1 query IMPORT statements only, not Sqoop EXPORT and TABLE IMPORT statements.

This issue has been resolved in this release. The SQLParserException is caught and the Cloudera Navigator console renders the message shown below rather than breaking the lineage diagram:

	Details	Lineage
--	6	0
Columns	Operation Executions	Inputs
		Outputs
▼ Columns		
Navigator was unable to parse the query to determine columns for this entity		
▶ Operation Executions (6)		
▶ Inputs (0)

Cloudera Bug: NAV-4479

Issues Fixed in Cloudera Navigator 2.10.0

Navigator cannot extract S3 metadata with some databases

Using a database other than MySQL, such as PostgreSQL (the default database) for the Navigator Metadata Server generated Java errors in the extracted data for Amazon S3 because of an incorrect string library. The issue has been resolved.

Cloudera Issue: NAV-4342

Metadata added to Amazon S3 files persists in Navigator

Once added to Amazon S3 data and extracted by Navigator, custom metadata (key-value pairs) remain with the data captured by Navigator, even after that metadata may have been deleted from the Amazon S3 files. Navigator continues to show the deleted metadata for that file. This issue has been resolved.

Cloudera Issue: NAV-3928

Managed metadata properties missing on the page

Clicking managed metadata entities in lineage diagrams to display details silently failed, displaying nothing. This issue has been resolved—the condensed details page now displays properly.

Cloudera Issue: NAV-4320

Cluster selection doesn't work properly

In certain cases, cluster facets on the search page did not work correctly.

Cloudera Issue: NAV-4260

Search results retained after deselecting search facet

After searching for a specific type of data using the selector box (the search facet, for example, selecting HDFS), the results populating the browser pane remain despite navigating away from the page or de-selecting the item. This issue has now been resolved. After searching and navigating away from the results or deselecting the data type, resulting display also refreshes, as it should.

Cloudera Issue: NAV-4190

Navigator Audit Server (Analytics) table locking issue (HDFS activity loader)

Executing multiple statements sometimes resulted in a mismatch between the connection used to execute the statement and the connection used for the commit. The mismatch would result in the server throwing an error message such as the following:

```
[AnalyticsStagingService]: Could not load HDFS activity data for analytics
org.springframework.dao.CannotAcquireLockException: StatementCallback; SQL
[TRUNCATE TABLE NAV_FILE_INFO_STAGING]...
```

Cloudera Bug: NAV-4479

Sqoop job extraction failures

Sqoop job extraction was failing because Sqoop table IMPORT operations were not being retrieved from Solr. This issue has been resolved in this release. Sqoop job extraction is now being processed as expected.

Fixed in Cloudera Navigator 2.9.1, 2.9.2

Cloudera Bug: NAV-4225

Navigator Audit Server (Analytics) table locking issue (HDFS activity loader)

Executing multiple statements sometimes resulted in a mismatch between the connection used to execute the statement and the connection used for the commit. The mismatch would result in the server throwing an error message such as the following:

```
[AnalyticsStagingService]: Could not load HDFS activity data for analytics org.springframework.dao.CannotAcquireLockException: StatementCallback; SQL [TRUNCATE TABLE NAV_FILE_INFO_STAGING]...
```

This issue has been resolved in this release. The same connection is now used to execute queries and for commits.

Fixed in Cloudera Navigator 2.8.3, 2.9.2, 2.10.1, 2.11.0

Cloudera Issue: NAV-4026

Issues Fixed in Cloudera Navigator 2.9.1

Sqoop job extraction failures

Sqoop job extraction was failing because Sqoop table IMPORT operations were not being retrieved from Solr. This issue has been resolved in this release. Sqoop job extraction is now being processed as expected.

Fixed in Cloudera Navigator 2.9.1, 2.9.2

Cloudera Bug: NAV-4225

Viewing deleted properties in managed metadata shows incorrect search results

Managed metadata property that was deleted drilled down to incorrect search results. The results are now displayed correctly.

Cloudera Issue: NAV-4116

Edit Managed Metadata link available for users with insufficient privilege

The Edit Managed Metadata link was available to users without sufficient privilege levels to view it (the link requires AUTH_WRITE_MANAGED_METADATA). The link is now available only to users with the correct privileges.

Cloudera Issue: NAV-3985

Some properties that are URLs in the user interface do not function as links

Previously, managed metadata property values and S3 property values that are URLs did not function as links to the URL. These properties are now formatted as clickable links.

Cloudera Issue: NAV-3960

Purge navigation and messages could be confusing

When purging deleted properties in Navigator, the maintenance page message was confusing in some situations, and the Continue link after purge returned you to the general Search page. The purge messages have been clarified and now, after successful purge, the page on which you started redisplay rather than the general Search page.

Cloudera Issue: NAV-3940

Dashboard average values difficult to read

Previously, the dashboard displayed average values in a long format that could be difficult to read. These values have been converted to a format that is more human-readable. For example, the value 33520.2 now reads 33.5k.

Cloudera Issue: NAV-3930

Audit page filter breadcrumbs missing spaces

There were no spaces in the filter breadcrumbs on the Audit page, making the filter difficult to read. Spaces have been added to improve readability.

Cloudera Issue: NAV-3876

Searching for text in the Name filter shows HTML bold tag

When using the Original Name filter in search, characters that you typed in the name box appeared with HTML bold tags in the drop-down results. The extraneous tags no longer appear.

Cloudera Issue: NAV-3765

Cloudera Navigator Data Management Release Notes

Directory contents do not distinguish deleted entities for Amazon S3 entities

In Navigator, search results indicate if an entity has been deleted. However, the Directory Contents information did not indicate that the entity had been deleted; it was indistinguishable from items in Directory Contents that had not been deleted. Directory Contents information now reflects S3 entity deletions.

Cloudera Issue: NAV-3786

Bucket name not included in S3 search results list

In S3 search results, the S3 bucket name was not included with the name of the entity. The S3 bucket name is now displayed.

Cloudera Issue: NAV-3786

Issues Fixed in Cloudera Navigator 2.9.0

Incomplete query strings in Navigator metadata

Storing more than 32K characters in Solr causes an exception, and Navigator previously handled this by truncating any field longer than 32K to prevent the exception.

Now, fields longer than 32K are preserved and no longer truncated.

Cloudera Issues: NAV-3548, NAV-3384

Lineage options and search items are missing

In the Safari browser, lineage options and lineage search could be empty in certain cases.

Cloudera Issue: NAV-3401

Out-of-date information when using Internet Explorer 11

In Internet Explorer 11, cached headers could cause out-of-date information to display.

Issues Fixed in Cloudera Navigator 2.8.3

Audit Event reports exported as CSV randomly contained quote character

When exporting an Audit Events report using the CSV format, a double-quotation mark (") was sometimes being inserted into the query used to collect audit events. For example, in the audit event shown below, the quote turns `_probable` into `_pro"bable` and `_beta` into `_bet"a`:

```
"2016-12-01T12:50:59.966Z",REDACTED,REDACTED,hive,QUERY,
"beta_vat_mart_delta:ds_dup_vrn_pro"bable",true,,,,,,,,,"
INSERT INTO exp_vat_oob_load_bet"a.temp_ds_dup_vrn_probable_delta_subset
```

The issue arose when exporting Audit Event reports as CSV format only (not JSON). The issue occurred when the string length of SQL query exceeded 35 characters.

The issue's root cause was an error in processing by the underlying Jackson JSON processor library (jackson-dataformat-csv 2.1.0) used to write the CSV files. The 2.2 version of the library fixes the underlying issue. The issue has been resolved in this release of Cloudera Navigator, which uses the 2.2 Jackson processor library.

Cloudera Issue: NAV-4114

Navigator Audit Server (Analytics) table locking issue (HDFS activity loader)

Executing multiple statements sometimes resulted in a mismatch between the connection used to execute the statement and the connection used for the commit. The mismatch would result in the server throwing an error message such as the following:

```
[AnalyticsStagingService]: Could not load HDFS activity data for analytics
org.springframework.dao.CannotAcquireLockException: StatementCallback; SQL
[TRUNCATE TABLE NAV_FILE_INFO_STAGING]...
```

This issue has been resolved in this release. The same connection is now used to execute queries and for commits.

Fixed in Cloudera Navigator 2.8.3, 2.9.2, 2.10.1, 2.11.0

Cloudera Issue: NAV-4026

Issues Fixed in Cloudera Navigator 2.8.1

Some APIs return incorrect error

In some cases, when a user performs an action with managed metadata that is not permitted because of the user role, Navigator issues an Access Denied error message (500) instead of the expected Forbidden error (403).

Cloudera Issue: NAV-3463

Resource path filtering does not working in audit event filter

Lineage options and search items are missing

In the Safari browser, lineage options and lineage search could be empty in certain cases.

Cloudera Issue: NAV-3401

Navigator logout link does not work when SAML is enabled

When SAML is enabled, clicking on the Logout link in Navigator executes only a local browser logout, without terminating the SAML session. As a result, after logging out, a user can log in again from the login page without providing credentials.

Issues Fixed in Cloudera Navigator 2.8.0

Last access time displayed for Hive tables is incorrect

Navigator no longer displays incorrect access time information for Hive.

Cloudera Issue: NAV-99

Deleted items not shown by default when Deleted filter added

Showing deleted items when the Deleted filter was not enabled by default. Deleted items are now shown by default when the Deleted filter is applied.

Cloudera Issue: NAV-441

No message shown when no Groups with Navigator roles are found

A message is now displayed in Navigator when no Groups with Navigator roles are found.

Cloudera Issue: NAV-836

Hive started and ended time fields not shown in results

Previously, started and ended time fields were not displayed when selected. These fields are now displayed in results.

Cloudera Navigator Data Management Release Notes

Cloudera Issue: NAV-1148

Maximum Complexity error message value incorrect

The value in the Maximum Complexity Exceeded error message has been corrected (>3000).

Cloudera Issue: NAV-1246

List of properties in audit filter not sorted

Audit filter properties are now sorted alphabetically.

Cloudera Issue: NAV-1414

Unable to exit Lineage Full Screen mode from Search Results page

Cloudera Issue: NAV-1514

Audit results do not display seconds or fractions seconds

Audit result display granularity has increased to show seconds and fractions of seconds in results.

Cloudera Issue: NAV-1679

Search on lineage page does not work for children

Lineage children are now shown when selected in a lineage search.

Cloudera Issue: NAV-2628

Create property UI does not use class display names

The create property user interface now displays the correct class display name instead of the abbreviated classname.

Cloudera Issue: NAV-2685

Regex entered cannot be confirmed as correct in managed metadata

Navigator now includes regular expression test validation to managed metadata creation.

Cloudera Issue: NAV-2811

Create namespace does not check against reserved names

The Navigator UI now rejects a reserved namespace when creating a new namespace.

Cloudera Issue: NAV-3193

Issues Fixed in Cloudera Navigator 2.7.3

Incomplete query strings in Navigator metadata

Storing more than 32K characters in Solr causes an exception. Navigator now truncates any field longer than 32K to prevent the exception.

Cloudera Issues: NAV-3548, NAV-3384

Issues Fixed in Cloudera Navigator 2.7.2

Long query text alters the display of the search box

Very long values in search strings did not display properly. The issue is fixed in this release.

Cloudera Issue: NAV-3166

Pop-up error in UI in clicking on hive table entity's schema entity

Cloudera Issue: NAV-3579

Lineage Options and Search items are missing

In the Safari browser, lineage options and lineage search could be empty in certain cases.

Cloudera Issue: NAV-3401

Google Analytics didn't load when Navigator is served over HTTPS/SSL

After upgrading to Navigator 2.6.1, Navigator Metadata Server logs included reference to failed loading of Google Analytics. The issue is resolved in this release.

Cloudera Issue: NAV-3200

Issues Fixed in Cloudera Navigator 2.7.1

Oozie and Yarn metadata is not visible for some jobs

The time window for polling for new jobs didn't account for some lag in the system, leaving out some events. The issue is fixed in this release.

Cloudera Issue: NAV-3268

Issues Fixed in Cloudera Navigator 2.7.0

Linker causing high memory consumption

Due to an incorrect internal setting, all results were being returned again in second batch requests to Search (Solr), resulting in high memory usage. The parameter `autoAdjustBatchSize` for the `AbstractSolrManager.query` setting is now correctly set (to `false` rather than `true`) so that subsequent batch requests after an initial request batch the proper number of requests.

Cloudera Issue: NAV-3223

Infinite loop during upgrade possible due to deleted entity query

The `CheckDeletedEntity::start` method was using the `*:*` query to get entities to mark as deleted. This adversely affected performance and made it possible to cause an upgrade to enter an infinite loop if the server crashed or was restarted during an upgrade. This issue has been resolved in this release.

Cloudera Issue: NAV-3111

Managed metadata does not display in lineage diagram

Lineage diagrams display custom metadata, but not managed metadata. This issue has been resolved in this release.

Cloudera Issue: NAV-2919

User-specified relations not properly marked in lineage

User-defined relations were not displaying correctly in the lineage diagrams. This issue has been resolved in this release.

Cloudera Issue: NAV-3137

Exporting lineage endpoints without direction causes errors

Attempting to export lineage endpoints without providing direction (upstream, downstream) in the query returns a server error (error 500) and adds a null pointer exception (NPE) to the log. This issue has been resolved in this release. Empty direction parameter is prevented from being submitted.

Cloudera Navigator Data Management Release Notes

Cloudera Issue: NAV-3155

Placement discrepancy in Cloudera Navigator console for Policies

The Policies **Command Action** section displays above Metadata Assignments for **View** but display below Metadata Assignments for **Edit**. This issue has been resolved in this release.

Cloudera Issue: NAV-3133

Delete VIEW to FILE relations

As part of metadata purge tasks, Navigator failed to delete VIEW to FILE relations. The issue is resolved in this release.

Cloudera Issue: NAV-3106

Logical physical relationships from Hive to YARN should be removed

Upgrading left lineage relationships that incorrectly link Hive entity sources to YARN operation targets. The issue is fixed in this release.

Cloudera Issue: NAV-3105

popover2 binding is positioned incorrectly

The content of the Additional Information pop-over displayed incorrectly in the console pages for creating a new metadata policy. The issue is fixed in this release.

Cloudera Issue: NAV-3071

Show parent when applicable on entity details page

Entities referenced in other entity details pages are now shown with navigation links.

Cloudera Issue: NAV-3034

Entity cannot be deselected in Lineage

Click on a clear section of the lineage canvas to deselect any selected entities or links. Panning or zooming does not deselect the current object.

Cloudera Issue: NAV-3033

Increase zoom out capability in lineage

Controls were added to allow you to zoom further out in the lineage view.

Cloudera Issue: NAV-3032

API/interactive/entities fails when managed metadata properties exist but did not yet have values

Although this problem was not visible in the console, it resulted in a mismatch between what showed in the Navigator console and Navigator stored metadata.

Cloudera Issue: NAV-3012

Entity Details page edit metadata did not show namespace in managed metadata

The namespace name is now available when you hover over the name of the managed metadata property.

Cloudera Issue: NAV-2886

Actions menu should not show Move for deleted entities

The Move menu option is no longer available for deleted entities.

Cloudera Issue: NAV-2727

No Operation/OperationExecution extracted for Hive and HDFS

The previous release introduced a change that caused Navigator communication with services to fail. The issue is fixed in this release.

Cloudera Issue: NAV-2670

numPartitions attribute for Hive should be suppressed

Hive does not produce consistent data for the `tp_numPartitions` property so Navigator no longer shows that value.

Cloudera Issue: NAV-2548

Inconsistent size and block size units

The Search and Analytics pages in the Navigator console used different units for displaying the size of files, tables, and blocks. The issue is fixed in this release.

Cloudera Issue: NAV-2492

Search drop-down width should be the same as the search input field width

The search drop-down now shows more of the previous queries for selection.

Cloudera Issue: NAV-2208

Heap for Navigator Metadata Server increased

The default heap value for Navigator Metadata Server is increased from 696 MB to 1.5 GB.

Cloudera Issue: NAV-2020

Improve labels for Analytics top users and top commands filter

The titles for filters were updated to make them more readable.

Cloudera Issue: NAV-1917

Cross-site Request Forgery (CSRF) vulnerability

Web client requests to Cloudera Navigator were not protected by default from cross-site request forgery attempts. Additional configuration was needed to protect the cluster. That issue has been resolved in this release. CSRF security is now enabled by default.

Cloudera Issue: NAV-1870

Policy earliest start time should be current time

The Navigator console was updated to allow users to set the current time in a policy start time.

Cloudera Issue: NAV-1733

Policy editor line wrapping divides words in the middle

The formatting was changed for in the policy creation interface.

Cloudera Issue: NAV-1702

Date format is different for facets, breadcrumbs, and full query text

Dates and times are now shown consistently using the current locale.

Cloudera Navigator Data Management Release Notes

Cloudera Issue: NAV-1084

Improve rendering for parent elements

This release includes changes in how lineage relationships are shown to improve readability.

Cloudera Issue: NAV-274

"created" date is later than "lastAccessed" date

This release uses the creation time to be the earlier of modified or accessed date when extracting new files.

Cloudera Issue: NAV-39

Added support for managed metadata in the Policy Editor

This release supports policies for managed metadata as well as custom metadata.

Cloudera Issue: NAV-2865

Navigator Metadata Server does not correctly index /hbase/ subpaths

Navigator disabled by default the metadata indexing of /hbase/WALs and /hbase/oldWALs and any entry under /hbase/* entirely.

Previously, /hbase/WALs and /hbase/oldWALs rules were not effective because they were masked by the rule /.*, which was matching everything under /hbase. This has been corrected. Now only nested hidden files and directories under /hbase are discarded.

Cloudera Issue: NAV-3096

Issues Fixed in Cloudera Navigator 2.6.5

Out of memory during file purge

Navigator runs out of memory during purge of files.

Cloudera Issue: NAV-2751

Hive parser issues errors

The Hive parser issued errors during a query in the following cases:

- Multiple struct attributes in a query
- Constants are projected as part of a subquery
- Functions involving constants with an alias

Cloudera Issue: NAV-3402

Incomplete query strings in Navigator metadata

Storing more than 32K characters in Solr causes an exception. Navigator now truncates any field longer than 32K to prevent the exception.

Cloudera Issues: NAV-3548, NAV-3384

Issues Fixed in Cloudera Navigator 2.6.2

Linker causes high memory consumption

When calculating lineage relations, Navigator was pulling more metadata into memory than required. The issue is resolved in this release.

Cloudera Issue: NAV-3223

Navigator Metadata Server fails with nav.batch and a high amount of heap

Cloudera Issue: NAV-3272

java.lang.IllegalArgumentException error causes Navigator to crash

Cloudera Issue: NAV-3244

Class not visible on Managed Metadata review screen

The fields Class and Additional class are not visible on the Review screen when creating or updating a Managed Metadata property.

Cloudera Issue: NAV-3123

Google Analytics didn't load when Navigator is served over HTTPS/SSL

After upgrading to Navigator 2.6.1, Navigator Metadata Server logs included reference to failed loading of Google Analytics. The issue is resolved in this release.

Cloudera Issue: NAV-3200

Column type for HBase qualifier value in Navigator Audit database should be LONGBLOB

The following errors appeared in the Navigator Audit Server logs when HBase audits were propagated to Navigator Audit Server MySQL Database:

```
2016-04-02 03:04:20,783 ERROR org.hibernate.engine.jdbc.spi.SqlExceptionHelper: Data
truncation: Data too long for column 'QUALIFIER' at row 1
2016-04-02 03:04:20,808 WARN com.cloudera.navigator.NavigatorServer: Error persisting
events for service hbase2
```

The type-conversion issue is resolved in this release.

Cloudera Issue: NAV-3147

Issues Fixed in Cloudera Navigator 2.6.1

Lineage returned deleted entities even if the Hide deleted entities option is selected

The issue is fixed in this release.

Cloudera Issue: NAV-2945

Browser sessions could be unexpectedly logged out

When multiple browser tabs are open to the same Metadata Server, an inactive tab can log you out even though you are active in another tab.

Cloudera Issue: NAV-2757

Navigator Metadata Server does not correctly index /hbase/ subpaths

Navigator disabled by default the metadata indexing of /hbase/WALs and /hbase/oldWALs and any entry under /hbase/* entirely.

Previously, /hbase/WALs and /hbase/oldWALs rules were not effective because they were masked by the rule /.*, which was matching everything under /hbase. This has been corrected. Now only nested hidden files and directories under /hbase are discarded.

Cloudera Issue: NAV-3096

Cloudera Navigator Data Management Release Notes

Issues with additional Group facet values in the Search page

If a new value is added to the subfacet SourceType:HDFS->Group, the 'Clear all' actions selects all the values in the Group facet, although they are not included in the query.

The input field expands outside the facet panel.

Adding a new (not suggested) value to the Group facet in Firefox leaves the suggestion drop-down open.

Cloudera Issue: NAV-3017

Logical Physical relationships unexpectedly shown in lineage

HDFS directories are displayed in Hive lineage.

Cloudera Issue: NAV-2984

Lineage rendering sometimes throws NPE when latest operation is selected

Missing start time values in the metadata used to generate lineage relationships causes errors in the Navigator console lineage view. The issue is fixed in this release.

Cloudera Issue: NAV-2969

ClassCastException thrown when a custom entity is encountered

The Navigator API allowed custom entities to be created without some required metadata; the Navigator console produced errors when attempting to display such an entity.

Cloudera Issue: NAV-2946

Mismatch in number of files between Search and Search from Analytics due to deleted files

Search queries invoked from the Analytics page now show the correct number of files.

Cloudera Issue: NAV-2854

On load, the originating entity might not be visible in lineage

If the lineage graph is tall or wide the originating entity might not be initially visible.

Cloudera Issue: NAV-2798

Browser support warning was not working

Internet Explorer 11 was not in the list of supported browsers.

Cloudera Issue: NAV-2780

Lineage could fail or display partial results when related to Workflows entities

Oozie workflows can have multiple parents however lineage cannot display this use case. Workflows are no longer returned for an operation. To get workflow detail, you must launch lineage on the workflow itself.

Cloudera Issue: NAV-2775

Metadata UI could be unreliable when viewing entities with no name

If an entity has no value in the name or originalName properties, they are now set to "(no name)".

Cloudera Issue: NAV-2746

User logging would in some cases be presented with the login screen again

Navigator console logout timing didn't match the server's timing and caused this loop of logout screens. The issue is fixed in this release.

Cloudera Issue: NAV-2731

Lineage load error banner could show on subsequent lineages

Navigator displays two warnings when lineage load fails. The yellow banner displays until dismissed or the page is reloaded even if it does not apply to the current lineage.

Cloudera Issue: NAV-2697

Missing managed metadata property details

Regular expressions and other details are not listed in the detailed managed metadata property view.

Cloudera Issue: NAV-2663

Alignment of logical physical relations does not follow data flow

Logical physical relations should be shown such that they follow data flow. For example, if downstream you hit a logical entity first then it should be logical -> physical. If you hit physical first it should be physical -> logical.

Cloudera Issue: NAV-2639

Input validation could in certain cases show errors after the error was fixed

Native input validation messages on properties in the Edit Metadata dialog keep displaying, for example when working with regular expression patterns.

Cloudera Issue: NAV-2523

Combo box display issues in Internet Explorer

The combo box scroll bar in search facets does not work in Internet Explorer. Clicking it closes the drop-down.

Cloudera Issue: NAV-2522

Hue link missing

When the Cluster Name facet is used, the Hue link is missing in search results.

Cloudera Issue: NAV-1927

Issues Fixed in Cloudera Navigator 2.6.0

Lineage performance suffers when more than 10000 relations are extracted

If more than 10000 relations must be traversed for a lineage diagram, performance suffers. This can occur when there are thousands of files in a directory or hundreds of columns in a table.

Cloudera Issue: NAV-390

In 2.3, the Navigator Search UI is missing the User Defined Property filter

The Navigator Search UI has changed between 2.2 and 2.3 with respect to the User Defined Property filter. In 2.3 it is no longer present.

Workaround: In the Search box type: `up_propertyName:value`. For example, `up_myName:myValue`.

Cloudera Issue: NAV-1691

Displaying the lineage of an entity may consume too much memory and the Metadata Server may run out of memory

Memory leaks have been fixed. However, the Navigator Metadata Server embeds Solr server inside its process, and its memory requirement is proportional to the data that is being indexed. For recommendations on how to configure memory, see [Memory Sizing Considerations for Navigator Metadata Server](#).

Cloudera Issue: NAV-1832

Cloudera Navigator Data Management Release Notes

After upgrade to 2.4.x, only entries related to deleted files are visible

In upgrading, Navigator failed to properly convert existing Hive entities to the new system. The problem involved how Hive query contents were used for creating entity names. The issue is fixed in this release.

Cloudera Issue: NAV-2542

Issues Fixed in Cloudera Navigator 2.5.0

After upgrade to 2.4.x, only entries related to deleted files are visible

In upgrading, Navigator failed to properly convert existing Hive entities to the new system. The problem involved how Hive query contents were used for creating entity names. The issue is fixed in this release.

Cloudera Issue: NAV-2542

Issues Fixed in Cloudera Navigator 2.4.4

Lineage does not render on MacOS using Chrome 48.0.2564.109

This change anticipates Google's deprecation and removal of the API that Navigator used to render lineage in Chrome browsers.

Cloudera Issue: NAV-2459

After upgrade to 2.4.x, only entries related to deleted files are visible

In upgrading, Navigator failed to properly convert existing Hive entities to the new system. The problem involved how Hive query contents were used for creating entity names. The issue is fixed in this release.

Cloudera Issue: NAV-2542

Issues Fixed in Cloudera Navigator 2.4.2

Note: If you are upgrading from a previous version of Cloudera Navigator, Cloudera recommends that you upgrade to version 2.4.3 or higher.

Searching for strings that start with forward slash ignored sometimes

Searching for a string that starts with a forward slash (/) in conjunction with another filter/facet or followed by AND and another search term will result in the string being ignored completely.

Workaround: Enclose the string starting with forward slash in double quotes, for example `"/some/path" AND sourceType:hdfs`

Cloudera Issue: NAV-2022

After upgrade, entities are incorrectly marked as deleted

The issue is resolved. However, upgrading from Cloudera Navigator 2.4.0 or 2.4.1 to 2.4.2 requires manual steps after the upgrade, in addition to the process detailed in the upgrade documentation. Specifically, the HDFS extractor state file (on the host system for each HDFS role instance that Cloudera Navigator extracts from) must be modified as detailed below:

1. Edit the HDFS extractor state file under the Cloudera Navigator storage directory. The default path is:

```
/var/lib/cloudera-scm-navigator/extractorState
```

The HDFS extractor state file contains a JSON object with an attribute `upgrades`, which has a list of upgrades and their statuses. For example:

```
{ "nextTxId":11394669, "lastKnownTransactionTime":1453931555151, "layoutVersion":-60,
"namespaceId":1613692955, "nextExtractionRunId":"df61cf41183dec8947078c228ec505e6##7453",
"upgrades": [
{"taskType":"SET_MISSING_ATTRIBUTES", "status":"SUCCEEDED", "startTime":1453484370390, "endTime":1453484370410, "attempts":1},
{"taskType":"UNDELETE", "status":"SUCCEEDED", "startTime":1453484370391, "endTime":1453484370418, "attempts":1},
{"taskType":"BLOCK_SIZE", "status":"SUCCEEDED", "startTime":1453484370391, "endTime":1453484370427, "attempts":1},
{"taskType":"REPLICATION_COUNT", "status":"SUCCEEDED", "startTime":1453484370391, "endTime":1453484370434, "attempts":1}]}
```

- Find entries in the `upgrades` list for `"taskType": "UNDELETE"`, `"status": "SUCCEEDED"` and change status to failed. For example, this entry:

```
{ "taskType": "UNDELETE", "status": "SUCCEEDED", "startTime":1453484370391, "endTime":1453484370418, "attempts":1}
```

should be changed to:

```
{ "taskType": "UNDELETE", "status": "FAILED", "startTime":1453484370391, "endTime":1453484370418, "attempts":1}
```

- Repeat this process for each HDFS extractor state file as needed for your Cloudera Navigator instance.

Cloudera Issue: NAV-2462

On a newly installed cluster, Hive lineage does not work

When Cloudera Manager starts, it does not automatically create the directory `/var/log/hive/lineage`. Because the Agent cannot detect this directory, it fails to set a watch on it. HiveServer2 creates the directory, but Hive metadata extracted to the directory is never read by Agent and sent to Navigator Metadata Server.

Workaround: Do one of the following:

- Use the Cloudera Manager Admin Console to restart HiveServer2 (results in downtime).
- To avoid HiveServer2 downtime, restart the Cloudera Manager Agent on the host running HiveServer2 role instance as follows:

```
sudo service cloudera-scm-agent restart
```

Cloudera Issue: NAV-2111

Entity landing page schema overflow hides name

If the schema type is very long, it can hide the name of the schema entity.

Cloudera Issue: NAV-2083

When Navigator uses the Cloudera Manager authenticator and Cloudera Manager is TLS enabled, authentication fails

When Navigator is configured to use the Cloudera Manager DB for authentication, and Cloudera Manager is TLS enabled, when a user attempts authentication, certificate validation fails with:

```
Caused by: sun.security.validator.ValidatorException: PKIX path building failed:
sun.security.provider.certpath.SunCertPathBuilderException: unable to find valid
certification path to requested target
```

Cloudera Issue: NAV-2178

Analytics page of Cloudera Navigator console includes deleted files

The Cloudera Navigator console **Analytics** page was including deleted files in its counts. This issue has been resolved.

Cloudera Navigator Data Management Release Notes

Cloudera Issue: NAV-2182

Policies created from the Analytics page were not working

Policies created from analytics UI were not working because it filtered on clusterName. Now it filters on sourceId.

Cloudera Issue: NAV-2183

No indication when Entity Details page is not completely loaded

Technical metadata displays immediately but it was not always obvious that loading Entity Details page was still loading. A loading spinner now displays on slow loads.

Cloudera Issue: NAV-2286

Tables might not load on Entity Details page

Tables might not load, depending on whether the schema finished loading before or after tables finish loading.

Cloudera Issue: NAV-2288

Issues Fixed in Cloudera Navigator 2.4.1

Potential Security Vulnerability Resolved

This release resolves a potential security vulnerability that may enable an attacker to execute arbitrary code from a remote machine without requiring authentication. Upgrading to the this release resolves the issue. See the Cloudera Security Bulletin, [Apache Commons Collections deserialization vulnerability](#), for complete details.

Cloudera Issue: NAV-2230

Issues Fixed in Cloudera Navigator 2.4.0

After HDFS upgrade, some changes to HDFS entities may not appear in Navigator

After an HDFS upgrade, Navigator might not detect changes to HDFS entities, such as move, rename, and delete operations, that were recorded only in the HDFS edit logs before the upgrade. This may cause an inconsistent view of HDFS entities between Navigator and HDFS.

Workaround: None.

Cloudera Issue: NAV-730

After upgrading TLS/SSL-enabled Navigator to 5.4.0, Navigator starts in non-TLS/SSL

After upgrading an TLS/SSL-enabled Navigator to 5.4.x, Navigator will start in non-TLS/SSL mode. Before the 5.4.x release of Navigator, TLS/SSL for Navigator was turned on using an advanced configuration snippet. In release 5.4.x, this option is exposed in the Cloudera Manager configuration UI. After upgrade to 5.4.x, this setting overrides the setting in the advanced configuration snippet, disabling TLS/SSL.

Workaround: Remove the setting from the advanced configuration snippet and specify it in the configuration UI directly.

Cloudera Issue: NAV-1536

Navigator login using Cloudera Manager credentials does not work if Cloudera Manager has TLS enabled

With Navigator configured to use Cloudera Manager for authentication and Cloudera Manager using TLS, when a user attempts authentication, certificate validation fails with:

```
Caused by: sun.security.validator.ValidatorException: PKIX path building failed:  
sun.security.provider.certpath.SunCertPathBuilderException: unable to find valid  
certification path to requested target
```

The issue is fixed in this release.

Cloudera Issue: NAV-2207

Memory leak when creating Impala lineage for very big queries (more than 32K characters)

Cloudera Issue: NAV-1832

Disabling auditing in Hive causes exception in HiveServer2

If you disable auditing for Hive, but do not restart the Hive service, HiveServer2 logs the following exception:

```
Hive Internal Error: com.cloudera.navigator.shaded.avro.AvroRuntimeException(Field  
serviceName type:STRING pos:0 does not accept null values)
```

Cloudera Issue: NAV-1316

Lineage is not collected for Hive on Spark jobs

Cloudera Issue: NAV-1309

Handle HDFS root as special case when generating Hue link

Cloudera Issue: NAV-1817

Entity description does not allow multiple lines

Cloudera Issue: NAV-422

Expanding entity causes unintuitive lineage layout

Cloudera Issue: NAV-1438

Selected Pig field not shown in lineage

When you view lineage for a Hive field, the Hive parent is expanded so you see the field. However, if there is a field of a Pig table inside a Pig operation execution, only the operation execution is expanded, not the table. The field is not visible and it is not obvious to which entity it belongs.

Cloudera Issue: NAV-1440

Pig inside Oozie not shown in lineage view

Cloudera Issue: NAV-1662

Page headers missing after selecting "Show Full Page" in lineage diagram

Cloudera Issue: NAV-1681

Facet does not visually retain selection after refresh

After reloading a page, some selections are not rendered as selected even though the search string itself is still correct.

Cloudera Issue: NAV-1913

Link and parent Hive table not displayed

If you launch a job with two input directories that are also both Hive tables, the Hive table is shown for one of the directories but not the other. If you expand the other directory, the Hive table is shown.

Cloudera Issue: NAV-1794

Links disappear when expanding Pig job run by Oozie

Cloudera Issue: NAV-1819

Cloudera Navigator Data Management Release Notes

Expanding a directory folder obscures the Hive table it is linked to

Cloudera Issue: NAV-1908

Source filter missing from filter list

Cloudera Issue: NAV-1159

Subfacets should be enabled and disabled based on values in facet type

Cloudera Issue: NAV-1051

Tags and key-value pairs should be sorted in the policy editor

Cloudera Issue: NAV-1760

Create Policy link should not be available for a policy viewer role

In this release, the Create Policy button does not appear for users who do not have a role that provides permission to create or update policies.

Cloudera Issue: NAV-1972

Impala auditing does not support filtering during event capture

Impala auditing does not support filtering during event capture.

Severity: Low

Workaround: None.

Cloudera Issue: OPSAPS-15372

Issues Fixed in Cloudera Navigator 2.3.9

Apache Commons Collections Deserialization Vulnerability

Cloudera has learned of a potential security vulnerability in a third-party library called the [Apache Commons Collections](#). This library is used in products distributed and supported by Cloudera (“Cloudera Products”), including core Apache Hadoop. The Apache Commons Collections library is also in widespread use beyond the Hadoop ecosystem. At this time, no specific attack vector for this vulnerability has been identified as present in Cloudera Products.

In an abundance of caution, we are currently in the process of incorporating a version of the Apache Commons Collections library with a fix into the Cloudera Products. In most cases, this will require coordination with the projects in the Apache community. One example of this is tracked by [HADOOP-12577](#).

The Apache Commons Collections potential security vulnerability is titled “Arbitrary remote code execution with InvokerTransformer” and is tracked by [COLLECTIONS-580](#). MITRE has not issued a CVE, but related [CVE-2015-4852](#) has been filed for the vulnerability. CERT has issued [Vulnerability Note #576313](#) for this issue.

Releases affected: CDH 5.5.0, CDH 5.4.8 and lower, Cloudera Manager 5.5.0, Cloudera Manager 5.4.8 and lower, Cloudera Navigator 2.4.0, Cloudera Navigator 2.3.8 and lower

Users affected: All

Severity (Low/Medium/High): High

Impact: This potential vulnerability may enable an attacker to execute arbitrary code from a remote machine without requiring authentication.

Immediate action required: Upgrade to Cloudera Navigator 2.3.9.

Issues Fixed in Cloudera Navigator 2.3.8

Disabling auditing in Hive causes exception in HiveServer2

If you disable auditing for Hive, but do not restart the Hive service, HiveServer2 logs the following exception:

```
Hive Internal Error: com.cloudera.navigator.shaded.avro.AvroRuntimeException(Field  
serviceName type:STRING pos:0 does not accept null values)
```

Cloudera Issue: NAV-1316

NPE during YARN extraction

The extractor no longer throws a NPE during YARN extraction.

Cloudera Issue: NAV-2016

Issues Fixed in Cloudera Navigator 2.3.3

Upgrade to 2.3.1 does not create column "NAME" in NAVMS_AUDIT_EVENTS

The upgrade process neglected to include a script to create the "NAME" column.

Cloudera Issue: NAV-1541

Navigator Search UI hangs due to blocked log4j thread

The Metadata Server log4j logger blocked due to a defect in how old logs are deleted. The logger has been replaced and the Cloudera Manager Agent deletes old log files.

Cloudera Issue: NAV-1539

Expanding Pig lineage can cause overlap

When you expand a Pig lineage diagram, relationship lines can sometimes obstruct one another.

Cloudera Issue: NAV-1545

Audit reports subject to cross-site scripting

Navigator does not do input validation on report names, which allows users to enter arbitrary code in this field. The next time a report name is viewed, the script is executed.

Cloudera Issue: NAV-1502

Session timeout results in a redirect using HTTP basic authentication

Upon session timeout, Navigator redirects to HTTP basic authentication instead of redirecting to the main login page.

Cloudera Issue: NAV-1506

"POODLE" vulnerability on TLS/SSL enabled ports

The POODLE (Padding Oracle On Downgraded Legacy Encryption) attack takes advantage of a cryptographic flaw in the obsolete SSLv3 protocol, after first forcing the use of that protocol. The only solution is to disable SSLv3 entirely. This requires changes across a wide variety of components of Cloudera Navigator in 2.3.x and all earlier versions. Cloudera Navigator 2.3.3 provides these changes for Cloudera Navigator 2.3.x deployments. All Cloudera Navigator users should upgrade to 2.3.3 as soon as possible. For more information, see the [Cloudera Security Bulletin](#).

Cloudera Issue: NAV-1501

LDAP group searches appear slow because of web UI behavior

Searching for LDAP groups in the web UI can appear slow because every time a character changes in the search field, an onchange Javascript event triggers a new LDAP search.

Cloudera Navigator Data Management Release Notes

Cloudera Issue: NAV-1491

Solr audit fields are incorrectly shown with capital letters in the web UI

Solr audit fields such as **sub_operation** and **entity_id** are rendered with capital letters and spaces such as **Sub Operation** or **Entity ID**.

Cloudera Issue: NAV-1481

Issues Fixed in Cloudera Navigator 2.3.1

Link disappears when expanded

Sometimes when you expand a lineage diagram, a link disappears.

Cloudera Issue: NAV-1416

Operations on canary files should be filtered out

Cloudera Issue: NAV-1419

Hive views have same icon as Hive fields in lineage

Cloudera Issue: NAV-1365

Facet count should show (0) instead of (-) when there are no matching entities

Facet counts show (-) when the Metadata Server does not return a value. It should show (0).

Workaround: None.

Cloudera Issue: NAV-1271

Column lineage does not display

Column lineage does not display when its parent is automatically expanded.

Workaround: Redisplay the lineage by clicking the parent entity.

Cloudera Issue: NAV-1380

Kite dataset extraction fails when HDFS HA is enabled

Workaround: None.

Cloudera Issue: NAV-1383

Exporting audit reports to CSV does not work

You can export audits to JSON with a limit of 10,000 audits.

Cloudera Issue: NAV-1332

Sentry auditing does not work if the Python version is lower than 2.5

Cloudera Issue: NAV-1080

Sqoop sub-operations don't display in schema view of lineage

Workaround: None.

Cloudera Issue: NAV-1211

Issues Fixed in Cloudera Navigator 2.3.0

There were no issues fixed in Cloudera Navigator 2.3.0.

Issues Fixed in Cloudera Navigator 2.2.9

Apache Commons Collections Deserialization Vulnerability

Cloudera has learned of a potential security vulnerability in a third-party library called the [Apache Commons Collections](#). This library is used in products distributed and supported by Cloudera (“Cloudera Products”), including core Apache Hadoop. The Apache Commons Collections library is also in widespread use beyond the Hadoop ecosystem. At this time, no specific attack vector for this vulnerability has been identified as present in Cloudera Products.

In an abundance of caution, we are currently in the process of incorporating a version of the Apache Commons Collections library with a fix into the Cloudera Products. In most cases, this will require coordination with the projects in the Apache community. One example of this is tracked by [HADOOP-12577](#).

The Apache Commons Collections potential security vulnerability is titled “Arbitrary remote code execution with InvokerTransformer” and is tracked by [COLLECTIONS-580](#). MITRE has not issued a CVE, but related [CVE-2015-4852](#) has been filed for the vulnerability. CERT has issued [Vulnerability Note #576313](#) for this issue.

Releases affected: CDH 5.5.0, CDH 5.4.8 and lower, Cloudera Manager 5.5.0, Cloudera Manager 5.4.8 and lower, Cloudera Navigator 2.4.0, Cloudera Navigator 2.3.8 and lower, Cloudera Navigator 2.2.8 and lower.

Users affected: All

Severity (Low/Medium/High): High

Impact: This potential vulnerability may enable an attacker to execute arbitrary code from a remote machine without requiring authentication.

Immediate action required: Upgrade to Cloudera Navigator 2.2.9.

Issues Fixed in Cloudera Navigator 2.2.4

“POODLE” vulnerability on TLS/SSL enabled ports

The POODLE (Padding Oracle On Downgraded Legacy Encryption) attack takes advantage of a cryptographic flaw in the obsolete SSLv3 protocol, after first forcing the use of that protocol. The only solution is to disable SSLv3 entirely. This requires changes across a wide variety of components of Cloudera Navigator in 2.2.x and all earlier versions. Cloudera Navigator 2.2.4 provides these changes for Cloudera Navigator 2.2.x deployments. All Cloudera Navigator users should upgrade to 2.2.4 as soon as possible. For more information, see the [Cloudera Security Bulletin](#).

Cloudera Issue: NAV-1501

Issues Fixed in Cloudera Navigator 2.2.3

Navigator Audit Server reports invalid null characters in HBase audit events when using the PostgreSQL database

Navigator Audit Server reports invalid null characters in HBase audit events when using the PostgreSQL database. HBase allows null characters in qualifiers, so now Navigator escapes them.

Cloudera Issue: NAV-1286

Oozie extractor throws too many Boolean clauses exception

Cloudera Issue: NAV-1203

Issues Fixed in Cloudera Navigator 2.2.2

The audit reports UI now returns results when there are a large number of audit records

The audit reports UI was not returning results when there were a large number of audit records matching a particular time period, especially when the period included multiple days. The UI is now also much more responsive.

Cloudera Issue: NAV-888

Issues Fixed in Cloudera Navigator 2.2.1

Browser autocomplete no longer enabled before authentication

Form fields before authentication in the application have auto-complete enabled. Any user using the same computer would be able to see information entered by a previous user.

Cloudera Issue: NAV-924

Navigator Web UI no longer exposes paths to directory listing/forceful browsing

The web server is configured to display the list of files contained in this directory. This is not recommended because the directory may contain files that are not normally exposed through links on the web site.

Cloudera Issue: NAV-923

Navigator Audit Server no longer throws OOM for very long Impala queries

Cloudera Issue: NAV-952

Issues Fixed in Cloudera Navigator 2.2.0

If Hue is added after Navigator, search results do not have links to Hue

In the Metadata UI, search results contain links to an appropriate application in Hue. However, if you add a Hue service after Navigator roles, there will be no links to Hue.

Workaround:

1. Set the cluster's display name and name properties to be the same:
 - a. Get cluster's name and display name using following API: `http://hostname:7180/api/v6/clusters`.
 - b. In the Cloudera Manager Admin Console, at the right of the cluster name, click the down arrow and select **Rename Cluster**. Set the cluster display name to match its name.
2. Restart the Navigator Metadata server.

Cloudera Issue: NAV-745

Issues Fixed in Cloudera Navigator 2.1.6

When auditing is enabled, the Cloudera Manager Agent may become slow or get stuck when responding to commands and when sending heartbeats to Cloudera Manager Server

This issue can occur when Cloudera Navigator auditing is turned on. The auditing code reads audit logs and sends them to the Audit Server. It acquires a lock to protect the list of roles being audited. The same list is also modified by the Cloudera Manager Agent's main thread when a role is started or stopped. If the Audit thread takes too much time to send audits to the Audit Server (which can happen if there is backlog of audit logs), it starves the main Agent thread. This causes the main Agent thread to not send heartbeats and to not respond to commands from the Cloudera Manager Server.

Issues Fixed in Cloudera Navigator 2.1.5

Navigator Audit Server reports invalid null characters in HBase audit events when using the PostgreSQL database

Navigator Audit Server reports invalid null characters in HBase audit events when using the PostgreSQL database. HBase allows null characters in qualifiers, so now Navigator escapes them.

Cloudera Issue: NAV-1286

Oozie extractor throws too many Boolean clauses exception

Cloudera Issue: NAV-1203

Issues Fixed in Cloudera Navigator 2.1.4

The audit reports UI now returns results when there are a large number of audit records

The audit reports UI was not returning results when there were a large number of audit records matching a particular time period, especially when the period included multiple days. The UI is now also much more responsive.

Cloudera Issue: NAV-888

Issues Fixed in Cloudera Navigator 2.1.2

Search results in Navigator now have links to Hue

In the Metadata UI, search results contain links to an appropriate application in Hue. The links may be missing for either of the following reasons:

- Hue was added after Navigator Metadata server was started.
- The cluster name and display name are different.

Workaround:

1. Set the cluster's display name and name properties to be the same:
 - a. Get cluster's name and display name using following API: `http://hostname:7180/api/v6/clusters`.
 - b. In the Cloudera Manager Admin Console, at the right of the cluster name, click the down arrow and select **Rename Cluster**. Set the cluster display name to match its name.
2. Restart the Navigator Metadata server.

Cloudera Issues: NAV-745, NAV-866

Browser autocomplete no longer enabled before authentication

Form fields before authentication in the application have auto-complete enabled. Any user using the same computer would be able to see information entered by a previous user.

Cloudera Issue: NAV-924

Navigator Web UI no longer exposes paths to directory listing/forceful browsing

The web server is configured to display the list of files contained in this directory. This is not recommended because the directory may contain files that are not normally exposed through links on the web site.

Cloudera Issue: NAV-923

Navigator Audit Server no longer throws OOM for very long Impala queries

Cloudera Issue: NAV-952

Issues Fixed in Cloudera Navigator 2.1.1

LDAP lookups in Active Directory to resolve group membership are now working

Cloudera Issue: NAV-784

Dropping a Hive table and creating a view with same name or vice versa no longer raises an error

Cloudera Issue: NAV-759

HDFS extraction now works after upgrading CDH from 5.1 to 5.2

Cloudera Issue: NAV-709

Setting a property in the Hue advanced configuration snippet no longer throws a "too many Boolean clauses" error in Navigator Metadata

Cloudera Issue: NAV-549

Issues Fixed in Cloudera Navigator 2.0.5

Memory leak in Navigator Audit Server due to error during batch operations

Cloudera Issue: NAV-984

Issues Fixed in Cloudera Navigator 2.0.3

Dropping a Hive table and creating a view with same name or vice versa no longer raises an error

Cloudera Issue: NAV-759

Setting a property in the Hue advanced configuration snippet no longer throws a "too many Boolean clauses" error in Navigator Metadata

Cloudera Issue: NAV-549

Issues Fixed in Cloudera Navigator 2.0.2

HBase auditing initialization failure can prevent region opening indefinitely

Cloudera Issue: NAV-512

Issues Fixed in Cloudera Navigator 2.0.1

Hive View to Table lineage is missing

The lineage of the underlying tables does not appear in the lineage view.

Workaround: Launch lineage on the underlying tables directly.

Cloudera Issue: NAV-432

The "allowed" query selector is missing from the audit REST API

Queries such as `http://hostname:7180/api/v7/audits?maxResults=10&query=allowed==false` are now supported.

Workaround: None.

Cloudera Issue: NAV-404

Metadata in metadata files is not processed

Workaround: None.

Cloudera Issue: NAV-490

Lineage does not work when launched on a field

When you launch lineage on a field (Hive column or Pig field, or a Sqoop sub-operation), the UI displays the initial graph properly. However if you expand the parent item (Hive table in case of a Hive column), then things start disappearing from the lineage diagram.

Workaround: None.

Cloudera Issue: NAV-365

When you specify an end date for the `created` property, no results are returned.

Workaround: Clear the end date control or specify an end date of `TO+*%5D%22%7D`.

Cloudera Issue: NAV-335

Navigating back to the parent entity in a Pig lineage diagram sometimes displays the error: Cannot read property 'x' of undefined.

Workaround: None.

Cloudera Issue: NAV-298

Issues Fixed in Cloudera Navigator 2.0.0

The last accessed time for Hive table is incorrect.

Workaround: None.

Cloudera Issue: OPSAPS-17227

Pig job that has relations with self is unreadable in lineage view.

The Metadata UI currently does not handle situation where there is a data-flow relation between elements that are also related via parent-child relation.

Workaround: None.

Cloudera Issue: OPSAPS-18836

If auditing is enabled, during an upgrade from Cloudera Manager 4.6.3 to 4.7, the Impala service won't start.

Impala auditing requires the Audit Log Directory property to be set, but the upgrade process fails to set the property.

Workaround: Do one of the following:

- Stop the Cloudera Navigator Audit server.
- Ensure that you have a Cloudera Navigator license and manually set the property to `/var/log/impalad/audit`.

Cloudera Issue: OPSAPS-15333

Empty box appears over the list of results after adding a tag to a file

When tags are added to an entity, in some cases a white box remains after pressing **Enter**.

Workaround: Refresh the page to remove the artifact.

Cloudera Issue: NAV-87

Issues Fixed in Cloudera Navigator 1.2.0

Certain complex multi-level lineages, such as directory/file and database/table, may not be fully represented visually.

Workaround: None.

Cloudera Issue: OPSAPS-18207

Cloudera Navigator Key Trustee Server Release Notes

These release notes provide information on the new and changed features, known issues, and fixed issues for Cloudera Navigator Key Trustee Server.

New Features and Changes in Cloudera Navigator Key Trustee Server

The following sections describe what's new and changed in each Cloudera Navigator Key Trustee Server release.

Note: Releases 5.4.3 and 5.4.9 are the only maintenance releases of Key Trustee Server 5.4.

Release 5.5.2 is the only maintenance release of Key Trustee Server 5.5.

There is no Release 5.6 of Key Trustee Server.

There are no maintenance releases of Key Trustee Server 5.7.

There are no maintenance releases of Key Trustee Server 5.8.

There are no maintenance releases of Key Trustee Server 5.9.

What's New in Cloudera Navigator Key Trustee Server

The following sections describe what's new in each Cloudera Navigator Key Trustee Server release.

What's New in Cloudera Navigator Key Trustee Server 5.15.0

An issue has been fixed. See [Issues Fixed in Cloudera Navigator Key Trustee Server 5.15.0](#) on page 2790.

What's New in Cloudera Navigator Key Trustee Server 5.14.0

An issue has been fixed. See [Issues Fixed in Cloudera Navigator Key Trustee Server 5.14.0](#) on page 2791.

What's New in Cloudera Navigator Key Trustee Server 5.13.0

An issue has been fixed. See [Issues Fixed in Cloudera Navigator Key Trustee Server 5.13.0](#) on page 2791.

What's New in Cloudera Navigator Key Trustee Server 5.12.0

- Key Trustee Server supports RHEL 6.9.
- Key Trustee Server supports CentOS 6.9.

What's New in Cloudera Navigator Key Trustee Server 5.11.0

- Key Trustee Server supports RHEL 7.4.
- Key Trustee Server supports OEL 7.4.

An issue has been fixed. See [Issues Fixed in Cloudera Navigator Key Trustee Server 5.11.0](#) on page 2791.

What's New in Cloudera Navigator Key Trustee Server 5.10.1

An issue has been fixed. See [Issues Fixed in Cloudera Navigator Key Trustee Server 5.10.1](#) on page 2791.

What's New in Cloudera Navigator Key Trustee Server 5.10.0

- Key Trustee Server supports RHEL 7.3.
- Key Trustee Server supports OEL 6.8, 7.2, and 7.3.
- Key Trustee Server supports modifying the supported ciphers and protocols for TLS.

Cloudera Navigator Key Trustee Server Release Notes

What's New in Cloudera Navigator Key Trustee Server 5.9.0

- Key Trustee Server supports RHEL 6.8.
- Running the [Key Trustee Server backup script](#) now backs up necessary hardware security module (HSM) configuration files.
- Key Trustee Server supports rolling restart in Cloudera Manager.

What's New in Cloudera Navigator Key Trustee Server 5.8.0

- When adding the parcel-based Key Trustee Server service for the first time, Cloudera Manager automatically backs up Key Trustee Server locally and schedules ongoing hourly local backups using `cron`.
- The Key Trustee Server backup script (`ktbackup.sh`) adds a new option, `--roll`, which specifies the number of backups to retain.

An issue has also been fixed. For more information, see [Issues Fixed in Cloudera Navigator Key Trustee Server 5.8.0](#) on page 2791.

What's New in Cloudera Navigator Key Trustee Server 5.7.0

- A backup script (`ktbackup.sh`) is included with Key Trustee Server.
- Parcel-based Key Trustee Server logs an error message at startup if the `keytrustee.conf` file is malformed.
- Error logging is improved for connection and certificate errors with Key Trustee Server connecting to Key HSM.

A number of issues have also been fixed. See [Issues Fixed in Cloudera Navigator Key Trustee Server 5.7.0](#) on page 2792.

What's New in Cloudera Navigator Key Trustee Server 5.5.2

- The `ktadmin` command has a new `--passphrase` option to allow migration of existing keys from a Key Trustee Server with a password-protected private key to an HSM.

An issue has also been fixed. See [Issues Fixed in Cloudera Navigator Key Trustee Server 5.5.2](#) on page 2792.

What's New in Cloudera Navigator Key Trustee Server 5.5.0

- Key Trustee Server supports RHEL 7.
- Key Trustee Server supports password-protected SSL certificates.
- TLS/SSL certificate file paths are configurable in Cloudera Manager.

A number of issues have also been fixed. See [Issues Fixed in Cloudera Navigator Key Trustee Server 5.5.0](#) on page 2792.

What's New in Cloudera Navigator Key Trustee Server 5.4.9

An issue has been fixed. See [Issues Fixed in Cloudera Navigator Key Trustee Server 5.4.9](#) on page 2794.

What's New in Cloudera Navigator Key Trustee Server 5.4.3

A number of issues have been fixed. See [Issues Fixed in Cloudera Navigator Key Trustee Server 5.4.3](#) on page 2795.

What's New in Cloudera Navigator Key Trustee Server 5.4.0

- Key Trustee Server can be installed and managed using Cloudera Manager.
- Existing keys stored in Key Trustee Server can be migrated to a Hardware Security Module (HSM) using Navigator Key HSM.

Changed Features and Behaviors in Cloudera Navigator Key Trustee Server

The following sections describe what's changed in each Cloudera Navigator Key Trustee Server release.

What's Changed in Cloudera Navigator Key Trustee Server 5.8.0

- Attempting to start the `keytrusteed` service using the `service` command when Key Trustee Server is already running now reports success with a message indicating that the service is already running.

What's Changed in Cloudera Navigator Key Trustee Server 5.7.0

The `ktadmin keyhsm` command can be used to update Key Trustee Server certificate information for Key HSM

The `ktadmin keyhsm` command can be used to update Key Trustee Server certificate information for Key HSM instead of manually modifying `keytrustee.conf`.

What's Changed in Cloudera Navigator Key Trustee Server 5.5.0

Key Trustee Server can be installed using Cloudera Manager without a CSD

Key Trustee Server no longer requires a Custom Service Descriptor (CSD) file.

What's Changed in Cloudera Navigator Key Trustee Server 5.4.0

All processes run as a single user

All Key Trustee Server processes now run as a single non-root user (`keytrustee` by default).

Key Trustee Server processes use a single port

Key Trustee Server processes (with the exception of the backing PostgreSQL database) now use a single port (11371 by default).

Known Issues and Workarounds in Cloudera Navigator Key Trustee Server

**Warning:**

Interrupting deposit migration from Key Trustee Server to Key HSM can result in lost data

Workaround: Do not interrupt deposit migration to Key HSM.

Key Trustee Server active database setup fails when command line configuration specifies non-default database port

If the Key Trustee Server is configured from the command line to use a non-default database port (the default port is 11381), then when the Key Trustee Server service is added to Cloudera Manager, the first database startup fails.

Affected Versions: 5.15.0, 5.16.0

Cloudera Bug: KT-6238

Workaround:

1. Log in to the Key Trustee Server and manually stop/start the databases:

```
service keytrustee-db stop
```

Make sure that the `postmaster.pid` file, which is located in the database directory, no longer exists. If necessary, replace `/var/lib/keytrustee/db` in the following command with the appropriate database directory for your system:

```
# ls /var/lib/keytrustee/db/postmaster.pid
```

If `postmaster.pid` has not been cleaned up, then use the `pg_ctl` utility to stop the database directly:

```
# pg_ctl stop
```

2. Return to the Cloudera Manager home page, where the Key Trustee Server service is listed.
3. Go into the Key Trustee Server service configuration and for **Key Trustee Server Database Port**, specify the port that was configured during the command line configuration.
4. Redeploy the Key Trustee Server configuration and restart the service.

Cloudera Navigator Key Trustee Server Release Notes

Key Trustee Server 5.4.x and lower is not supported by Cloudera Manager 5.10.x and higher

Key Trustee Server 5.4.x and lower is not supported by Cloudera Manager 5.10.x and higher.

Affected Versions: 5.4.x

Fixed in Version(s): 5.10.1 through 5.14.0

Cloudera Bug: KT-6178

Workaround: Upgrade to a version of Key Trustee Server higher than 5.4.x.

Malicious user can access database used to store HDFS encryption zone keys

This vulnerability, which impacts Key Trustee Server, allows anyone with access to the host on which Key Trustee Server is running to use a non-libpq based connection driver to connect to the Postgres database used by Key Trustee Server without specifying a password.

The keys stored in the database are encrypted, which means access to data cannot be gained by this method. However, the vulnerability could provide a way for someone to alter encryption zone key metadata, delete the encryption zone keys, or delete the contents of the entire database.

Affected Versions: 5.3.0, 5.4.0, 5.5.0, 5.6.0, 5.7.0, 5.8.0, 5.9.0, 5.10.0, 5.11.0, 5.12.0, 5.13.0

Fixed in Version: 5.14.0

Cloudera Bug: DOCS-2788

Workaround: To remove the connection capability to Postgres (via the local network from all Key Trustee Server roles):

1. Log in as root to the host running Key Trustee Server.
2. Make a backup of the original Postgres configuration file:

```
cp /var/lib/keytrustee/db/pg_hba.conf \ /var/lib/keytrustee/db/pg_hba.conf.bak
```

3. Edit the Postgres configuration file to comment out the use of network connections for Postgres.
4. Using a preferred editor, edit `/var/lib/keytrustee/db/pg_hba.conf`, and add a `#` character to the beginning of the following lines in the file:

```
host keytrustee keytrustee 127.0.0.1/32 md5
host keytrustee keytrustee ::1/128 md5
```

After editing, the files should appear as:

```
#host keytrustee keytrustee 127.0.0.1/32 md5
#host keytrustee keytrustee ::1/128 md5
```

5. Save the file.
6. Perform a rolling restart of Key Trustee Server service.

Note:

While Key Trustee Server is restarting, new keys cannot be created and keys cannot be rolled. The restart should complete in under five minutes.

If there is only one instance of Key Trustee Server, restarting the Key Trustee Service may result in delayed or failed jobs waiting on an encryption zone key. If a job fails, rerun the job after the single instance of Key Trustee Server has restarted.

The encryption wizard continues to fail if there is a failure during initial configuration run

The encryption wizard continues to fail if there was a failure during the initial run configuring HSM KMS.

Affected Versions: 5.12.0, 5.13.0, 5.14.0, 5.15.0, 5.16.0

Cloudera Bug: KT-4909

Workaround: Open Cloudera Manager in another browser tab, and manually stop the installed KMS by clicking the arrow next to the KMS and selecting **Stop**. Then retry the installation in the new tab after correcting the cause of the install failure.

Before installing the Thales backed HSM KMS, you must add the KMS user to the `nfast` group

After installation of the Thales HSM client, and before installing Navigator HSM KMS backed by Thales HSM, you must add the KMS user to the `nfast` group..

Affected Versions: 5.12.0, 5.13.0, 5.14.0, 5.15.0, 5.16.0

Cloudera Bug: KT-4618

Workaround: Run the following command to manually add the KMS user to the `nfast` group:
`usermod -a -G nfast kms`

Navigator Key HSM may become unresponsive when there are network delays or connection issues with the HSM

This issue manifests itself as job failures within CDH. To verify that this issue is the source of the failed CDH jobs and that Key HSM has become unresponsive log into the Key HSM server and look at the log file in `/var/log/keyhsm/`. If no new entries are being written to the log file while key requests are being made, e.g. CDH jobs continue to retry, then follow the directions in the Workaround section.

Workaround: If threads accumulate and Navigator Key HSM has become unresponsive then restart Key HSM by executing the following commands:

```
$ sudo service keyhsm shutdown
$ sudo service keyhsm start
```

Key Trustee KMS cannot connect to Key Trustee Server using TLS versions other than 1.0 on JDK 7

If you have configured Key Trustee Server to use a TLS version other than 1.0, Key Trustee KMS fails to connect to Key Trustee Server, and key operations fail when using JDK 7.

Workaround: Use TLS version 1.0 only, or JDK 8.

Key Trustee Server cannot use TLS version 1.2 on RHEL 6

Configuring Key Trustee Server to use TLS version 1.2 causes Key Trustee Server to be unable to start.

Workaround: Use your operating system package manager to upgrade the `pyOpenSSL` package to version 1.4 or higher, or do not configure Key Trustee Server to use TLS version 1.2.

Upgraded passive Key Trustee Server fails to start due to incorrect ownership of `recovery.conf`

Passive Key Trustee Servers upgraded from Key Trustee Server 3.8.x or lower fail to start with the following error:

```
WARNING:root:stdout pg_basebackup: directory "/var/lib/pgsql/9.3/keytrustee" exists but
is not empty
:
Traceback (most recent call last):
  File "/usr/bin/ktadmin", line 484, in <module>
    main()
  File "/usr/bin/ktadmin", line 473, in main
    init_slave()
  File "/usr/bin/ktadmin", line 349, in init_slave
    pgsetup.base_backup(ARGS.pg_rootdir, ARGS.master, PKG, run_as=ARGS.postgres_user)
  File "/usr/lib/python2.6/site-packages/keytrustee/server/setup/postgres.py", line 206,
in base_backup
    run([pg_basebackup, '-D', dest, '--host=%s' % master_ip, '--port=%d' % port,
```

Cloudera Navigator Key Trustee Server Release Notes

```
'--username=%s' % db_user], run_as=run_as)
File "/usr/lib/python2.6/site-packages/keytrustee/util.py", line 145, in run
raise subprocess.CalledProcessError(p.returncode, cmd)
subprocess.CalledProcessError: Command '['/usr/bin/pg_basebackup', '-D',
'/var/lib/pgsql/9.3/keytrustee', '--host=kt01.example.com', '--port=5432',
'--username=keytrustee']' returned non-zero exit status 1
```

Workaround: Change the owner and group of `/var/lib/pgsql/9.3/keytrustee/recovery.conf` to postgres:

```
$ sudo chown postgres:postgres /var/lib/pgsql/9.3/keytrustee/recovery.conf
```

Key Trustee Server PKCS8 private key cannot communicate with Key HSM

If its private key is in PKCS8 format, Key Trustee Server cannot communicate with Key HSM.

Cloudera Bug: KT-3172

Workaround: Convert the Key Trustee Server private key to raw RSA format.

Key Trustee Server backup script fails if PostgreSQL versions lower than 9.3 are installed

If PostgreSQL versions lower than 9.3 are installed on the Key Trustee Server host, the `ktbackup.sh` script fails with an error similar to the following:

```
pg_dump: server version: 9.3.11; pg_dump version: 9.2.14
pg_dump: aborting because of server version mismatch
```

Workaround: Uninstall the lower PostgreSQL version.

Issues Fixed in Cloudera Navigator Key Trustee Server

The following sections describe issues fixed in each Cloudera Navigator Key Trustee Server release.

Note: Releases 5.4.3 and 5.4.9 are the only maintenance releases of Key Trustee Server 5.4.

Release 5.5.2 is the only maintenance release of Key Trustee Server 5.5.

There is no Release 5.6 of Key Trustee Server.

There are no maintenance releases of Key Trustee Server 5.7.

There are no maintenance releases of Key Trustee Server 5.8.

There are no maintenance releases of Key Trustee Server 5.9.

Issues Fixed in Cloudera Navigator Key Trustee Server 5.15.0

`ktbackup.sh` script not rolling GPG encrypted files

Encrypted backup tarballs have an additional `.gpg` file extension after `.tar` to indicate that they are encrypted (`.tar.gpg`). When the `ktbackup.sh` script searched for files to roll, it only sought files that ended in `.tar`, so it was not rolling the encrypted backup tarballs. The script has been updated to account for the `.tar.gpg` extension for encrypted backups, and now rolls them as expected.

Cloudera Bug: KT-6107

Issues Fixed in Cloudera Navigator Key Trustee Server 5.14.0

Malicious user can access database used to store HDFS encryption zone keys

This vulnerability, which impacted Key Trustee Server, allowed anyone with access to the host on which Key Trustee Server is running to use a non-libpq based connection driver to connect to the Postgres database used by Key Trustee Server without specifying a password.

The keys stored in the database are encrypted, which means access to data could not be gained by this method. However, the vulnerability could provide a way for someone to alter encryption zone key metadata, delete the encryption zone keys, or delete the contents of the entire database.

Cloudera Bug: DOCS-2788

Issues Fixed in Cloudera Navigator Key Trustee Server 5.13.0

There are no fixed issues in Cloudera Navigator Key Trustee Server 5.13.0.

Issues Fixed in Cloudera Navigator Key Trustee Server 5.12.0

For new features in Key Trustee Server 5.9.0, see [New Features and Changes in Cloudera Navigator Key Trustee Server](#) on page 2785.

Issues Fixed in Cloudera Navigator Key Trustee Server 5.8.0

Key Trustee Server logs superfluous error during registration

When you register a client to the Key Trustee Server, the following error message appears in the Key Trustee Server log:

```
Traceback (most recent call last):
  File "/usr/lib/python2.6/site-packages/keytrustee/server/webapp.py", line 2151, in lookup
    return hkp.lookup(g.hkpdb, app.config['LOCAL_FINGERPRINT'])
  File "/usr/lib/python2.6/site-packages/keytrustee/server/hkp.py", line 72, in lookup
```

Cloudera Navigator Key Trustee Server Release Notes

```
raise wzex.BadRequest("Operation not specified.")
BadRequest: 400: Operation not specified.
```

Issues Fixed in Cloudera Navigator Key Trustee Server 5.7.0

Email messages from Key Trustee Server use hostname instead of fully qualified domain name

Email sent from Key Trustee Server includes a link that uses the Key Trustee Server short name instead of the fully qualified domain name.

Host Inspector displays the wrong version of Key Trustee Server

Host Inspector displays the wrong Key Trustee Server version, showing the Key Trustee KMS version instead.

Key Trustee Server supports weak RC4 ciphers for TLS

Key Trustee Server supports weak RC4 ciphers for TLS connections, potentially allowing clients to negotiate a weaker connection.

The `ktadmin keyhsm` command fails with M2Crypto error

Running the `ktadmin keyhsm --server https://khs01.example.com:9090 --trust` command fails with the following error:

```
M2Crypto.X509.X509Error: 140405990356800:error:0906D06C:PEM routines:PEM_read_bio:no
start line:pem_lib.c:703:Expecting: CERTIFICATE
```

Issues Fixed in Cloudera Navigator Key Trustee Server 5.5.2

Key Trustee Server with password-protected private key cannot communicate with Key HSM

If its private key is password-protected, Key Trustee Server cannot communicate with Key HSM.

Issues Fixed in Cloudera Navigator Key Trustee Server 5.5.0

Key Trustee Server missing from Components page

Key Trustee Server is not listed in the **Components** page (**Hosts > Hostname > Components**) of the host it is installed on.

Passive Database role fails to restart after enabling synchronous replication

After enabling synchronous replication, the Passive Database role fails to start when restarting the Key Trustee Server service in Cloudera Manager.

Key Trustee Server using CherryPy allows SSLv3

Key Trustee Server using CherryPy as the web backend allows SSLv3 connections, which are considered insecure.

Key Trustee Server sends wrong command in email notification

When you register a client, Key Trustee Server sends an email notification with a command to import the Key Trustee Server GPG key. The command uses the `hkps` protocol and port 80. The correct protocol is `hkps` and the correct port is 11371.

Enabling synchronous replication fails if `python-ordereddict` is not installed

On Key Trustee Server hosts where the `python-ordereddict` package is not installed, enabling synchronous replication fails, and the Passive Database role fails to start. The `stderr.log` file for the `DB_ACTIVE-setup` process (`/var/run/cloudera-scm-agent/process/ID-keytrustee_server-DB_ACTIVE-setup/logs/stderr.log`) contains the following error:

```
Traceback (most recent call last):
  File "aux/prop2x.py", line 14, in <module>
    from ordereddict import OrderedDict
ImportError: No module named ordereddict
```

Key Trustee Server does not respond to requests

On systems with low entropy, local fingerprint generation fails during setup, but Cloudera Manager reports no issues with the Key Trustee Server service. Subsequent attempts to use Key Trustee Server fail with an error similar to the following in the Key Trustee Server log:

```
2015-06-03 11:44:17,232 - keytrustee.server.webapp - ERROR - 'None' is not a valid

Cannot register a client with Key Trustee Server after registering GPG public key

After creating an organization, the organization administrator receives a link to register a GPG key. If the administrator registers the GPG key before any clients are registered with the organization, all subsequent registrations with that organization fail.

Cloudera Navigator Key Trustee Server Release Notes

Starting Key Trustee Server with `--daemonize` option fails

Starting Key Trustee Server with the command `keytrustee-server start --daemonize` fails with the following error:

```
2015-04-01 05:33:26,843 - cherrypy.error - ERROR - [01/Apr/2015:05:33:26] ENGINE Error
in 'start' listener <bound method Daemonizer.start of
<cherrypy.process.plugins.Daemonizer object at 0x1e71490>>
Traceback (most recent call last):
  File "/usr/lib/python2.6/site-packages/cherrypy/process/wspbus.py", line 197, in
publish
    output.append(listener(*args, **kwargs))
  File "/usr/lib/python2.6/site-packages/cherrypy/process/plugins.py", line 380, in
start
    si = open(self.stdin, "r")
IOError: [Errno 2] No such file or directory: '/tmp/stdout'
```

Starting Key Trustee Server when it is already running updates `keytrustee.pid` file

If you try to start Key Trustee Server when it is already running, the `/var/lib/keytrustee/.keytrustee/keytrustee.pid` file is updated with the new process ID (PID). The new process fails to start, but the `keytrustee.pid` retains the new PID, and `service` commands fail with the following error:

```
Traceback (most recent call last):
  File "/usr/bin/keytrustee-server", line 136, in <module>
    main()
  File "/usr/bin/keytrustee-server", line 131, in main
    status()
  File "/usr/bin/keytrustee-server", line 104, in status
    pid_file = ProcessIDInfo(ARGS.pidfile)
  File "/usr/lib/python2.6/site-packages/keytrustee/process.py", line 8, in __init__
    raise ex.KeytrusteeError('Invalid PID path: %s' % path)
keytrustee.exceptions.KeytrusteeError: Invalid PID path:
/var/lib/keytrustee/.keytrustee/keytrustee.pid
```

Starting Key Trustee Server while the port is in use fails silently

If you try to start Key Trustee Server while the port is in use (for example, due to a stale process or another process using the port), the process appears to start successfully, but ends shortly after with no indication to the user. The Key Trustee Server log contains the following error:

```
Traceback (most recent call last):
  File "/usr/lib/python2.6/site-packages/cherrypy/process/wspbus.py", line 235, in start
    self.publish('start')
  File "/usr/lib/python2.6/site-packages/cherrypy/process/wspbus.py", line 215, in
publish
    raise exc
ChannelFailures: IOError("Port 11371 not free on 'keytrustee01.example.com',")
```

Starting Key Trustee Server as a user other than `keytrustee` fails

Starting Key Trustee Server as a user other than `keytrustee` (for example, as `root` or another super user) fails.

Issues Fixed in Cloudera Navigator Key Trustee Server 5.4.9

Cannot register a client with Key Trustee Server after registering GPG public key

After creating an organization, the organization administrator receives a link to register a GPG key. If the administrator registers the GPG key before any clients are registered with the organization, all subsequent registrations with that organization fail.

Cloudera Bug: KT-1894

Issues Fixed in Cloudera Navigator Key Trustee Server 5.4.3

Key Trustee Server logs error GnuPG operation exited with return code=2

The Key Trustee Server log (`keytrustee.log`) includes error messages such as the following:

```
2014-12-30 04:23:22,166 - keytrustee.gnupg - ERROR - GnuPG operation exited with return
code=2:

    data = self._sock.recv(self._rbufsize)
timeout: timed out
```

Passive Database role sometimes fails to start when starting the Key Trustee Server service

Starting or restarting the Key Trustee Server service attempts to start the Active Database role and Passive Database role. If the Active Database has not completed starting up when the Passive Database attempts to start, the Passive Database fails to start.

For parcel-based installations, client and path environments must be manually configured

Users cannot use Key Trustee Server command-line utilities without configuring the path and setting environment variables.

Initializing high availability Key Trustee Servers fails if SSH communication fails

Initializing the active Key Trustee Server fails if the active Key Trustee Server cannot reach the passive Key Trustee Server over the default SSH port (22).

Cloudera Navigator Key Trustee Server Release Notes

Enabling synchronous replication for high availability Key Trustee Servers fails

Running the `ktadmin enable-synchronous-replication` command does not properly configure synchronous replication in Key Trustee Server 5.4.0.

Issues Fixed in Cloudera Navigator Key Trustee Server 5.4.0

Cannot configure Key HSM after upgrade

After upgrading Key Trustee Server and Key HSM, the `ktadmin keyhsm --server khsm01.example.com --trust` command fails with the following error:

```
TypeError: coercing to Unicode: need string or buffer, NoneType found
```

Cloudera Navigator Key HSM Release Notes

These release notes provide information on the new and changed features, known issues, and fixed issues for Cloudera Navigator Key HSM.

New Features and Changes in Cloudera Navigator Key HSM

The following sections describe what's new and changed in each Cloudera Navigator Key HSM release.

What's New in Cloudera Navigator Key HSM

The following sections describe what's new in each Cloudera Navigator Key HSM release.

What's New in Cloudera Navigator Key HSM 1.11.0

- Support for RHEL 7.4.
- Support for SafeNet KeySecure 8.7.0.

What's New in Cloudera Navigator Key HSM 1.10.0

- Support for RHEL 6.9.
- Support for CentOS 6.9.

What's New in Cloudera Navigator Key HSM 1.9.0

- There are no new features in Cloudera Navigator Key HSM 1.9.0.

What's New in Cloudera Navigator Key HSM 1.8.0

- Key HSM supports RHEL 6.8.
- The Key HSM keystore now uses a randomly-generated password. To specify a password, set `keyhsm.keystore.password.set` to `yes` in the `application.properties` file.

What's New in Cloudera Navigator Key HSM 1.7.0

- Key HSM can be started in debug mode with more verbose logging.
- Key HSM logging has been improved.
- A new HTTP endpoint has been added to test hardware security module (HSM) connectivity and functionality.

What's New in Cloudera Navigator Key HSM 1.6.0

- Log size and rollover limits are configurable.

A number of issues have also been fixed. See [Issues Fixed in Cloudera Navigator Key HSM 1.6.0](#) on page 2799.

What's New in Cloudera Navigator Key HSM 1.5.1

An issue has been fixed. See [Issues Fixed in Cloudera Navigator Key HSM 1.5.1](#) on page 2799.

What's New in Cloudera Navigator Key HSM 1.5.0

- Key HSM supports RHEL 7.
- Key HSM restricts key names to universally allowed character sets to prevent problems with key migration.

A number of issues have also been fixed. See [Issues Fixed in Cloudera Navigator Key HSM 1.5.0](#) on page 2799.

What's New in Cloudera Navigator Key HSM 1.4.0

- Key HSM can now be attached to a Key Trustee Server instance with existing deposits.

- Support for SafeNet KeySecure
- KeySecure can be configured for HTTPS during setup

A number of issues have also been fixed. See [Issues Fixed in Cloudera Navigator Key HSM 1.4.0](#) on page 2800.

Known Issues and Workarounds in Cloudera Navigator Key HSM

Key HSM Luna setup not showing the correct login status

When running the `keyhsm setup luna` command, you are prompted for the Luna HSM slot number and login password. Key HSM then attempts to log into the Luna HSM to verify these settings are correct. In some circumstances, the setup script reports that the login was successful, even if it failed.

Affected Version: 5.14.0

Fixed in Version: 5.16.0

Cloudera Bug: KT-6623

Workaround: Any incorrect settings will cause the Key HSM service to throw an exception upon startup and exit. If the Key HSM service does not start correctly, check the log for the message: "Unable to sign into Luna HSM server. Please rerun application with 'setup' option to configure password." If this message appears, re-run the `keyhsm setup luna` command, and enter the correct slot number and login password.

Roll key command throws an exception and cannot retrieve metadata for key

When using Key Trustee KMS with Key Trustee Server and Key HSM (backed by an HSM device), if there is significant (> 15 ms ping time) network latency between the Key Trustee Server and the HSM device, then EDEK generation errors can occur during the roll key operation. These errors manifest in the KMS log as errors on the `generateEncryptedKey` operation. The KMS will recover from these errors on its own, but they may represent a nuisance to the operator.

Affected Version: 5.14.0, 5.16.0

Cloudera Bug: KT-5646

Workaround: When these errors occur, you can use the `hadoop key list -metadata` command to confirm whether or not the key roll was successful, despite the error condition.

Keys with certain special characters cannot be migrated from Key Trustee Server to Key HSM

If any existing key names in Key Trustee Server use special characters other than hyphen (-), period (.), or underscore (_), or begin with non-alphanumeric characters, the migration to Key HSM fails.

Workaround: Decrypt any data using the affected key names, and re-encrypt it using a new key name without special characters, and retry the migration.

Upgrading Key HSM removes init script and binary

Upgrading Key HSM from 1.4.x to 1.5.x and higher removes the Key HSM init script and `/usr/bin/keyhsm` binary.

Workaround: Reinstall Key HSM:

```
$ sudo yum reinstall keytrustee-keyhsm
```

Key HSM cannot trust Key Trustee Server certificate if it has extended attributes

Key HSM cannot trust the Key Trustee Server certificate if it has extended attributes, and therefore cannot integrate with Key Trustee Server.

Workaround: Import the Key Trustee Server certificate to the Key HSM trust store using Java `keytool` instead of the `keyhsm trust` command.

Issues Fixed in Cloudera Navigator Key HSM

The following sections describe issues fixed in each Cloudera Navigator Key HSM release.

Issues Fixed in Cloudera Navigator Key HSM 1.11.0

Minor stability improvements.

Issues Fixed in Cloudera Navigator Key HSM 1.10.0

Minor stability improvements.

Issues Fixed in Cloudera Navigator Key HSM 1.9.0

Minor stability improvements.

Issues Fixed in Cloudera Navigator Key HSM 1.8.0

For new features in Key HSM 1.8.0, see [What's New in Cloudera Navigator Key HSM 1.8.0](#) on page 2797.

Issues Fixed in Cloudera Navigator Key HSM 1.7.0

Using Key HSM with SafeNet KeySecure over TLS fails

When Key HSM is integrated with SafeNet KeySecure over TLS, Key HSM stops communicating with KeySecure after a period of time.

Issues Fixed in Cloudera Navigator Key HSM 1.6.0

Key HSM fails to start if the HSM contains a large number of keys

If the HSM stores a large number (hundreds) of keys, Key HSM fails to start with a timeout error similar to the following:

```
SEVERE: Timeout attempting to start services.  
All services available:                :[ Failed ]
```

Key HSM logs do not roll over

Key HSM logs do not roll over, resulting in a log file that perpetually grows larger.

Issues Fixed in Cloudera Navigator Key HSM 1.5.1

Upgrading Key HSM removes init script

Upgrading Key HSM from 1.4.x to 1.5.x removes the Key HSM init script and `/usr/bin/keyhsm` binary. With this fix, future upgrades (from 1.5.1 to a higher release) do not experience this issue. To resolve the issue after upgrading to 1.5.x, reinstall Key HSM (`yum reinstall keytrustee-keyhsm`).

Issues Fixed in Cloudera Navigator Key HSM 1.5.0

Interrupting key migration from Key Trustee Server to Key HSM can result in lost data

Interrupting key migration (for example, using `Ctrl+C`) when integrating Key Trustee Server with Key HSM can result in data loss.

Issues Fixed in Cloudera Navigator Key HSM 1.4.0

Inserting deposits to Key HSM with Luna HSM logs stack trace

Inserting deposits to Key HSM using a Luna HSM logs the following stack trace to `keyhsm.log`:

```
SEVERE: -----Extended reason-----
Nov 21, 2014 4:39:11 PM com.cloudera.app.display.logging.AppLogger logInfo
INFO: com.safenetinc.luna.LunaCryptokiException.ThrowNew(LunaCryptokiException.java:66)

`service keyhsm trust` **only works with absolute path**

Running `service keyhsm trust cert_file` fails if `cert_file` is a relative path.

Key Trustee KMS Release Notes

These release notes provide information on the new and changed features, known issues, and fixed issues for Key Trustee KMS.

New Features in Key Trustee KMS

The following sections describe what's new in each Key Trustee KMS release.

Note: Release 5.4.3 is the only maintenance release of Key Trustee KMS 5.4.

Release 5.5.4 is the only maintenance release of Key Trustee KMS 5.5.

There is no Release 5.6 of Key Trustee KMS.

Releases 5.7.1 and 5.7.4 are the only maintenance releases of Key Trustee KMS 5.7.

Release 5.8.2 is the only maintenance release of Key Trustee KMS 5.8.

There is no maintenance release of Key Trustee KMS 5.9.

There is no maintenance release of Key Trustee KMS 5.10.

What's New in Key Trustee KMS

The following sections describe what's new in each Key Trustee KMS release.

What's New in Key Trustee KMS 5.16.0

There is a newly-documented feature that describes how to move a Key Trustee KMS proxy service role instance from an existing cluster host to another cluster host. For details, refer to [Migrating a Key Trustee KMS Server Role Instance to a New Host](#).

What's New in Key Trustee KMS 5.15.0

There is a new feature that provides logic to detect and warn users about a potential problem where the GPG private keys have not been properly synchronized across all Key Trustee KMS HA hosts. For details, refer to [Validating Private Key Synchronization \(Key Trustee KMS HA Only\)](#), [Enabling Key Trustee KMS High Availability](#), and [Key Trustee KMS Encryption Issues](#).

What's New in Key Trustee KMS 5.14.0

There is a new procedure for migrating from a Key Trustee KMS (KT KMS) to a Hardware Security Module KMS (HSM KMS). For details, refer to [Migrating from a Key Trustee KMS to an HSM KMS](#).

What's New in Key Trustee KMS 5.13.0

- Re-encryption of encrypted data encryption keys (EDEKs), which ensures the automated re-encryption of all datafiles, and helps companies avoid the cost in time and resource of copying, decrypting, and re-encrypting datafiles. New, or re-encrypted key versions apply to datafiles previously encrypted by earlier key versions.
- Support for RHEL 7.4
- Support for OEL 7.4

What's New in Key Trustee KMS 5.12.0

- The Key Trustee Parcel will no longer be released via archive.cloudera.com. The parcel will now be released via www.cloudera.com/downloads. Parcels already released on the archive site will continue to be available there.
- Support for RHEL 6.9

Key Trustee KMS Release Notes

- Support for OEL 6.9

What's New in Key Trustee KMS 5.11.0

- Support for SLES 12 SP2
- Support for Ubuntu 16.04

What's New in Key Trustee KMS 5.10.0

- Support for RHEL 7.3
- Support for OEL 7.3

What's New in Key Trustee KMS 5.9.0

- Support for RHEL 6.8
- Support for OEL 6.8
- Support for Debian 8.4
- Support for SLES 12 SP1

What's New in Key Trustee KMS 5.8.2

- An issue has been fixed. See [Issues Fixed in Key Trustee KMS 5.8.2](#) on page 2806.

What's New in Key Trustee KMS 5.8.0

- Support for Debian 8.2
- When adding the parcel-based Key Trustee KMS service for the first time, Cloudera Manager automatically backs up Key Trustee KMS locally.
- The Key Trustee KMS backup script (`ktbackup.sh`) adds a new option, `--roll`, which specifies the number of backups to retain.
- When Key Trustee Server is configured for high availability, adding the Key Trustee KMS service in Cloudera Manager automatically configures round robin DNS load balancing.

What's New in Key Trustee KMS 5.7.4

- An issue has been fixed. See [Issues Fixed in Key Trustee KMS 5.7.4](#) on page 2807.

What's New in Key Trustee KMS 5.7.1

- An issue has been fixed. See [Issues Fixed in Key Trustee KMS 5.7.1](#) on page 2807.

What's New in Key Trustee KMS 5.7.0

- Support for RHEL 7.2
- Support for OEL 5.11, 7.2
- Support for SLES 11 SP4
- Support for Debian 7.8
- A backup script (`ktbackup.sh`) is included with Key Trustee KMS.

What's New in Key Trustee KMS 5.5.4

- A number of issues have been fixed. See [Issues Fixed in Key Trustee KMS 5.5.4](#) on page 2807.

What's New in Key Trustee KMS 5.5.0

- Rolling restart works with Key Trustee KMS high availability.
- When running Key Trustee KMS in a highly available configuration, Cloudera Manager can automatically generate the load balancer URL.

What's New in Key Trustee KMS 5.4.3

- A passive Key Trustee Server can be added to the Key Trustee KMS configuration using Cloudera Manager.

- An issue has also been fixed. See [Issues Fixed in Key Trustee KMS 5.4.3](#) on page 2808.

Known Issues and Workarounds in Key Trustee KMS

CDH upgrade failure

When upgrading to Key Trustee KMS 5.15.0 or 5.15.1 from Key Trustee KMS 5.14.0 or lower, *and* performing a rolling restart (instead of a full restart), the first Key Trustee KMS instance to restart may fail to come up and present the error:

```
"Unable to verify private key match between KMS hosts. If the system has been recently upgraded, DO NOT TAKE FURTHER ACTION and contact your support representative as soon as possible. If this is a new installation, verify private key files have been synched between all KMS hosts. Aborting to prevent data inconsistency."
```

Affected Versions: 5.15.0, 5.15.1

Fixed in Version: 5.16.0

Cloudera Bug: KT-6499

Workaround: If possible, perform a full restart instead of a rolling restart.

If you cannot execute a full restart, then add the following line to the `/var/lib/kms-keytrustee/keytrustee/.keytrustee/keytrustee.conf` file on all Key Trustee KMS instances, and then restart the Key Trustee KMS that failed:

```
"FINGERPRINT_VALIDATED" : "True"
```

Error when enabling Key Trustee KMS HA mode

When a new Key Trustee KMS instance is added to an existing Key Trustee KMS service, the new instance may initially fail to start up and return the error message:

```
Unable to verify private key match between KMS hosts.
```

This error will be corrected automatically after the GPG private keys are synchronized and the KMS service is restarted to pick up the new configuration. No user intervention is required.

Affected Versions: 5.15.0

Fixed in Version: 5.16.0

Cloudera Bug: KT-6471

Workaround: None.

Validation fails if `hostname` command returns `shortname`

If the `hostname` command on the OS returns `shortname`, and the `core-site.xml` of the KMS process has a `hadoop.security.key.provider.path` with a fully qualified domain name (FQDN), then the `znodes` will be created with the `shortname`. Consequently, when KMS 1 checks the fingerprint of KMS 2, it will expect the FQDN as the `znode`, and fail the validation.

Affected Versions: 5.15.0

Fixed in Version: 5.15.1

Cloudera Bug: KT-6412

Workaround: In `/var/lib/kms-keytrustee/keytrustee/.keytrustee/keytrustee.conf`, change the value of `FINGERPRINT_VALIDATED` from `True` to `False`.

Incorrect default KMS ACL values allow remote access to purge and undelete API calls on encryption zone keys

The Navigator Key Trustee KMS includes two API calls in addition to those in Apache Hadoop KMS: `purge` and `undelete`. The KMS ACL values for these commands are `keytrustee.kms.acl.PURGE` and `keytrustee.kms.acl.UNDELETE`, respectively. The default value for the ACLs in Key Trustee KMS 5.12.0 and 5.13.0 is `"*`", which allows anyone who knows the name of an encryption zone key and has network access to the Key Trustee KMS to make those calls against known encryption zone keys. The `UNDELETE` command will result in the recovery of a previously deleted, but not purged, key. The key will still be protected by normal ACLs and is not exposed. The `PURGE` command will permanently delete a key in active use, resulting in loss of access to encrypted HDFS data.

Affected Versions:

- Navigator Key Trustee KMS 5.12.0, 5.13.0
- Cloudera Manager 5.12.0, 5.12.1, 5.12.2
- Cloudera Manager 5.13.0, 5.13.1

Fixed in Version: 5.14.0

Cloudera Bug: DOCS-2910

Workaround: Use Cloudera Manager to set the values of the ACLs for `purge` (`keytrustee.kms.acl.PURGE`) and `undelete` (`keytrustee.kms.acl.UNDELETE`) to be empty; this denies access to all calls to those functions.

To set the values:

1. Log into Cloudera Manager as an administrative user.
2. Click on the **Key Trustee KMS** service.
3. Click on **Configuration**.
4. In the Search box, type "ACL".
5. At the bottom of the section **Key Management Server Proxy Advanced Configuration Snippet (Safety Valve) for kms-acls.xml** add a new ACL by clicking the + icon.
6. In the **Name** field add "keytrustee.kms.acl.PURGE".
7. Repeat step 5, and in the **Name** field add "keytrustee.kms.acl.UNDELETE".
8. Scroll to the bottom of the page and click **Save**.
9. Use Cloudera Manager to perform a rolling restart of the Navigator Key Trustee KMS service.

Note: If there is only one instance of Navigator Key Trustee KMS, then restarting the service may result in delayed or failed jobs waiting on an encryption zone key. If a job fails, then rerun the job after the single instance of Navigator Key Trustee KMS has restarted.

Cannot re-encrypt an encryption zone if a previous re-encryption on it was canceled

When canceling a re-encryption on an encryption zone, the status of the re-encryption may continue to show "Processing". When this occurs, future re-encrypt commands for this encryption zone will fail inside the NameNode, and the re-encryption will never complete.

Affected Version: 5.13.0

Fixed Version: 5.13.1

Cloudera Bug: CDH-59073

Workaround: To halt, or remove the "Processing" status for the encryption zone, re-issue the cancel re-encryption command on the encryption zone. If a new re-encryption command is required for this encryption zone, restart the NameNode before issuing the command.

Adding Key Trustee KMS 5.4 to Cloudera Manager 5.5 displays warning

Adding the Key Trustee KMS service to a CDH 5.4 cluster managed by Cloudera Manager 5.5 displays the following message, even if Key Trustee KMS is installed:

"The following selected services cannot be used due to missing components: keytrustee-keyprovider. Are you sure you wish to continue with them?"

Affected Version: 5.4

Workaround: Verify that the Key Trustee KMS parcel or package is installed and click **OK** to continue adding the service.

The Key Trustee KMS service fails to start if the Trust Store is configured without also configuring the Keystore

If you configure the Key Trustee KMS service **Key Management Server Proxy TLS/SSL Certificate Trust Store File** and **Key Management Server Proxy TLS/SSL Certificate Trust Store Password** parameters without also configuring the **Key Management Server Proxy TLS/SSL Server JKS Keystore File Location** and **Key Management Server Proxy TLS/SSL Server JKS Keystore File Password** parameters, the Key Trustee KMS service does not start.

Workaround: Configure all Trust Store and Keystore parameters.

Key Trustee KMS backup script fails if PostgreSQL versions lower than 9.3 are installed

If PostgreSQL versions lower than 9.3 are installed on the Key Trustee KMS host, the `ktbackup.sh` script fails with an error similar to the following:

```
pg_dump: server version: 9.3.11; pg_dump version: 9.2.14
pg_dump: aborting because of server version mismatch
```

Workaround: Uninstall the lower PostgreSQL version.

Issues Fixed in Key Trustee KMS

The following sections describe issues fixed in each Key Trustee KMS release.

Note: Release 5.4.3 is the only maintenance release of Key Trustee KMS 5.4.

Release 5.5.4 is the only maintenance release of Key Trustee KMS 5.5.

There is no Release 5.6 of Key Trustee KMS.

Releases 5.7.1 and 5.7.4 are the only maintenance releases of Key Trustee KMS 5.7.

Release 5.8.2 is the only maintenance release of Key Trustee KMS 5.8.

There is no maintenance release of Key Trustee KMS 5.9.

There is no maintenance release of Key Trustee KMS 5.10.

Issues Fixed in Key Trustee KMS 5.16.0

CDH upgrade failure

When upgrading to Key Trustee KMS 5.15.0 or 5.15.1 from Key Trustee KMS 5.14.0 or lower, *and* performing a rolling restart (instead of a full restart), the first Key Trustee KMS instance to restart may fail to come up and present an error.

Cloudera Bug: KT-6499

Error when enabling Key Trustee KMS HA mode

When a new Key Trustee KMS instance is added to an existing Key Trustee KMS service, the new instance may initially fail to start up and return the error message:

```
Unable to verify private key match between KMS hosts.
```

This error will be corrected automatically after the GPG private keys are synchronized and the KMS service is restarted to pick up the new configuration. No user intervention is required.

Cloudera Bug: KT-6471

Issues Fixed in Key Trustee KMS 5.15.1

Validation fails if `hostname` command returns `shortname`

If the `hostname` command on the OS returns `shortname`, and the `core-site.xml` of the KMS process has a `hadoop.security.key.provider.path` with a fully qualified domain name (FQDN), then the `znodes` will be created with the `shortname`. Consequently, when KMS 1 checks the fingerprint of KMS 2, it will expect the FQDN as the `znode`, and fail the validation.

Issues Fixed in Key Trustee KMS 5.15.0

For new features in Key Trustee KMS 5.15.0, see [What's New in Key Trustee KMS 5.15.0](#) on page 2801.

Issues Fixed in Key Trustee KMS 5.14.0

For new features in Key Trustee KMS 5.14.0, see [What's New in Key Trustee KMS 5.14.0](#) on page 2801.

Issues Fixed in Key Trustee KMS 5.13.1

Cannot re-encrypt an encryption zone if a previous re-encryption on it was canceled

When canceling a re-encryption on an encryption zone, the status of the re-encryption would remain at "Processing". When this occurred, future re-encrypt commands for this encryption zone failed inside the NameNode, and the re-encryption never completed. This issue has been fixed.

Issues Fixed in Key Trustee KMS 5.13.0

For new features in Key Trustee KMS 5.13.0, see [What's New in Key Trustee KMS 5.13.0](#) on page 2801.

Issues Fixed in Key Trustee KMS 5.12.0

For new features in Key Trustee KMS 5.12.0, see [What's New in Key Trustee KMS 5.12.0](#) on page 2801.

Issues Fixed in Key Trustee KMS 5.11.0

For new features in Key Trustee KMS 5.11.0, see [What's New in Key Trustee KMS 5.11.0](#) on page 2802.

Issues Fixed in Key Trustee KMS 5.10.0

For new features in Key Trustee KMS 5.10.0, see [What's New in Key Trustee KMS 5.10.0](#) on page 2802.

Issues Fixed in Key Trustee KMS 5.9.0

For new features in Key Trustee KMS 5.9.0, see [What's New in Key Trustee KMS 5.9.0](#) on page 2802.

Issues Fixed in Key Trustee KMS 5.8.2

KMS does not fail over to Passive Key Trustee Server in some network failure scenarios

In some situations, if the Active Key Trustee Server is unreachable on the network, Key Trustee KMS does not fail over to the Passive Key Trustee Server.

Cloudera Bug: KT-3289

Issues Fixed in Key Trustee KMS 5.8.0

For new features in Key Trustee KMS 5.8.0, see [What's New in Key Trustee KMS 5.8.0](#) on page 2802.

Issues Fixed in Key Trustee KMS 5.7.4

KMS does not fail over to Passive Key Trustee Server in some network failure scenarios

In some situations, if the Active Key Trustee Server is unreachable on the network, Key Trustee KMS does not fail over to the Passive Key Trustee Server.

Cloudera Bug: KT-3289

Issues Fixed in Key Trustee KMS 5.7.1

KMS ACLs read from wrong file

The UNDELETE and PURGE ACL entries were being read from `kms-site.xml` instead of `kms-acls.xml`.

Cloudera Bug: KT-2857

Issues Fixed in Key Trustee KMS 5.7.0

For new features in Key Trustee KMS 5.7.0, see [What's New in Key Trustee KMS 5.7.0](#) on page 2802.

Issues Fixed in Key Trustee KMS 5.5.4

Key Trustee KMS configuration file and keys are stored in a volatile location

If the Key Trustee KMS 5.5.0 parcel is deactivated, any existing GPG keys are also deactivated. If the parcel is then reactivated, new GPG keys (used to create an authenticated and private communication channel with the Key Trustee Server) are generated. The existing GPG keys that were in use before the deactivation are not lost; however, they become inactive. If remedial action is not taken before deactivation, this can result in a loss of access to HDFS Encryption Zone keys generated with the older set of GPG keys. This in turn leads to loss of access to all data in all encryption zones. As long as the Key Trustee KMS parcel directory is not deleted, access can be restored. Assistance from Cloudera Support may be required. See [TSB 2016-121](#) for more information (requires login to the Cloudera Support Portal).

Cloudera Bug: KT-2460

KMS ACLs read from wrong file

The UNDELETE and PURGE ACL entries were being read from `kms-site.xml` instead of `kms-acls.xml`.

Cloudera Bug: KT-2858

Issues Fixed in Key Trustee KMS 5.5.0

Key Trustee KMS intermittently fails to start due to permission issues

Key Trustee KMS sometimes fails to start with the following error:

```
java.io.IOException: TrusteeKeyProvider initialization failed.
    at
    com.cloudera.keytrustee.TrusteeKeyProvider.createInitialClient(TrusteeKeyProvider.java:212)

    at com.cloudera.keytrustee.TrusteeKeyProvider.<init>(TrusteeKeyProvider.java:114)
    at com.cloudera.keytrustee.TrusteeKeyProvider.<init>(TrusteeKeyProvider.java:86)
    [...]
Caused by: java.io.FileNotFoundException:
/var/lib/kms-keytrustee/keytrustee/.keytrustee/keytrustee.conf (Permission denied)
    at java.io.FileOutputStream.open(Native Method)
    at java.io.FileOutputStream.<init>(FileOutputStream.java:221)
```

Key Trustee KMS Release Notes

```
at java.io.FileOutputStream.<init>(FileOutputStream.java:171)
at
com.cloudera.keytrustee.impl.ClientFactoryImpl.createNewClient(ClientFactoryImpl.java:129)
... 30 more
```

Key Trustee KMS starts up successfully even if it cannot contact the Key Trustee Server

Key Trustee KMS starts successfully when it cannot connect to the Key Trustee Server, instead of properly failing to start.

Issues Fixed in Key Trustee KMS 5.4.3

[Host Component page display](#)

The Host Component page now displays the package version for the KMS Trustee Key Provider.

Cloudera Bug: OPSAPS-25692

Cloudera Navigator HSM KMS Release Notes

These release notes provide information on the new and changed features, known issues, and fixed issues for Cloudera Navigator HSM KMS.

New Features and Changes in Cloudera Navigator HSM KMS

The following sections describe what's new and changed in each Cloudera Navigator HSM KMS release.

What's New in Cloudera Navigator HSM KMS

The following section describes what's new in this Cloudera Navigator HSM KMS release.

What's New in Cloudera Navigator HSM KMS 5.15.0

This release of Cloudera Navigator HSM KMS does not include new features or functionality.

What's New in Cloudera Navigator HSM KMS 5.14.0

This release of Cloudera Navigator HSM KMS provides the following new functionality:

- When an enterprise requires the highest level of encryption zone key (EZ key) security, or, it must adhere to strict security certification compliance standards, users now have the option of migrating from a Key Trustee KMS (KT KMS) to a Hardware Security Module KMS (HSM KMS). Migrating from KT KMS to HSM KMS essentially means that EZ key metadata is moved from one KMS to another. For details, see [Migrating from a Key Trustee KMS to an HSM KMS](#).

What's New in Cloudera Navigator HSM KMS 5.13.0

This release of Cloudera Navigator HSM KMS provides the following new functionality:

- Support for RHEL 7.4.

What's New in Cloudera Navigator HSM KMS 5.12.0

This is the first release of the new Cloudera Navigator HSM KMS. The new component provides:

- HSM KMS backed by Thales HSM is a custom Key Management Server (KMS) that uses a supported Thales HSM as the underlying keystore, instead of the file-based Java KeyStore (JKS) used by the default Hadoop KMS.
- Navigator HSM KMS backed by Luna HSM is a custom Key Management Server (KMS) that uses a supported Luna HSM as the underlying keystore, instead of the file-based Java KeyStore (JKS) used by the default Hadoop KMS.

Known Issues and Workarounds in Cloudera Navigator HSM KMS

HSM KMS `get_keys` returns wrong number of keys even though creation of one key failed

If the HSM KMS is left running while its local HSM KMS Metastore is stopped, then commands that attempt to write to the metastore (such as `create key`, `roll key`, and `delete key`) will fail (expected behavior). However, commands that retrieve key metadata and/or key material (such as `key list`) may appear to succeed, but can return incorrect results (for example, an empty key list when there are extant keys) due to cache invalidation without the ability to refresh the cache from the metastore.

Affected Versions: 5.12.0, 5.13.0, 5.14.0, 5.15.0, 5.16.0

Cloudera Bug: KT-5060

Workaround: None

"Exception in generateEncryptedKeys" error in HSM KMS log file after key migration

During the migration of encryption zone keys from a KT KMS to an HSM KMS, you may see errors related to the `generateEncryptedKeys` call (this operation populates the EDEK cache) on the HSM KMS node that is not running the migration. These errors will not prevent the migration operation from completing and will not cause ongoing problems after migration completes.

Affected Version: 5.14.0, 5.15.0, 5.16.0

Cloudera Bug: KT-5672

Workaround: None

KT KMS migration to HSM KMS fails if a key is not found on HSM

When using Key Trustee KMS with Key Trustee Server and Key HSM (backed by an HSM device), if a key version is deleted on the HSM device directly without also deleting and purging that key version on the Key Trustee KMS, then attempts to migrate from the KT KMS to the HSM KMS will fail.

Affected Version: 5.14.0, 5.15.0, 5.16.0

Cloudera Bug: KT-5671

Workaround: None

Timeout error during encryption zone key creation

There are situations where the key cache is synchronously populated to capacity during the create encryption zone operation. The expected behavior is that the key cache is synchronously populated only to the low watermark level (the rest of the keys should be created asynchronously).

Affected Version: 5.13.0, 5.14.0, 5.15.0, 5.16.0

Cloudera Bug: KT-5296

Workaround: On the HSM KMS, in the field **HSM KMS Proxy Advanced Configuration Snippet (Safety Valve)** for `kms-site.xml`:

- `hadoop.security.kms.encrypted.key.cache.low.watermark .05`
- `hadoop.security.kms.encrypted.key.cache.size 30`

On the HDFS, in the field **HDFS Cluster-wide Advanced Configuration Snippet (Safety Valve)** for `core-site.xml`:

- `hadoop.security.kms.client.encrypted.key.cache.size 30`
- `hadoop.security.kms.client.encrypted.key.cache.low-watermark .05`

Key description is not synchronized with the second metastore

If the `description` option is specified as the argument in a Hadoop `key create` command, then the description information is stored only on the KMS instance that responds to the create request. The description metadata is not synchronized to the other KMS instances in the role group. This does not affect normal key operations.

Affected Version(s): 5.12.0

Fixed Version: 5.12.1

Cloudera Bug: KT-5042

Workaround: Use the `-provider` argument on the key list operation to target key queries to a specific KMS instance.

HSM KMS Luna may need to be restarted if inactive for extended period

If Hadoop key operations return `com.safenetinc.luna.exception.LunaCryptokiException` after the KMS has been running without activity for an extended period time, the Luna session may have been dropped.

Affected Version(s): 5.12.0, 5.13.0, 5.14.0, 5.15.0, 5.16.0

Cloudera Bug: KT-5018

Workaround: Restart the KMS service.

[Creating multiple instances of HSM KMS on the same host and port causes an error upon delete](#)

Creating a KMS role instance on a host that previously hosted a KMS role instance in the same role group that had its data directories deleted results in errors when attempting to run Hadoop `key delete` operations.

Affected Version(s): 5.12.0, 5.13.0, 5.14.0, 5.15.0, 5.16.0

Cloudera Bug: KT-4992

Workaround: This workaround requires the assistance of Cloudera support; request assistance with issue KT-4992

[Incorrect status for "Restart stale services" step in HDFS encryption wizard post-service installation](#)

There are times when completion of the HDFS Encryption Wizard does not show an active "Restart stale services and redeploy client configuration" link.

Affected Version(s): 5.12.0, 5.13.0, 5.14.0, 5.15.0, 5.16.0

Cloudera Bug: KT-4987

Workaround: Refresh the page and the link should become active.

[The encryption wizard continues to fail if there is a failure during initial configuration run](#)

The encryption wizard continues to fail if there was a failure during the initial run configuring HSM KMS.

Affected Version(s): 5.12.0, 5.13.0, 5.14.0, 5.15.0, 5.16.0

Cloudera Bug: KT-4909

Workaround: Open Cloudera Manager in another browser tab, and manually stop the installed KMS by clicking the arrow next to the KMS and selecting **Stop**. Then retry the installation in the new tab after correcting the cause of the install failure.

[Before installing the Thales backed HSM KMS, you must add the KMS user to the `nfast` group](#)

After installation of the Thales HSM client, and before installing Navigator HSM KMS backed by Thales HSM, you must add the KMS user to the `nfast` group..

Affected Version(s): 5.12.0, 5.13.0, 5.14.0, 5.15.0, 5.16.0

Cloudera Bug: KT-4618

Workaround: Run the following command to manually add the KMS user to the `nfast` group:
`usermod -a -G nfast kms`

Issues Fixed in Cloudera Navigator HSM KMS

The following section describe issues fixed in each HSM KMS release.

Issues Fixed in Cloudera Navigator HSM KMS 5.15.0

For details about what is new in this release, see [What's New in Cloudera Navigator HSM KMS 5.15.0](#) on page 2809.

Issues Fixed in Cloudera Navigator HSM KMS 5.14.0

For details about what is new in this release, see [New Features and Changes in Cloudera Navigator HSM KMS](#) on page 2809.

Issues Fixed in Cloudera Navigator HSM KMS 5.13.0

Failure creating keys after Metastore restart.

Previously, stopping or restarting the HSM KMS Metastore role while the HSM KMS Proxy role remained running resulted in stale metastore connections and errors such the following: "FATAL: terminating connection due to administrator command."

Cloudera Bug: KT-4912

Issues Fixed in Cloudera HSM KMS 5.12.1

Key version number information now reported correctly by Hadoop `key list -metadata` operation after key roll.

Previously, after the key roll operation, the key's version number remained the same. Now, rather than returning a hard-coded version number on keys loaded from metastore, that information is returned dynamically.

Cloudera Bug: KT-5044

Key description is not synchronized with the second metastore

When the description option was specified as the argument in a Hadoop `key create` command, then the description information was stored only on the KMS instance that responded to the create request. The description metadata was not synchronized to the other KMS instances in the role group. This issue did not affect normal key operations.

Cloudera Bug: KT-5042

Issues Fixed in Cloudera Navigator HSM KMS 5.12.0

This is the first release of Cloudera Navigator HSM KMS and consequently, there are no fixed issues. For details about what is new in this release, see [New Features and Changes in Cloudera Navigator HSM KMS](#) on page 2809.

Cloudera Navigator Encrypt Release Notes

These release notes provide information on the new and changed features, known issues, and fixed issues for Cloudera Navigator Encrypt.

New Features and Changes in Cloudera Navigator Encrypt

The following sections describe what's new and changed in each Cloudera Navigator Encrypt release.

What's New in Cloudera Navigator Encrypt

The following sections describe what's new in each Cloudera Navigator Encrypt release.

What's New in Cloudera Navigator Encrypt 3.16.0

- Support for RHEL/CentOS 7.5 including kernel version 3.10.0-862.14.4

What's New in Cloudera Navigator Encrypt 3.15.1

- Support for RHEL/CentOS 7.5 up to but not including kernel version 3.10.0-862.14.4

What's New in Cloudera Navigator Encrypt 3.15.0

- Support for SLES 12 SP3

What's New in Cloudera Navigator Encrypt 3.14.0

- The `navencrypt exec` command option has been deprecated.
- Support for RHEL 7.4
- Support for OEL 7.4

What's New in Cloudera Navigator Encrypt 3.13.0

- Support for RHEL 6.9
- Support for CentOS 6.9
- Navigator Encrypt now supports preparing devices using a UUID, in addition to device name. This UUID is simply a symbolic link to the actual device, and is created when preparing a device with Navigator Encrypt during a `navencrypt-prepare` operation.

What's New in Cloudera Navigator Encrypt 3.12.0

- Support for SLES 12 SP2
- Support for Ubuntu 16.04

What's New in Cloudera Navigator Encrypt 3.11.0

- Support for RHEL 6.8, 7.3
- Support for SLES 12 SP1

What's New in Cloudera Navigator Encrypt 3.10.0

- Support for OEL 7.2
- Several new commands have been added:
 - `navencrypt-collect` displays environment information for troubleshooting. For more information, see [Collecting Navigator Encrypt Environment Information](#).
 - `navencrypt-move --list-categories` lists existing categories.

Cloudera Navigator Encrypt Release Notes

- `navencrypt restore-control-file` restores the `/etc/navencrypt/control` file from Key Trustee Server.
- `navencrypt status --integrity` validates the Navigator Encrypt configuration.
- Access control list (ACL) policy files now support comments.

What's New in Cloudera Navigator Encrypt 3.9.0

- Support for RHEL 7.2
- Support for SLES 11 SP4
- Support for Debian 7.8
- Support for Ubuntu 14.04.3

An issue has also been fixed. See [Issues Fixed in Cloudera Navigator Encrypt 3.9.0](#) on page 2817.

What's New in Cloudera Navigator Encrypt 3.8.0

- Support for RHEL 7.1
- Support for automatically mounting loop devices on boot
- Automatic failover for high availability Key Trustee Servers
- The ability to restore deleted local mount encryption keys (MEKs) from Key Trustee Server by UUID

What's New in Cloudera Navigator Encrypt 3.7.1

- A number of issues have been fixed. See [Issues Fixed in Cloudera Navigator Encrypt 3.7.1](#) on page 2818.

What's New in Cloudera Navigator Encrypt 3.7.0

- Migration utility to migrate zNcrypt to Cloudera Navigator Encrypt

What's Changed in Cloudera Navigator Encrypt

The following sections describe what's changed in each Cloudera Navigator Encrypt release.

What's Changed in Cloudera Navigator Encrypt 3.8.0

- The kernel module is renamed from `zncrypt-kernel-module` to `navencrypt-kernel-module`.

Known Issues and Workarounds in Cloudera Navigator Encrypt

Navigator Encrypt will not build on RHEL kernel 3.10.0-862.14.4

The Navigator Encrypt kernel module will not build on RHEL kernel 3.10.0-862.14.4. This impacts new installations, and existing installations that are upgrading to kernel 3.10.0-862.14.4. This issue prevents the `navencrypt-mount` service from running and Navigator Encrypt mount points from being accessible.

Affected Versions: 3.15.1

Fixed in Version: 3.16.0

Cloudera Bug: KT-6677

Workaround: Upgrade to Navigator Encrypt 3.16.0 before upgrading to RHEL kernel 3.10.0-862.14.4.

Interactive console does not support UUID and datastore options

The Interactive console does not support UUID (3.13 and later) and datastore options (3.14.0 and earlier).

Affected Versions: Navigator Encrypt versions 3.6, 3.7, 3.8, 3.9, 3.10, 3.11, 3.12, 3.13, 3.14, 3.15, 3.16.

Fixed in Version: None

Cloudera Bug: DOCS-2505

Workaround: None.

The Navigator Encrypt `-exec` option does not work.

The `navencrypt -exec` command option does not work.

Affected Versions: Navigator Encrypt versions 3.6, 3.7, 3.8, 3.9, 3.10, 3.11, 3.12, 3.13

Fixed in Version: Navigator Encrypt 3.14.0 (option deprecated)

Cloudera Bug: KT-5113

Workaround: Execute a temporal command such as `cp /data/encrypted /destination/path` to temporarily add the process (for example, `cp`) to the ACLs.

Navigator Encrypt progress bar random display anomaly

When running the `navencrypt-move` command, the graphic display of progress randomly breaks. This display anomaly does *not* impact the move operation and there is no data loss. This is a graphic display issue only, and is not related to the `move` command operation being performed.

When the display issue occurs, it appears as follows:

```
Moving from: '/local/mnt/navencrypt/mount/mysql/local/mnt/mis/mysql/2net_kernel'
Moving to: '/local/mnt/mis/mysql/2net_kernel'
100% [====/usr/sbin/navencrypt-move: line 462: printf: write error: Interrupted system
call
100% [=====>] [ 72.06 GB]
```

Affected Versions: CDH: 5.3.0, 5.4.0, 5.5.0, 5.6.0, 5.7.0, 5.8.0, 5.9.0, 5.10.0, 5.11.0, 5.12.0/Navigator Encrypt: 3.6, 3.7, 3.8, 3.9, 3.10, 3.11, 3.12, 3.13

Fixed in Version: CDH 5.15.0/Navigator Encrypt 3.15

Cloudera Bug: KT-5093

Workaround: None.

The `navencrypt status --integrity` command does not detect loop devices properly

Running the `navencrypt status --integrity` command on a system using a loop device incorrectly reports that the backing file does not exist.

Affected Versions: CDH 5.8.0/Navigator Encrypt 3.10.

Fixed in Version: CDH 5.10.0/Navigator Encrypt 3.11.

Cloudera Bug: KT-3174

Workaround: None.

Navigator Encrypt 3.12 and earlier does not support specific kernels

Versions of Navigator Encrypt 3.12 and earlier do not support the following kernels:

- 3.10.0-514.2.2.el7.x86_64
- 3.10.0-514.16.1.el7.x86_64
- 3.10.0-514.10.2.el7.x86_64

Note that this is not specific to a particular platform; rather, it is specific only to the kernels listed here.

Affected Versions: CDH 5.9.0/Navigator Encrypt: 3.6, 3.7, 3.8, 3.9, 3.10, 3.11, 3.12

Fixed in Version: CDH 5.11.0/Navigator Encrypt 3.13

Cloudera Bug: KT-4727

Cloudera Navigator Encrypt Release Notes

Workaround: Use a kernel other than those listed here.

The Navigator Encrypt kernel module does not build on Ubuntu 14.04.04

The Navigator Encrypt kernel module does not build on Ubuntu 14.04.04 (kernel version 4.2).

Affected Versions: CDH 5.7.0/Navigator Encrypt 3.9

Fixed in Version: CDH 5.8.0/Navigator Encrypt 3.10

Cloudera Bug: KT-2544

Workaround: None.

Using `screen` utility with Cloudera Navigator Encrypt does not work

Running Cloudera Navigator Encrypt commands within the Linux `screen` utility does not work correctly.

Affected Versions: CDH: 5.3, 5.4.0

Fixed in Version: CDH 5.4.9, 5.5.0

Cloudera Bug: KT-1971

Workaround: None.

Sophos antivirus is not compatible with Cloudera Navigator Encrypt

Kernel panics have been observed on machines running both Sophos antivirus and Cloudera Navigator Encrypt.

Affected Versions: CDH: 5.3, 5.4, 5.5, 5.6

Fixed in Version: CDH 5.7.x

Cloudera Bug: KT-3098

Workaround: None. Do not use Sophos antivirus in conjunction with Cloudera Navigator Encrypt.

Cloudera Navigator Encrypt crashes in Docker container

Cloudera Navigator Encrypt crashes when run in a Docker container.

Affected Versions: CDH: 5.3, 5.4, 5.5, 5.6

Fixed in Version: CDH 5.7.x

Cloudera Bug: KT-3098

Workaround: None. Do not use Cloudera Navigator Encrypt with Docker.

Issues Fixed in Cloudera Navigator Encrypt

The following sections describe issues fixed in each Cloudera Navigator Encrypt release.

Issues Fixed in Cloudera Navigator Encrypt 3.16.0

See [New Features and Changes in Cloudera Navigator Encrypt](#) on page 2813 for new features in Cloudera Navigator Encrypt 3.16.0.

Issues Fixed in Cloudera Navigator Encrypt 3.15.0

See [New Features and Changes in Cloudera Navigator Encrypt](#) on page 2813 for new features in Cloudera Navigator Encrypt 3.15.0.

Issues Fixed in Cloudera Navigator Encrypt 3.14.0

See [New Features and Changes in Cloudera Navigator Encrypt](#) on page 2813 for new features in Cloudera Navigator Encrypt 3.14.0.

Issues Fixed in Cloudera Navigator Encrypt 3.13.0

See [New Features and Changes in Cloudera Navigator Encrypt](#) on page 2813 for new features in Cloudera Navigator Encrypt 3.13.0

Issues Fixed in Cloudera Navigator Encrypt 3.12.2

Cryptsetup Password Quality Check Skipped

The Navigator Encrypt `prepare` operation was failing on systems running RHEL 7.x because the 'Password quality check' of `cryptsetup` was enabled by default. It is possible that this could impact other operating systems.

The `navencrypt-prepare` command now skips the 'Password quality check' whenever it is enabled by default. This update has been implemented for all distributions supported by Navigator Encrypt.

Build `makefile` Fix

This patch fixes the build `makefile` and supports for following kernels:

- 3.10.0-514.2.2.el7.x86_64
- 3.10.0-514.16.1.el7.x86_64
- 3.10.0-327.el7.x86_64
- 3.10.0-514.10.2.el7.x86_64

Issues Fixed in Cloudera Navigator Encrypt 3.12.0

See [What's New in Cloudera Navigator Encrypt 3.12.0](#) on page 2813 for new features in Cloudera Navigator Encrypt 3.12.0.

Issues Fixed in Cloudera Navigator Encrypt 3.11.0

See [What's New in Cloudera Navigator Encrypt 3.11.0](#) on page 2813 for new features in Cloudera Navigator Encrypt 3.11.0.

Issues Fixed in Cloudera Navigator Encrypt 3.10.0

See [What's New in Cloudera Navigator Encrypt 3.10.0](#) on page 2813 for new features in Cloudera Navigator Encrypt 3.10.0.

Issues Fixed in Cloudera Navigator Encrypt 3.9.0

The software-signing GPG key is missing from the repository tarball for Navigator Encrypt

The GPG key used to sign the Navigator Encrypt packages is missing from the repository tarball, and must be imported from `archive.gazzang.com`.

Cloudera Bug: KT-2207

Issues Fixed in Cloudera Navigator Encrypt 3.8.0

Encrypting or decrypting a file or folder with a space in the name generates extraneous message

Running `navencrypt-move` to encrypt or decrypt a file or folder with a space in the name generates the following message at the command line:

```
/usr/sbin/navencrypt-move: line 233: [: /root/encrypt: binary operator expected
```

This message can be safely ignored.

Cloudera Bug: KT-1335

Running `navencrypt-move` twice on the same file does not fail properly

Running `navencrypt-move` twice on the same file succeeds on files with long paths with a message similar to the following:

```
ln: creating symbolic link '/path/to/file/to/encrypt' to  
'/path/to/mountpoint/category/path/to/file/to/encrypt': File exists
```

Cloudera Bug: KT-1707

Running `navencrypt-prepare --undo` removes all similar entries from `/etc/navencrypt/ztab`

Running `navencrypt-prepare --undo /path/to/mountpoint` removes all similar entries from `/etc/navencrypt/ztab`. For example, if you have mountpoints named `/mnt/data`, `/mnt/data1`, and `/mnt/data2`, running `navencrypt-prepare --undo /mnt/data` removes `/mnt/data`, `/mnt/data1`, and `/mnt/data2` from the Navigator Encrypt mount table (`/etc/navencrypt/ztab`).

Cloudera Bug: KT-1928

Encrypting or decrypting in parallel fails

Running `navencrypt-move` simultaneously in multiple terminals results in failure to encrypt or decrypt all of the specified data, with the following error message:

```
keyctl_unlink: Required key not available
```

No data is lost, because the source data is not removed, but you must re-run the failed operations sequentially.

Cloudera Bug: KT-1036

Restarting `navencrypt-mount` service after running `navencrypt-prepare` sometimes fails

Running `service navencrypt-mount restart` after `navencrypt-prepare` sometimes fails with the following error message:

```
WARNING: Another navencrypt-mount start process is currently running.
```

Cloudera Bug: KT-1206

Issues Fixed in Cloudera Navigator Encrypt 3.7.1

Pressing **Ctrl + C** during rule creation corrupts rule file

Pressing **Ctrl + C** before rule addition completes results in a corrupted rule file. Attempting to add further ACL rules fails with the following error:

```
[ERROR] Cannot parse ACL format: ACL header is not found: Did you type an incorrect key?
```

Intermittent Key Trustee Server communication errors

Intermittently, communication with the Key Trustee Server fails with an error similar to the following:

```
[error] UnicodeDecodeError: 'utf8' codec can't decode byte 0x80 in position 1: invalid start byte
```

The `navencrypt-move --per-file` option works only if the source and destination are on the same device

Using the `navencrypt-move --per-file` fails if the source and destination are on different devices.

Issues Fixed in Cloudera Navigator Encrypt 3.7.0

Kernel module reported by SLES as tainted kernel

The Navigator Encrypt kernel module is identified as a [tainted kernel](#) by SLES.

Navigator Encrypt does not always detect all processes accessing data to encrypt

Navigator Encrypt sometimes fails to detect all running processes that are accessing data that you want to encrypt.

Using `navencrypt-move` improperly fills storage device completely

Running `navencrypt-move` to encrypt a directory which contains the encryption mount point results in an infinite loop that fills the storage device.

Deprecated Items

The section lists OSs, Java versions, databases, platforms, CDH components and subcomponents, and product functionality that have been deprecated.

Terminology

Deprecated

Feature, component, platform, or functionality that Cloudera is planning to remove in a future release. Cloudera supports items that are deprecated until they are removed, and the deprecation gives customers time to plan for removal.

Removed

Feature, component, platform, or functionality that has been removed from the product and is no longer supported.

OSs, Java Versions, Databases, and Platforms

Item	Related Information	Release in Which Item Is Deprecated	Release in Which Item Is Removed
Operating System <ul style="list-style-type: none"> Ubuntu 14.04 	CDH and Cloudera Manager Supported Operating Systems on page 20	5.8.0	5.16.1, 6.0.0

TERMS AND CONDITIONS FOR USE, REPRODUCTION, AND DISTRIBUTION

1. Definitions.

"License" shall mean the terms and conditions for use, reproduction, and distribution as defined by Sections 1 through 9 of this document.

"Licensor" shall mean the copyright owner or entity authorized by the copyright owner that is granting the License.

"Legal Entity" shall mean the union of the acting entity and all other entities that control, are controlled by, or are under common control with that entity. For the purposes of this definition, "control" means (i) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (ii) ownership of fifty percent (50%) or more of the outstanding shares, or (iii) beneficial ownership of such entity.

"You" (or "Your") shall mean an individual or Legal Entity exercising permissions granted by this License.

"Source" form shall mean the preferred form for making modifications, including but not limited to software source code, documentation source, and configuration files.

"Object" form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and conversions to other media types.

"Work" shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work (an example is provided in the Appendix below).

"Derivative Works" shall mean any work, whether in Source or Object form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof.

"Contribution" shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, "submitted" means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as "Not a Contribution."

"Contributor" shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work.

2. Grant of Copyright License.

Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form.

3. Grant of Patent License.

Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims

licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed.

4. Redistribution.

You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions:

1. You must give any other recipients of the Work or Derivative Works a copy of this License; and
2. You must cause any modified files to carry prominent notices stating that You changed the files; and
3. You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and
4. If the Work includes a "NOTICE" text file as part of its distribution, then any Derivative Works that You distribute must include a readable copy of the attribution notices contained within such NOTICE file, excluding those notices that do not pertain to any part of the Derivative Works, in at least one of the following places: within a NOTICE text file distributed as part of the Derivative Works; within the Source form or documentation, if provided along with the Derivative Works; or, within a display generated by the Derivative Works, if and wherever such third-party notices normally appear. The contents of the NOTICE file are for informational purposes only and do not modify the License. You may add Your own attribution notices within Derivative Works that You distribute, alongside or as an addendum to the NOTICE text from the Work, provided that such additional attribution notices cannot be construed as modifying the License.

You may add Your own copyright statement to Your modifications and may provide additional or different license terms and conditions for use, reproduction, or distribution of Your modifications, or for any such Derivative Works as a whole, provided Your use, reproduction, and distribution of the Work otherwise complies with the conditions stated in this License.

5. Submission of Contributions.

Unless You explicitly state otherwise, any Contribution intentionally submitted for inclusion in the Work by You to the Licensor shall be under the terms and conditions of this License, without any additional terms or conditions.

Notwithstanding the above, nothing herein shall supersede or modify the terms of any separate license agreement you may have executed with Licensor regarding such Contributions.

6. Trademarks.

This License does not grant permission to use the trade names, trademarks, service marks, or product names of the Licensor, except as required for reasonable and customary use in describing the origin of the Work and reproducing the content of the NOTICE file.

7. Disclaimer of Warranty.

Unless required by applicable law or agreed to in writing, Licensor provides the Work (and each Contributor provides its Contributions) on an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied, including, without limitation, any warranties or conditions of TITLE, NON-INFRINGEMENT, MERCHANTABILITY, or FITNESS FOR A PARTICULAR PURPOSE. You are solely responsible for determining the appropriateness of using or redistributing the Work and assume any risks associated with Your exercise of permissions under this License.

8. Limitation of Liability.

In no event and under no legal theory, whether in tort (including negligence), contract, or otherwise, unless required by applicable law (such as deliberate and grossly negligent acts) or agreed to in writing, shall any Contributor be liable to You for damages, including any direct, indirect, special, incidental, or consequential damages of any character arising as a result of this License or out of the use or inability to use the Work (including but not limited to damages for loss of goodwill, work stoppage, computer failure or malfunction, or any and all other commercial damages or losses), even if such Contributor has been advised of the possibility of such damages.

9. Accepting Warranty or Additional Liability.

While redistributing the Work or Derivative Works thereof, You may choose to offer, and charge a fee for, acceptance of support, warranty, indemnity, or other liability obligations and/or rights consistent with this License. However, in accepting such obligations, You may act only on Your own behalf and on Your sole responsibility, not on behalf of any other Contributor, and only if You agree to indemnify, defend, and hold each Contributor harmless for any liability incurred by, or claims asserted against, such Contributor by reason of your accepting any such warranty or additional liability.

END OF TERMS AND CONDITIONS

APPENDIX: How to apply the Apache License to your work

To apply the Apache License to your work, attach the following boilerplate notice, with the fields enclosed by brackets "[]" replaced with your own identifying information. (Don't include the brackets!) The text should be enclosed in the appropriate comment syntax for the file format. We also recommend that a file or class name and description of purpose be included on the same "printed page" as the copyright notice for easier identification within third-party archives.
