Maven Artifacts for CDH 5.4.x Releases
CDH 5.4.11

The following table lists the project name, groupId, artifactId, and version required to access each CDH artifact.

Project	groupId	artifactId	version
Apache Hadoop	org.apache.hadoop	hadoop-annotations	2.6.0-cdh5.4.11
	org.apache.hadoop	hadoop-ant	2.6.0-cdh5.4.11
	org.apache.hadoop	hadoop-archives	2.6.0-cdh5.4.11
	org.apache.hadoop	hadoop-assemblies	2.6.0-cdh5.4.11
	org.apache.hadoop	hadoop-auth	2.6.0-cdh5.4.11
	org.apache.hadoop	hadoop-aws	2.6.0-cdh5.4.11
	org.apache.hadoop	hadoop-azure	2.6.0-cdh5.4.11
	org.apache.hadoop	hadoop-common	2.6.0-cdh5.4.11

CDH 5.1.2

**Note:**

There is no CDH 5.1.1 release. This skip in the CDH 5.x sequence allows the CDH and Cloudera Manager components of Cloudera Enterprise 5.1.2 to have consistent numbering.

The following table lists the project name, groupId, artifactId, and version required to access each CDH 5 artifact.

Project	groupId	artifactId	version
Apache Hadoop	org.apache.hadoop	hadoop-annotations	2.3.0-cdh5.1.2
	org.apache.hadoop	hadoop-archives	2.3.0-cdh5.1.2
	org.apache.hadoop	hadoop-assemblies	2.3.0-cdh5.1.2

Cloudera Navigator Key Trustee Server Version and Download Information

You can install Key Trustee Server using parcels in Cloudera Manager or using packages. Key Trustee Server 5.4 requires a Custom Service Descriptor (CSD) for parcel-based installations, but Key Trustee Server 5.5 and higher do not. See [Parcels](#) for more information on parcels, and [Custom Service Descriptor Files](#) for more information on CSDs.

See the following sections for information on Key Trustee Server packaging.

For repositories, replace `<username>` and `<password>` with your credentials. If you do not know your credentials, contact your Cloudera account representative.

Navigator Key Trustee Server 5.15

Navigator Key Trustee Server 5.15.0

RHEL, CentOS, and Oracle Linux

- Package repository tarball:
 - Go to the Cloudera Navigator Key Trustee Server [download page](#). Select **Packages** from the **Package or Parcel** drop-down menu, select your OS version, and click **DOWNLOAD NOW**.
- Package installation command:

```
yum install keytrustee-server-5.15.0
```

- Parcel repository tarball:
 - Go to the Cloudera Navigator Key Trustee Server [download page](#). Select **Parcels** from the **Package or Parcel** drop-down menu and click **DOWNLOAD NOW**.
- Release notes:
[Cloudera Navigator Key Trustee Server Release Notes](#) on page 2785

Navigator Key Trustee Server 5.14

Navigator Key Trustee Server 5.14.0

RHEL, CentOS, and Oracle Linux

- Package repository tarball:
 - Go to the Cloudera Navigator Key Trustee Server [download page](#). Select **Packages** from the **Package or Parcel** drop-down menu, select your OS version, and click **DOWNLOAD NOW**.
- Package installation command:

```
yum install keytrustee-server-5.14.0
```

- Parcel repository tarball:
 - Go to the Cloudera Navigator Key Trustee Server [download page](#). Select **Parcels** from the **Package or Parcel** drop-down menu and click **DOWNLOAD NOW**.
- Release notes:
[Cloudera Navigator Key Trustee Server Release Notes](#) on page 2785

Navigator Key Trustee Server 5.13

Navigator Key Trustee Server 5.13.0

RHEL, CentOS, and Oracle Linux

- Package repository tarball:
 - Go to the Cloudera Navigator Key Trustee Server [download page](#). Select **Packages** from the **Package or Parcel** drop-down menu, select your OS version, and click **DOWNLOAD NOW**.
- Package installation command:

```
yum install keytrustee-server-5.13.0
```

- Parcel repository tarball:
 - Go to the Cloudera Navigator Key Trustee Server [download page](#). Select **Parcels** from the **Package or Parcel** drop-down menu and click **DOWNLOAD NOW**.
- Release notes:
[Cloudera Navigator Key Trustee Server Release Notes](#) on page 2785

Navigator Key Trustee Server 5.12

Navigator Key Trustee Server 5.12.0

RHEL, CentOS, and Oracle Linux

- Package repository tarball:
 - Go to the Cloudera Navigator Key Trustee Server [download page](#). Select **Packages** from the **Package or Parcel** drop-down menu, select your OS version, and click **DOWNLOAD NOW**.
- Package installation command:

```
yum install keytrustee-server-5.12.0
```

- Parcel repository tarball:
 - Go to the Cloudera Navigator Key Trustee Server [download page](#). Select **Parcels** from the **Package or Parcel** drop-down menu and click **DOWNLOAD NOW**.
- Release notes:
[Cloudera Navigator Key Trustee Server Release Notes](#) on page 2785

Navigator Key Trustee Server 5.11

Navigator Key Trustee Server 5.11.0

RHEL, CentOS, and Oracle Linux

- Package repository tarball:
 - Go to the Cloudera Navigator Key Trustee Server [download page](#). Select **Packages** from the **Package or Parcel** drop-down menu, select your OS version, and click **DOWNLOAD NOW**.
- Package installation command:

```
yum install keytrustee-server-5.11.0
```

Version and Download Information

- Parcel repository tarball:
 - Go to the Cloudera Navigator Key Trustee Server [download page](#). Select **Parcels** from the **Package or Parcel** drop-down menu and click **DOWNLOAD NOW**.
- Release notes:
[Cloudera Navigator Key Trustee Server Release Notes](#) on page 2785

Navigator Key Trustee Server 5.10

Navigator Key Trustee Server 5.10.1

RHEL, CentOS, and Oracle Linux

- Package repository tarball:
 - Go to the Cloudera Navigator Key Trustee Server [download page](#). Select **Packages** from the **Package or Parcel** drop-down menu, select your OS version, and click **DOWNLOAD NOW**.
- Package installation command:

```
yum install keytrustee-server-5.10.1
```

- Parcel repository tarball:
 - Go to the Cloudera Navigator Key Trustee Server [download page](#). Select **Parcels** from the **Package or Parcel** drop-down menu and click **DOWNLOAD NOW**.
- Release notes:
[Cloudera Navigator Key Trustee Server Release Notes](#) on page 2785

Navigator Key Trustee Server 5.10.0

RHEL, CentOS, and Oracle Linux

- Package repository tarball:
 - Go to the Cloudera Navigator Key Trustee Server [download page](#). Select **Packages** from the **Package or Parcel** drop-down menu, select your OS version, and click **DOWNLOAD NOW**.
- Package installation command:

```
yum install keytrustee-server-5.10.0
```

- Parcel repository tarball:
 - Go to the Cloudera Navigator Key Trustee Server [download page](#). Select **Parcels** from the **Package or Parcel** drop-down menu and click **DOWNLOAD NOW**.
- Release notes:
[Cloudera Navigator Key Trustee Server Release Notes](#) on page 2785

Navigator Key Trustee Server 5.9

Navigator Key Trustee Server 5.9.0

RHEL or CentOS

- Package repository tarball:

- Go to the Cloudera Navigator Key Trustee Server [download page](#). Select **Packages** from the **Package or Parcel** drop-down menu, select your OS version, and click **DOWNLOAD NOW**.

- Package installation command:

```
yum install keytrustee-server-5.9.0
```

- Parcel repository tarball:
 - Go to the Cloudera Navigator Key Trustee Server [download page](#). Select **Parcels** from the **Package or Parcel** drop-down menu and click **DOWNLOAD NOW**.
- Release notes:
[Cloudera Navigator Key Trustee Server Release Notes](#) on page 2785

Navigator Key Trustee Server 5.8

Navigator Key Trustee Server 5.8.0

RHEL or CentOS

- Package repository tarball:
 - Go to the Cloudera Navigator Key Trustee Server [download page](#). Select **Packages** from the **Package or Parcel** drop-down menu, select your OS version, and click **DOWNLOAD NOW**.

- Package installation command:

```
yum install keytrustee-server-5.8.0
```

- Parcel repository tarball:
 - Go to the Cloudera Navigator Key Trustee Server [download page](#). Select **Parcels** from the **Package or Parcel** drop-down menu and click **DOWNLOAD NOW**.
- Release notes:
[Cloudera Navigator Key Trustee Server Release Notes](#) on page 2785

Navigator Key Trustee Server 5.7

Navigator Key Trustee Server 5.7.0

RHEL or CentOS

- Package repository tarball:
 - Go to the Cloudera Navigator Key Trustee Server [download page](#). Select **Packages** from the **Package or Parcel** drop-down menu, select your OS version, and click **DOWNLOAD NOW**.

- Package installation command:

```
yum install keytrustee-server-5.7.0
```

- Parcel repository tarball:
 - Go to the Cloudera Navigator Key Trustee Server [download page](#). Select **Parcels** from the **Package or Parcel** drop-down menu and click **DOWNLOAD NOW**.
- Release notes:
[Cloudera Navigator Key Trustee Server Release Notes](#) on page 2785

Navigator Key Trustee Server 5.5

Navigator Key Trustee Server 5.5.2

RHEL or CentOS

- Package repository tarball:
 - Go to the Cloudera Navigator Key Trustee Server [download page](#). Select **Packages** from the **Package or Parcel** drop-down menu, select your OS version, and click **DOWNLOAD NOW**.
- Package installation command:

```
yum install keytrustee-server-5.5.2
```

- Parcel repository tarball:
 - Go to the Cloudera Navigator Key Trustee Server [download page](#). Select **Parcels** from the **Package or Parcel** drop-down menu and click **DOWNLOAD NOW**.
- Release notes:
[Cloudera Navigator Key Trustee Server Release Notes](#) on page 2785

Navigator Key Trustee Server 5.5.0

RHEL or CentOS

- Package repository tarball:
 - Go to the Cloudera Navigator Key Trustee Server [download page](#). Select **Packages** from the **Package or Parcel** drop-down menu, select your OS version, and click **DOWNLOAD NOW**.
- Package installation command:

```
yum install keytrustee-server-5.5.0
```

- Parcel repository tarball:
 - Go to the Cloudera Navigator Key Trustee Server [download page](#). Select **Parcels** from the **Package or Parcel** drop-down menu and click **DOWNLOAD NOW**.
- Release notes:
[Cloudera Navigator Key Trustee Server Release Notes](#) on page 2785

Navigator Key Trustee Server 5.4

Note: Cloudera Navigator Key Trustee Server 5.4 is the major release following Key Trustee Server 3.8, and is the first Key Trustee Server release to support parcel-based installation using Cloudera Manager. 5.4.3 and 5.4.9 are the only maintenance releases of Key Trustee Server 5.4.

Navigator Key Trustee Server 5.4.9

RHEL or CentOS

- Package repository:

```
https://<username>:<password>@archive.gazzang.com/redhat/stable/6/
```

- Package installation command:

```
yum install keytrustee-server-5.4.9
```

- Parcel repository:

```
https://<username>:<password>@archive.gazzang.com/parcels/cloudera/keytrustee-server/5.4.9/stable/
```

- Custom Service Descriptor:

```
https://<username>:<password>@archive.gazzang.com/parcels/cloudera/keytrustee-server/5.4.9/stable/csd/
```

- Release notes:

[Cloudera Navigator Key Trustee Server Release Notes](#) on page 2785

Navigator Key Trustee Server 5.4.3

RHEL or CentOS

- Package repository:

```
https://<username>:<password>@archive.gazzang.com/redhat/stable/6/
```

 - Visit the Key Trustee KMS [download page](#).
 - Select **Packages** from the **SELECT DOWNLOAD TYPE** drop-down menu.
 - Select your operating system from the **SELECT AN OS** drop-down menu.
 - Click **DOWNLOAD NOW**.
 - Set up an internal repository, following the instructions in [Creating and Using a Package Repository for Cloudera Manager](#).
- Installation instructions:
 - [Installing Key Trustee KMS](#)
- Release notes:
 - [Key Trustee KMS Release Notes](#) on page 2801.

Key Trustee KMS 5.4

Key Trustee KMS 5.4.3

RHEL compatible

- Parcel repository:
 - <https://archive.cloudera.com/navigator-keytrustee5/parcels/5.4.3/>
- Package repository .repo file:

```
https://archive.cloudera.com/navigator-keytrustee5/redhat/<version>/x86_64/navigator-keytrustee/navigator-keytrustee5.repo
```

Replace *<version>* with 5 or 6, depending on your OS version.

Edit the `navigator-keytrustee5.repo` file and change the 5 at the end of the line that begins `baseurl=` to 5.4.3. For example:

```
baseurl=https://archive.cloudera.com/navigator-keytrustee5/redhat/<version>/x86_64/navigator-keytrustee/5.4.3/
```

- Installation instructions:
 - [Installing Key Trustee KMS](#)
- Release notes:
 - [Key Trustee KMS Release Notes](#) on page 2801

SLES

- Parcel repository:
 - <https://archive.cloudera.com/navigator-keytrustee5/parcels/5.4.3/>

- Package repository:

```
https://archive.cloudera.com/navigator-keytrustee5/sles/11/x86_64/navigator-keytrustee/navigator-keytrustee5.repo
```

Edit the `navigator-keytrustee5.repo` file and change the 5 at the end of the line that begins `baseurl=` to 5.4.3. For example:

```
baseurl=https://archive.cloudera.com/navigator-keytrustee5/sles/11/x86_64/navigator-keytrustee/5.4.3/
```

- Installation instructions:
 - [Installing Key Trustee KMS](#)
- Release notes:
 - [Key Trustee KMS Release Notes](#) on page 2801

Ubuntu

- Parcel repository:
 - <https://archive.cloudera.com/navigator-keytrustee5/parcels/5.4.3/>
- Package repository:

```
https://archive.cloudera.com/navigator-keytrustee5/ubuntu/<version>/amd64/navigator-keytrustee/cloudera.list
```

Replace `<version>` with `precise` for Ubuntu 12.04 or `trusty` for Ubuntu 14.04.

Edit the `cloudera.list` file and change `<distribution>-navigator-keytrustee5` to `<distribution>-navigator-keytrustee5.4.3` on both lines. For example, for Ubuntu Precise:

```
deb [arch=amd64]
https://archive.cloudera.com/navigator-keytrustee5/ubuntu/precise/amd64/navigator-keytrustee
precise-navigator-keytrustee5.4.3 contrib
deb-src
https://archive.cloudera.com/navigator-keytrustee5/ubuntu/precise/amd64/navigator-keytrustee
precise-navigator-keytrustee5.4.3 contrib
```

- Installation instructions:
 - [Installing Key Trustee KMS](#)
- Release notes:
 - [Key Trustee KMS Release Notes](#) on page 2801

Debian

- Parcel repository:
 - <https://archive.cloudera.com/navigator-keytrustee5/parcels/5.4.3/>
- Package repository:

```
https://archive.cloudera.com/navigator-keytrustee5/debian/wheezy/amd64/navigator-keytrustee/cloudera.list
```

Edit the `cloudera.list` file and change `wheezy-navigator-keytrustee5` to `wheezy-navigator-keytrustee5.4.3` on both lines. For example:

```
deb
https://archive.cloudera.com/navigator-keytrustee5/debian/wheezy/amd64/navigator-keytrustee
wheezy-navigator-keytrustee5.4.3 contrib
deb-src
```

Version and Download Information

```
https://archive.cloudera.com/navigator-keytrustee5/debian/wheezy/amd64/navigator-keytrustee-wheezy-navigator-keytrustee5.4.3 contrib
```

- Installation instructions:
 - [Installing Key Trustee KMS](#)
- Release notes:
[Key Trustee KMS Release Notes](#) on page 2801

Key Trustee KMS 5.4.0

RHEL compatible

- Parcel repository:
 - <https://archive.cloudera.com/navigator-keytrustee5/parcels/5.4.0/>
- Package repository .repo file:

```
https://archive.cloudera.com/navigator-keytrustee5/redhat/<version>/x86_64/navigator-keytrustee/navigator-keytrustee5.repo
```

Replace `<version>` with 5 or 6, depending on your OS version.

Edit the `navigator-keytrustee5.repo` file and change the 5 at the end of the line that begins `baseurl=` to 5.4.0. For example:

```
baseurl=https://archive.cloudera.com/navigator-keytrustee5/redhat/<version>/x86_64/navigator-keytrustee/5.4.0/
```

- Installation instructions:
 - [Installing Key Trustee KMS](#)
- Release notes:
[Key Trustee KMS Release Notes](#) on page 2801

SLES

- Parcel repository:
 - <https://archive.cloudera.com/navigator-keytrustee5/parcels/5.4.0/>
- Package repository:

```
https://archive.cloudera.com/navigator-keytrustee5/sles/11/x86_64/navigator-keytrustee/navigator-keytrustee5.repo
```

Edit the `navigator-keytrustee5.repo` file and change the 5 at the end of the line that begins `baseurl=` to 5.4.0. For example:

```
baseurl=https://archive.cloudera.com/navigator-keytrustee5/sles/11/x86_64/navigator-keytrustee/5.4.0/
```

- Installation instructions:
 - [Installing Key Trustee KMS](#)
- Release notes:
[Key Trustee KMS Release Notes](#) on page 2801

Ubuntu

- Parcel repository:

- <https://archive.cloudera.com/navigator-keytrustee5/parcels/5.4.0/>

- Package repository:

```
https://archive.cloudera.com/navigator-keytrustee5/ubuntu/<version>/amd64/navigator-keytrustee/cloudera.list
```

Replace `<version>` with `precise` for Ubuntu 12.04 or `trusty` for Ubuntu 14.04.

Edit the `cloudera.list` file and change `<distribution>-navigator-keytrustee5` to `<distribution>-navigator-keytrustee5.4.0` on both lines. For example, for Ubuntu Precise:

```
deb [arch=amd64]
https://archive.cloudera.com/navigator-keytrustee5/ubuntu/precise/amd64/navigator-keytrustee
precise-navigator-keytrustee5.4.0 contrib
deb-src
https://archive.cloudera.com/navigator-keytrustee5/ubuntu/precise/amd64/navigator-keytrustee
precise-navigator-keytrustee5.4.0 contrib
```

- Installation instructions:

- [Installing Key Trustee KMS](#)

- Release notes:

[Key Trustee KMS Release Notes](#) on page 2801

Debian

- Parcel repository:

- <https://archive.cloudera.com/navigator-keytrustee5/parcels/5.4.0/>

- Package repository:

```
https://archive.cloudera.com/navigator-keytrustee5/debian/wheezy/amd64/navigator-keytrustee/cloudera.list
```

Edit the `cloudera.list` file and change `wheezy-navigator-keytrustee5` to `wheezy-navigator-keytrustee5.4.0` on both lines. For example:

```
deb
https://archive.cloudera.com/navigator-keytrustee5/debian/wheezy/amd64/navigator-keytrustee
wheezy-navigator-keytrustee5.4.0 contrib
deb-src
https://archive.cloudera.com/navigator-keytrustee5/debian/wheezy/amd64/navigator-keytrustee
wheezy-navigator-keytrustee5.4.0 contrib
```

- Installation instructions:

Impala Version and Download Information

The information in this section applies to CDH 4 clusters, where Impala is downloaded and installed separately from CDH itself. You can disregard this section if you are running a CDH 5 cluster. This information is included with the CDH 5 documentation for users who manage CDH 4 clusters through Cloudera Manager 5.

See the following sections for Impala download information:

- [Impala 2.2.0 and Higher](#) on page 1792 (latest 2.2.x, for CDH 5 only)
- [Impala 2.1.0](#) on page 1792 (latest 2.1.x, for CDH 4 or CDH 5)

Version and Download Information

- [Impala 2.0.1](#) on page 1793 (latest 2.0.x, for CDH 4 or CDH 5)
- [Impala 2.0.0](#) on page 1793
- [Impala 1.4.3](#) on page 1794 (latest 1.4.x, for CDH 4 or CDH 5)
- [Impala 1.4.0](#) on page 1794
- [Impala 1.3.1](#) on page 1795 (latest 1.3.x, for CDH 4 or CDH 5)
- [Impala 1.2.4](#) on page 1795 (latest 1.2.x, for CDH 4)
- [Impala 1.2.3](#) on page 1796 (for CDH 4; also bundled with CDH 5 beta 2)
- [Impala 1.2.2](#) on page 1797
- [Impala 1.2.1](#) on page 1797
- [Impala 1.2.0 \(Beta\)](#) on page 1798 (for use with CDH 5 beta 1)
- [Impala 1.1.1](#) on page 1798 (latest 1.1.x)
- [Impala 1.0.1](#) on page 1798 (latest 1.0.x)

For installation instructions, see [Setting Up Apache Impala Using the Command Line](#).

For information about new features in the latest release, and issues that are fixed or still outstanding, see the [Cloudera Release Guide](#).

Impala Download Information

Note: All packages are 64-bit.

Impala 2.2.0 and Higher

Important: Impala 2.2.0 and higher are only available for CDH 5, not for CDH 4. For version and compatibility information for the Impala bundled with CDH 5, see [CDH Version and Packaging Information](#).

Impala 2.1.0

Release Date: December 2014 **Status:** Production

These Impala packages work with CDH 4. For the Impala bundled with CDH 5, see [CDH Version and Packaging Information](#).

What's New in Cloudera Documentation

This page describes new topics added and changes made to Cloudera documentation.

What's New in Cloudera Documentation in May, 2019

This section describes new topics added and major changes made to Cloudera documentation in May, 2019:

Table 43:

Product	What's New	Link
Cloudera Navigator	Improved information on <ul style="list-style-type: none"> Navigator TLS configuration Configuring Cloudera Navigator for LDAP 	<ul style="list-style-type: none"> Configuring TLS/SSL for Navigator Metadata Server Configuring Cloudera Navigator for LDAP

What's New in Cloudera Documentation in April, 2019

This section describes new topics added and major changes made to Cloudera documentation in April, 2019:

Table 44:

Product	What's New	Link
Cloudera Navigator	Added detailed information on how metadata is extracted from multiple sources and combined to generate lineage for data assets, specifically for Hive. This section helps understand when you can expect lineage to appear after data assets are created on the cluster.	Metadata Extraction Timing

What's New in Cloudera Documentation in March, 2019

This section describes new topics added and major changes made to Cloudera documentation in March, 2019:

Table 45:

Product	What's New	Link
Cloudera Data Science Workbench	Published a new Security Overview for Cloudera Data Science Workbench. This topic goes over the basics of the CDSW security model, the wildcard DNS requirement, and how authentication, authorization, and wire encryption work in Cloudera Data Science Workbench.	CDSW Security Overview

What's New in Cloudera Documentation in February, 2019

This section describes new topics added and major changes made to Cloudera documentation in February, 2019:

Table 46:

Product	What's New	Link
Apache Impala	Added a new section on load-balancing proxy in TLS-enabled cluster.	Special Proxy Considerations for TLS/SSL-Enabled Clusters
	Added a new section on enabling LDAP in Cloudera Manager.	Enabling LDAP in Cloudera Manager
	Updated docs to reflect decoupling of compute and storage in Hadoop clusters.	Components of the Impala Server
Apache Kudu	Added a recommendation to use nscd (name service caching daemon) for all name resolutions.	Slow Name Resolution and nscd
Hue	The Hue Guide has been completely re-organized and additional content added. Look for further improvements in the areas of performance tuning and reference architectures to be released soon.	<ul style="list-style-type: none"> • CDH 5.16 Hue Guide • CDH 5.15 Hue Guide

What's New in Cloudera Documentation in January, 2019

This section describes new topics added and major changes made to Cloudera documentation in January, 2019:

Table 47:

Product	What's New	Link
Apache Spark ML	Learn how to configure Spark ML to use native math libraries that accelerate model training speed for algorithms like Alternating Least Squares (ALS).	Using Native Math Libraries to Accelerate Spark Machine Learning Applications
Workload XM	The new Workload View feature enables you to break down workloads by specific criteria to perform deep-dive analysis on the queries. For example, you can use the Workload View feature to determine which users are executing workloads that do not adhere to SLAs. You can also examine how queries being sent to specific databases or that use specific pools are performing against SLAs.	<ul style="list-style-type: none"> • Classifying Workloads for Analysis with Workload Views • Video: Classifying Workloads to Gain Insights

What's New in Cloudera Documentation in November, 2018

This section describes new topics added and major changes made to Cloudera documentation in November, 2018:

Table 48:

Product	What's New	Link
Apache HBase	Information about how to move the HBase Master role from one host to another.	Moving HBase Master Role to Another Host
Cloudera Navigator Key Trustee KMS	Added a new procedure that describes how to move a Key Trustee KMS proxy service role instance from an existing cluster host to another cluster host. This feature is for 5.16.1 and later <i>only</i> .	Migrating a Key Trustee KMS Server Role Instance to a New Host
Workload Experience Manager (Workload XM)	With the release of Cloudera Manager 5.16.1, new functionality has been added to Workload XM to redact logs and queries and for proxy server support. These new features can be enabled by configuring the Telemetry Publisher service in Cloudera Manager. In addition to these new features, now you can download the SQL commands to address "Corrupt Table Statistics" and "Missing Table Statistics" query health checks and numerous usability enhancements have also been added.	What's New from Workload XM
	Information about how to configure Workload XM to tunnel through a firewall in your environment.	Configuring a Firewall for Workload XM
	Detailed description of the diagnostic data collection performed by Workload XM.	Workload XM Diagnostic Data Collection

What's New in Cloudera Documentation in October, 2018

This section describes new topics added and major changes made to Cloudera documentation in October, 2018:

Table 49:

Product	What's New	Link
Cloudera Data Science Workbench	Released Cloudera Data Science Workbench 1.4.2. This release fixes some critical bugs, including TSB-346: Risk of Data Loss on Cloudera Data Science Workbench Shutdown and Restart . Please read the TSB and Upgrade Notes carefully before you start upgrading or perform a shutdown/restart operation on any previous version of CDSW.	<ul style="list-style-type: none"> • Release Notes • Known Issues and Limitations
Apache HDFS	Documented how to enable authorization for HDFS web UIs.	Enabling Authorization for HDFS Web UIs
Apache Impala	Documented using a query option to set an execution time limit on queries.	Setting Time Limits on Long Running Queries

Product	What's New	Link
	Documented the scheduler-related query hints and options support Kudu tablets.	<ul style="list-style-type: none"> • Impala Hints • Impala Query Option
Apache Kudu	Noted that it is better to let Kudu manage its own striping over multiple devices rather than delegating the striping to a RAID-0 array.	Kudu Configuration
Cloudera Navigator	Added detailed steps for streaming Navigator audit events to a Kafka topic.	Publishing Audit Events to Kafka
	Added tips on how to get the most from your Navigator Audit Server implementation, including some maintenance steps that will help you make sure you are collecting the right audit events.	Maintaining Navigator Audit Server
Apache Sentry	Updated the Sentry privilege tables for Hive and Impala. They now include all possible privileges on each possible scope.	Privilege Tables for Hive and Impala

What's New in Cloudera Documentation in September, 2018

This section describes new topics added and major changes made to Cloudera documentation in September, 2018:

Table 50:

Product	What's New	Link
Apache Impala	Documented missing query options: <ul style="list-style-type: none"> • PARQUET_READ_STATISTICS • PARQUET_DICTIONARY_FILTERING 	<ul style="list-style-type: none"> • PARQUET_DICTIONARY_FILTERING Query Option • PARQUET_READ_STATISTICS Query Option • •
	Added a table of all Impala functions with links to each function as an alternative approach to having a page for each built-in function.	Impala Built-In Functions
	Reformatted the built-in functions docs format change for better readability.	
	Re-factored the Impala Authorization doc with the focus on Sentry privilege model and the de-emphasis on the policy file-based model.	Enabling Sentry Authorization for Impala
Apache Kudu	Added a best practice section in the Kudu-Spark Integration avoiding multiple Kudu clients per cluster.	Developing Applications With Apache Kudu
	Added the troubleshooting info on detecting ext2 and ext3 filesystems.	Troubleshooting Apache Kudu

Product	What's New	Link
Apache YARN	Added new topic that describes all aspects of creating and managing YARN ACLs.	Managing YARN ACLs

What's New in Cloudera Documentation in August, 2018

This section describes new topics added and major changes made to Cloudera documentation in August, 2018:

Table 51:

Product	What's New	Link
Cloudera Data Science Workbench	Added two new videos that demonstrate how to run experiments and deploy models with Cloudera Data Science Workbench.	<ul style="list-style-type: none"> • Experiments [YouTube] • Model Deployment [YouTube]
Apache Sentry	There is a new video on the Cloudera YouTube channel that shows how you can verify that your HDFS ACLs are synching with Sentry. The video also shows that URI privileges are not applied as ACLs in HDFS.	How to verify that HDFS ACLs are synching with Sentry
CDH - YARN	Updated the YARN tuning guide with new values.	Tuning YARN
Cloudera Altus	Description of Altus groups and their usage.	Groups
Cloudera Navigator	Added a new video that describes how to make sure your audit system is doing what you expect: are you collecting the right events? are you retaining them as long as you need them? are you archiving them where they are retrievable?	Navigator Audit Checkup Video [Youtube]
Workload Experience Manager (Workload XM)	Cloudera's Workload XM launched this month and with it a new documentation set that explains how to use this tool to gain in-depth understanding of the workloads you send to clusters managed by Cloudera Manager. It provides information that can be used for troubleshooting failed jobs and for optimizing slow jobs that run on those clusters.	Workload Experience Manager

What's New in Cloudera Documentation in July, 2018

This section describes new topics added and major changes made to Cloudera documentation in July, 2018:

Product	What's New	Link
Cloudera Data Science Workbench	Released Cloudera Data Science Workbench 1.4 with new features: Experiments and Models	1.4 Release Notes
	Reorganized documentation to align with major product components: Projects, Jobs, Experiments, Models, Engines, and Site Administration.	<ul style="list-style-type: none"> • Experiments • Model Deployment

Product	What's New	Link
	Improved LDAP/SAML experience with support for group filters.	LDAP and SAML
	New consolidated section for Engines in Cloudera Data Science Workbench.	Engines Overview
	New topic that describes how engines are used for experiments and models.	Engines for Experiments & Models
	This section also includes a topic that lists all the pre-installed packages in CDSW's Python and R kernels.	Pre-Installed Python and R Packages
	Provided more code samples that demonstrate how to access cluster data from CDSW.	Data Access
Cloudera Navigator	Added a new video that gives a light-hearted look at the Cloudera Navigator brand and helps identify the value of each of the Navigator components.	Navigator Brand Video [Youtube]
Reference Architectures	Cloudera Reference Architectures are now available in HTML format.	Reference Architectures
Apache Sentry	After upgrading to CDH 5.13.0 and above, some customers experience a period of time in which HDFS ACLs are not synched. Possible reasons for this problem are explained in the Release Notes, along with affected versions and fixes.	<ul style="list-style-type: none"> • After upgrade, HDFS ACLs are not synched due to Sentry taking too many snapshots • After upgrade, HDFS ACLs are not synched due to Sentry taking too long to retrieve the snapshot from the database
Cloudera Altus	Added a description of the optional ec2:DeleteKeyPair permission in the AWS cross-account role that determines how Altus generates key pairs for clusters.	Key Pair Permissions on EC2

What's New in Cloudera Documentation in June, 2018

This section describes new topics added and major changes made to Cloudera documentation in June, 2018:

Product	What's New	Link
Apache Hive - HiveServer2 High Availability	Added new command-line instructions for configuring a proxy load balancer to support HiveServer2 high availability on unmanaged clusters (those not managed by Cloudera Manager) with or without Kerberos.	Configuring HiveServer2 to Load Balance Behind a Proxy on Unmanaged Clusters
Apache Sentry	Clarified the GRANT ROLE statement on group name restrictions, such as character restrictions, how to use backticks with those restrictions, and OS group name requirements.	GRANT ROLE Statement
	Clarified the description of what happens to synchronized ACLs during Sentry service failure.	HDFS/Sentry Synchronized Permissions

Product	What's New	Link
	Added instructions for how to override Sentry's Kerberos prerequisite for the Hive metastore in Cloudera Manager.	Securing the Hive Metastore
	Added new Amazon S3 information on creating a table in a bucket.	Creating a Table in a Bucket
	Added new information on the privileges the Sentry Admin needs in HUE.	Hive SQL Syntax for Use with Sentry
	Added the SHOW CREATE VIEW operation to the Hive and Impala privilege tables.	Authorization Privilege Model for Hive and Impala
	Added a new example explaining how a user may see data from a database that they do not have access to if that data is in a view.	Authorization Privilege Model for Hive and Impala
CDK Powered by Apache Kafka	Updated Kafka Requirements and Supported Versions with additional information about compatibility: <ul style="list-style-type: none"> among client and broker versions between Spark and embedded Kafka clients. 	<ul style="list-style-type: none"> Kafka Client-Broker Compatibility across Kafka Versions Kafka Client Versions used by Apache Spark in CDH
Apache ZooKeeper	Provided instructions for configuring the ZooKeeper server for Kerberos authentication using Cloudera Manager.	Configuring ZooKeeper Server for Kerberos Authentication
Cloudera Manager	Added a new procedure that describes how to migrate from the Cloudera Manager Embedded PostgreSQL database server to an external PostgreSQL database.	Migrating from the Cloudera Manager Embedded PostgreSQL Database Server to an External PostgreSQL Database
Cloudera Navigator	Added information on lineage in Navigator: what information is collected and how it is used to create lineage diagrams, what entities are captured in the diagrams, and how diagrams change through the lifecycle of data assets.	Generating Lineage Diagrams
Cloudera Altus	Added a description of a new Altus environment option for secure clusters.	Enable Secure Clusters

What's New in Cloudera Documentation in May, 2018

This section describes new topics added and major changes made to Cloudera documentation in May, 2018:

Product	What's New	Link
Cloudera Upgrade	Added a new interactive topic that walks you through the steps to upgrade Cloudera Manager. You can select your operating system, upgrade version, and database type and a customized page displays the steps for your upgrade.	Upgrading Cloudera Manager Using Packages
	Added a new interactive topic that walks you through the steps to upgrade CDH using Cloudera Manager. You can select your Cloudera Manager version, CDH upgrade version, and other information	Upgrading CDH

Product	What's New	Link
	and a customized page displays the steps for your upgrade.	
HDFS Transparent Encryption	Extensively revised the KMS ACL topic, which now includes descriptions of all operations for each ACL class, as well as a diagram and explanation that guides readers through the process of how the KMS evaluates the various ACL classes.	Configuring KMS Access Control Lists (ACLs)
Key Trustee KMS HA	Added new documentation for a feature that provides logic to detect and warn users about a potential problem where the GPG private keys have not been properly synchronized across all Key Trustee KMS HA hosts.	<ul style="list-style-type: none"> • Validating Private Key Synchronization (Key Trustee KMS HA Only) • Enabling Key Trustee KMS High Availability • Key Trustee KMS Encryption Issues
Cloudera Navigator HSM KMS	Added a new topic to guide users through the steps to upgrade an HSM KMS.	Upgrading Cloudera Navigator HSM KMS
HBase	Added new content that describes how to configure and enable cell-level ACLs for HBase.	Configure Cell-Level Access Control Lists
Hue	Added new content that clarifies how to migrate the Hue database for MariaDB and MySQL.	MariaDB / MySQL
Cloudera Altus	Added information about defining custom tags for clusters. Added information about Altus support for CDH 5.14.	Creating a Cluster for AWS Creating a Cluster for Azure
	Restructured Altus documentation to create one doc set for Altus on AWS and Altus on Azure. Altus documentation now includes an Administration Guide and a Data Engineering Guide.	Overview of Cloudera Altus Overview of Altus Data Engineering

What's New in Cloudera Documentation in April, 2018

This section describes new topics added and major changes made to Cloudera documentation in April, 2018:

Product	What's New	Link
Cloudera Altus	Added a new topic that describes how to set up an Altus trial account.	Getting Started with a Trial Account

What's New in Cloudera Documentation in March, 2018

This section describes new topics added and major changes made to the Cloudera documentation library in March, 2018:

Product	What's New	Link
Cloudera Data Science Workbench	Added a new video that demonstrates how to get started with a Cloudera Data Science Workbench built-in template project.	CDSW Quickstart Demo [Youtube]
	Added new Known Issues for Cloudera Manager and CDH integration.	Known Issues

What's New in Cloudera Documentation

Product	What's New	Link
	Added a new topic on migrating a CDSW Deployment to Another Host.	Migrating a CDSW Deployment
	Revamped the Backup topic with detailed instructions.	Creating a Backup
	Added a new topic on how to uninstall Cloudera Data Science Workbench.	Uninstalling CDSW
JDK Requirements	Added new section on Java Cryptography Extension (JCE) Unlimited Strength Jurisdiction requirements.	Java Cryptography Extension (JCE) Unlimited Strength Jurisdiction
Navigator	Added a new example for Navigator Audit Server on how to use audit events to determine what caused a schema change to a table. Use audit reports to identify the user or process that may be causing unwanted changes.	Who ran which operation against a table?
Cloudera Director	Added a new topic on using custom DNS names and DNS servers with auto-TLS.	Using Custom DNS with Auto-TLS in AWS

What's New in Cloudera Documentation in February, 2018

This section describes new topics added and major changes made to Cloudera documentation in February, 2018:

Product	What's New	Link
Flume	The Apache Flume content is moved to a new Flume Guide. Information for configuring, using, and managing Flume is consolidated in the Flume Guide.	Flume Guide
HBase	The Apache HBase content is moved to a new HBase Guide. All the information for configuring, managing, and troubleshooting HBase is in one central location.	HBase Guide
Key HSM	Added a new section describing the file naming convention used for encryption zone keys.	Key Naming Convention
HDFS (Encryption)	Added a new section describing how to resolve an error that can occur when the KMS jute buffer size is insufficient to hold all the tokens.	KMS server jute buffer exception
Sentry	The Apache Sentry content is moved to a new Sentry Guide. The Sentry Guide contains information on configuring, using, and troubleshooting Sentry, as well as how-to guides.	Sentry Guide
Cloudera Altus	Added a new topic that describes how to use the Cloudera Altus SDK for Java.	Using the Altus SDK for Java

What's New in Cloudera Documentation in January, 2018

This section describes new topics added and major changes made to Cloudera documentation in January, 2018:

Product	What's New	Link
Cloudera Data Science Workbench	Released Cloudera Data Science Workbench 1.3.0.	<ul style="list-style-type: none">Cloudera Data Science Workbench 1.3.0 Release Notes

Product	What's New	Link
		<ul style="list-style-type: none"> • Known Issues and Limitations • New - Custom Project Templates • New - Rollback Cloudera Data Science Workbench • Updated Requirements and Supported Platforms • Updated CSD Upgrade Guide
Impala	Added tip about using Kudu Java API, instead of JDBC interface, for rapid insert operations.	Configuring Impala to Work with JDBC
	Added <code>DATE_TRUNC()</code> function.	Impala Date and Time Functions
	Added new upper limit for <code>BATCH_SIZE</code> query option.	BATCH_SIZE Query Option
	Added information about a new kind of runtime filter, the “min-max” filter, which applies to join queries involving Kudu tables.	Using Impala to Query Kudu Tables
	Added new conditional operators: <code>IS [NOT] TRUE</code> , <code>IS [NOT] FALSE</code> , and <code>IS [NOT] UNKNOWN</code> .	SQL Operators
	Added information about changes to the output of the <code>SET</code> statement, dividing the options into multiple groups, and hiding some groups by default. New <code>SET ALL</code> syntax shows all the option groups.	SET Statement
Added a new <code>impala-shell</code> option <code>--query_option</code> and configuration file section <code>[impala.query_options]</code> . These features both allow specifying values for query options when starting <code>impala-shell</code> .	impala-shell Configuration Options	
Kafka	Updated examples and removed deprecated properties for how to use Kafka with Flume.	Using Kafka with Flume
Kafka	Updated Kafka upgrade topic to include versions.	Rolling Upgrade to Kafka 3.0.x
Key Trustee KMS	Added new procedure for migrating from a Key Trustee KMS (KT KMS) to a Hardware Security Module KMS (HSM KMS).	Migrating from a Key Trustee KMS to an HSM KMS
Cloudera Manager	Added information on using Cloudera Manager to configure credentials for cluster access to Microsoft ADLS. This access is enabled for running Hive and Impala queries on tables backed by data stored in ADLS and to browse ADLS data using Hue.	Configuring ADLS Access Using Cloudera Manager
	Added information on how to enable performing minor maintenance on cluster hosts, Cloudera Manager now fully manages the host decommission and recommission process. You can specify whether or not to replicate under-replicated data blocks to other DataNodes to maintain the cluster's replication factor during a maintenance window.	Tuning and Troubleshooting Host Decommissioning
	Provided examples for how to use the API to manage BDR.	How To Automate BDR Replication with the Cloudera Manager API

Product	What's New	Link
	Added a video walkthrough for how to add a cluster to Cloudera Manager.	How to Add a Cluster to Cloudera Manager [YouTube]
Cloudera Director	Added information on Cloudera Director 2.7 configuration option to point to an organization's LDAP server so that users common credentials may be used to login to Cloudera Director. When enabling LDAP support, Cloudera Director's built in user management is disabled.	Configuring Cloudera Director Server for LDAP and Active Directory
	Added information that Cloudera Director can handle all aspects of Java installation on the instances that it allocates and configures for Cloudera Manager and CDH clusters, offering more flexibility while simplifying the process for users.	Deploying Java on Cluster Instances
	Added a configuration option to Cloudera Director's AWS plugin to accommodate regions like GovCloud and China, where EC2 cannot tag instances upon creation. The documentation now includes the procedure for configuring the plugin to use this option.	Configuring Tag-on-create for AWS GovCloud (US) and China (Beijing) Regions
Cloudera Navigator	Added information that metadata searches in Navigator now include the ability to group search results by common properties. Group by lets you use technical, managed, and custom metadata to quickly identify small files, active SQL users, table-creation trends, and other data aggregation trends revealed by metadata properties. The documentation includes some examples of how grouping search results can help you understand trends in your data and to find specific data assets.	Grouping Search Results Using Metadata
	Updated Navigator role names to more clearly reflect the privileges they provide. One specific change is that the privilege for editing the name and description metadata for Navigator entities is now part of the Managed & Custom Metadata Editor role. Users with that role or the Full Administrator role can add and update entity names and descriptions in the Navigator console.	Cloudera Navigator User Roles
	Added information that audit filtering now allows a "not like" operator.	Filtering Audit Events
	Added information on handling sensitive data that links to the Cloudera Manager log redaction details.	Sensitive Data
	The documentation now includes the specific metadata removed during Navigator Metadata Server purge tasks.	What Metadata is Purged?
Kudu	Added new features and updates to Kudu administration:	Kudu Administration

Product	What's New	Link
	<ul style="list-style-type: none"> You can now add data directories to an existing master or tablet server. Kudu tablet servers are resilient to disk failures that occur on a disk storing data blocks. The description of the workflow to migrate to multi-master cluster was improved with details and examples. The description of the workflow to recover from a dead Kudu master was improved with details. 	
	Specified how client applications connect to Kerberized Kudu servers.	Client Authentication to Secure Kudu Clusters
Cloudera Altus	Added a description of public keys for cluster creation.	Creating a Cluster for AWS

CDH 5 Release Notes

For links to the detailed change lists that describe the bug fixes and improvements to all of the CDH 5 projects, see [CDH Version and Packaging Information](#) on page 145.

For more information about installing and configuring CDH 5, see [Cloudera Installation Guide](#).

New Features and Changes in CDH 5

Note: There is no CDH 5.0.7, 5.1.1, 5.1.6, 5.2.2, 5.2.7, 5.3.7, or 5.4.6 release.

What's New in CDH 5.16.x

See below for new features in CDH 5.16.x, grouped by component:

Apache Hive

The following new features have been added to Apache Hive in CDH 5.16.1:

Fine Grained Privileges

Sentry and Hive introduced fine grained privileges to provide object-level privileges to roles.

Fine grained privileges adds the `CREATE` privilege, which allow users to create databases and tables. See the [Sentry Privileges](#) documentation for more information about the new privileges.

Object Ownership

Object ownership designates an owner for a database, table, or view in Sentry. The owner of an object has the equivalent of the `ALL` privilege on the object. See the [Object Ownership](#) documentation for information about enabling object ownership.

Because of the new object ownership feature, HMS stores the user that creates a table or database in Hive as the object owner. If object ownership is enabled, Sentry grants the user the `OWNER` privilege. Whether or not object ownership is enabled, HMS stores the user that creates the object as the object owner. Previously, HMS stored the `hive` user as the object owner.

The following statements were added to Hive to support object ownership via Sentry:

- `ALTER DATABASE SET OWNER`
- `ALTER TABLE SET OWNER`
- `SHOW GRANT USER`

Apache Impala

The following new features have been added to Apache Impala in CDH 5.16.1:

Fine Grained Privileges

Sentry and Impala introduced fine grained privileges to provide object-level privileges to roles.

Fine grained privileges include the `REFRESH` and `CREATE` privileges, which allow users to create databases and tables, and to execute commands that update metadata information on Impala databases and tables. See [Impala Sentry documentation](#) for the new privileges and the scopes of the objects that you can grant the new privileges on.

The following new privileges were added:

- The `REFRESH` privilege
- The `CREATE` privilege

- The `SELECT` and `INSERT` privileges on `SERVER`

If a role has `SELECT` or `INSERT` privilege on an object in Impala before upgrading to CDH 5.16.1, that role will automatically get the `REFRESH` privilege during the upgrade.

Object Ownership

Object ownership designates an owner for a database, table, or view in Sentry. The owner of an object has the `OWNER` privilege which is the equivalent of the `ALL` privilege on the object. See the [Object Ownership](#) documentation for information about enabling object ownership.

If the object ownership feature is enabled, Sentry grants the user the `OWNER` privilege. Whether or not object ownership is enabled, HMS stores the object creator as the default object owner. Previously, HMS stored the Kerberos user as the object owner.

The following statements were added to Impala to support object ownership via Sentry:

- `ALTER DATABASE SET OWNER`
- `ALTER TABLE SET OWNER`
- `ALTER VIEW SET OWNER`
- `SHOW GRANT USER`

Admission Control Enhancement

A new query option, [MAX MEM ESTIMATE FOR ADMISSION](#), was added. Use the new option to set an upper limit on the memory estimates of a query as a workaround for over-estimates precluding a query from being admitted.

General Performance Improvements

A new query option, [SHUFFLE DISTINCT EXPRS](#), controls the shuffling behavior when a query has both grouping and distinct expressions.

Metadata Performance Improvements

- Incremental Stats

The following enhancements improve Impala stability. The features reduce chances of having `catalogd` and `impalad` crash due to be out of memory when using incremental stats.

- Incremental stats are now compressed in memory in `catalogd`, reducing memory footprint in `catalogd`.
- Incremental stats are fetched on demand from `catalogd` by `impalad` coordinators. This enhancement reduces memory footprint for `impalad` coordinators and `statedored` and also reduces network requirements to broadcast metadata.

See [Loading Incremental Statistics from Catalogd](#) for details.

- Automatic Invalidation of Metadata

Note: This feature is experimental and not recommended for use in production clusters.

To keep the size of metadata bounded and to reduce the chances of `catalogd` cache running out of memory, this release introduces an automatic metadata invalidation feature with time-based and memory-based invalidation.

Automatic invalidation of metadata provides more stability with lower chances of running out of memory, but could potentially cause performance risks. The feature is turned off by default.

See [Startup Options for Automatic Invalidation of Metadata](#) for details.

Compatibility and Usability Enhancements

- Additional separators are supported between date and time in default `TIMESTAMP` format, specifically, the multi-space separator and the 'T' separator. See [TIMESTAMP Data Type](#) for more information on `TIMESTAMP` format.

- New hint placement is supported for `INSERT` statements. See [Optimizer Hints in Impala](#) for detail.
- The `REGEX_ESCAPE()` function was implemented for escaping special characters to treat them literally in string literals.
- `SHOW CREATE VIEW` was implemented with the same functionality as `SHOW CREATE TABLE`.
- Impala Shell can connect directly to `impalad` when configured with proxy load balancer and Kerberos. See [Configuration Options](#) for the new flag that enables the direct connection.

Apache Sentry

The following new features have been added to Apache Sentry in CDH 5.16.1:

Fine Grained Privileges

The `CREATE` and `REFRESH` (Impala only) privileges have been introduced to allow users to create databases, tables and functions, and to execute commands that update metadata information on Impala databases and tables.

For more information about the new privileges, see [Sentry Privileges](#).

Object Ownership

Object ownership designates an owner for a database, table, or view in Sentry. The owner of an object has the equivalent of the `ALL` privilege on the object.

In CDH 5.16.1, object ownership is disabled by default. For information about enabling and using object ownership, see [Object Ownership](#).

No Group Name Case Restrictions

Sentry no longer normalizes group name characters to be lowercase. Therefore, operating system group names do not need to be treated as case insensitive. In previous versions, Sentry modified capital letters in operating system group names to be lowercase.

OpenJDK Support

OpenJDK is now supported with Cloudera Manager and CDH 5.16.1.

For information about migrating your Oracle JDK to OpenJDK, see [Upgrading the JDK](#). To use OpenJDK in a new deployment, see [Install Java Development Kit](#).

Cloudera Bug: CDH-60334

Apache Kudu

The following new features have been added to Apache Hive in CDH 5.16.1:

Starting with Apache Kudu 1.5.0 / CDH 5.13.x, Kudu has been fully integrated into CDH. Kudu now ships as part of the CDH parcel and packages. For a complete list of new features and changes introduced in Kudu 1.7 / CDH 5.16.1, see [What's New in Apache Kudu](#) on page 1901.

Apache Phoenix

Apache Phoenix is available with CDH 5.16.2:

Starting with Apache Phoenix 4.14.1/ CDH 5.16.2, Phoenix parcel can be installed and used with CDH. You can now download and install the Phoenix parcel on CDH 5.16.2. For more information about installing and using Phoenix, see the [Phoenix Guide](#).

What's New in CDH 5.15.x

The following sections describe new features introduced in 5.15.0.

Apache Flume

You can use Cloudera Manager to configure Flume to communicate with Kafka sources, sinks, and channels over TLS. The **Kafka Service** property in Cloudera Manager allows you to select a dependent Kafka service for the Flume service. Cloudera Manager then creates `jaas.conf` and `flume.keytab` files and adds Kafka security properties to the Flume configuration file.

Note:

There is a known issue with this feature in 5.15.0, fixed in 5.15.1. For more information, see [Flume uses default values for Kafka TLS settings](#) on page 2522.

For more information about how to use Cloudera Manager to configure Flume and Kafka communication, see [Configuring Flume Security with Kafka](#).

Apache Hadoop

HDFS Immutable Snapshots

You can now enable immutable snapshots for HDFS. When you enable immutable snapshots, HDFS captures the sizes of files that are currently open (being written to). If immutable snapshots are not enabled, the sizes of those files in the snapshot will continue to grow based on any appends to the files. Therefore, immutable snapshots provide a more accurate point-in-time snapshot of HDFS.

This feature is useful for using snapshots with replication to prevent failures caused by file sizes growing in the source.

To enable immutable snapshots, open the **Cloudera Manager Admin Console**, select **<HDFS service> > Configuration** and search for the **Enable Immutable Snapshots** property.

You must enable immutable snapshots to use snapshot diff-based replication for Cloudera Manager's Backup and Disaster Recovery. For more information, see [What's New in Cloudera Manager 5.15.0](#) on page 2474.

Hue

End-user Data Catalog improvements:

- Simpler top table search
- Unification and caching of all SQL metadata (Hive, Navigator, NavOpt)

Apache Impala

- Added the `TABLESAMPLE` clause in the `COMPUTE STATS` statement. See [for the new TABLESAMPLE clause](#).
- Extended `COMPUTE STATS` to support a list of columns. See [for the new syntax](#).
- Added the new `COMPUTE_STATS_MIN_SAMPLE_SIZE` query option. The query option specifies the minimum number of bytes that will be scanned in `COMPUTE STATS TABLESAMPLE`, regardless of the user-supplied sampling percent. See [for information about the new option](#).
- Added a `TBLPROPERTY` for controlling stats extrapolation on a per-table basis: `impala.enable.stats.extrapolation=true/false`. See [for information about stats extrapolation](#).
- Added the new built-in `regex_escape` function. The function instructs Impala to interpret the following special characters literally rather than as special characters: `.\+*?[\^]${}!=!<>| :-`

See [for information about the regex_escape function](#).

- Enhanced the existing `ltrim` and `rtrim` string functions to accept an argument that specifies a set of characters to be trimmed from the input string. See [for information about the functions](#).
- Implemented `murmur_hash` function. See [for information about the new function](#).
- Introduced the support for the Kudu `DECIMAL` type in Kudu 1.7.0.
- Now Impala maps a signed integer logical type in Parquet to a supported Impala column type as below:
 - `INT_8` -> `TINYINT`
 - `INT_16` -> `SMALLINT`

- INT_32 -> INT
- INT_64 -> BIGINT
- Parquet dictionary filtering now works on nested data.
- Based on the existing Parquet column chunk level statistics `null_count`, Impala's Parquet scanner was enhanced to skip an entire row group if the `null_count` statistics indicate that all the values under the predicated column are `NULL` as no result rows would be returned from that row group.
- The Oracle-style hint placement for `INSERT` statements is now supported. See [for information on hints in Impala SQL](#).
- Insert plan hints for `CREATE TABLE AS SELECT` are now supported. See [for information on hints in Impala SQL](#).
- Improved concurrency of DDL and DML operations during catalog updates.
- The statestore update logic was improved to reduce issues, such as too many queries being admitted by different coordinators, or queries being queued for longer than necessary and blocking subsequent updates to different topics.
- The size limit for statestore updates was increased, and copying of the metadata and reduce the memory footprint were reduced. Now the catalog objects are passed and (de)compressed between FE and BE one at a time.

Apache Kudu

Starting with Apache Kudu 1.5.0 / CDH 5.13.x, Kudu has been fully integrated into CDH. Kudu now ships as part of the CDH parcel and packages. The documentation for Kudu has also been incorporated into the Cloudera Enterprise documentation [here](#).

For a complete list of new features and changes introduced in Kudu (in CDH 5.15), see [What's New in Apache Kudu](#) on page 1901.

Apache Spark

More flexibility to interpret `TIMESTAMP` values written by Impala. Setting the `spark.sql.parquet.int96TimestampConversion` configuration setting to `true` makes Spark interpret `TIMESTAMP` values, when reading from Parquet files written by Impala, without applying any adjustment from the UTC to the local time zone of the server. This behavior provides better interoperability for Parquet data written by Impala, which does not apply any time zone adjustment to `TIMESTAMP` values when reading or writing them.

What's New in CDH 5.14.x

The following sections describe new features introduced in 5.14.0.

Apache Impala

- **New Boolean operators:** `IS TRUE`, `IS NOT TRUE`, `IS FALSE`, `IS NOT FALSE`, `IS UNKNOWN`, and `IS NOT UNKNOWN`. These operators always return `TRUE` or `FALSE`, even if the left-hand expression evaluates to `NULL`. `IS [NOT] TRUE` and `IS [NOT] FALSE` are `NULL`-safe equivalents for equality and inequality comparisons. `IS [NOT] UNKNOWN` is identical to `IS [NOT] NULL`.
- The new built-in function `DATE_TRUNC()` lets you truncate a `TIMESTAMP` value to a given precision. For example, calling `date_trunc('hour', ts)` truncates `ts` to the beginning of the corresponding hour, with all minutes, seconds, milliseconds, and so on set to zero.
- The `impala-shell` command now accepts a command-line argument `--query_option=option=value` to set a query option for that shell session. You can specify multiple query options by supplying multiple instances of `--query_option` in the `impala-shell` invocation.

Configuration files for `impala-shell`, such as `.impalarc`, can also contain a section beginning with `[impala.query_options]`, followed by lines of the form `query_option=value`. These query options take effect by default for all `impala-shell` sessions that use the specified configuration file.

- The `SET` statement, when run without any argument, now divides its output into groups corresponding to “regular”, “advanced”, “development” (unfinished, not ready for general use), and “deprecated” (subject to removal). By

default, the “development” and “deprecated” option groups are not shown in `SET` output. Issue the statement `SET ALL` to see the options and values from all groups.

- Impala optimizes some join queries against Kudu tables by constructing runtime filters representing the minimum and maximum matching values from the join columns. The min-max information is “pushed down” to Kudu so that Kudu can prune unnecessary rows before sending the result set back to Impala.
- The allowed range for the `BATCH_SIZE` query option is now 0 to 65536. Formerly, the upper bound was undefined.
- Arithmetic expressions involving both `DECIMAL` and `FLOAT` or `DOUBLE` arguments now produce results of `DECIMAL` type instead of `DOUBLE`.

Apache Kudu

Starting with Apache Kudu 1.5.0 / CDH 5.13.x, Kudu has been fully integrated into CDH. Kudu now ships as part of the CDH parcel and packages. The documentation for Kudu has also been incorporated into the Cloudera Enterprise documentation [here](#).

For a complete list of new features and changes introduced in Kudu (in CDH 5.14), see [What's New in Apache Kudu](#) on page 1901.

Cloudera Search

In previous versions, the Lily HBase Indexer service only supported Sentry policy files for authorization. It now supports the Sentry Service. For more information, see [Configuring Lily HBase Indexer Security](#).

What's New in CDH 5.13.x

The following sections describe new features introduced in 5.13.0.

Apache Hive / Hive-on-Spark / HCatalog

- Support for dynamic partition pruning for map joins on Hive on Spark. Dynamic partition pruning (DPP) is a database optimization that can significantly decrease the amount of data that a query scans, thereby executing your workloads faster. It is disabled by default, but can be enabled by setting the `hive.spark.dynamic.partition.pruning.map.join.only` property to `true`. When enabled, DPP only triggers for queries where the join on the partitioned column is a map join. For details, see [Dynamic Partition Pruning for Hive Map Joins](#).
- Sentry supports Hive metastore high availability. In CDH 5.13 and above, you can use Sentry with Hive metastore high availability, with or without Sentry high availability. For information about the high availability architecture and steps to set up Sentry high availability, see [Sentry High Availability](#).
- Apache Pig now supports writing partitioned Hive tables in the Parquet format using HCatalog. For details, see [Using HCatalog to Write to Parquet Hive Tables with Pig](#).

Apache Impala

The following are some of the most significant new Impala features in this release:

- Improvements to memory management through the use of a buffer pool. This mechanism allows queries to use less memory, reserves the required memory during query startup, and reduces the frequency of out-of-memory errors. It makes query planning and memory estimation more accurate, so that if a query begins executing it is unlikely to encounter an out-of-memory error partway through. The memory buffer used during spill-to-disk processing is smaller: instead of 8 MiB, this buffer defaults to 2 MiB and Impala can reduce it to as little as 64 KiB when appropriate.

This feature includes new query options for fine-tuning memory areas used during query processing: `MIN_SPILLABLE_BUFFER_SIZE`, `DEFAULT_SPILLABLE_BUFFER_SIZE`, `MAX_ROW_SIZE`, and `BUFFER_POOL_LIMIT`.

- Improvements to the mechanism for caching HDFS file handles. This caching mechanism improves the performance and scalability of queries that access the same file multiple times, for example to retrieve different columns from a Parquet file. Caching the file handle across `open()` calls reduces the load on the HDFS NameNode.

This feature is currently disabled by default. It is enabled by setting a non-zero value for the `max_cached_file_handles` configuration setting. Currently, ETL processes that append to existing HDFS files or overwrite HDFS files in place can interact with this setting in a way that turns off short-circuit reads for some `impalad` hosts. See [HDFS-12528](#) for tracking information.

- A new command in `impala-shell`, `rerun` or its abbreviation `@`, lets you re-execute previous commands based on their numbering in the `history` output.
- You can specify the minimum required TLS/SSL version using the `--ssl_minimum_version` setting, for example `--ssl_minimum_version=tlsv1.2`.
- You can specify the set of allowed TLS ciphers using the `--ssl_cipher_list` configuration setting. See the output of `man ciphers` for the full set of keywords and notation allowed in the argument string.
- New or enhanced built-in functions:
 - `trunc()` can now apply to numeric types (`FLOAT`, `DOUBLE`, and `DECIMAL`) in addition to `TIMESTAMP`. Although this functionality was already available through the `truncate()` function, the new signatures for `trunc()` make it easier to port code from other popular database systems to Impala.
 - A new date/time function `utc_timestamp()` provides a simple way to get a stable, interoperable representation of a `TIMESTAMP` value without using a chain of functions to convert between representations and apply a specific timezone.
- The `CREATE TABLE LIKE PARQUET` statement can now handle Parquet files produced outside of Impala and containing `ENUM` types. The `ENUM` columns become `STRING` columns in the target table, and the `ENUM` values are turned into corresponding `STRING` values.
- Kudu enhancements:
 - You can now create a Kudu table without using a `PARTITION BY` clause. Kudu automatically creates a single partition to cover the entire possible range of values. This feature is intended for small lookup tables, where the overhead of partitioning does not make sense for tables that typically have a full table scan for each query.
 - More granular Sentry authorization for Kudu tables. Kudu tables can now use column-level privileges. The `SELECT` and `INSERT` statements can now use the corresponding `SELECT` and `INSERT` privileges. Other Kudu statements still require the `ALL` privilege.
 - The `ALTER TABLE` statement can modify a number of storage attributes for the columns of Kudu tables. You can use the `ALTER COLUMN` clause of `ALTER TABLE` along with the `SET` keyword to change the properties `DEFAULT`, `BLOCK_SIZE`, `ENCODING`, and `COMPRESSION`. You can use the `DROP DEFAULT` clause to remove the default value from a column.
- For non-Kudu tables, you can use the `ALTER TABLE` syntax `ALTER COLUMN col SET COMMENT 'text'` to change the comment for an individual column.

Apache Kudu

Starting with Apache Kudu 1.5.0 / CDH 5.13.x, Kudu has been fully integrated into CDH. Kudu now ships as part of the CDH parcel and packages. The documentation for Kudu has also been incorporated into the Cloudera Enterprise documentation [here](#).

For a complete list of new features and changes introduced in Kudu (in CDH 5.13), see [What's New in Apache Kudu](#) on page 1901.

Apache Pig

- Pig now supports writing partitioned Hive tables in the Parquet format using HCatalog. For details, see [Using HCatalog to Write to Parquet Hive Tables with Pig](#).

Apache Sentry

- High availability for Sentry provides automatic failover in the event that your primary Sentry host goes down or is unavailable. In CDH 5.13.0, you can have two Sentry hosts. For information about how to configure high availability for Sentry, see [Sentry High Availability](#).
- You must add Sentry to the list of groups that the Hive user can impersonate in the **Hive Metastore Access Control and Proxy User Groups Override** setting. See [Configuring the Sentry Service](#) for more information about Sentry service configuration.
- Sentry supports Hive metastore high availability.

What's New in CDH 5.12.x

The following sections describe new features introduced in 5.12.0.

Apache Hadoop

- Added documentation for using the HA nameservice of a remote cluster in the DistCp command line arguments. For more information, see [Using DistCp with Highly Available Remote Clusters](#).
- [HADOOP-14104](#): Added DistCp support for clusters with HDFS encryption zones.

Apache Hive / Hive-on-Spark

- Support for Microsoft Azure Data Lake Store (ADLS) as a secondary filesystem for both Hive on MapReduce2 (YARN) and Hive-on-Spark. You can now use both Hive on MapReduce2 and Hive-on-Spark to read and write data stored on ADLS.

See [Configuring ADLS Connectivity for CDH](#)

- The Hive `schematool` is integrated with Cloudera Manager where you can use it to upgrade or validate the Hive metastore schema.

See [Using the Hive Schema Tool in CDH](#) for details.

- [HIVE-1575](#): Added support for JSON arrays at the root level by the `get_json_object` function. For example:

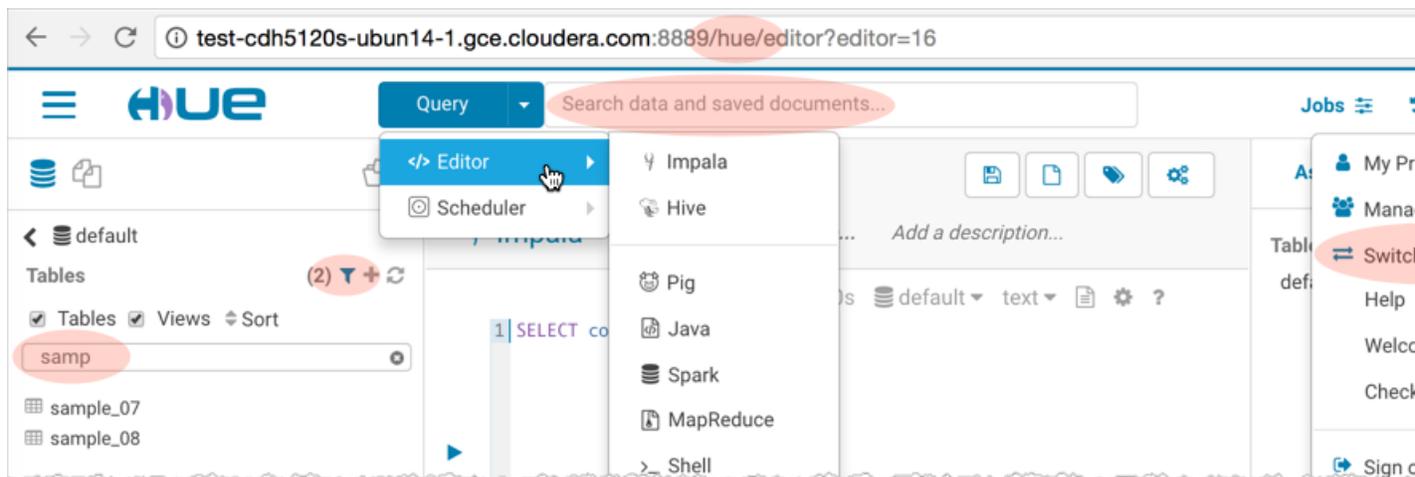

```
SELECT get_json_object('[1,2,3]', '$[0]')...
```

Hue

Hue 4 is out and jam-packed with great new features.

New Layout in Hue 4!

- Apps are consolidated under blue button—set your favorite as default landing page
- Top search bar lets you search for saved queries and other data
- Left and right assist panels let you search and filter schema objects
- Cursor position determines which of multiple queries to run
- New Pig editor, Job Designer, and Job Browser
- Access old Hue 3 layout under user drop down or remove "hue" from URL.

Load Balancer Added by Default

During a new installation of CDH/Hue, one Load Balancer is automatically promoted to ensure optimal performance—it can reduce the Hue server load by up to 90%! In existing clusters, administrators are prompted to add a load balancer role and users are then guided on how to enable it. See the Cloudera Blog on [Automatic HA](#).

Test LDAP Configuration

Verify your LDAP configuration, *on-the-fly*, with this new feature in Cloudera Manager under **Hue > Actions > Test LDAP Configuration**. See [Authenticate Hue Users with LDAP](#).

Navigator Optimizer Integrated (Phase 1)

With Navigator Optimizer enabled in Hue, popular tables, columns, joins, filters are displayed in the autocompleter. Risky statements, such as missing filters on partitioned tables, trigger an alert.

Navigator Search & Tag Enabled by Default

With Navigator enabled in Hue, you can search and tag metadata. This feature is now enabled by default (with Cloudera Navigator installed). See [How to Use Governance-Based Data Discovery](#).

Other Cool Features

- You can create partitioned tables from files
- Impala metadata is refreshed automatically
- SQL autocompleter handles more advanced corner cases
- Remote Load balancer works with SSL
- Query history is paginated!

Apache Impala

The following are some of the most significant new Impala features in this release:

- Impala can now read and write data stored on the Microsoft Azure Data Lake Store (ADLS). See [Using Impala with the Azure Data Lake Store \(ADLS\)](#) for details.
- New built-in functions:
 - A new string function, `replace()`, which is faster than `regexp_replace()` for simple string substitutions. See [Impala String Functions](#) for details.
 - A new conditional function, `nv12()`, which offers more flexibility than the `nv1()` function. It lets you return one value for `NOT NULL` arguments, and a different value for `NULL` arguments. See [Impala Conditional Functions](#) for details.
 - A new date/time function, `last_day()`, for finding the date corresponding to the last day of a particular month. See [Impala Date and Time Functions](#) for details.

- New syntax, `REFRESH FUNCTIONS db_name`, lets Impala recognize newly added functions, such as UDFs created through Hive. Impala scans the metadata for a specified database to locate the new functions, which is faster and more convenient than doing a full `INVALIDATE METADATA` operation.
 - The new `TABLESAMPLE` clause for the `SELECT` statement lets you specify a percentage of the overall data volume within a table to process during a query.
 - Startup flags for the `impalad` daemon, `is_executor` and `is_coordinator`, let you divide the work on a large, busy cluster between a small number of hosts acting as query coordinators, and a larger number of hosts acting as query executors. By default, each host can act in both roles, potentially introducing bottlenecks during heavily concurrent workloads. See [How to Configure Impala with Dedicated Coordinators](#) for details.
 - A new query option, `DEFAULT_JOIN_DISTRIBUTION_MODE`, lets you change the default assumption about how join queries should handle tables with no statistics. This can help to avoid out-of-memory conditions for join queries, without manual tuning to add the `/* +SHUFFLE */` hint for queries on large tables with missing statistics.
 - The `SORT BY` clause lets you create Parquet files with more efficient compression and smaller ranges of values for specified columns, allowing Impala to apply optimizations to skip reading data from Parquet files that do not contain any values that match equality and range operators in the `WHERE` clause. See [CREATE TABLE Statement](#) for details.
 - The `max_audit_event_log_files` lets you perform log rotation for the audit event log files, similar to the rotation for regular Impala log files.
 - Kudu enhancements:
 - The `ALTER TABLE` statement can specify more attributes for a Kudu table with the `ADD COLUMNS` clause. Now you can specify `[NOT] NULL`, `ENCODING COMPRESSION`, `DEFAULT`, and `BLOCK_SIZE`. See [ALTER TABLE Statement](#) for details.
 - The `TIMESTAMP` type is now available for Kudu tables.
-  **Note:** See [Handling Date, Time, or Timestamp Data with Kudu](#) for information about the tradeoffs between performance and convenience when using this data type. For high-performance applications, you might continue to use the `BIGINT` type to represent date/time values.
- The `INSERT` and `CREATE TABLE AS SELECT` statements are more efficient when writing to Kudu tables. Formerly, the overhead for the write operations could result in timeouts when writing large numbers of rows in a single operation.

Apache HBase

- Apache HBase now has ADLS support and recommendations for Azure deployment.
- Outside of cloud, HBase now has support for long-lived Spark applications via token renewal.

Apache Spark

Spark can read and write data on the Azure Data Lake Store (ADLS) cloud service. See [Accessing Data Stored in Azure Data Lake Store \(ADLS\) through Spark](#) for details.

S3Guard List-After-Delete Consistency

This release adds Delete Tracking for [S3Guard](#). Running CDH 5.11.0 clusters against the same DynamoDB table as clusters running CDH5.12.0 or higher is not supported. S3Guard in CDH5.11.0 does not work with the newer schema. CDH 5.11.1 and higher releases are compatible with the newer tables when running CDH 5.12.0 and higher.

S3Guard does not track deletes unless you are running a version with Delete Tracking support (CDH 5.12.0 and higher).

What's New in CDH 5.11.x

What's New in CDH 5.11.2

This is a maintenance release that fixes some important issues. For details, see [Issues Fixed in CDH 5.11.2](#) on page 2151.

What's New in CDH 5.11.1

This is a maintenance release that fixes some important issues. For details, see [Issues Fixed in CDH 5.11.1](#) on page 2154.

What's New In CDH 5.11.0

The following sections describe new features introduced in 5.11.0.

Apache Hadoop

- Supported Apache Tomcat TLS ciphers for HttpFS are configurable using the `HTTPFS_SSL_CIPHERS` environment variable.
- Supported Apache Tomcat TLS ciphers for the KMS are configurable using the `KMS_SSL_CIPHERS` environment variable.
- Amazon S3 Consistency with Metadata Caching (S3Guard)

Data written to Amazon S3 buckets is subject to the "eventual consistency" guarantee provided by Amazon Web Services (AWS), which means that data written to S3 may not be immediately available for queries and listing operations. This can cause failures in multi-step ETL workflows, where data from a previous step is not available to the next step. To mitigate these consistency issues you can now configure metadata caching for data stored in Amazon S3 using S3Guard. S3Guard requires that you provision a DynamoDB database from Amazon Web Services and configure S3Guard using the Cloudera Manager Admin Console or command-line tools. See [Configuring and Managing S3Guard](#).

- Amazon S3 Server-side Encryption with SSE-KMS

Clusters that use Amazon S3 storage can now use Amazon [Server-Side Encryption with AWS KMS–Managed Keys \(SSE-KMS\)](#) to encrypt data, so you now have two choices for data-at-rest encryption on Amazon S3 (SSE-S3, SSE-KMS). Use Cloudera Manager Admin Console to configure the cluster to use this new feature as detailed in [How to Configure Encryption for Amazon S3](#).

Apache HBase

- CDH 5.11.0 includes the introduction of “region server groups”. This feature allows for specific tables to be tied to specific region servers. The primary benefit of region server groups is application isolation. Multiple applications on HBase can be assured that there will be no i/o, cpu, and memory contention as long as they only access tables in mutually exclusive region server groups. There are trade-offs when using region server groups, notably performance. Tables that are assigned to region server groups will not be able to recruit the full hardware resources of the cluster, and the maximum possible throughput for tables assigned to region server groups composed of a subset of the region servers that comprise the cluster will be slower than those that are not.
- Use `MOB_COMPACT_PARTITION_POLICY` options to reduce the number of MOB files stored in HDFS. You can choose from daily, weekly, and monthly options.

Apache Hive

- Hive on Amazon S3 performance optimizations for:
 - [HIVE-14204](#) : Dynamic partitioning writes and the INSERT OVERWRITE statement
 - [HIVE-15546](#) : Parallel input path listing
 - [HIVE-13901](#), [HIVE_15879](#) : Performance and stability of the MSCK command for recovering partitions

See [Tuning Hive Performance on the Amazon S3 Filesystem](#)

- Support for Microsoft Azure Data Lake Store (ADLS) as a secondary filesystem for Hive on MapReduce2 (YARN). You can use Hive on MapReduce2 or Hive-on-Spark to read and write data stored on ADLS.

See [Configuring ADLS Connectivity for CDH](#).

- AWS cloud clusters can now share a single persistent instance of Amazon Relational Database Service (RDS) as the Hive metastore backend database, enabling persistent sharing of metadata beyond a cluster's life cycle.

See [How To Set Up a Shared Amazon RDS as Your Hive Metastore for CDH](#)

Hue

- Integrate Navigator with Hue: Phase 1, Metadata Discovery
 - Search and tag partitions, databases, views, tables, columns.
 - Off by default. Check both "Enable" fields in **Hue > Configuration > Cloudera Navigator**.
 - See [How to Use Governance-Based Data Discovery](#).
- Embed new create table wizard within Editor and Assist
 - Safely import multiple formats such as Kudu, Parquet, JSON, and CSV.
 - More easily create table partitions.
- Continued SQL improvements
 - Visually more pleasant colors and text.
 - No more hanging spinner in the Editor.
- [HUE-5742](#): Allow non-public PostgreSQL schemas.
- [HUE-5608](#): Add ability to DESC table without TABLE level privilege

Apache Impala

See [What's New in Apache Impala](#) on page 1869.

Apache Oozie

- Supported TLS ciphers for Apache Tomcat are configurable using the `OOZIE_HTTPS_CIPHERS` environment variable.

Apache Spark

Blacklisting. This feature reduces the chance of application failure, by not scheduling work on hosts that are experiencing intermittent disk failures. See [this blog post](#) for background information.

You can enable Kerberos authentication and TLS/SSL encryption for the Spark History Server through Cloudera Manager configuration settings, rather than including the password in clear text in an Advanced Configuration Snippet field. See these settings in the Cloudera Manager user interface:

- `history_server_spnego_enabled` - for Kerberos authentication
- `history_server_admin_users`
- `spark.ssl.historyServer.enabled`
- `spark.ssl.historyServer.protocol`
- `spark.ssl.historyServer.port`
- `spark.ssl.historyServer.enabledAlgorithms`
- `spark.ssl.historyServer.keyStore`
- `spark.ssl.historyServer.keyStorePassword`

With authentication enabled, only Kerberos-authorized users can read data from the Spark History Server, and non-admin users can only see information about their own jobs.

With TLS/SSL enabled, you provide the location of the keystore and its password, similar to the security configuration for other components.

Navigator lineage. The former Spark lineage extractor that was enabled through a safety valve is superseded by a more robust lineage collection mechanism. See [Apache Spark Known Issues](#) on page 2043 for some limitations and restrictions with this feature.

Support for Azure Data Lake Store (ADLS) as a secondary filesystem. You can use Spark jobs to read and write data stored on ADLS. Hive-on-Spark and Spark with Kudu are not currently supported for ADLS data.

Cloudera Search

- Supported TLS ciphers for Apache Tomcat are configurable using the `SOLR_CIPHERS_CONFIG` environment variable.

ZooKeeper

Server-Server Mutual Authentication

All ZooKeeper servers in an ensemble can now be configured to support quorum peer (server-server) mutual authentication, mitigating risk of spoofing by a rogue server on an unsecured network. The feature leverages Kerberos authentication through the SASL framework, so Kerberos is required.

This feature is easy to enable using Cloudera Manager Admin Console. See [Enabling Server-Server Mutual Authentication](#) in the [ZooKeeper Authentication](#) page of [Cloudera Security](#) for details.

What's New in CDH 5.10.x

What's New in CDH 5.10.2

This is a maintenance release that fixes some important issues. For details, see [Issues Fixed in CDH 5.10.2](#) on page 2168.

What's New in CDH 5.10.1

This is a maintenance release that fixes some important issues. For details, see [Issues Fixed in CDH 5.10.1](#) on page 2172.

What's New In CDH 5.10.0

Apache HBase

- Replication debugging functionality has been added.
- G1 Garbage Collection performance has been improved.

Apache Hive

- [HIVE-14269](#): Enhanced write performance for Hive tables stored on Amazon S3. See [Tuning Apache Hive Performance on the Amazon S3 Filesystem in CDH](#).

Hue

- [HUE-4560](#): Auto-configure Hue connectivity to S3 for all components. See [How to Enable S3 Cloud Storage in Hue](#).

Apache Impala

See [New Features in Impala 2.8.x / CDH 5.10.x](#) on page 1875.

Apache Oozie

[OOZIE-2225](#) In addition to the filter parameters `name`, `user`, `group`, `status`, `frequency` and `unit`, Oozie now supports a wild card parameter that matches a partial name, a partial user, or a complete ID.

For example, a query with `text='asdf'` would return all jobs that satisfy ANY of the following conditions.

1. `job.name.contains(text)`
2. `job.user.contains(text)`
3. `job.id = text`

Cloudera Search

- The `solrctl` command can be run in debug mode using the `--debug` or `--trace` parameters.

YARN

- **Expose maxResources per user in YARN Dynamic Resource Pools**

YARN Dynamic Resource Pools now supports default capacity limits (**Max Resources**) that automatically apply to all child pools of any resource pool. You can control the YARN resources available to any user or group on the cluster by configuring these settings on a parent pool, and then use placement rules to auto-create child pools per user or group.

- **UX improvements in the Pools page**

Improvements include:

- Every input row is now clickable and takes the user to that input field in the edit dialog.
- Split vcores (min/max) and memory (min/max) into min resources and max resources.
- Renamed **Configuration Sets** tab to **Resource Limits**.

What's New In CDH 5.9.x

What's New in CDH 5.9.3

This is a maintenance release that fixes some important issues. For details, see [Issues Fixed in CDH 5.9.3](#) on page 2194.

What's New in CDH 5.9.2

This is a maintenance release that fixes some important issues. For details, see [Issues Fixed in CDH 5.9.2](#) on page 2197.

What's New in CDH 5.9.1

This is a maintenance release that fixes some important issues. For details, see [Issues Fixed in CDH 5.9.1](#) on page 2203.

What's New in CDH 5.9.0

Apache Hadoop

- CDH 5.9 supports temporary credentials obtained from AWS Security Token Service (STS) to log in to Amazon S3.

Apache HBase

- A tool has been added--`org.apache.hadoop.hbase.replication.regionserver.DumpReplicationQueues`--to dump existing replication peers, configurations, and queues when using HBase replication. The tool includes two flags:
 - `--distributed` - Polls each replication server for information about the replication queues being processed on this replication server. By default, this is not enabled, and the information about the replication queues and configuration is obtained from ZooKeeper.
 - `--hdfs` When `--distributed` is used, this flag attempts to calculate the total size of the WAL files used by the replication queues. Because multiple peers can be configured, this value can be overestimated.

For more information, see [Class DumpReplicationQueues](#).

- Metrics have been added that expose the amount of replayed work occurring in the HBase replication system. For more information on these metrics, see [Replication Metrics](#) in the *Apache HBase Reference Guide*.

Apache Hive

- [HIVE-14270](#) : Added parameters to optimize write performance for Hive tables and partitions that are stored on Amazon S3. See [Optimizing Hive Write Performance on Amazon S3](#).

Hue

- [HUE-2915](#): Integrates Hue with [Amazon S3](#). You can now access both S3 and HDFS in the File Browser, create tables from files in S3, and save query results in S3. See how to [Enable S3 Cloud Storage](#).
- [HUE-4039](#): Improves SQL Autocompleter. The new Autocompleter deeply understands Hive and Impala SQL dialects and provides smart suggestions based on statement structure and cursor position. See how to manually [Enable and Disable Autocompleter](#).
- [HUE-3877](#): Adds support for Amazon RDS. You can now deploy Hue against an Amazon RDS database instance with MySQL, PostgreSQL, and Oracle engines.
- Rebase of Hue on upstream [Hue 3.11](#).

Apache Impala

- Performance improvements:
 - [\[IMPALA-3206\]](#) Speedup for queries against `DECIMAL` columns in Avro tables. The code that parses `DECIMAL` values from Avro now uses native code generation.
 - [\[IMPALA-3674\]](#) Improved efficiency in LLVM code generation can reduce codegen time, especially for short queries.
 - [\[IMPALA-2979\]](#) Improvements to scheduling on worker nodes, enabled by the `REPLICA_PREFERENCE` query option. See [REPLICA_PREFERENCE Query Option \(CDH 5.9 or higher only\)](#) for details.
- [\[IMPALA-1683\]](#) The `REFRESH` statement can be applied to a single partition, rather than the entire table. See [REFRESH Statement](#) and [Refreshing a Single Partition](#) for details.
- Improvements to the Impala web user interface:
 - [\[IMPALA-2767\]](#) You can now force a session to expire by clicking a link in the web UI, on the `/sessions` tab.
 - [\[IMPALA-3715\]](#) The `/memz` tab includes more information about Impala memory usage.
 - [\[IMPALA-3716\]](#) The **Details** page for a query now includes a **Memory** tab.
- [\[IMPALA-3499\]](#) Scalability improvements to the catalog server. Impala handles internal communication more efficiently for tables with large numbers of columns and partitions, where the size of the metadata exceeds 2 GiB.
- [\[IMPALA-3677\]](#) You can send a `SIGUSR1` signal to any Impala-related daemon to write a Breakpad minidump. For advanced troubleshooting, you can now produce a minidump without triggering a crash. See [Breakpad Minidumps for Impala \(CDH 5.8 or higher only\)](#) for details about the Breakpad minidump feature.
- [\[IMPALA-3687\]](#) The schema reconciliation rules for Avro tables have changed slightly for `CHAR` and `VARCHAR` columns. Now, if the definition of such a column is changed in the Avro schema file, the column retains its `CHAR` or `VARCHAR` type as specified in the SQL definition, but the column name and comment from the Avro schema file take precedence. See [Creating Avro Tables](#) for details about column definitions in Avro tables.
- [\[IMPALA-3575\]](#) Some network operations now have additional timeout and retry settings. The extra configuration helps avoid failed queries for transient network problems, to avoid hangs when a sender or receiver fails in the middle of a network transmission, and to make cancellation requests more reliable despite network issues.

Apache Oozie

Oozie adds a new database tool for migration and upgrade from Apache Derby (or any other supported database). For more information, see [How to Use the New Apache Oozie Migration Tool](#).

Apache Sentry

- Sentry supports data on Amazon RDS and can secure URIs with an RDS schema.
- [SENTRY-1233](#) - Logging improvements for `SentryConfigToolSolr`.

- [SENTRY-1119](#) - Allow data engines to obtain the `ActionFactory` directly from the configuration, instead of having hardcoded component-specific classes. This will allow external data engines to integrate with Sentry easily.
- [SENTRY-1229](#) - Added a basic configurable cache to `SentryGenericProviderBackend`.

Apache Spark

- You can now set up AWS credentials for Spark with the Hadoop credential provider, to avoid exposing the AWS secret key in configuration files.

Apache Sqoop

- The mainframe import module extension has been added to support data sets on tape.

Cloudera Search

- The Solr watchdog is now configured to use the fully qualified domain name (FQDN) of the host on which the Solr process is running (instead of `127.0.0.1`). You can override this configuration by setting `SOLR_HOSTNAME` environment variable to appropriate value (before starting the Solr server).
- Cloudera Search adds support for index snapshots. For more information on how to back up, migrate, or restore your indexed data, see [Backing Up and Restoring Cloudera Search](#).

What's New In CDH 5.8.x

What's New in CDH 5.8.5

This is a maintenance release that fixes some important issues. For details, see [Issues Fixed in CDH 5.8.5](#) on page 2232.

What's New in CDH 5.8.4

This is a maintenance release that fixes some important issues. For details, see [Issues Fixed in CDH 5.8.4](#) on page 2247.

What's New in CDH 5.8.3

This is a maintenance release that fixes some important issues. For details, see [Issues Fixed in CDH 5.8.3](#) on page 2251.

What's New in CDH 5.8.2

- Support for HDFS Disk Balancer. For details, see <http://hadoop.apache.org/docs/r3.0.0-alpha1/hadoop-project-dist/hadoop-hdfs/HDFSDiskbalancer.html>.

What's New in CDH 5.8.0

The following sections describe new features introduced in CDH 5.8.0.

Operating System Support

- **Operating Systems** - Support for Debian 8.2.

Apache HBase

- Additional metrics have been added to monitor garbage collection pauses and other external pauses that might cause a server process to momentarily block any request processing.
- New throughput and Bloom filter metrics have been added to the existing HBase microbenchmarks.
- Downstream users of CDH who build on top of Apache HBase can now pull in fewer transitive dependencies by relying on shaded client artifacts. To do so, use the maven artifact `hbase-shaded-client` where you would normally use the `hbase-client` artifact. All HBase APIs remain the same.

Note: In a previous release of CDH, this maven artifact exists but does not contain any of the needed classes to interact with an HBase cluster.

- The HMaster Web UI now shows the aggregate of all space being used by snapshots.

Hue

General Features:

- Rebase of Hue on upstream [Hue 3.10](#).
- Refactor of Hue Infrastructure:
 - Performance is further optimized for large numbers of databases and tables.
 - Exporting and importing documents is improved.

SQL Editor and Browser:

- Revamp of the Hue SQL Application:
 - Editor is redesigned to create a single-page experience.
 - Code editor is redesigned with enhanced auto-complete, keyboard shortcuts, search and replace, and more.
 - A live status of the query history displays as an icon

Admin and Security:

- [HUE-3386](#): Users are auto-logged out when TTL Expires. See [Securing Sessions](#).
- [Hue-3808](#): Users can do live DEBUG log toggling.
- A new step in the Cloudera Manager Add Service wizard helps configure and test an external Hue database.

Search:

- [SENTRY-1217](#): Users can grant Sentry Solr privileges.

Oozie:

- [Hue-3464](#): The dashboard and editor are decoupled for granular access.
- Saved Hive queries can be dragged and dropped into a workflow.

Apache Impala

See [New Features in Impala 2.6.x / CDH 5.8.x](#) on page 1878.

Apache Oozie

- [OOZIE-2330](#) : The Spark Action now allows <file> and <archive> elements. It also omits <job-tracker> and <name-node> elements to allow for the use of the global or default values.
- The launcher job no longer uses YARN's uber mode by default.

Cloudera Search

- Cloudera Search adds support for storing permissions in the Sentry service. You can enable storing permissions in the Sentry service by [Enabling the Sentry Service for Solr](#). If you have already configured Sentry's policy file-based approach, you can migrate existing authorization settings as described in [Migrating from Sentry Policy Files to the Sentry Service](#). `solrctl` has been extended to support:
 - Migrating existing policy files to the Sentry service
 - Managing managing permissions in the Sentry service

Apache Sentry

- Sentry supports data stored on Amazon S3 and can secure URIs with an S3 schema.
- Cloudera Search adds support for storing permissions in the Sentry service. You can enable storing permissions in the Sentry service by [Enabling the Sentry Service for Solr](#). If you have already configured Sentry's policy file-based approach, you can migrate existing authorization settings as described in [Migrating from Sentry Policy Files to the Sentry Service](#). `solrctl` has been extended to support:
 - Migrating existing policy files to the Sentry service
 - Managing managing permissions in the Sentry service

- [SENTRY-1175](#): Improved usability for Sentry URIs and URI privileges. If URIs in Hive DDL statements or URI privileges lack scheme and authority components, Sentry automatically completes such URIs by applying the default scheme and authority based on the HDFS configuration provided to Sentry.
- **Performance Improvements**
 - [SENTRY-1293](#): ResourceAuthorizationProvider.doHasAccess no longer performs expensive operations to convert string permissions to Privilege objects.
 - [SENTRY-1292](#): Reordered the DBModelAction EnumSet to improve authorization performance.

Key Trustee Server

Auto backup on install of Key Trustee Server

Key Trustee server backs up automatically on first run when using parcels and Cloudera Manager, and sets up a cron job (hourly) for continuous backup.

Auto backup on install of KMS

Key Trustee KMS backs up automatically on first run when using parcels and Cloudera Manager.

What's New In CDH 5.7.x

What's New in CDH 5.7.0

The following sections describe new features introduced in CDH 5.7.0.

Operating System Support

- **Operating Systems** - Support for:
 - RHEL/CentOS 6.6, 6.7, 7.1, and 7.2
 - Oracle Enterprise Linux (OEL) 7.1 and 7.2
 - SUSE Linux Enterprise Server (SLES) 11 with Service Packs 2, 3, 4
 - Debian: Wheezy 7.0, 7.1, and 7.8

Important: Cloudera supports RHEL 7 with the following limitations:

- Only RHEL 7.3, 7.2 and 7.1 are supported. RHEL 7.0 is not supported.
- RHEL 7.1 is only supported with CDH 5.5 and higher.
- RHEL 7.2 is only supported with CDH 5.7 and higher.
- Only new installations of RHEL 7.2 and 7.1 are supported by Cloudera. For upgrades to RHEL 7.1 or 7.2, contact your OS vendor and see [Does Red Hat support upgrades between major versions of Red Hat Enterprise Linux?](#)

Apache Hadoop

- Improve support for heterogeneous storage. [Heterogeneous Storage Management](#) (HSM) is now supported natively in Cloudera Manager.
- [HADOOP-10651](#) - Service access can be restricted by IP and hostname. You can now define a whitelist and blacklist per service. The default whitelist is * and the default blacklist is empty.
- [HADOOP-12764](#) - You can configure `KMS maxHttpHeaderSize`. The default value of `KMS maxHttpHeaderSize` increased from 4096 to 65536 and is now configurable in `service.xml`.
- [HDFS-7279](#) - In CDH 5.5.0 and higher, DataNode WebHDFS implementation uses Netty as an HTTP server instead of Jetty. With improved buffer and connection management, Netty lowers the risk for DataNode latency and OutOfMemoryError (OOM).
- [HDFS-8873](#) - You can rate-limit the directoryScanner. A new configuration property, `dfs.datanode.directoryscan.throttle.limit.ms.per.sec`, allows you to reduce the impact on disk performance of directory scanning. The default value is 1000.

- [HDFS-9260](#) - Garbage collection of full block reports is improved. Data structures for `BlockInfo` and replicas were changed to keep them sorted. This allows for faster and easier garbage collection of full block reports.

Apache HBase

See also [Apache HBase Known Issues](#) on page 1970.

- CDH 5.7.0 adds support for a snapshot owner for a table. To configure a table snapshot owner, set the `OWNER` attribute on the table to a valid HBase user. By default, the table owner is the user who created the table. The table owner and the table creator can restore the table from a snapshot.
- You can set an HDFS storage policy to store write-ahead logs (WALs) on solid-state drives (SSDs) or a mix of SSDs and spinning disks.
- Configuration for snapshot timeouts has been simplified. A single configuration option, `hbase.snapshot.master.timeout.millis`, controls how long the master waits for a response from the `RegionServer` before timing out. The default timeout value has been increased from 60,000 milliseconds to 300,000 to accommodate larger tables.
- You can optionally balance a table's regions by size by setting the `hbase.normalizer.enabled` property to `true`. The default value is `false`. To configure the time interval for the HMaster to check for region balance, set the `hbase.normalizer.period` property to the interval, in milliseconds. The default value is 1800000, or 30 minutes.
- You can configure parallel request cancellation for multi-get operations using the `hbase.client.replica.interrupt.multiget` configuration property, using an advanced configuration snippet in Cloudera Manager, or in `hbase-site.xml` if you do not use Cloudera Manager.
- The `hbase-spark` module has been added, which provides support for using HBase data in Spark jobs using `HBaseContext` and `JavaHBaseContext` contexts. See the [HBase and Spark chapter](#) of the Apache HBase Reference Guide for details about building a Spark application with HBase support.
- The REST API now supports creating, reading, updating, and deleting namespaces.
- If you use the G1 garbage collector, you can disable the `BoundedByteBufferPool`.
- The HBase web UI includes graphical tools for managing MemStore and StoreFile details for a region.
- The HBase web UI displays the number of regions a table has.
- Two new methods of the Scan API, `setColumnFamilyTimeRange` and `getColumnFamilyTimeRange`, allow you to limit Scan results to versions of columns within a specified timestamp range.
- A new API, `MultiRowRangeFilter`, allows you to scan multiple row ranges in a single scan.
- A new client API, `SecurityCapability`, enables you to check whether the HBase server supports cell-level security.
- When using the `scan` command in HBase Shell, you can use the `ROWPREFIXFILTER` option to include only rows matching a given prefix, in addition to any other filters you specify. For example:

```
hbase> scan 't1', {ROWPREFIXFILTER => 'row2',
                  FILTER => (QualifierFilter (>=, 'binary:xyz')) AND
                  (TimestampsFilter ( 123, 456))}
```

- The new `get_splits` HBase Shell command returns the split points for a table. For example:

```
hbase> get_splits 't2'
Total number of splits = 5
=> ["", "10", "20", "30", "40"]
```

- Three new commands relating to the region normalizer have been added to the HBase Shell:
 - `normalizer_enabled` checks whether the region normalizer is enabled.
 - `normalizer_switch` toggles the region normalizer on or off.
 - `normalize` runs the region normalizer if it is enabled.

- When configuring a ZooKeeper quorum for HBase, you can now specify the port for each ZooKeeper host separately, instead of using the same port for each ZooKeeper host. The configuration property `hbase.zookeeper.clientPort` is no longer required. For example:

```
<property>
  <name>hbase.zookeeper.quorum</name>
  <value>zk1.example.com:2181,zk2.example.com:20000,zk3.example.com:31111</value>
</property>
```

- A new configuration option, `hbase.regionserver.hostname`, was added, but Cloudera recommends against its use. See [Compatibility Notes for CDH 5.7](#) on page 1922.
- Two new configuration options allow you to disable loading of all coprocessors or only table-level coprocessors: `hbase.coprocessor.enabled` (which defaults to `true`) and `hbase.coprocessor.user.enabled` (which also defaults to `true`). Cloudera does not recommend disabling HBase-wide coprocessors, because security functionality is implemented using coprocessors. However, disabling table-level coprocessors may be appropriate in some cases.
- A new configuration option, `hbase.loadincremental.validate.hfile`, allows you to skip validation of HFiles during a bulk load operation when set to `false`. The default setting is `true`.
- The default `PermSize` for HBase processes is now set to 128 MB. This setting is effective only for JDK 7, because JDK 8 ignores the `PermSize` setting. To change this setting, edit the **HBase Client Environment Advanced Configuration Snippet (Safety Valve) for `hbase-env.sh`** if you use Cloudera Manager or `conf/hbase-env.sh` otherwise.
- In CDH 5.6 and lower, the `HBaseFsck#checkRegionConsistency()` method would throw an `IOException` if a region repair operation timed out after `hbase.hbck.assign.timeout` (which defaults to 120 seconds). This exception would the entire `hbck` operation to fail. In CDH 5.7.0, if the region being repaired is not `hbase:meta` or another system table, the region is skipped, an error is logged, and the `hbck` operation continues. This new behavior is disabled by default; to enable it, set the `hbase.hbck.skipped.regions.limit` option to an integer greater than 0. If more than this number of regions is skipped, the `hbck` operation fails.
- Two new options, `-exclusive` and `-disableBalancer`, have been added to the `hbck` utility. The `hbck` utility now runs without locks unless in fixer mode, and the balancer is only disabled in fixer mode, by default. You can disable these options to retain the old behavior, but Cloudera recommends using the new default behavior.
- Two new MapReduce jobs, `SyncTable` and `HashTable`, allow you to synchronize two different HBase tables that are each receiving live writes. To print usage instructions, run the job with no arguments. These examples show how to run these jobs:

```
$ bin/hbase org.apache.hadoop.hbase.mapreduce.SyncTable \
    --dryrun=true \
--sourcezkcluster=zk1.example.com,zk2.example.com,zk3.example.com:2181:/hbase \
    hdfs://nn:9000/hashes/tableA \
    tableA tableA
```

```
$ bin/hbase org.apache.hadoop.hbase.mapreduce.HashTable \
    --batchsize=32000 \
    --numhashfiles=50 \
    --starttime=1265875194289 \
    --endtime=1265878794289 \
    --families=cf2,cf3 \
    TestTable /hashes/testTable
```

- The `CopyTable` command now allows you to override the `org.apache.hadoop.hbase.mapreduce.TableOutputFormat` property by prefixing the property keys with the `hbase.mapred.output.` prefix. For example, `hbase.mapred.output.hbase.security.authentication` is passed to `CopyTable` as `hbase.security.authentication`. This is useful when directing output to a peer cluster with different configuration settings.
- Several improvements have been made to the HBase canary, including:
 - Sniffing of regions and RegionServers is now parallel to improve performance in large clusters with more than 1000 regions and more than 500 RegionServers.

- The canary sets `cachecheck` to `false` when performing Gets and Scans to avoid influencing the BlockCache.
- `FirstKeyOnlyFilter` is used during Gets and Scans to improve performance in a flat wide table.
- A region is selected at random when sniffing a RegionServer.
- The sink class used by the canary is now configurable.
- A new flag, `-allRegions`, sniffs all regions on a RegionServer if running in RegionServer mode.
- Distributed log replay has been disabled in CDH 5.7 and higher, due to reliability issues. Distributed log replay is unsupported.
- A new configuration option, `hbase.hfile.drop.behind.compaction`, causes the OS-level filesystem cache to be dropped behind compactions. This provides significant performance improvements on large compactions. To disable this behavior, set the option to `false`. It defaults to `true`.
- Two new configuration options, `hbase.hstore.compaction.max.size` and `hbase.hstore.compaction.max.size.offpeak`, allow you to specify a maximum compaction size during normal hours and during off-peak hours, if the off-peak feature is used. If unspecified, `hbase.hstore.compaction.max.size` defaults to 9,223,372,036,854,775,807 (`Long.MAX_VALUE`), which is essentially unbounded.
- The HDFS replication factor can now be specified per column family by setting the `DFS_REPLICATION` attribute of the column family to the desired number of replicas, either at table creation or by altering an existing table schema. If set to 0, the default replication factor is used. If fewer than the desired number of replicas exist, the HDFS FSCK utility reports it.
- If you use the ChaosMonkey tool, you can low-load a custom ChaosMonkey implementation by passing the class to the `-m` or `--monkey` option of the ChaosMonkey tool, in the same way that you would normally pass `SLOW` or `CALM`.
- A new configuration option, `hbase.use.dynamic.jars`, allows you to disable the dynamic classloader if set to `false`.

Apache Hive

- [HIVE-9298](#) - Supports reading alternate timestamp formats. The SerDe property, `timestamp.formats`, is added to allow you to pass in a comma-delimited list of alternate timestamp formats. For example, the following ALTER TABLE statement (in this case, with Joda date-time parsing) adds: `yyyy-MM-dd'T'HH:mm:ss` and milliseconds since [Unix epoch](#), represented by the special case pattern `millis`.

```
ALTER TABLE timestamp_formats SET SERDEPROPERTIES
 ("timestamp.formats"="yyyy-MM-dd'T'HH:mm:ss,millis");
```

- [HIVE-7292](#) - Hive on Spark (HoS) General Availability. This release supports running Hive jobs using Spark as an additional execution backend. This improves performance for Hive queries, especially those involving multiple reduce stages.
- [HIVE-12338](#) - Add Web UI to HiveServer2. Exposes a Web UI on the HiveServer2 service to surface process metrics (JVM stats, open session, and similar) and per-query runtime information (query plan, performance logs). The Web UI is available on port 10002 by default.
- [HIVE-10115](#) - Handle LDAP and Kerberos authentication on the same HiveServer2 interface. In a Kerberized cluster when alternate authentication is enabled on HiveServer2, it accepts Kerberos authentication. Before this enhancement, when LDAP authentication to HiveServer2 was enabled, the service blocked acceptance of other authentication mechanisms.
- Hive Metastore / HiveServer2 metadata scalability improvements. Fixes to improve scalability and performance include support for DirectSQL by default for metastore operations and incremental memory usage improvements.
- [HIVE-12271](#) - Add additional catalog and query execution metrics for Hive Metastore / HiveServer2 and integrate with Cloudera Manager. Additional Hive metrics include catalog information (number of databases, tables, and partitions in Hive Metastore) and query execution stats (number of worker threads used, job submission times, and statistics for planning and compilation times). All metrics are available in Cloudera Manager.

Hue

- Hive metastore service improvements make browsing Hive data faster and easier.
- SQL editor improvements:

- SQL assist scales to thousands of tables and databases.
- Improved row and column headers.
- Button to delete the query history.
- Button to format SQL.
- Security improvements:
 - Timeout property for idle sessions.
 - Customizable splash screen on the login page.
 - Support for password-protected SAML certificates.
 - Custom xmlsec1 binary for multiple SAML protocols.
 - Ability to synchronize groups on login for any authentication backend.
- Oozie application improvements:
 - Display graph of external workflow.
 - Option to dry run jobs on submission.
 - User timezone recognition.
 - Automatic email on failure.
 - Ability to execute individual actions.

Apache Impala

See [New Features in Impala 2.5.x / CDH 5.7.x](#) on page 1880.

MapReduce

- The `mapred job -history` command provides an efficient way to fetch history for MapReduce jobs.

Apache Oozie

- [OOZIE-2411](#) - The Oozie email action now supports `BCC:`, as well as `TO:` and `CC:`.

Cloudera Search

- Improvements to `loadSolr`. For additional information about these improvements, see the [Morphlines Reference Guide](#). Improvements include:
 - `loadSolr` retries SolrJ requests if exceptions, such as connection resets, occur. This is useful in cases such as temporary Solr server overloads or transient connectivity failures. This behavior is enabled by default, but can be disabled by setting the Java system property `org.kitesdk.morphline.solr.LoadSolrBuilder.disableRetryPolicyByDefault=true`.
 - `loadSolr` includes an optional rate-limiting parameter that is used to set the maximum number of morphline records to ingest per second. The default value is no limit.

Apache Spark

- Spark is rebased on Apache Spark 1.6.0.
- [SPARK-10000](#) - Spark 1.6.0 includes a new unified memory manager. The new memory manager is turned off by default (unlike Apache Spark 1.6.0), to make it easier for users to migrate existing workloads, but it is supported.
- [SPARK-9999](#) - Spark 1.6.0 introduces a new Dataset API. However this API is experimental, likely to undergo some changes, and unsupported.
- [SPARK-6028](#) and [SPARK-6230](#) - Encryption support for Spark RPC
- [SPARK-2750](#) - HTTPS support for History Server and web UI
- Added support for Spark SQL (DataFrames) in PySpark.
- Added support for the following MLlib features:
 - `spark.ml`
 - ML pipeline APIs

CDH 5 Release Notes

- The `hbase-spark` module has been added, which provides support for using HBase data in Spark jobs using `HBaseContext` and `JavaHBaseContext` contexts. See the [HBase and Spark chapter](#) of the Apache HBase Reference Guide for details about building a Spark application with HBase support.
- The `DATE` datatype is supported for Parquet and Avro tables.

Apache Sentry

[SENTRY-510](#) - Added support for collection of metrics for the Sentry/HDFS plugin

YARN

- Preemption guarantees that important tasks are not starved for resources, while allowing the CDH cluster to be used for experimental and research tasks. In FairScheduler, you can now disable preemption for a specific queue to ensure that its resources are not taken for other tasks.

What's New in CDH 5.7.1

This is a maintenance release that fixes some important issues. For details, see [Issues Fixed in CDH 5.7.1](#) on page 2277.

What's New in CDH 5.7.2

This is a maintenance release that fixes some important issues. For details, see [Issues Fixed in CDH 5.7.2](#) on page 2273.

What's New in CDH 5.7.3

This is a maintenance release that fixes some important issues. For details, see [Issues Fixed in CDH 5.7.3](#) on page 2272.

What's New in CDH 5.7.4

This is a maintenance release that fixes some important issues. For details, see [Issues Fixed in CDH 5.7.4](#) on page 2269.

What's New in CDH 5.7.5

This is a maintenance release that fixes some important issues. For details, see [Issues Fixed in CDH 5.7.5](#) on page 2267.

What's New in CDH 5.7.6

This is a maintenance release that fixes some important issues. For details, see [Issues Fixed in CDH 5.7.6](#) on page 2264.

What's New In CDH 5.6.x

What's New in CDH 5.6.0

CDH 5.6.0 is a maintenance release that introduces the EMC DSSD D5 Storage Appliance Integration for Hadoop DataNodes.

What's New in CDH 5.6.1

This is a maintenance release that fixes some important issues. For details, see [Issues Fixed in CDH 5.6.1](#) on page 2291.

What's New In CDH 5.5.x

What's New in CDH 5.5.0

The following sections describe new features introduced in CDH 5.5.0.

Operating System and Database Support

- **Operating Systems** - Support for RHEL/CentOS 6.6 (in SE Linux mode), 6.7, and 7.1, and Oracle Enterprise Linux 7.1.

Important: Cloudera supports RHEL 7 with the following limitations:

- Only RHEL 7.1 is supported. RHEL 7.0 is not supported.
- Only new installations of RHEL 7.1 are supported by Cloudera. For upgrades to RHEL 7.1, contact your OS vendor and see [Does Red Hat support upgrades between major versions of Red Hat Enterprise Linux?](#)

- **Databases** - Supports MariaDB 5.5, Oracle 12c, and PostgreSQL 9.4.

Apache Flume

- CDH 5.5 release is rebased on Flume 1.6.
- [FLUME-2498](#) Taildir source.
- [FLUME-2215](#) ResettableFileInputStream support for ucs-4 character.
- [FLUME-2729](#) PollableSource backoff times made configurable.
- [FLUME-2628](#) Netcat source support for different source encodings.
- [FLUME-2753](#) Support for empty replace string in Search and Replace interceptor.
- [FLUME-2763](#) Flume_env script support to handle JVM parameters.
- [FLUME-2095](#) JMS source support for username and password.

Apache Hadoop

- [HADOOP-1540](#) - DistCp supports file exclusions with a new filter option, `-exclusions <argument>`, to prevent files from being copied. The argument is a file that contains a list of Java regex patterns (one per line). If an exclusion pattern is matched, the file is not copied. To use, pass `-filters <pathToFileterFile>` to the `distcp` command.
- [HADOOP-8989](#) - The Hadoop shell now has a `find` utility, like that in UNIX, that allows users to search for files by name. Run `hadoop fs -help find` for more info.
- [HADOOP-11219](#), [HADOOP-7280](#) - WebImageViewer was upgraded to Netty 4. This does not affect the external classpath of Hadoop.
- [HADOOP-11827](#) - DistCp `buildListing()` now uses a threadpool to improve performance. To use, pass `--numListstatusThreads <numThreads>` to the `distcp` command. The default value is 1.
- [HDFS-6133](#) - HDFS balancer supports the exclusion of subtrees because running the HDFS balancer can destroy local data that is important for applications such as the HBase RegionServer.
- [HDFS-8828](#) - DistCp leverages HDFS snapshot diff to more easily build file and directory lists. The snapshot diff report provides diff information between two snapshots or between a snapshot and a non-HDFS directory.
- Improvements to HDFS scalability and performance:
 - [HDFS-7279](#) - In CDH 5.5.0 and higher, DataNode WebHDFS implementation uses Netty as an HTTP server instead of Jetty. With improved buffer and connection management, Netty lowers the risk for DataNode latency and OutOfMemoryError (OOM).
 - [HDFS-7435](#) and [HDFS-8867](#) add more efficient over-the-wire encoding.
 - [HDFS-7923](#) adds rate-limiting for block reports so that the NameNode is not swamped by DataNodes sending too many block reports at once.
 - [HDFS-7923](#) and [HDFS-7999](#) eliminate some cases on the DataNode side where I/O errors lead to scans being repeated on the local disks.
 - [HDFS-8581](#) fixes some cases where a lock is held for too long.
 - [HDFS-8792](#) and [HDFS-7609](#) optimize data structures on the NameNode side.
 - [HDFS-9107](#) fixes a bug that could limit scalability on larger clusters by causing the NameNode to falsely consider DataNodes to be dead.
 - Other bugs included: [HADOOP-11785](#), [HADOOP-12172](#), [HADOOP-11659](#), [HDFS-8845](#)

Apache HBase

- CDH now includes a *scanner heartbeat check*, which enforces a time limit on the execution of scan RPC requests. When the server receives a scan RPC request, a time limit is calculated to be half of the smaller of the two values `hbase.client.scanner.timeout.period` and `hbase.rpc.timeout`. When the time limit is reached, the server will return the results it has accumulated up to that point. For more information, see [Configuring the HBase Scanner Heartbeat](#).

Cloudera Search

- Cloudera Search adds support for Kerberos authentication for hosts running Solr behind a proxy server.
- Cloudera Search adds support for using LDAP and Active Directory for authentication.
- `solrctl` supports the `Config` API.

`solrctl` includes a `config` command that uses the `Config` API to directly manage configurations represented in `Config` objects. `Config` objects represent collection configuration information as specified by the `solrctl collection --create -c configName` command. `instancedir` and `Config` objects handle the same information, meeting the same need from the Solr server perspective, but there a number of differences between these two implementations.

Table 52: Config and instancedir Comparison

Attribute	Config	instancedir
Security	<p>Security support provided.</p> <ul style="list-style-type: none"> • In a Kerberos-enabled cluster, the ZooKeeper hosts associated with configurations created using the Config API automatically have proper ZooKeeper ACLs. • Sentry can be used to control access to the Config API, providing access control. For more information, see Configuring Sentry Authorization for Cloudera Search. 	<ul style="list-style-type: none"> • No ZooKeeper security support. Any user can create, delete, or modify an <code>instancedir</code> directly in ZooKeeper. • Because <code>instancedir</code> updates ZooKeeper directly, it is the client's responsibility to add the proper ACLs, which can be cumbersome.
Creation method	Generated from existing <code>config</code> or <code>instancedir</code> in ZooKeeper using the ConfigSet API.	Manually edited locally and re-uploaded directly to ZooKeeper using <code>solrctl</code> utility.
Template support	<ul style="list-style-type: none"> • Several predefined templates are available. These can be used as the basis for creating additional configs. Additional templates can be created by creating configs that are immutable. • Mutable templates that use a Managed Schema can be modified using the Schema API as opposed to being manually edited. As a result, configs are less flexible, but they are also less error-prone than <code>instancedirs</code>. 	One standard template.

Attribute	Config	instancedir
Sentry support	Configs include a number of templates, each with Sentry-enabled and non-Sentry-enabled versions. To enable Sentry, choose a Sentry-enabled template.	instancedirs include a single template that supports enabling Sentry. To enable Sentry with instancedirs, overwrite the original <code>solrconfig.xml</code> file with <code>solrconfig.xml.secure</code> as described in Enabling Solr as a Client for the Sentry Service Using the Command Line .

- Solr includes a set of built-in immutable configurations.

These templates are instantiated when Solr is initialized. This means these templates are not automatically available after an upgrade. To enable these templates on upgraded installations, use `solrctl init` or initialize Solr using Cloudera Manager. The newly included templates and the functionality each template supports are as follows:

Table 53: Available Config Templates and Attributes

Template Name	Supports Schema API	Uses Schemaless Solr	Supports Sentry
predefinedTemplate			
managedTemplate	■		
schemalessTemplate	■	■	
predefinedTemplateSecure			■
managedTemplateSecure	■		■
schemalessTemplateSecure	■	■	■

Apache Sentry (incubating)

- Sentry is rebased on Apache Sentry 1.5.1.
- Sentry introduces column-level access control for tables in Hive and Impala. Previously, Sentry supported privilege granularity only at the table level. To restrict access to a column of sensitive data, you needed to first create a view for a subset of columns, and then grant privileges on that view. Instead, Sentry now allows you to assign the `SELECT` privilege on a subset of columns in a table.
- Support for enabling Kerberos authentication for the Sentry web server.

Apache Spark

- Spark is rebased on Apache Spark 1.5.0.
- Dynamic allocation is enabled by default. You can explicitly disable dynamic allocation by using the option: `spark.dynamicAllocation.enabled = false`. Dynamic allocation is implicitly disabled if `--num-executors` is specified in the job.
- The following Spark libraries are now supported:
 - Spark SQL (including DataFrames). The following Spark SQL features are not supported:
 - Thrift JDBC/ODBC server
 - Spark SQL CLI
 - MLlib. The following MLlib features are not supported:
 - `spark.ml`
 - ML pipeline APIs
 -

CDH 5 Release Notes

Apache Sqoop

- Sqoop is rebased on Apache Sqoop 1.4.6.

What's New in CDH 5.5.1

This is a maintenance release that fixes important issues in Apache Commons and Apache HBase; for details, see [Issues Fixed in CDH 5.5.1](#) on page 2315.

What's New in CDH 5.5.2

This is a maintenance release that fixes some important issues. For details, see [Issues Fixed in CDH 5.5.2](#) on page 2310.

What's New in CDH 5.5.4

**Note:**

There is no CDH 5.5.3 release. This skip in the CDH 5.x sequence allows the CDH and Cloudera Manager components of Cloudera Enterprise 5.5.4 to have consistent numbering.

This is a maintenance release that fixes some important issues. For details, see [Issues Fixed in CDH 5.5.4](#) on page 2304.

What's New in CDH 5.5.5

This is a maintenance release that fixes some important issues. For details, see [Issues Fixed in CDH 5.5.5](#) on page 2301.

What's New in CDH 5.5.6

This is a maintenance release that fixes some important issues. For details, see [Issues Fixed in CDH 5.5.6](#) on page 2297.

What's New In CDH 5.4.x

What's New in CDH 5.4.0

**Important:**

Upgrading to CDH 5.4.0 and later from any earlier release requires an HDFS metadata upgrade. Be careful to follow all of the upgrade steps as instructed.

For the latest Impala features, see [New Features in Impala 2.2.x / CDH 5.4.x](#) on page 1886.

Operating System Support

CDH 5.4.0 adds support for RHEL and CentOS 6.6.

Security

The following summarizes new security capabilities in CDH 5.4.0:

- Secure Hue impersonation support for the Hue HBase application.
- Redaction of sensitive data from logs, centrally managed by Cloudera Manager, which prevents the `WHERE` clause in queries from leaking sensitive data into logs and management UIs.
- Cloudera Manager support for custom Kerberos principals.
- Kerberos support for Sqoop 2.
- Kerberos and TLS/SSL support for Flume Thrift source and sink.
- Navigator SAML support (requires Cloudera Manager).
- Navigator Key Trustee can now be installed and monitored by Cloudera Manager.
- Search can be configured to use SSL.

- Search supports protecting Solr and Lily HBase Indexer metadata using ZooKeeper ACLs in a Kerberos-enabled environment.

Apache Crunch

New HBase-related features:

- `HBaseTypes.cells()` was added to support serializing HBase Cell objects.
- All of the `HFileUtils` methods now support `PCollectionC extends Cell`, which includes both `PCollectionKeyValue` and `PCollectionCell`, on their method signatures.
- `HFileTarget`, `HBaseTarget`, and `HBaseSourceTarget` all support any subclass of `Cell` as an output type. `HFileSource` and `HBaseSourceTarget` still return `KeyValue` as the input type for backward compatibility with existing Crunch pipelines.

Developers can use Cell-based APIs in the same way as KeyValue-based APIs if they are not ready to update their code, but will probably have to change code inside `DoFns` because HBase 0.99 and later APIs deprecated or removed a number of methods from the HBase 0.96 API.

Apache Flume

CDH 5.4.0 adds SSL and Kerberos support for the Thrift source and sink, and implements `DatasetSink 2.0`.

Apache Hadoop

HDFS

- CDH 5.4.0 implements HDFS 2.6.0.
- CDH 5.4.0 HDFS provides hot-swap capability for DataNode disk drives. You can add or replace HDFS data volumes without shutting down the DataNode host ([HDFS-1362](#)).
- CDH 5.4.0 introduces cluster-wide redaction of sensitive data in logs and SQL queries. See [Sensitive Data Redaction](#).
- CDH 5.4.0 adds support for [Heterogenous Storage Policies](#).
- HDFS 2.6.0+ supports the option to configure AES encryption for block data transfer, using the property `dfs.encrypt.data.transfer.algorithm`. AES offers improved cryptographic strength and performance over the prior options of 3DES and RC4.

MapReduce

CDH 5.4.0 implements [MAPREDUCE-5785](#), which simplifies MapReduce job configuration. Instead of having to set both the heap size (`mapreduce.map.java.opts` or `mapreduce.reduce.java.opts`) and the container size (`mapreduce.map.memory.mb` or `mapreduce.reduce.memory.mb`), you can now choose to set only one of them; the other is inferred from `mapreduce.job.heap.memory-mb.ratio`. If you do not specify either of them, the container size defaults to 1 GB and the heap size is inferred.

For jobs that do not set the heap size, the JVM size increases from 200 MB to a default 820 MB. This is adequate for most jobs, but streaming tasks might need more memory because the Java process causes total usage to exceed the container size. This typically occurs only for those tasks relying on aggressive garbage collection to keep the heap under 200 MB.

YARN

- [YARN-2990](#) improves application launch time by 6 seconds when using FairScheduler (with the default Cloudera Manager settings shown in [YARN \(MR2 Included\) Properties in CDH 5.4.0](#)).

Apache HBase

CDH 5.4.0 implements HBase 1.0.

MultiWAL Support for HBase

CDH 5.4.0 introduces MultiWAL support for HBase region servers, allowing you to increase throughput when a region writes the write-ahead log (WAL).

doAs Impersonation for HBase

CDH 5.4.0 introduces `doAs` impersonation for the HBase Thrift server. `doAs` impersonation allows a client to authenticate to HBase as any user, and re-authenticate at any time, instead of as a static user only.

Read Replicas for HBase

CDH 5.4.0 introduces read replicas, along with a new timeline consistency model. This feature allows you to balance consistency and availability on a per-read basis, and provides a measure of high availability for reads if a RegionServer becomes unavailable.

Storing Medium Objects (MOBs) in HBase

CDH 5.4.0 HBase MOB allows you to store objects up to 10 MB (medium objects, or MOBs) directly in HBase while maintaining read and write performance.

Apache Hive

CDH 5.4.0 implements Hive 1.1.0. New capabilities include:

- A test-only version of [Hive on Spark](#) with the following limitations:
 - Parquet does not currently support vectorization; it simply ignores the setting of `hive.vectorized.execution.enabled`.
 - Hive on Spark does not yet support dynamic partition pruning.
 - Hive on Spark does not yet support HBase. If you want to interact with HBase, Cloudera recommends that you use Hive on MapReduce.

To deploy and test Hive on Spark in a test environment, use Cloudera Manager.

Important: Hive on Spark is included in CDH 5.4 and higher but is not currently supported nor recommended for production use. To try this feature, use it in a test environment until Cloudera resolves currently existing issues and limitations to make it ready for production use.

- Support for JAR files changes without scheduled maintenance.

To implement this capability, proceed as follows:

1. Set `hive.reloadable.aux.jars.path` in `/etc/hive/conf/hive-site.xml` to the directory that contains the JAR files.
2. Execute the `reload;` statement on HiveServer2 clients such as Beeline and the Hive JDBC.

- Beeline support for retrieving and printing query logs.

Some features in the upstream release are not yet supported for production use in CDH; these include:

- [HIVE-7935](#) - Support dynamic service discovery for HiveServer2
- [HIVE-6455](#) - Scalable dynamic partitioning and bucketing optimization
- [HIVE-5317](#) - Implement insert, update, and delete in Hive with full ACID support
- [HIVE-7068](#) - Integrate `AccumuloStorageHandler`
- [HIVE-7090](#) - Support session-level temporary tables in Hive
- [HIVE-7341](#) - Support for Table replication across HCatalog instances
- [HIVE-4752](#) - Add support for HiveServer2 to use Thrift over HTTP

Hue

CDH 5.4.0 adds the following:

- New Oozie editor
- Performance improvements
- New Search facets
- HBase impersonation

Kite

Kite in CDH has been rebased on the 1.0 release upstream. This breaks backward compatibility with existing APIs. The APIs are documented at <http://kitesdk.org/docs/1.0.0/apidocs/index.html>.

Notable changes are:

- Dataset writers that implement flush and sync now extend interfaces (Flushable and Syncable). Writers that no longer have misleading flush and sync methods.
- `DatasetReaderException`, `DatasetWriterException`, and `DatasetRepositoryException` have been removed and replaced with more specific exceptions, such as `IncompatibleSchemaException`. Exception classes now indicate what went wrong instead of what threw the exception.
- The `partition` API is no longer exposed; use the `view` API instead.
- `kite-data-hcatalog` is now `kite-data-hive`.

Note:

From 1.0 on, Kite will be strict about breaking compatibility and will use [semantic versioning](#) to signal which compatibility guarantees you can expect from a release (for example, incompatible changes require increasing the major version number). For more information, see the [Hello, Kite SDK 1.0](#) blog post.

Apache Oozie

- Added Spark action which lets you run Spark applications from Oozie workflows. See the [Oozie documentation](#) for more details.
- The Hive2 action now collects and reports Hadoop Job IDs for MapReduce jobs launched by Hive Server 2.
- The launcher job now uses YARN uber mode for all but the Shell action; this reduces the overhead (time and resources) of running these Oozie actions.

Apache Parquet

- Parquet memory manager now changes the row group size if the current size is expected to cause out-of-memory (OOM) errors because too many files are open. This causes a `WARN` message to be printed in the logs. A new setting, `parquet.memory.pool.ratio`, controls the percentage of the JVM's heap memory Parquet attempts to use.
- To improve job startup time, footers are no longer read by default for MapReduce jobs ([PARQUET-139](#)).

Note:

To revert to the old behavior (`ParquetFileReader` reads in all the files to obtain the footers), set `parquet.task.side.metadata` to `false` in the job configuration.

- The Parquet Avro object model can now read lists and maps written by Hive, Avro, and Thrift (similar capabilities were added to Hive in CDH 5.3). This compatibility fix does not change behavior. The extra record layer wrapping the list elements when Avro reads lists written by Hive can now be removed; to do this, set the expected Avro schema or set `parquet.avro.add-list-element-records` to `false`.
- Avro's map representation now writes null values correctly.
- The Parquet Thrift object model can now read data written by other object models (such as Hive, Impala, or Parquet-Avro), given a Thrift class for the data; compile a Thrift definition into an object, and supply it when creating the job.

Cloudera Search

- Solr metadata stored in ZooKeeper can now be protected by Zookeeper ACLs. In a Kerberos-enabled environment, Solr metadata stored in ZooKeeper is owned by the `solr` user and cannot be modified by other users.

Note:

- The Solr principal name can be configured in Cloudera Manager. The default name is `solr`, although other names can be specified.
- Collection configuration information stored under the `/solr/configs` znode is not affected by this change. As a result, collection configuration behavior is unchanged.

Administrators who modify Solr ZooKeeper metadata through operations like `solrctl init` or `solrctl cluster --put-solrxml` must now supply `solrctl` with a JAAS configuration using the `--jaas` configuration parameter. The JAAS configuration must specify the principal, typically `solr`, that the solr process uses.

End users, who typically do not need to modify Solr metadata, are unaffected by this change.

- Lily HBase Indexer metadata stored in ZooKeeper can now be protected by ZooKeeper ACLs. In a Kerberos-enabled environment, Lily HBase Indexer metadata stored in ZooKeeper is owned by the Solr user and cannot be modified by other users.

End users, who typically do not manage the Lily HBase Indexer, are unaffected by this change.

- The Lily HBase Indexer supports restricting access using Sentry.
- Services included with Search for CDH 5.4.0, including Solr, Key-Value Store Indexer, and Flume, now support SSL.
- The Spark Indexer and the Lily HBase Batch Indexer support delegation tokens for mapper-only jobs.
- Search for CDH 5.4.0 implements [SOLR-5746](#), which improves `solr.xml` file parsing. Error checking for duplicated options or unknown option names was added. These checks can help identify mistakes made during manual edits of the `solr.xml` file. User-modified `solr.xml` files may cause errors on startup due to these parsing improvements.
- By default, `CloudSolrServer` now uses multiple threads to add documents.

Note: Note: Due to multithreading, if document addition is interrupted by an exception, some documents, in addition to the one being added when the failure occurred, may be added.

To get the old, single-threaded behavior, set `parallel updates` to `false` on the `CloudSolrServer` instance.

Related JIRA: [SOLR-4816](#).

- Updates are routed directly to the correct shard leader, eliminating document routing at the server. This allows for near linear indexing throughput scalability. Document routing requires that the `solrj` client must know each document's unique identifier. The unique identifiers allow the client to route the update directly to the correct shard. For additional information, see [Shards and Indexing Data in SolrCloud](#).

Related JIRA: [SOLR-4816](#).

- The `loadSolr` morphline command supports nested documents. For more information, see [Morphlines Reference Guide](#).
- Navigator can be used to audit Cloudera Search activity.
- Search for CDH 5.4 supports logging queries before they are executed. This allows you can identify queries that could increase resource consumption. This also enables improving schemas or filters to meet your performance requirements. To enable this feature, set the `SolrCore` and `SolrCore.Request` log level to `DEBUG`.

Related JIRA: [SOLR-6919](#)

- `UniqFieldsUpdateProcessorFactory`, which Solr Server implements, has been improved to support all of the `FieldMutatingUpdateProcessorFactory` selector options. The `<lst named="fields"> init` param option is deprecated. Replace this option with `<arr name="fieldName">`.

If the `<lst named="fields"> init` param option is used, Solr logs a warning.

Related JIRA: [SOLR-4249](#).

- Configuration information was previously available using `FieldMutatingUpdateProcessorFactory` (`oneOrMany` or `getBooleanArg`). Those methods are now deprecated. The methods have been moved to `NamedList` and renamed to `removeConfigArgs` and `removeBooleanArg`, respectively.

If the `oneOrMany` or `getBooleanArg` methods of `FieldMutatingUpdateProcessorFactory` are used, Solr logs a warning.

Related JIRA: [SOLR-5264](#).

Apache Spark

CDH 5.4.0 Spark is rebased on Apache Spark 1.3.0 and provides the following new capabilities:

- Spark Streaming WAL (write-ahead log) on HDFS, preventing any data loss on driver failure
- Kafka connector for Spark Streaming to avoid the need for the HDFS WAL
- Spark Streaming recovery is supported for production use
- Spark external shuffle service
- Improvements in automatically setting CDH classpaths for Avro, Parquet, Flume, and Hive
- Improvements in the collection of task metrics

The following is not supported in a production environment because of its immaturity:

- Spark SQL (which now includes dataframes)

See also [Apache Spark Known Issues](#) on page 2043 and [Apache Spark Incompatible Changes and Limitations](#) on page 1942.

Apache Sqoop

- **Sqoop 2:**
 - Implements Sqoop 2 version 1.99.5.
 - Sqoop 2 supports Kerberos.
 - Sqoop 2 supports PostgreSQL as the repository database.

What's New in CDH 5.4.1

This is a maintenance release that fixes the following issue; for details of other important fixes, see [Issues Fixed in CDH 5.4.1](#) on page 2339.

Upgrades to CDH 5.4.1 from Releases Earlier than 5.4.0 May Fail

Problem: Because of a change in the implementation of the NameNode metadata upgrade mechanism, upgrading to CDH 5.4.1 from a version lower than 5.4.0 can take an inordinately long time. In a cluster with NameNode high availability (HA) configured and a large number of edit logs, the upgrade can fail, with errors indicating a timeout in the pre-upgrade step on JournalNodes.

What to do:

To avoid the problem: Do not upgrade to CDH 5.4.1; upgrade to CDH 5.4.2 instead.

If you experience the problem: If you have already started an upgrade and seen it fail, contact Cloudera Support. This problem involves no risk of data loss, and manual recovery is possible.

If you have already completed an upgrade to CDH 5.4.1, or are installing a new cluster: In this case you are not affected and can continue to run CDH 5.4.1.

Cloudera Search

- Beginning with CDH 5.4.1, Search for CDH supports configurable transaction log replication levels for replication logs stored in HDFS.

Apache Spark

- Spark supports submitting python applications in cluster mode.

What's New in CDH 5.4.2

This is a maintenance release that fixes the following issue; for details of other important fixes, see [Issues Fixed in CDH 5.4.2](#) on page 2339.

Upgrades to CDH 5.4.1 from Releases Earlier than 5.4.0 May Fail

Problem: Because of a change in the implementation of the NameNode metadata upgrade mechanism, upgrading to CDH 5.4.1 from a version lower than 5.4.0 can take an inordinately long time. In a cluster with NameNode high availability (HA) configured and a large number of edit logs, the upgrade can fail, with errors indicating a timeout in the pre-upgrade step on JournalNodes.

What to do:

CDH 5 Release Notes

To avoid the problem: Do not upgrade to CDH 5.4.1; upgrade to CDH 5.4.2 instead.

If you experience the problem: If you have already started an upgrade and seen it fail, contact Cloudera Support. This problem involves no risk of data loss, and manual recovery is possible.

If you have already completed an upgrade to CDH 5.4.1, or are installing a new cluster: In this case you are not affected and can continue to run CDH 5.4.1.

What's New in CDH 5.4.3

This is a maintenance release that fixes the following issue; for details of other important fixes, see [Issues Fixed in CDH 5.4.3](#) on page 2337.

NameNode Incorrectly Reports Missing Blocks During Rolling Upgrade

Problem: During a rolling upgrade to any of the releases listed below, the NameNode may report missing blocks after rolling back multiple DataNodes. This is caused by a race condition with block reporting between the DataNode and the NameNode. No permanent data loss occurs, but data can be unavailable for up to six hours before the problem corrects itself.

Releases affected: CDH 5.0.6, 5.1.5, 5.2.5, 5.3.3, 5.4.1, 5.4.2

What to do:

To avoid the problem: Cloudera advises skipping the affected releases and installing a release containing the fix. For example, do not upgrade to CDH 5.4.2; upgrade to CDH 5.4.3 instead.

The releases containing the fix are: CDH 5.3.4, 5.4.3

If you have already completed an upgrade to an affected release, or are installing a new cluster: You can continue to run the release, or upgrade to a release that is not affected.

What's New in CDH 5.4.4

This is a maintenance release that fixes some important issues. For details, see [Issues Fixed in CDH 5.4.4](#) on page 2336.

What's New in CDH 5.4.5

This is a maintenance release that fixes some important issues. For details, see [Issues Fixed in CDH 5.4.5](#) on page 2333.

What's New in CDH 5.4.7

Note:

There is no CDH 5.4.6 release. This skip in the CDH 5.x sequence allows the CDH and Cloudera Manager components of Cloudera Enterprise 5.4.7 to have consistent numbering.

This is a maintenance release that fixes some important issues. For details, see [Issues Fixed in CDH 5.4.7](#) on page 2331

What's New in CDH 5.4.8

This is a maintenance release that fixes some important issues; for details, see [Issues Fixed in CDH 5.4.8](#) on page 2328

What's New in CDH 5.4.9

This is a maintenance release that fixes some important issues. For details, see [Issues Fixed in CDH 5.4.9](#) on page 2326.

What's New in CDH 5.4.10

This is a maintenance release that fixes some important issues. For details, see [Issues Fixed in CDH 5.4.10](#) on page 2323.

What's New in CDH 5.4.11

This is a maintenance release that fixes some important issues. For details, see [Issues Fixed in CDH 5.4.11](#) on page 2320

What's New In CDH 5.3.x

What's New in CDH 5.3.0

Oracle JDK 8 Support

CDH 5.3 supports Oracle JDK 1.8.

Apache Hadoop

HDFS

CDH 5.3 provides the following new capabilities:

- **HDFS Data At Rest Encryption** - This feature is now ready for use in production environments.

Important:

Client hosts may need a more recent version of `libcrypto.so`. See [Apache Hadoop Known Issues](#) on page 1952 for more information.

Important: Cloudera provides two solutions:

- **Navigator Encrypt** is production ready and available to Cloudera customers licensed for Cloudera Navigator. Navigator Encrypt operates at the Linux volume level, so it can encrypt cluster data inside and outside HDFS. Consult your Cloudera account team for more information.
- **HDFS Encryption** is production ready and operates at the HDFS directory level, enabling encryption to be applied only to HDFS folders where needed.

- **S3A** - S3A is an HDFS implementation of the Simple Storage Service (S3) from Amazon Web Services. It is similar to S3N, which is the other implementation of this functionality. The key difference is that S3A relies on the officially-supported AWS Java SDK for communicating with S3, while S3N uses a best-effort-supported `jets3t` library to do the same. For a listing of the parameters, see [HADOOP-10400](#).

YARN

YARN now provides a way for long-running applications to get new delegation tokens.

Apache Flume

CDH 5.3 provides a Kafka Channel ([FLUME-2500](#)).

Apache HBase

CDH 5.3 provides `checkAndMutate(RowMutations)`, in addition to existing support for atomic `checkAndPut` as well as `checkAndDelete` operations on individual rows ([HBASE-11796](#)).

Apache Hive

- Hive can use multiple HDFS encryption zones.
- Hive-HBase integration contains many fixes and new features such as reading HBase snapshots.
- Many Hive Parquet fixes.
- Hive Server 2 can handle multiple LDAP domains for authentication.

Hue

New Features:

- Hue is re-based on Hue 3.7
- SAML authentication has been revamped.
- CDH 5.3 simplifies the task of configuring Hue to store data in an Oracle database by bundling the Oracle Install Client.

Apache Oozie

- You can now update the definition and properties of an already running Coordinator. See the [documentation](#) for more information.
- A new `poll` command in the Oozie client polls a Workflow Job, Coordinator Job, Coordinator Action, or Bundle Job until it finishes. See the [documentation](#) for more information.

Apache Parquet

- [PARQUET-132](#): Add type parameter to AvroParquetInputFormat for Spark
- [PARQUET-107](#): Add option to disable summary metadata files
- [PARQUET-64](#): Add support for new type annotations (date, time, timestamp, etc.)

Cloudera Search

New Features:

- Cloudera Search includes a version of Kite 0.15.0, which includes all morphlines-related backports of all fixes and features in Kite 0.17.1. Morphlines now includes functionality that enables partially updating document as well as deleting documents. Partial updating or deleting can be completed by unique IDs or by documents that match a query. For additional information on Kite, see:
 - [Kite repository](#)
 - [Kite Release Notes](#)
 - [Kite documentation](#)
 - [Kite examples](#)
- CrunchIndexerTool now sends a commit to Solr on job success.
- Added support for deleting documents stored in Solr [by unique id](#) as well as [by query](#).

Apache Sentry (incubating)

- Sentry HDFS Plugin - Allows you to configure synchronization of Sentry privileges to HDFS ACLs for specific HDFS directories. This simplifies the process of sharing table data between Hive or Impala and other clients (such as MapReduce, Pig, Spark), by automatically updating the ACLs when a `GRANT` or `REVOKE` statement is executed. It also allows all roles and privileges to be managed in a central location (by Sentry).
- Metrics - CDH 5.3 supports metrics for the Sentry service. These metrics can be reported either through JMX or the console; configure this by setting the property `sentry.service.reporter` to `jmx` or `console`. A Sentry web server listening by default on port 51000 can expose the metrics in `json` format. Web reporting is disabled by default; enable it by setting `sentry.service.web.enable` to `true`. You can configure the port on which Sentry web server listens by means of the `sentry.service.web.port` property .

Apache Spark

- CDH Spark has been rebased on Apache Spark 1.2.0.
- Spark Streaming can now save incoming data to a WAL (write-ahead log) on HDFS, preventing any data loss on driver failure.

Important:

This feature is currently in Beta; Cloudera includes it in CDH Spark but does not support it.

- The YARN back end now supports dynamic allocation of executors. See [Job Scheduling](#) for more information.
- Native library paths (set via Spark configuration options) are correctly propagated to executors in YARN mode ([SPARK-1719](#)).
- The Snappy codec should now work out-of-the-box on Linux distributions with older `glibc` versions such as CentOS 5.
- Spark SQL now includes the Spark Thrift Server in CDH.

**Important:**

Spark SQL remains an experimental and unsupported feature in CDH.

See [Apache Spark Incompatible Changes and Limitations](#) on page 1942 and [Apache Spark Known Issues](#) on page 2043 for additional important information.

Apache Sqoop

- **Sqoop 1:**

- The MySQL connector now fetches on a row-by row-basis.
- The SQL server now has *upsert* (insert or update) support ([SQOOP-1403](#)).
- The Oracle direct connector now works with index-organized tables ([SQOOP-1632](#)). To use this capability, you must set the chunk method to `PARTITION`:

```
-Doraoop.chunk.method=PARTITION
```

- **Sqoop 2:**

- `FROM/TO` re-factoring is now supported ([SQOOP-1367](#)).

What's New in CDH 5.3.1

This is a maintenance release that fixes some important issues; for details, see [Issues Fixed in CDH 5.3.1](#) on page 2360.

What's New in CDH 5.3.2

This is a maintenance release that fixes some important issues; for details, see [Issues Fixed in CDH 5.3.2](#) on page 2358.

What's New in CDH 5.3.3

This is a maintenance release that fixes some important issues; for details, see [Issues Fixed in CDH 5.3.3](#) on page 2356.

What's New in CDH 5.3.4

This is a maintenance release that fixes some important issues; for details, see [Issues Fixed in CDH 5.3.4](#) on page 2354.

What's New in CDH 5.3.5

This is a maintenance release that fixes the following issue. For details of other fixes, see [Issues Fixed in CDH 5.3.5](#) on page 2354:

Potential job failures during YARN rolling upgrades to CDH 5.3.4

Problem: A MapReduce security fix introduced a compatibility issue that results in job failures during YARN rolling upgrades from CDH 5.3.3 to CDH 5.3.4.

Cloudera Bug: CDH-28680

Release affected: CDH 5.3.4

Release containing the fix: CDH 5.3.5

Workarounds: You can use any one of the following workarounds for this issue:

- Upgrade to CDH 5.3.5.
- Restart any jobs that might have failed during the upgrade.
- Explicitly set the version of MapReduce to be used so it is picked on a per-job basis.
 1. Update the YARN property, **MR Application Classpath** (`mapreduce.application.classpath`), either in Cloudera Manager or in the `mapred-site.xml` file. Remove all existing values and add a new entry: `<parcel-path>/lib/hadoop-mapreduce/*`, where `<parcel-path>` is the absolute path to the parcel

installation. For example, the default installation path for the CDH 5.3.3 parcel would be:
`/opt/cloudera/parcels/CDH-5.3.3-1.cdh5.3.3.p0.5/lib/hadoop-mapreduce/*`.

2. Wait until jobs submitted with the above client configuration change have run to completion.
3. Upgrade to CDH 5.3.4.
4. Update the **MR Application Classpath** (`mapreduce.application.classpath`) property to point to the new CDH 5.3.4 parcel.

Do *not* delete the old parcel until after all jobs submitted prior to the upgrade have finished running.

What's New in CDH 5.3.6

This is a maintenance release that fixes several issues. For details, see [Issues Fixed in CDH 5.3.6](#) on page 2352.

What's New in CDH 5.3.8

This is a maintenance release that fixes some important issues; for details, see [Issues Fixed in CDH 5.3.8](#) on page 2350.

What's New in CDH 5.3.9

This is a maintenance release that fixes some important issues; for details, see [Issues Fixed in CDH 5.3.9](#) on page 2348.

What's New in CDH 5.3.10

This is a maintenance release that fixes some important issues; for details, see [Issues Fixed in CDH 5.3.10](#) on page 2346.

What's New In CDH 5.2.x

What's New in CDH 5.2.0

**Important:**

Upgrading to CDH 5.2.0 and later from any earlier release requires an HDFS metadata upgrade and other steps not usually required for a minor-release upgrade.

CDH 5.2.0 is a minor release which includes new features and bug fixes.

Go to [Issues Fixed In CDH 5.2.0](#) or keep reading for [New Features and Changes](#) on page 1848.

See also [Known Issues in CDH 5](#) on page 1944.

New Features and Changes

New features and changes are grouped by area.

Operating System Support

CDH 5.2.0 adds support for Ubuntu Trusty (version 14.04).

**Important:**

Installing CDH by adding a repository entails an additional step on Ubuntu Trusty, to ensure that you get the CDH version of ZooKeeper, rather than the version that is bundled with Trusty.

Apache Avro

CDH 5.2 implements Avro version 1.7.6, with backports from 1.7.7. Important changes include:

- [AVRO-1398](#): Increase default sync interval from 16k to 64k. There is a very small chance this could causes an incompatibility in some cases, but you can be control the interval by setting `avro.mapred.sync.interval` in the MapReduce job configuration. For example, set it to 16000 to get the old behavior.

- [AVRO-1355](#): Record schema should reject duplicate field names. This change rejects schemas with duplicate field names. This could affect some applications, but if schemas have duplicate field names then they are unlikely to work properly in any case. The workaround is to make sure a record's field names are unique within the record.

Apache Hadoop

HDFS

CDH 5.2 provides the following new capabilities:

- **HDFS Data at Rest Encryption**

Note: Cloudera provides the following two solutions for data at rest encryption:

- **Navigator Encrypt** - Is production ready and available for Cloudera customers licensed for Cloudera Navigator. Navigator Encrypt operates at the Linux volume level, so it can encrypt cluster data inside and outside HDFS. Talk to your Cloudera account team for more information about this capability.
- **HDFS Encryption** - Included in CDH 5.2.0 and operates at the HDFS folder level, enabling encryption to be applied only to HDFS folders where needed. This feature has several known limitations. Therefore, Cloudera does not currently support this feature in CDH 5.2 and it is *not* recommended for production use. To try the feature, upgrade to the latest version of CDH 5.

HDFS now implements transparent, end-to-end encryption of data read from and written to HDFS by creating encryption zones. An encryption zone is a directory in HDFS with all of its contents, that is, every file and subdirectory in it, encrypted. You can use either the **KMS** or the **Key Trustee** service to store, manage, and access encryption zone keys.

HDFS now implements transparent, end-to-end encryption of data read from and written to HDFS by creating encryption zones. An encryption zone is a directory in HDFS with all of its contents, that is, every file and subdirectory in it, encrypted.

- Extended attributes: HDFS `XATTRS` allow extended attributes to be stored per file (<https://issues.apache.org/jira/browse/HDFS-2006>).
- Authentication improvements when using an HTTP proxy server.
- A new Hadoop Metrics sink that allows writing directly to Graphite.
- Specification for Hadoop Compatible Filesystem effort.
- `OfflineImageViewer` to browse an `fsimage` via the WebHDFS API.
- Supportability improvements and bug fixes to the NFS gateway.
- Modernized web UIs (HTML5 and JavaScript) for HDFS daemons.

MapReduce

CDH 5.2 provides an optimized implementation of the mapper side of the MapReduce shuffle. The optimized implementation may require tuning different from the original implementation, and so it is considered experimental and is not enabled by default.

You can select this new implementation on a per-job basis by setting the job configuration value

```
mapreduce.job.map.output.collector.class to
org.apache.hadoop.mapred.nativetask.NativeMapOutputCollectorDelegator, or use enable Cloudera
Manager to enable it.
```

Some jobs which use custom writable types or comparators may not be able to take advantage of the optimized implementation.

the following new capabilities and improvements:

YARN

CDH 5.2 provides the following new capabilities and improvements:

- New features and improvements in the Fair Scheduler:
 - New features:
 - Fair Scheduler now allows setting the `fairsharePreemptionThreshold` per queue (leaf and non-leaf). This threshold is a decimal value between 0 and 1; if a queue's usage is under (`preemption-threshold * fairshare`) for a configured duration, resources from other queues are preempted to satisfy this queue's request. Set this value in `fair-scheduler.xml`. The default value is 0.5.
 - Fair Scheduler now allows setting the `fairsharePreemptionTimeout` per queue (leaf and non-leaf). For a starved queue, this timeout determines when to trigger preemption from other queues. Set this value in `fair-scheduler.xml`.
 - Fair Scheduler now shows the **Steady Fair Share** in the Web UI. The Steady Fair Share is the share of the cluster resources a particular queue or pool would get if all existing queues had running applications.
 - Improvements:
 - Fair Scheduler uses **Instantaneous Fair Share** (`fairshare` that considers only active queues) for scheduling decisions to improve the time to achieve steady state (fairshare).
 - The default for `maxAMShare` is now 0.5, meaning that only half the cluster's resources can be taken up by Application Masters. You can change this value in `fair-scheduler.xml`.
- YARN's REST APIs support submitting and killing applications.
- YARN's timeline store is integrated with Kerberos.

Apache Crunch

CDH 5.2 provides the following new capabilities:

- Improvements in [Scrunch](#), including:
 - New `join` API that matches the one in Crunch
 - New aggregation API, including support for [Algebird](#)-based aggregations
 - Built-in serialization support for all tuple types as well as case classes.
- A new module, `crunch-hive`, for reading and writing **Optimized Row Columnar** (ORC) Files with Crunch.

Apache Flume

CDH 5.2 provides the following new capabilities:

- [Kafka](#) Integration: Flume can now accept data from Kafka via the `KafkaSource` ([FLUME-2250](#)) and push to Kafka using the `KafkaSink` ([FLUME-2251](#)).
- Kite Sink can now write to Hive and HBase datasets ([FLUME-2463](#)).
- Flume agents can now be configured via Zookeeper (experimental, [FLUME-1491](#))
- Embedded Agents now support Interceptors ([FLUME-2426](#))
- `syslog` Sources now support configuring which fields should be kept ([FLUME-2438](#))
- File Channel replay is now much faster ([FLUME-2450](#))
- New regular-expression search-and-replace interceptor ([FLUME-2431](#))
- Backup checkpoints can be optionally compressed ([FLUME-2401](#))

Hue

CDH 5.2 provides the following new capabilities:

- New application for editing Sentry roles and Privileges on databases and tables
- Search App
- Heatmap, Tree, Leaflet widgets
- Micro-analysis of fields
- Exclusion facets
- Oozie Dashboard: bulk actions, faster display
- File Browser: drag-and-drop upload, history, ACLs edition

- Hive and Impala: LDAP pass-through, query expiration, TLS/SSL (Hive), new graphs
- Job Browser: YARN kill application button

Apache HBase

CDH 5.2 implements HBase 0.98.6, which represents a minor upgrade to HBase. This upgrade introduces new features and moves some features which were previously marked as experimental to fully supported status.

Apache Hive

CDH 5.2 introduces the following important changes in Hive.

- CDH 5.2 implements Hive 0.13, providing the following new capabilities:
 - Sub-queries in the `WHERE` clause
 - Common table expressions (CTE)
 - Parquet supports `timestamp`
 - HiveServer2 can be configured with a `hiverc` file that is automatically run when users connect
 - Permanent UDFs
 - HiveServer2 session and operation timeouts
 - Beeline accepts a `-i` option to initialize with a SQL file
 - New `join` syntax (implicit joins)
- As of CDH 5.2.0, you can create Avro-backed tables simply by using `STORED AS AVRO` in a DDL statement. The AvroSerDe takes care of creating the appropriate Avro schema from the Hive table schema, making it much easier to use Avro with Hive.
- Hive supports additional datatypes, as follows:
 - Hive can read `char` and `varchar` datatypes written by Hive, and `char` and `varchar` datatypes written by Impala.
 - Impala can read `char` and `varchar` datatypes written by Hive and Impala.

These new types have been enabled by expanding the supported DDL, so they are backward compatible. You can add `varchar(n)` columns by creating new tables with that type, or changing a *string* column in existing tables to `varchar`.

Note:

`char(n)` columns are not stored in a fixed-length representation, and do not improve performance (as they do in some other databases). Cloudera recommends that in most cases you use `text` or `varchar` instead.

- `DESCRIBE DATABASE` returns additional fields: `owner_name` and `owner_type`. The command will continue to behave as expected if you identify the field you're interested in by its (string) name, but could produce unexpected results if you use a numeric index to identify the field(s).

Impala

Impala in CDH 5.2.0 includes major new features such as spill-to-disk for memory-intensive queries, subquery enhancements, analytic functions, and new `CHAR` and `VARCHAR` data types. For the full feature list and more details, see [What's New in Apache Impala](#) on page 1869.

Kite

Kite is an open source set of libraries, references, tutorials, and code samples for building data-oriented systems and applications. For more information about Kite, see the [Kite SDK Development Guide](#).

Kite has been rebased to version 0.15.0 in CDH 5.2.0, from the base version 0.10.0 in CDH 5.1. `kite-morphlines` modules are backward-compatible, but this change breaks backward-compatibility for the `kite-data` API.

Kite Data

The Kite data API has had substantial updates since the version included in CDH 5.1.

Changes from 0.15.0

The Kite version in CDH 5.2 is based on 0.15.0, but includes some newer changes. Specifically, it includes support for dataset namespaces, which can be used to set the database in the Hive Metastore.

The introduction of namespaces changed the file system repository layout; now there is an additional namespace directory for datasets stored in HDFS (`repository/namespace/dataset/`). There are no compatibility problems when you use `Dataset` URIs, but all datasets created with the `DatasetRepository` API will be located in a namespace directory. This new directory level is not expected in Kite 0.15.0 or 0.16.0 and will prevent the dataset from being loaded. The work-around is to switch to using `Dataset` URIs (see below) that include the namespace component. Existing datasets will work without modification.

Except as noted above, Kite 0.15.0 in CDH 5.2 is fully backward-compatible. It can load datasets written with any previous Kite version.

Dataset URIs

Datasets are identified with a single URI, rather than a repository URI and dataset name. The dataset URI contains all the information Kite needs to determine which implementation (Hive, HBase, or HDFS) to use for the dataset, and includes both the dataset's name and a namespace.

The Kite API has been updated so that developers call methods in the `Datasets` utility class as they would use `DatasetRepository` methods. The `Datasets` methods are recommended, and the `DatasetRepository` API is deprecated.

Views

The Kite data API now allows you to select a view of the dataset by setting constraints. These constraints are used by Kite to automatically prune unnecessary partitions and filter records.

MapReduce input and output formats

The `kite-data-mapreduce` module has been added. It provides both `DatasetKeyInputFormat` and `DatasetKeyOutputFormat` that allow you to run MapReduce jobs over datasets or views. Spark is also supported by the input and output formats.

Dataset CLI tool

Kite now includes a command-line utility that can run common maintenance tasks, like creating a dataset, migrating a dataset's schema, copying from one dataset to another, and importing CSV data. It also has helpers that can create Avro schemas from data files and other Kite-related configuration.

Flume DatasetSink

The Flume `DatasetSink` has been updated for the `kite-data` API changes. It supports all previous configurations without modification.

In addition, the `DatasetSink` now supports dataset URIs with the configuration option `kite.dataset.uri`.

Apache Mahout

Mahout jobs launched from the `bin/mahout` script will now use cluster's default parameters, rather than hard-coded parameters from the library. This may change the algorithms' run-time behavior, possibly for the better. ([MAHOUT-1565](#).)

Apache Oozie

CDH 5.2 introduces the following important changes:

- A new [Hive 2 Action](#) allows Oozie to run HiveServer2 scripts. Using the Hive Action with HiveServer2 is now deprecated; you should switch to the new Hive 2 Action as soon as possible.
- The MapReduce action can now also be configured by Java code
This gives users the flexibility of using their own driver Java code for configuring the MR job, while also getting the advantages of the MapReduce action (instead of using the Java action). See the [documentation](#) for more info.
- The `PurgeService` is now able to remove completed child jobs from long running coordinator jobs
- `ALL` can now be set for `oozie.service.LiteWorkflowStoreService.user.retry.error.code.ext` to make Oozie retry actions automatically for every type of error
- All Oozie servers in an Oozie HA group now synchronize on the same randomly generated rolling secret for signing auth tokens
- You can now upgrade from CDH 4.x to CDH 5.2 and later with jobs in `RUNNING` and `SUSPENDED` states. (An upgrade from CDH 4.x to a CDH 5.x release *earlier* than CDH 5.2.0 would still require that no jobs be in either of those states).

Apache Parquet (incubating)

CDH 5.2 Parquet is rebased on Parquet 1.5 and Parquet-format 2.1.0.

Cloudera Search

New Features:

- Cloudera Search adds support for Spark indexing using the `CrunchIndexerTool`.
- Cloudera Search adds fault tolerance for single-shard deployments. This fault tolerance is enabled with a new `-a` option in `solrctl`, which configures shards to automatically be re-added on an existing, healthy node if the node hosting the shard become unavailable.
- Components of Cloudera Search include Kite 0.15.0. This includes all morphlines-related backports of all fixes and features in Kite 0.17.0. For additional information on Kite, see:
 - [Kite repository](#)
 - [Kite Release Notes](#)
 - [Kite documentation](#)
 - [Kite examples](#)
- Search adds support for multi-threaded faceting on fields. This enables parallelizing operations, allowing them to run more quickly on highly concurrent hardware. This is especially helpful in cases where faceting operations apply to large datasets over many fields.
- Search adds support for distributed pivot faceting, enabling faceting on multi-shard collections.

Apache Sentry (incubating)

CDH 5.2 introduces the following changes to Sentry.

Sentry Service:

- If you are using the database-backed Sentry service, upgrading from CDH 5.1 to CDH 5.2 will require a schema upgrade.
- **Hive SQL Syntax:**
 - `GRANT` and `REVOKE` statements have been expanded to include `WITH GRANT OPTION`, thus allowing you to delegate granting and revoking privileges.
 - The `SHOW GRANT ROLE` command has been updated to allow non-admin users to list grants for roles that are currently assigned to them.
 - The `SHOW ROLE GRANT GROUP <groupName>` command has been updated to allow non-admin users that are part of the group specified by `<groupName>` to list all roles assigned to this group.

Apache Spark

CDH 5.2 Spark is rebased on Apache Spark/Streaming 1.1 and provides the following new capabilities:

- Stability and performance improvements.
- New sort-based shuffle implementation (disabled by default).
- Better performance monitoring through the Spark UI.
- Support for arbitrary Hadoop `InputFormats` in PySpark.
- Improved Yarn support with several bug fixes.

Apache Sqoop

CDH 5.2 Sqoop 1 is rebased on Sqoop 1.4.5 and includes the following changes:

- Mainframe connector added.
- Parquet support added.

There are no changes for Sqoop 2.

What's New in CDH 5.2.1

CDH 5.2.1 maintenance release that fixes the “POODLE” and Apache Hadoop Distributed Cache vulnerabilities described below. All CDH 5.2.0 users should upgrade to 5.2.1 as soon as possible.

Go to [Issues Fixed In CDH 5.2.1](#).

“POODLE” Vulnerability on TLS/SSL enabled ports

The POODLE (Padding Oracle On Downgraded Legacy Encryption) attack forces the use of the obsolete SSLv3 protocol and then exploits a cryptographic flaw in SSLv3. The only solution is to disable SSLv3 entirely. This requires changes across a wide variety of components of CDH and Cloudera Manager in 5.2.0 and all earlier versions. CDH 5.2.1 provides these changes for CDH 5.2.0 deployments. For more information, see the [Cloudera Security Bulletin](#).

Apache Hadoop Distributed Cache Vulnerability

The Distributed Cache Vulnerability allows a malicious cluster user to expose private files owned by the user running the YARN NodeManager process. For more information, see the [Cloudera Security Bulletin](#).

What's New in CDH 5.2.3

This is a maintenance release that fixes some important issues; for details, see [Issues Fixed in CDH 5.2.3](#).

What's New in CDH 5.2.4

This is a maintenance release that fixes some important issues; for details, see [Issues Fixed in CDH 5.2.4](#).

What's New in CDH 5.2.5

This is a maintenance release that fixes some important issues; for details, see [Issues Fixed in CDH 5.2.5](#).

What's New in CDH 5.2.6

This is a maintenance release that fixes some important issues; for details, see [Issues Fixed in CDH 5.2.6](#).

What's New in CDH 5.1.x

The following sections describe what's new in CDH 5.1.x releases. You can also review [Known Issues in CDH 5](#) on page 1944 and [Incompatible Changes and Limitations](#) on page 1916.

What's New in CDH 5.1.0

This is a minor release, which includes new features, changes, and fixed issues. See also [Issues Fixed in CDH 5.1.0](#) on page 2375.

New Features and Changes in CDH 5.1.0

This is a minor release which introduces the following new features and changes, organized by component. See also [What's New in Apache Impala](#) on page 1869.

Operating System Support

CDH 5.1 adds support for version 6.5 of RHEL and related platforms.

Apache Crunch

- CDH 5.1.0 implements Crunch 0.10.0.

Apache Flume

- CDH 5.1.0 implements Flume 1.5.0.

Apache Hadoop

HDFS

POSIX Access Control Lists: As of CDH 5.1, HDFS supports POSIX Access Control Lists (ACLs), an addition to the traditional POSIX permissions model already supported. ACLs provide fine-grained control of permissions for HDFS files by providing a way to set different permissions for specific named users or named groups.

NFS Gateway Improvements: CDH 5.1 makes the following improvements to the HDFS NFS gateway capability:

- Subdirectory mounts :
 - Previously, clients could mount only the HDFS root directory.
 - As of CDH 5.1, a single mount point, configured via the `nfs.export.point` property in `hdfs-site.xml` on the NFS gateway node, is available to clients.
- Improved support for Kerberized clusters ([HDFS-5898](#)):
 - Previously the NFS Gateway could connect to a secure cluster, but didn't support logging in from a keytab.
 - As of CDH 5.1, set the `nfs.kerberos.principal` and `nfs.keytab.file` properties in `hdfs-site.xml` to allow users to log in from a keytab.
- Support for port monitoring ([HDFS-6406](#)):
 - Previously, the NFS Gateway would always accept connections from any client.
 - As of CDH 5.1, set `nfs.port.monitoring.disabled` to `false` in `hdfs-site.xml` to allow connections only from privileged ports (those with root access).
- Static uid/gid mapping for NFS clients that are not in synch with the NFS Gateway ([HDFS-6435](#)):
 - NFS sends UIDs and GIDs over the network from client to server, meaning that the UIDs and GIDs must be in synch between clients and server machines in order for users and groups to be set appropriately for file access and file creation; this is usually but not always the case.
 - As of CDH 5.1, you can configure a static UID/GID mapping file, by default `/etc/nfs.map`.
 - You can change the default (to use a different file path) by means of the `nfs.static.mapping.file` property in `hdfs-site.xml`.
 - The following sample entries illustrate the format of the file:

```
uid 10 100 # Map the remote UID 10 the local UID 100
gid 11 101 # Map the remote GID 11 to the local GID 101
```

- Hadoop portmap, or insecure system portmap, no longer required:
 - Many supported OS have portmap bugs detailed [here](#).
 - CDH 5.1 allows you to circumvent the problems by starting the NFS gateway as root, whether you install CDH from packages or parcels.

**Note:**

After initially registering with the system portmap as root, the NFS Gateway drops privileges and runs as a regular user.

- Cloudera Manager starts the gateway as root by default.
- Support for AIX NFS clients ([HDFS-6549](#)):
 - To deploy AIX NFS clients, set `nfs.aix.compatibility.mode.enabled` to `true` in `hdfs-site.xml`.
 - This enables code that handles bugs in the AIX implementation of NFS.

MapReduce and YARN

YARN with Impala supports Dynamic Prioritization.

Apache HBase

- CDH 5.1.0 implements HBase 0.98.
- As of CDH 5.1.0, HBase fully supports BucketCache, which was introduced as an experimental feature in CDH 5 Beta 1.
- HBase now supports access control for `EXEC` permissions.
- CDH 5.1.0 HBase introduces a reverse scan API; allowing you to scan a table in reverse.
- You can now run a MapReduce job over a snapshot from HBase, rather than being limited to live data.
- A new stateless streaming scanner is available over the REST API.
- The `delete*` methods of the Delete class of the HBase Client API now use the timestamp from the constructor, the same behavior as the Put class. (In HBase versions before CDH 5.1, the `delete*` methods ignored the constructor's timestamp, and used the value of `HConstants.LATEST_TIMESTAMP`. This behavior was different from the behavior of the `add()` methods of the Put class.)
- The `SnapshotInfo` tool has been enhanced in the following ways:
 - A new option, `-list-snapshots`, has been added to the `SnapshotInfo` command. This option allows you to list snapshots on either a local or remote server.
 - You can now pass the `-size-in-bytes` flag to print the size of snapshot files in bytes rather than the default human-readable format.
 - The size of each snapshot file in bytes is checked against the size reported in the manifest, and if the two sizes differ, the tool reports the file as corrupt.
- A new `-target` option for `ExportSnapshot` allows you to specify a different name for the target cluster from the snapshot name on the source cluster.

In addition, Cloudera has fixed some binary incompatibilities between HBase 0.96 and 0.98. As a result, the incompatibilities introduced by [HBASE-10452](#) and [HBASE-10339](#) *do not* affect CDH 5.1 HBase, as explained below:

- HBASE-10452 introduced a new exception and error message in `setTimeStamp()`, for an extremely unlikely event when where getting a `TimeRange` could fail because of an integer overflow. CDH 5.1 suppresses the new exception to retain compatibility with HBase 0.96, but logs the error.
- HBASE-10339 contained code which inadvertently changed the signatures of the `getFamilyMap` method. CDH 5.1 restores these signatures to those used in HBase 0.96, to retain compatibility.

Apache Hive

- Permission inheritance fixes
- Support for decimal computation, and for reading and writing decimal-format data from and to Parquet and Avro

Hue

CDH 5.1.0 implements Hue 3.6.

New Features:

- Search App v2:
 - 100% Dynamic dashboard
 - Drag-and-Drop dashboard builder
 - Text, Timeline, Pie, Line, Bar, Map, Filters, Grid and HTML widgets
 - Solr Index creation wizard (from a file)
- Ability to view compressed Snappy, Avro and Parquet files
- Impala HA
- Close Impala and Hive sessions queries and commands

Apache Mahout

- CDH 5.1.0 implements Mahout 0.9.

See also [Apache Mahout Incompatible Changes and Limitations](#) on page 1938.

Apache Oozie

- You can now submit Sqoop jobs from the Oozie command line.
- LAST_ONLY execution mode now works correctly ([OOZIE-1319](#)).

Cloudera Search

New Features:

- A Quick Start script that automates using Search to query data from the Enron Email dataset. The script downloads the data, expands it, moves it to HDFS, indexes, and pushes the results live. The documentation now also includes a companion quick start guide, which describes the tasks the script completes, as well as customization options.
- `solrctl` now has built-in support for schema-less Solr.
- Sentry-based document-level security for role-based access control of a collection. Document-level access control associates authorization tokens with each document in the collection, enabling granting Sentry roles access to sets of documents in a collection.
- Cloudera Search includes a version of Kite 0.10.0, which includes all morphlines-related backports of all fixes and features in Kite 0.15.0. For additional information on Kite, see:
 - [Kite repository](#)
 - [Kite Release Notes](#)
 - [Kite documentation](#)
 - [Kite examples](#)
- Support for the Parquet file format is included with this version of Kite 0.10.0.
- Inclusion of `hbase-indexer-1.5.1`, a new version of the Lily HBase Indexer. This new version of the indexer includes the 0.10.0 version of Kite mentioned above. This 0.10.0 version of Kite includes the backports and fixes included in Kite 0.15.0.

Apache Sentry (incubating)

- CDH 5.1.0 implements Sentry 1.2. This includes a database-backed Sentry service which uses the more traditional GRANT/REVOKE statements instead of the previous policy file approach making it easier to maintain and modify privileges.
- Revised authorization privilege model for Hive and Impala.

Apache Spark

- CDH 5.1.0 implements Spark 1.0.
- The `spark-submit` command abstracts across the variety of deployment modes that Spark supports and takes care of assembling the classpath for you.
- Application History Server (SparkHistoryServer) improves monitoring capabilities.
- You can launch PySpark applications against YARN clusters. PySpark currently only works in YARN Client mode.

Other improvements include:

- Streaming integration with Kerberos
- Addition of more algorithms to MLLib (Sparse Vector Support)
- Improvements to Avro integration
- Spark SQL alpha release (new SQL engine). Spark SQL allows you to run SQL statements inside a Spark application that manipulate and produce RDDs.

Note:

Because of its immaturity and alpha status, Cloudera does not currently offer commercial support for Spark SQL, but bundles it with our distribution so that you can try it out.

- Authentication of all Spark communications

What's New in CDH 5.1.2

This is a maintenance release which fixes several issues. See [Issues Fixed in CDH 5.1.2](#) on page 2374

Note:

There is no CDH 5.1.1 release. This skip in the CDH 5.x sequence allows the CDH and CM components of Cloudera Enterprise 5.1.2 to have consistent numbering.

What's New in CDH 5.1.3

This is a maintenance release that fixes several issues. See [Issues Fixed in CDH 5.1.3](#) on page 2373.

What's New in CDH 5.1.4

This is a maintenance release that fixes important security issues. See [Issues Fixed in CDH 5.1.4](#) on page 2372,

What's New in CDH 5.1.5

This is a maintenance release that fixes several issues. See [Issues Fixed in CDH 5.1.5](#) on page 2371.

What's New in CDH 5.0.x

Use these links to go to a specific release.

What's New in CDH 5.0.0

This is a major release which includes new features, changes, and fixed issues. See also [Issues Fixed in CDH 5.0.x](#) on page 2376 and [Known Issues in CDH 5](#) on page 1944.

For information about CDH 5 Beta releases, see [What's New In CDH 5 Beta Releases](#) on page 1861.

New Features and Changes in CDH 5.0.0

Apache Hadoop

Apache Hadoop MapReduce Version 1 (MRv1) and Version 2 (MRv2)

Important: Cloudera recommends that you use YARN (now production-ready) with CDH 5.

- **MapReduce 2.0 (MRv2):** CDH 5 includes MapReduce 2.0 (MRv2) running on YARN. The YARN architecture splits up the two primary responsibilities of the JobTracker — resource management and job scheduling/monitoring — into separate daemons: a global ResourceManager (RM) and per-application ApplicationMasters (AM). With MRv2, the ResourceManager (RM) and per-node NodeManagers (NM) form the data-computation framework. The ResourceManager service effectively replaces the functions of the JobTracker, and NodeManagers run on worker nodes instead of TaskTracker daemons. The per-application ApplicationMaster is, in effect, a framework-specific

library and is tasked with negotiating resources from the ResourceManager and working with the NodeManagers to execute and monitor tasks. See [Apache Hadoop NextGen MapReduce \(YARN\)](#) for more information.

- **MapReduce Version 1 (MRv1):** For backward compatibility, CDH 5 continues to support the original MapReduce JobTracker and TaskTrackers, but you should migrate to MRv2.

Note:

Cloudera does not support running MRv1 and YARN daemons on the same nodes at the same time.

- **Deprecated properties:**

In Hadoop 2.0.0 and later (MRv2), several Hadoop and HDFS properties have been deprecated. (The change dates from Hadoop 0.23.1, on which the Beta releases of CDH 4 were based). See [Hadoop Deprecated Properties](#) for a list of deprecated properties and their replacements.

Note: Deprecated properties continue to work in MRv1. However, new `mapreduce*` properties do not work in MRv1.

HDFS

New Features:

- [HDFS-5776](#)- Hedged reads in HDFS for improved HBase MTTR.
- [HDFS-4685](#)- Implementation of extended file access control lists in HDFS.

Notable Bug Fixes:

- [HDFS-5339](#) - WebHDFS URI does not accept logical nameservices when security is enabled.
- [HDFS-5898](#) - Allow NFS gateway to login/relogin from its Kerberos keytab.
- [HDFS-5921](#) - "Browse filesystem" on the Namenode UI does not work if any directory has the sticky bit set.
- HDFS and Hive replication between different Kerberos realms now works.
- [HDFS-5922](#) - DataNode heartbeat thread can get stuck in a tight loop.

MapReduce & YARN

New Feature:

- FairScheduler supports moving running applications between queries.

Notable Bug Fixes:

- Several critical fixes to stabilize ResourceManager HA - Web UI, unmanaged ApplicationMasters and secure-cluster support.
- Support for large values of `mapreduce.task.io.sort.mb`.
- JobHistory Server has information on failed MapReduce jobs.

Apache HBase

New Features:

- [HBASE-10436](#)- Restore RegionServer lists removed from HBase 0.96.0 JMX.

Many of the metrics exposed in CDH 4/0.94 were removed with the refactorization of metrics in CDH 5/0.96. This patch restores the availability of the lists of live and dead RegionServers. In 0.94 this was a large nested structure as shown below, which included the RegionServer lists and metrics from each region.

```
{
  "name" : "hadoop:service=Master,name=Master",
  "modelerType" : "org.apache.hadoop.hbase.master.MXBeanImpl",
  "ZookeeperQuorum" : "localhost:2181",
```

```

....
  "RegionsInTransition" : [ ],
  "RegionServers" : [ {
    "key" : "localhost,48346,1390857257246",
    "value" : {
      "load" : 2,
    }
  }
....

```

CDH 5 Beta 1 and Beta 2 did not contain this list; they only displayed counts of the number of live and dead RegionServers. As of CDH 5.0.0, this list is now presented in a semi-colon separated field as follows:

```

{
  "name" : "Hadoop:service=HBase,name=Master,sub=Server",
  "modelerType" : "Master,sub=Server",
  "tag.Context" : "master",
  "tag.liveRegionServers" : "localhost,56196,1391992019130",
  "tag.deadRegionServers" :
"localhost,40010,1391035309673;localhost,41408,1391990380724;localhost,38682,1390950017735",
  ...
}

```

- Assorted usability and compatibility improvements as well as improvements to exporting snapshots.

Apache Flume

New Feature:

- The HBase Sink now supports coalescing multiple Increment RPCs into one ([FLUME-2338](#)).

Changed Behavior:

- File Channel Write timeout has been removed and the configuration parameter is now ignored ([FLUME-2307](#)).
- Syslog UDP source can now accept larger messages ([FLUME-2130](#)).
- AsyncHBase Sink is now fully functional ([FLUME-2334](#)).
- Use standard lookup to find queue/topic in JMS Source ([FLUME-2311](#)).

Notable Bug Fixes:

- Deadlock fixed in Dataset sink ([FLUME-2320](#)).
- FileChannel Dual Checkpoint Backup Thread is now released on application stop ([FLUME-2328](#)).
- Spool Dir source now checks interrupt flag before writing to channel ([FLUME-2283](#)).
- Morphline sink increments `eventDrainAttemptCount` when it takes event from channel ([FLUME-2323](#)).
- Bucketwriter now permanently closed only on idle and roll timeouts ([FLUME-2325](#)).
- `BucketWriter#close` now cancels `idleFuture` ([FLUME-2305](#)).

Apache Oozie

As of CDH 5.0.0 Oozie includes a glob pattern feature ([OOZIE-1471](#)), allowing you do a move of wild cards in the FS Action. For example:

```

<fs name="archive-files">
<move source="hdfs://namenode/output/*"
target="hdfs://namenode/archive" />
<ok to="next"/>
<error to="fail"/>
</fs>

```

By default, up to 1000 files can be matched; you can change this default by means of the `oozie.action.fs.glob.max` parameter.

Cloudera Search

- Cloudera Search includes a version of Kite 0.10.0, which includes backports of all fixes and features in Kite 0.12.0. For additional information on Kite, see:

- [Kite repository](#)
- [Kite Release Notes](#)
- [Kite documentation](#)
- [Kite examples](#)

What's New in CDH 5.0.1

This is a maintenance release which fixes several issues. In addition, it introduces a change to the configuration for HTTPS communication between HDFS and YARN. See also [Issues Fixed in CDH 5.0.1](#) on page 2379.

New Features and Changes in CDH 5.0.1

Enabling TLS/SSL in CDH 5: Enabling HTTPS communication in CDH 5 requires extra configuration properties to be added to YARN (`yarn-site.xml` and `mapred-site.xml`) and HDFS (`hdfs-site.xml`), in addition to the existing configuration settings described [here](#).

What's New in CDH 5.0.2

This is a maintenance release which fixes several issues. See [Issues Fixed in CDH 5.0.2](#) on page 2378.

What's New in CDH 5.0.3

This is a maintenance release that fixes several issues. See [Issues Fixed in CDH 5.0.3](#) on page 2377.

What's New in CDH 5.0.4

This is a maintenance release that fixes several issues. See [Issues Fixed in CDH 5.0.4](#) on page 2377.

What's New in CDH 5.0.5

This is a maintenance release that fixes the “POODLE” and Apache Hadoop Distributed Cache vulnerabilities described in [“POODLE” Vulnerability on TLS/SSL enabled ports](#) on page 2376, as well as other issues. All CDH 5.0.x users should upgrade to 5.0.5 as soon as possible. See [Issues Fixed in CDH 5.0.5](#) on page 2376.

What's New in CDH 5.0.6

This is a maintenance release that fixes several issues. See [Issues Fixed in CDH 5.0.6](#) on page 2376.

What's New In CDH 5 Beta Releases

Use these links to go to a specific release.

What's New in CDH 5 Beta 1

This is a beta release which previews new features, changes, and fixed issues.

Oracle JDK 7 Support

- CDH 5 supports Oracle JDK 1.7 and supports users running applications compiled with JDK 1.7. For CDH 5 Beta 1 the certified version is JDK 1.7.0_25. Cloudera has tested this version across all components.
- CDH 5 does not support JDK 1.6; you must install JDK 1.7.

Apache Flume

New Features:

- [FLUME-2190](#) - Includes a new Twitter Source that feeds off the Twitter firehose
- [FLUME-2109](#) - HTTP Source now supports HTTPS
- Flume now auto-detects Cloudera Search dependencies.

Apache Hadoop

HDFS

New Features:

- [HDFS-4953](#): Enable HDFS local reads via mmap.
- [HDFS-2802](#): Support for RW/RO snapshots in HDFS. See:
`hadoop-hdfs-project/hadoop-hdfs/src/site/apt/HdfsNfsGateway.appt.vm`
- [HDFS-4750](#): Support NFSv3 interface to HDFS.
- [HDFS-4817](#): Make HDFS advisory caching configurable on a per-file basis.
- [HDFS-3601](#): Add BlockPlacementPolicyWithNodeGroup to support block placement with 4-layer network topology.
- [HDFS-5122](#): Support failover and retry in WebHdfsFileSystem for NN HA.
- [HDFS-4772](#) / [HDFS-5043](#): Add number of children (of a directory) in HdfsFileStatus.
- [HDFS-4434](#): Provide a mapping from INodeId to INode. See: `/.reserved/.inodes/<INODE_NUMBER>`
- [HDFS-2576](#): Enhances the DistributedFileSystem's Create API so that clients can specify favored DataNodes for a file's blocks.

Changed Features:

- [HDFS-4659](#): Support setting execution bit for regular files.
 - **Impact:** In CDH 5, files copied out of `copyToLocal` may now have the executable bit set if it was set when they were created or copied into HDFS.
- [HDFS-4594](#): WebHDFS open sets Content-Length header to what is specified by length parameter rather than how much data is actually returned.
 - **Impact:** In CDH 5, Content-Length header will contain the number of bytes actually returned, rather than the request length.

Changed Behavior:

- [HDFS-4645](#): Move from randomly generated block ID to sequentially generated block ID.
- [HDFS-4451](#): HDFS balancer command returns exit code 1 on success instead of 0.

MapReduce v2 (YARN)

New Features:

- **ResourceManager High Availability:** YARN now allows you to use multiple ResourceManagers so that there is no single point of failure. In-flight jobs are recovered without re-running completed tasks.
- Monitoring and enforcing memory and CPU-based resource utilization using `cgroups`.
- **Continuous Scheduling:** This feature decouples scheduling from the node heartbeats for improved performance in large clusters.

Changed Feature:

- **ResourceManager Restart:** Persistent implementations of the RMStateStore (filesystem-based and ZooKeeper-based) allow recovery of in-flight jobs.

Apache HBase

Summary of New Features

- Support for Hadoop 2.0
- Improved MTTR (meta first recovery, distributed log replay)
- Improved compatibility and upgradeability (ProtoBuf serialization format)
- Namespaces added for administrative domains
- Snapshots (ported to 0.94 / CDH4.2)
- Online region merge mechanisms added
- Major security and functional improvements made for the REST proxy server

Administrative Features

ProtoBuf: All of the serialization that goes across the wire between servers written to and read by HBase file formats have been converted to extensible Protobuf encodings. This breaks compatibility with previous versions but should make future extensions less likely to break compatibility in these areas. This feature is enabled by default.

- [HBASE-5305](#): Improve cross-version compatibility and upgradeability.
- [HBASE-7898](#): Serializing cells over RPC.

Namespaces: Namespaces is a new feature that groups tables into different administrative domains. An admin can be only given rights to act upon a particular namespace. This feature is enabled by default and requires file system layout changes that must be completed during upgrade.

- [HBASE-8015](#): Added support for namespaces.

MTTR Improvements: Mean time to recovery has greatly improved.

- [HBASE-7590](#): “Costless” notifications from master to rs/clients.
- [HBASE-7213](#) / [HBASE-8631](#): New `.meta` suffix to separate HLog file / Recover Meta before other regions in case of server crash.
- [HBASE-7006](#): Distributed log replay (Caveat).
- [HBASE-9116](#): Adds a view/edit tool for favored node mappings for regions (incomplete, likely a dot version).

Metrics: There are several new metrics and a new naming convention for metrics in HBase. This also includes metrics for each region.

- [HBASE-3614](#): Per region metrics.
- [HBASE-4050](#): Rationalize metrics; Update HBase metrics framework to metrics2.

Miscellaneous:

- [HBASE-7403](#): HBase online region merge.
- Shell improvements; tables list to be more well-rounded.
- [HBASE-5953](#): Expose the current state of the balancerSwitch.
- [HBASE-5934](#): Add the ability for Performance Evaluation to set table compression.
- [HBASE-6135](#): New Web UI.
- [HBASE-8148](#): Allow IPC to bind to a specific address (also 0.94.7)
- [HBASE-5498](#): Secure Bulk Load (also 0.94.5)

Backup and Disaster Recovery Features

Replication: Several critical bug fixes.

- [HBASE-9373](#): Replication has been hardened.
- [HBASE-9158](#): Serious bug in cyclic replication.
- [HBASE-8737](#): Changes to the replication RPC to use cell blocks.

Snapshots: HBase table snapshots were backported to 0.94.x. There are some incompatibilities between the implementation released in CDH 4 with that in CDH 5.

- [HBASE-7290](#): Online snapshots (backported to 0.94.x).
- [HBASE-8352](#): Rename snapshots folder from `.snapshot` to `.hbase-snapshots` (Incompatible change).

Copy table:

- [HBASE-8609](#): Add startRow-stopRow options to the CopyTable.

Import:

- [HBASE-7702](#): Add filtering to import jobs.

HBase Proxies

The REST server now supports Hadoop authentication and authorization mechanisms. The Avro gateway has been removed while the Thrift2 proxy has made progress but is not complete. However, it has been included as a preview feature.

REST:

- [HBASE-9347](#): Support for specifying filter in REST server requests.
- [HBASE-7803](#): Support caching on scan.
- [HBASE-7757](#): Add Web UI for Thrift and REST servers.
- [HBASE-5050](#): SPNEGO-based authentication.
- [HBASE-8661](#): Support REST over HTTPS.
- [HBASE-8662](#): Support for impersonation.
- [HBASE-7986](#): [REST] Make HTablePool size configurable.

Thrift:

- [HBASE-5879](#): Enable JMX metrics collection for the Thrift proxy.

Thrift2: Ongoing efforts to match Thrift and REST functionality. (Incomplete, only a preview feature)

Avro:

- [HBASE-5948](#): Avro gateway removed.

Stability Features

There have been several bug fixes, test fixes and configuration default changes that greatly increase our confidence in the stability of the 0.96.0 release. The main improvement comes from the use of a systematic fault-injection framework.

- [HBASE-7721](#) Atomic multi-row mutations in META
- Integration testing
- [HBASE-7977](#) - TableLocks
- [HBASE-7898](#) [many flaky tests hardened](#)

Performance Features

Several features have been added to improve throughput and performance characteristics of HBase and its clients.

Warning:

Currently the 0.95.2/CDH 5 beta 1 release will suffer performance degradation when over 40 nodes are used when compared to CDH 4.

Throughput:

- [HBASE-4676](#): Prefix compression / tree encoding.
- [HBASE-8334](#): Essential column families on by default (filtering optimization).
- [HBASE-5074](#) / [HBASE-8322](#): Re-enable HBase checksums by default.
- [HBASE-6466](#): Enable multi-threaded memstore flush
- [HBASE-6783](#): Make short circuit read the default.

Predictable Performance:

- [HBASE-5959](#): Added a Stochastic LoadBalancer
- [HBASE-7842](#): Exploring compactor.
- [HBASE-7236](#): Add per-table/per-cf configuration via metadata
- [HBASE-8163](#): MemStoreChunkPool: Improvement for Java GC

- [HBASE-4391](#)[HBASE-6567](#): Mlock / Memory locking improvements (less disk swap).
- [HBASE-4391](#): Bucket cache (untested)

Miscellaneous:

- [HBASE-6870](#): Improvement to HTable coprocessorExec scan performance.

Developer Features

These features are to aid application developers or for major changes that will enable future minor version improvements.

- [HBASE-9121](#): HTrace updates.
- [HBASE-8375](#): Durability setting per table.
 - [HBASE-7801](#) Deferred sync for WAL logs (0.94.7 and later)
- [HBASE-7897](#): Tags supported in cell interface (for future security features).
- [HBASE-5937](#): Refactor HLog into interface (allows for new HLogs in 0.96.x).
- [HBASE-4336](#): Modularization of POM / Multiple jars (many follow-ons, [HBASE-7898](#)).
- [HBASE-8224](#): Publish -hadoop1 and -hadoop2 versioned jars to Maven (CDH published jars are assumed -hadoop2).
- [HBASE-9164](#): Move towards Cell interface in client instead of KeyValue.
- [HBASE-7898](#): Serializing cells over RPC.
- [HBASE-7725](#): Add ability to create custom compaction request.

Hue

New Features:

- With the Sqoop 2 application, data from databases can be easily exported or imported into HDFS in a scalable manner. The Job Wizard hides the complexity of creating Sqoop jobs and the dashboard offers live progress and log access.
- Zookeeper App: Navigate and browse the Znode hierarchy and content of a Zookeeper cluster. Znodes can be added, deleted and edited. Multi-clusters are supported and various statistics are available for them.
- The Hue Shell application has been removed and replaced by the Pig Editor, HBase Browser and the Sqoop 1 apps.
- Python 2.6 is required.
- Beeswax daemon has been replaced by HiveServer2.
- CDH 5 Hue will only work with HiveServer2 from CDH 5. No support for impersonation.

Hue also includes the following changed features (Updated to upstream version 3.0.0):

- [\[HUE-897\]](#) - [core] Redesign of the overall layout
- [\[HUE-1521\]](#) - [core] Improve JobTracker High Availability
- [\[HUE-1493\]](#) - [beeswax] Replace the Beeswax server with HiveServer2
- [\[HUE-1474\]](#) - [core] Upgrade Django backend version from 1.2 to 1.4
- [\[HUE-1506\]](#)- [search] Impersonation support added
- [\[HUE-1475\]](#) - [core] Switch back from the Spawning web server
- [\[HUE-917\]](#) - Support SAML based authentication to enable single sign-on (SSO)

From master:

- [\[HUE-950\]](#) - [core] Improvements to the document model
- [\[HUE-1595\]](#) - Integrate Metastore data into Hive and Impala Query UIs
- [\[HUE-1275\]](#) - [metastore] Show Metastore table details
- [\[HUE-1622\]](#) - [core] Mini tour added to Hue home page

Apache Hive and HCatalog

New Features (Updated to upstream version 0.11.0):

- [\[HIVE-446\]](#) - Implement TRUNCATE for table data
- [\[HIVE-896\]](#) - Add LEAD/LAG/FIRST/LAST analytical windowing functions to Hive

- [\[HIVE-2693\]](#) - Add DECIMAL data type
- [\[HIVE-3834\]](#) - Support ALTER VIEW AS SELECT in Hive

Performance improvements (from 0.12):

- [\[HIVE-3764\]](#) - Support metastore version consistency check
- [\[HIVE-305\]](#) - Port Hadoop streaming process's counters/status reporters to Hive Transforms
- [\[HIVE-1402\]](#) - Add parallel ORDER BY to Hive
- [\[HIVE-2206\]](#) - Add a new optimizer for query correlation discovery and optimization
- [\[HIVE-2517\]](#) - Support GROUP BY on struct type
- [\[HIVE-2655\]](#) - Ability to define functions in HQL
- [\[HIVE-4911\]](#) - Enable QOP configuration for HiveServer2 Thrift transport

Cloudera Impala

Cloudera Impala 1.2.0 is now available as part of CDH 5. For more details on Impala, refer the [Impala Documentation](#).

Llama

Llama is a system that mediates resource management between Cloudera Impala and Hadoop YARN. Llama enables Impala to reserve, use, and release resource allocations in a Hadoop cluster. Llama is only required if resource management is enabled in Impala.

Apache Mahout

New Features (Updated to Mahout 0.8):

- Numerous performance improvements to Vector and Matrix implementations, APIs and their iterators (see also [MAHOUT-1192](#), [MAHOUT-1202](#))
- Numerous performance improvements to the recommender implementations (see also [MAHOUT-1272](#), [MAHOUT-1035](#), [MAHOUT-1042](#), [MAHOUT-1151](#), [MAHOUT-1166](#), [MAHOUT-1167](#), [MAHOUT-1169](#), [MAHOUT-1205](#), [MAHOUT-1264](#))
- [MAHOUT-1088](#): Support for biased item-based recommender.
- [MAHOUT-1089](#): SGD matrix factorization for rating prediction with user and item biases.
- [MAHOUT-1106](#): Support for SVD++
- [MAHOUT-944](#): Support for converting one or more Lucene storage indexes to SequenceFiles as well as an upgrade of the supported Lucene version to Lucene 4.3.
- [MAHOUT-1154](#) and related: New streaming k-means implementation that offers online (and fast) clustering.
- [MAHOUT-833](#): Make conversion to SequenceFiles Map-Reduce. 'seqdirectory' can now be run as a MapReduce job.
- [MAHOUT-1052](#): Add an option to MinHashDriver that specifies the dimension of vector to hash (indexes or values).
- [MAHOUT-884](#): Matrix concatenate utility; presently only concatenates two matrices.

Apache Oozie

New Features:

- Updated to Oozie 4.0.0.
- **High Availability:** Multiple Oozie servers can now be utilized to provide an HA Oozie service as well as provide horizontal scalability. See upstream [documentation](#) for more details.
- **HCatalog Integration:** HCatalog table partitions can now be used as data dependencies in coordinators. See upstream [documentation](#) for more details. .
- **SLA Monitoring:** Oozie can now actively monitor SLA-sensitive jobs and send out notifications for SLA meets and misses. SLA information is also now available through a new SLA tab in the Oozie Web UI, JMS messages, and a REST API. See upstream [documentation](#).
- **JMS Notifications:** Oozie can now publish notifications to a JMS Provider about job status changes and SLA events. See upstream [documentation](#).
- The FileSystem action can now use glob patterns for file paths when doing `move`, `delete`, `chmod`, and `chgrp`.

Cloudera Search

Cloudera Search 1.0.0 is now available as part of CDH 5. For more details on Search see the [Search documentation](#).

The Cloudera Development Kit (CDK) is a set of libraries and tools that can be used with Search and other CDH components to build jobs/systems on top of the Hadoop ecosystem. See the [CDK Documentation](#) and [Release Notes](#) for more details.

Note: An existing dependency, Apache Tika, has been upgraded to version 1.4.

Apache Sentry (incubating)

CDH 5 Beta 1 includes the first upstream release of Apache Sentry, `sentry-1.2.0-incubating`.

Apache Sqoop

CDH 5 Sqoop 1 has been rebased on Apache Sqoop 1.4.4.

What's New in CDH 5 Beta 2

This is a beta release which previews new features, changes, and fixed issues. See also [Issues Fixed in CDH 5 Beta 2](#) on page 2383.

New Features and Changes in CDH 5 Beta 2

Apache Crunch

The Apache Crunch™ project develops and supports Java APIs that simplify the process of creating data pipelines on top of Apache Hadoop. The Crunch APIs are modeled after FlumeJava (PDF), which is the library that Google uses for building data pipelines on top of their own implementation of MapReduce.

Apache DataFu

- Upgraded from version 0.4 to 1.1.0 (this upgrade is not backward compatible).
- New features include UDFS SHA, `SimpleRandomSample`, `COALESCE`, `ReservoirSample`, `EmptyBagToNullFields`, and many others.

Apache Flume

- [FLUME-2294](#) - Added a new sink to write Kite datasets.
- [FLUME-2056](#) - Spooling Directory Source can now only pass the name of the file in the event headers.
- [FLUME-2155](#) - File Channel is indexed during replay to improve replay performance for faster startup.
- [FLUME-2217](#) - Syslog Sources can optionally preserve all syslog headers in the message body.
- [FLUME-2052](#) - Spooling Directory Source can now replace or ignore malformed characters in input files.

Apache Hadoop

HDFS

New Features/Improvements:

- As of CDH 5 Beta 2, you can upgrade HDFS with high availability (HA) enabled, if you are using Quorum-based storage. (Quorum-based storage is the only method available in CDH 5; NFS shared storage is not supported.)
- [HDFS-4949](#) - CDH 5 Beta 2 supports HDFS caching.
- As of CDH 5 Beta 2, you can configure an NFSv3 gateway that allows any NFSv3-compatible client to mount HDFS as a file system on the client's local file system.
- [HDFS-5709](#) - Improve upgrade with existing files and directories named `.snapshot`.

Major Bug Fixes:

- [HDFS-5449](#) - Fix WebHDFS compatibility break.
- [HDFS-5671](#) - Fix socket leak in `DFSInputStream#getBlockReader`.
- [HDFS-5353](#) - Short circuit reads fail when `dfs.encrypt.data.transfer` is enabled.
- [HDFS-5438](#) - Flaws in block report processing can cause data loss.

Changed Behavior:

- As of CDH 5 Beta 2, in order for the NameNode to start up on a secure cluster, you should have the `dfs.web.authentication.kerberos.principal` property defined in `hdfs-site.xml`. For clusters managed by Cloudera Manager, you do not need to explicitly define this property.
- [HDFS-5037](#) - Active NameNode should trigger its own edit log rolls. Clients will now retry for a configurable period when encountering a NameNode in Safe Mode.
- The default behavior of the `mkdir` command has changed. As of CDH 5 Beta 2, if the parent folder does not exist, the `-p` switch must be explicitly mentioned otherwise the command fails.

MapReduce (MRv1 and YARN)

- Fair Scheduler (in YARN and MRv1) now supports advance configuration to automatically place applications in queues.
- MapReduce now supports running multiple reducers in `uber` mode and in local job runner.

Apache HBase

- **Online Schema Change** is now a supported feature.
- **Online Region Merge** is now a supported feature.
- **Namespaces:** CDH 5 Beta 2 includes the namespaces feature which enables different sets of tables to be administered by different administrative users. All upgraded tables will live in the default "hbase" namespace. Administrators may create new namespaces and create tables users with rights to the namespace may administer permissions on the tables within the namespace.
- There have been several improvements to HBase's **mean time to recovery** (mttr) in the face of Master or RegionServer failures.
 - Distributed log splitting has matured, and is always activated. The option to use the old slower splitting mechanism no longer exists.
 - Failure detection time has been improved. New notifications are now sent when RegionServers or Masters fail which triggers corrective action quickly.
 - The Meta table has a dedicated write ahead log which enables faster recovery region recovery if the RegionServer serving meta goes down.
- The **Region Balancer** has been significantly updated to take more load attributes into account.
- Added **TableSnapshotInputFormat** and **TableSnapshotScanner** to perform scans over HBase table snapshots from the client side, bypassing the HBase servers. The former configures a MapReduce job, while the latter does a single client-side scan over snapshot files. Can also be used with offline HBase with in-place or exported snapshot files.
- The KeyValue API has been deprecated for applications in favor of the **Cell** interface. Users upgrading to HBase 0.96 may still use KeyValue by future upgrades may remove the class or parts of its functionality. Users are encouraged to update their applications to use the new Cell interface.
- Currently Experimental features:
 - **Distributed log replay:** This mechanism allows for faster recovery from RegionServer failures but has one special case where it will violate ACID guarantees. Cloudera does not currently recommend activating this feature.
 - **Bucket cache:** This is an offheap caching mechanism that use extra RAM and block devices (such as flash drives) to greatly increase the read caching capabilities provided by the BlockCache. Cloudera does not currently recommend activating this feature.
 - **Favored nodes:** This feature enables HBase to better control where its data is written to in HDFS in order to better preserve performance after a failure. This is disabled currently because it doesn't interact well with the HBase Balancer or HDFS Balancer. Cloudera does not currently recommend activating this feature.

See this [blog post](#) for more details.

*Apache Hive***New Features:**

- Improved JDBC specification coverage:

- Improvements to `getDatabaseMajorVersion()`, `getDatabaseMinorVersion()` APIs ([HIVE-3181](#))
- Added JDBC support for new datatypes: Char ([HIVE-5683](#)), Decimal ([HIVE-5355](#)) and Varchar ([HIVE-5209](#))
- You can now specify the database for a session in the HiveServer2 connection URL ([HIVE-4256](#))
- Encrypted communication between the Hive Server and Clients. This includes TLS/SSL encryption for non-Kerberos connections to HiveServer2 ([HIVE-5351](#)).
- A native Parquet SerDe is now available as part of the CDH 5 Beta 2 package. Users can directly create a Parquet format table without any external package dependency.

Changed Behavior:

- [HIVE-4256](#) - With Sentry enabled, the `use <database>` command is now executed as part of the connection to HiveServer2. Hence, a user with no privileges to access a database will not be allowed to connect to HiveServer2.

Hue

- Hue has been upgraded to version 3.5.0.
- Impala and Hive Editor are now one-page apps. The Editor, Progress, Table list and Results are all on the same page
- Result graphing for the Hive and Impala Editors.
- Editor and Dashboard for Oozie SLA, crontab and credentials.
- The Sqoop2 app supports autocomplete of database and table names/fields.
- [DBQuery App](#): MySQL and PostgreSQL Query Editors.
- New Search feature: [Graphical facets](#)
- Integrate external Web applications in any language. See this [blog post](#) for more details.
- Create Hive tables and load quoted CSV data. Tutorial available [here](#).
- Submit any Oozie jobs directly from HDFS. Tutorial available [here](#)
- New [SAML backend](#) enables single sign-on (SSO) with Hue.

Apache Oozie

- Oozie now supports cron-style scheduling capability.
- Oozie now supports High Availability with security.

Apache Pig

- `AvroStorage` rewritten for better performance, and moved from `piggybank` to core Pig
- `ASSERT`, `IN`, and `CASE` operators added
- `ParquetStorage` added for integration with Parquet

Cloudera Search

- The Cloudera CDK has been renamed and updated to Kite version 0.11.0. For additional information on Kite, see:
 - [Kite repository](#)
 - [Kite Release Notes](#)
 - [Kite documentation](#)
 - [Kite examples](#)

Apache Spark (incubating)

Spark is a fast, general engine for large-scale data processing. For installation and configuration instructions, see [Setting Up Apache Spark Using the Command Line](#).

Apache Sqoop

Sqoop 2 has been upgraded from version 1.99.2 to 1.99.3.

What's New in Apache Impala

This release of Impala contains the following changes and enhancements from previous releases.

New Features in CDH 5.16.x

The following are some of the most significant new features in this release.

Fine Grained Privileges

Sentry and Impala introduced fine grained privileges to provide object-level privileges to roles.

Fine grained privileges include the `REFRESH` and `CREATE` privileges, which allow users to create databases and tables, and to execute commands that update metadata information on Impala databases and tables. See [Impala Sentry documentation](#) for the new privileges and the scopes of the objects that you can grant the new privileges on.

The following new privileges were added:

- The `REFRESH` privilege
- The `CREATE` privilege
- The `SELECT` and `INSERT` privileges on `SERVER`

If a role has `SELECT` or `INSERT` privilege on an object in Impala before upgrading to CDH 5.16.1, that role will automatically get the `REFRESH` privilege during the upgrade.

Object Ownership

Object ownership designates an owner for a database, table, or view in Sentry. The owner of an object has the `OWNER` privilege which is the equivalent of the `ALL` privilege on the object. See the [Object Ownership](#) documentation for information about enabling object ownership.

If the object ownership feature is enabled, Sentry grants the user the `OWNER` privilege. Whether or not object ownership is enabled, HMS stores the object creator as the default object owner. Previously, HMS stored the Kerberos user as the object owner.

The following statements were added to Impala to support object ownership via Sentry:

- `ALTER DATABASE SET OWNER`
- `ALTER TABLE SET OWNER`
- `ALTER VIEW SET OWNER`
- `SHOW GRANT USER`

Admission Control Enhancement

A new query option, [MAX_MEM_ESTIMATE_FOR_ADMISSION](#), was added. Use the new option to set an upper limit on the memory estimates of a query as a workaround for over-estimates precluding a query from being admitted.

General Performance Improvements

A new query option, [SHUFFLE_DISTINCT_EXPRS](#), controls the shuffling behavior when a query has both grouping and distinct expressions.

Metadata Performance Improvements

- Incremental Stats

The following enhancements improve Impala stability. The features reduce chances of having `catalogd` and `impalad` crash due to be out of memory when using incremental stats.

- Incremental stats are now compressed in memory in `catalogd`, reducing memory footprint in `catalogd`.
- Incremental stats are fetched on demand from `catalogd` by `impalad` coordinators. This enhancement reduces memory footprint for `impalad` coordinators and `statestored` and also reduces network requirements to broadcast metadata.

See [Loading Incremental Statistics from Catalogd](#) for details.

- Automatic Invalidation of Metadata

Note: This feature is experimental and not recommended for use in production clusters.

To keep the size of metadata bounded and to reduce the chances of `catalogd` cache running out of memory, this release introduces an automatic metadata invalidation feature with time-based and memory-based invalidation.

Automatic invalidation of metadata provides more stability with lower chances of running out of memory, but could potentially cause performance risks. The feature is turned off by default.

See [Startup Options for Automatic Invalidation of Metadata](#) for details.

Compatibility and Usability Enhancements

- Additional separators are supported between date and time in default `TIMESTAMP` format, specifically, the multi-space separator and the 'T' separator. See [TIMESTAMP Data Type](#) for more information on `TIMESTAMP` format.
- New hint placement is supported for `INSERT` statements. See [Optimizer Hints in Impala](#) for detail.
- The `REGEX_ESCAPE()` function was implemented for escaping special characters to treat them literally in string literals.
- `SHOW CREATE VIEW` was implemented with the same functionality as `SHOW CREATE TABLE`.
- Impala Shell can connect directly to `impalad` when configured with proxy load balancer and Kerberos. See [Configuration Options](#) for the new flag that enables the direct connection.

New Features in CDH 5.15.x

The following are some of the most significant new features in this release:

- Added the `TABLESAMPLE` clause in the `COMPUTE STATS` statement. See [TABLESAMPLE](#) for the new `TABLESAMPLE` clause.
- Extended `COMPUTE STATS` to support a list of columns. See [COMPUTE STATS](#) for the new syntax.
- Added the new `COMPUTE_STATS_MIN_SAMPLE_SIZE` query option. The query option specifies the minimum number of bytes that will be scanned in `COMPUTE STATS TABLESAMPLE`, regardless of the user-supplied sampling percent. See [COMPUTE_STATS_MIN_SAMPLE_SIZE](#).
- Added a `TBLPROPERTY` for controlling stats extrapolation on a per-table basis: `impala.enable.stats.extrapolation=true/false`. See [stats extrapolation](#) for information about stats extrapolation.
- Added the new built-in `regex_escape` function. The function instructs Impala to interpret the following special characters literally rather than as special characters: `.\+*?[^\]$()\{ }=!<>| :-`
See [regex_escape](#) for information about the `regex_escape` function.
- Enhanced the existing `ltrim` and `rtrim` string functions to accept an argument that specifies a set of characters to be trimmed from the input string. See [ltrim and rtrim](#) for information about the functions.
- Implemented `murmur_hash` function. See [murmur_hash](#) for information about the new function.
- Introduced the support for the Kudu `DECIMAL` type in Kudu 1.7.0.
- Now Impala maps a signed integer logical type in Parquet to a supported Impala column type as below:
 - `INT_8` -> `TINYINT`
 - `INT_16` -> `SMALLINT`
 - `INT_32` -> `INT`
 - `INT_64` -> `BIGINT`
- Parquet dictionary filtering now works on nested data.
- Based on the existing Parquet column chunk level statistics `null_count`, Impala's Parquet scanner was enhanced to skip an entire row group if the `null_count` statistics indicate that all the values under the predicated column are `NULL` as no result rows would be returned from that row group.

- The Oracle-style hint placement for `INSERT` statements is now supported. See for information on hints in Impala SQL.
- Insert plan hints for `CREATE TABLE AS SELECT` are now supported. See for information on hints in Impala SQL.
- Improved concurrency of DDL and DML operations during catalog updates.
- The statestore update logic was improved to reduce issues, such as too many queries being admitted by different coordinators, or queries being queued for longer than necessary and blocking subsequent updates to different topics.
- The size limit for statestore updates was increased, and copying of the metadata and reduce the memory footprint were reduced. Now the catalog objects are passed and (de)compressed between FE and BE one at a time.

New Features in CDH 5.14.x

The following are some of the most significant new features in this release:

- **New Boolean operators:** `IS TRUE`, `IS NOT TRUE`, `IS FALSE`, `IS NOT FALSE`, `IS UNKNOWN`, and `IS NOT UNKNOWN`. These operators always return `TRUE` or `FALSE`, even if the left-hand expression evaluates to `NULL`. `IS [NOT] TRUE` and `IS [NOT] FALSE` are `NULL`-safe equivalents for equality and inequality comparisons. `IS [NOT] UNKNOWN` is identical to `IS [NOT] NULL`.
- The new built-in function `DATE_TRUNC()` lets you truncate a `TIMESTAMP` value to a given precision. For example, calling `date_trunc('hour', ts)` truncates `ts` to the beginning of the corresponding hour, with all minutes, seconds, milliseconds, and so on set to zero.
- The `impala-shell` command now accepts a command-line argument `--query_option=option=value` to set a query option for that shell session. You can specify multiple query options by supplying multiple instances of `--query_option` in the `impala-shell` invocation.

Configuration files for `impala-shell`, such as `.impalarc`, can also contain a section beginning with `[impala.query_options]`, followed by lines of the form `query_option=value`. These query options take effect by default for all `impala-shell` sessions that use the specified configuration file.

- The `SET` statement, when run without any argument, now divides its output into groups corresponding to “regular”, “advanced”, “development” (unfinished, not ready for general use), and “deprecated” (subject to removal). By default, the “development” and “deprecated” option groups are not shown in `SET` output. Issue the statement `SET ALL` to see the options and values from all groups.
- Impala optimizes some join queries against Kudu tables by constructing runtime filters representing the minimum and maximum matching values from the join columns. The min-max information is “pushed down” to Kudu so that Kudu can prune unnecessary rows before sending the result set back to Impala.
- The allowed range for the `BATCH_SIZE` query option is now 0 to 65536. Formerly, the upper bound was undefined.
- Arithmetic expressions involving both `DECIMAL` and `FLOAT` or `DOUBLE` arguments now produce results of `DECIMAL` type instead of `DOUBLE`.

New Features in CDH 5.13.x

The following are some of the most significant new features in this release:

- Improvements to memory management through the use of a buffer pool. This mechanism allows queries to use less memory, reserves the required memory during query startup, and reduces the frequency of out-of-memory errors. It makes query planning and memory estimation more accurate, so that if a query begins executing it is unlikely to encounter an out-of-memory error partway through. The memory buffer used during spill-to-disk processing is smaller: instead of 8 MiB, this buffer defaults to 2 MiB and Impala can reduce it to as little as 64 KiB when appropriate.

This feature includes new query options for fine-tuning memory areas used during query processing:

`MIN_SPILLABLE_BUFFER_SIZE`, `DEFAULT_SPILLABLE_BUFFER_SIZE`, `MAX_ROW_SIZE`, and `BUFFER_POOL_LIMIT`.

- Improvements to the mechanism for caching HDFS file handles. This caching mechanism improves the performance and scalability of queries that access the same file multiple times, for example to retrieve different columns from a Parquet file. Caching the file handle across `open()` calls reduces the load on the HDFS NameNode.

This feature is currently disabled by default. It is enabled by setting a non-zero value for the `max_cached_file_handles` configuration setting. Currently, ETL processes that append to existing HDFS files or overwrite HDFS files in place can interact with this setting in a way that turns off short-circuit reads for some `impalad` hosts. See [HDFS-12528](#) for tracking information.

- A new command in `impala-shell`, `rerun` or its abbreviation `@`, lets you re-execute previous commands based on their numbering in the `history` output.
- You can specify the minimum required TLS/SSL version using the `--ssl_minimum_version` setting, for example `--ssl_minimum_version=tlsv1.2`.
- You can specify the set of allowed TLS ciphers using the `--ssl_cipher_list` configuration setting. See the output of `man ciphers` for the full set of keywords and notation allowed in the argument string.
- New or enhanced built-in functions:
 - `trunc()` can now apply to numeric types (`FLOAT`, `DOUBLE`, and `DECIMAL`) in addition to `TIMESTAMP`. Although this functionality was already available through the `truncate()` function, the new signatures for `trunc()` make it easier to port code from other popular database systems to Impala.
 - A new date/time function `utc_timestamp()` provides a simple way to get a stable, interoperable representation of a `TIMESTAMP` value without using a chain of functions to convert between representations and apply a specific timezone.
- The `CREATE TABLE LIKE PARQUET` statement can now handle Parquet files produced outside of Impala and containing `ENUM` types. The `ENUM` columns become `STRING` columns in the target table, and the `ENUM` values are turned into corresponding `STRING` values.
- Kudu enhancements:
 - You can now create a Kudu table without using a `PARTITION BY` clause. Kudu automatically creates a single partition to cover the entire possible range of values. This feature is intended for small lookup tables, where the overhead of partitioning does not make sense for tables that typically have a full table scan for each query.
 - More granular Sentry authorization for Kudu tables. Kudu tables can now use column-level privileges. The `SELECT` and `INSERT` statements can now use the corresponding `SELECT` and `INSERT` privileges. Other Kudu statements still require the `ALL` privilege.
 - The `ALTER TABLE` statement can modify a number of storage attributes for the columns of Kudu tables. You can use the `ALTER COLUMN` clause of `ALTER TABLE` along with the `SET` keyword to change the properties `DEFAULT`, `BLOCK_SIZE`, `ENCODING`, and `COMPRESSION`. You can use the `DROP DEFAULT` clause to remove the default value from a column.
- For non-Kudu tables, you can use the `ALTER TABLE` syntax `ALTER COLUMN col SET COMMENT 'text'` to change the comment for an individual column.

New Features in CDH 5.12.x

The following are some of the most significant new features in this release:

- Impala can now read and write data stored on the Microsoft Azure Data Lake Store (ADLS). See [Using Impala with the Azure Data Lake Store \(ADLS\)](#) for details.
- New built-in functions:
 - A new string function, `replace()`, which is faster than `regexp_replace()` for simple string substitutions. See [Impala String Functions](#) for details.

- A new conditional function, `nv12()`, which offers more flexibility than the `nv1()` function. It lets you return one value for `NOT NULL` arguments, and a different value for `NULL` arguments. See [Impala Conditional Functions](#) for details.
 - A new date/time function, `last_day()`, for finding the date corresponding to the last day of a particular month. See [Impala Date and Time Functions](#) for details.
 - New syntax, `REFRESH FUNCTIONS db_name`, lets Impala recognize newly added functions, such as UDFs created through Hive. Impala scans the metadata for a specified database to locate the new functions, which is faster and more convenient than doing a full `INVALIDATE METADATA` operation.
 - The new `TABLESAMPLE` clause for the `SELECT` statement lets you specify a percentage of the overall data volume within a table to process during a query.
 - Startup flags for the `impalad` daemon, `is_executor` and `is_coordinator`, let you divide the work on a large, busy cluster between a small number of hosts acting as query coordinators, and a larger number of hosts acting as query executors. By default, each host can act in both roles, potentially introducing bottlenecks during heavily concurrent workloads. See [How to Configure Impala with Dedicated Coordinators](#) for details.
 - A new query option, `DEFAULT_JOIN_DISTRIBUTION_MODE`, lets you change the default assumption about how join queries should handle tables with no statistics. This can help to avoid out-of-memory conditions for join queries, without manual tuning to add the `/* +SHUFFLE */` hint for queries on large tables with missing statistics.
 - The `SORT BY` clause lets you create Parquet files with more efficient compression and smaller ranges of values for specified columns, allowing Impala to apply optimizations to skip reading data from Parquet files that do not contain any values that match equality and range operators in the `WHERE` clause. See [CREATE TABLE Statement](#) for details.
 - The `max_audit_event_log_files` lets you perform log rotation for the audit event log files, similar to the rotation for regular Impala log files.
 - Kudu enhancements:
 - The `ALTER TABLE` statement can specify more attributes for a Kudu table with the `ADD COLUMNS` clause. Now you can specify `[NOT] NULL`, `ENCODING COMPRESSION`, `DEFAULT`, and `BLOCK_SIZE`. See [ALTER TABLE Statement](#) for details.
 - The `TIMESTAMP` type is now available for Kudu tables.
-  **Note:** See [Handling Date, Time, or Timestamp Data with Kudu](#) for information about the tradeoffs between performance and convenience when using this data type. For high-performance applications, you might continue to use the `BIGINT` type to represent date/time values.
- The `INSERT` and `CREATE TABLE AS SELECT` statements are more efficient when writing to Kudu tables. Formerly, the overhead for the write operations could result in timeouts when writing large numbers of rows in a single operation.

New Features in CDH 5.12 / Impala 2.9

For the full list of issues closed in this release, including the issues marked as “new features”, see the [changelog for CDH 5.12](#).

The following are some of the most significant new features in this release:

- A new function, `replace()`, which is faster than `regexp_replace()` for simple string substitutions. See [Impala String Functions](#) for details.
- Startup flags for the `impalad` daemon, `is_executor` and `is_coordinator`, let you divide the work on a large, busy cluster between a small number of hosts acting as query coordinators, and a larger number of hosts acting

as query executors. By default, each host can act in both roles, potentially introducing bottlenecks during heavily concurrent workloads. See [How to Configure Impala with Dedicated Coordinators](#) for details.

New Features in CDH 5.11.x

The following are some of the most significant new features in this release:

- Improved security for Kudu tables. This enhancement comes from upgrading the Kudu client code shipped with CDH 5.11.
 - Encryption on the wire, and in the web UI. (Not on the client side.)
 - Kerberos authentication.

New Features in Impala 2.8.x / CDH 5.10.x

- Performance and scalability improvements:
 - Improved scalability for highly concurrent loads by reducing the possibility of TCP/IP timeouts. A configuration setting, `accepted_cnxn_queue_depth`, can be adjusted upwards to avoid this type of timeout on large clusters.
 - Several performance improvements were made to the mechanism for generating native code:
 - Some queries involving analytic functions can take better advantage of native code generation.
 - Modules produced during intermediate code generation are organized to be easier to cache and reuse during the lifetime of a long-running or complicated query.
 - The `COMPUTE STATS` statement is more efficient (less time for the codegen phase) for tables with a large number of columns, especially for tables containing `TIMESTAMP` columns.
 - The logic for determining whether or not to use a runtime filter is more reliable, and the evaluation process itself is faster because of native code generation.
 - The `MT_DOP` query option enables multithreading for a number of Impala operations. `COMPUTE STATS` statements for Parquet tables use a default of `MT_DOP=4` to improve the intra-node parallelism and CPU efficiency of this data-intensive operation. See [MT_DOP Query Option](#) for details.
 - A new hint, `CLUSTERED`, allows Impala `INSERT` operations on a Parquet table that use dynamic partitioning to process a high number of partitions in a single statement. The data is ordered based on the partition key columns, and each partition is only written by a single host, reducing the amount of memory needed to buffer Parquet data while the data blocks are being constructed.
 - The new configuration setting `inc_stats_size_limit_bytes` lets you reduce the load on the catalog server when running the `COMPUTE INCREMENTAL STATS` statement for very large tables.
 - Impala folds many constant expressions within query statements, rather than evaluating them for each row. This optimization is especially useful when using functions to manipulate and format `TIMESTAMP` values, such as the result of an expression such as `to_date(now() - interval 1 day)`.
 - Parsing of complicated expressions is faster. This speedup is especially useful for queries containing large `CASE` expressions.
 - Evaluation is faster for `IN` operators with many constant arguments. The same performance improvement applies to other functions with many constant arguments.
 - Impala optimizes identical comparison operators within multiple `OR` blocks.
 - The reporting for wall-clock times and total CPU time in profile output is more accurate.
 - A new query option, `SCRATCH_LIMIT`, lets you restrict the amount of space used when a query exceeds the memory limit and activates the “spill to disk” mechanism. This option helps to avoid runaway queries or make

queries “fail fast” if they require more memory than anticipated. You can prevent runaway queries from using excessive amounts of spill space, without restarting the cluster to turn the spilling feature off entirely. See [SCRATCH_LIMIT Query Option](#) for details.

- Integration with Apache Kudu:
 - The experimental Impala support for the Kudu storage layer has been folded into the main Impala development branch. Impala can now directly access Kudu tables, opening up new capabilities such as enhanced DML operations and continuous ingestion.
 - The `DELETE` statement is a flexible way to remove data from a Kudu table. Previously, removing data from an Impala table involved removing or rewriting the underlying data files, dropping entire partitions, or rewriting the entire table. This Impala statement only works for Kudu tables.
 - The `UPDATE` statement is a flexible way to modify data within a Kudu table. Previously, updating data in an Impala table involved replacing the underlying data files, dropping entire partitions, or rewriting the entire table. This Impala statement only works for Kudu tables.
 - The `UPSERT` statement is a flexible way to ingest, modify, or both data within a Kudu table. Previously, ingesting data that might contain duplicates involved an inefficient multi-stage operation, and there was no built-in protection against duplicate data. The `UPSERT` statement, in combination with the primary key designation for Kudu tables, lets you add or replace rows in a single operation, and automatically avoids creating any duplicate data.
 - The `CREATE TABLE` statement gains some new clauses that are specific to Kudu tables: `PARTITION BY`, `PARTITIONS`, `STORED AS KUDU`, and column attributes `PRIMARY KEY`, `NULL` and `NOT NULL`, `ENCODING`, `COMPRESSION`, `DEFAULT`, and `BLOCK_SIZE`. These clauses replace the explicit `TBLPROPERTIES` settings that were required in the early experimental phases of integration between Impala and Kudu.
 - The `ALTER TABLE` statement can change certain attributes of Kudu tables. You can add, drop, or rename columns. You can add or drop range partitions. You can change the `TBLPROPERTIES` value to rename or point to a different underlying Kudu table, independently from the Impala table name in the metastore database. You cannot change the data type of an existing column in a Kudu table.
 - The `SHOW PARTITIONS` statement displays information about the distribution of data between partitions in Kudu tables. A new variation, `SHOW RANGE PARTITIONS`, displays information about the Kudu-specific partitions that apply across ranges of key values.
 - Not all Impala data types are supported in Kudu tables. In particular, currently the Impala `TIMESTAMP` type is not allowed in a Kudu table. Impala does not recognize the `UNIXTIME_MICROS` Kudu type when it is present in a Kudu table. (These two representations of date/time data use different units and are not directly compatible.) You cannot create columns of type `TIMESTAMP`, `DECIMAL`, `VARCHAR`, or `CHAR` within a Kudu table. Within a query, you can cast values in a result set to these types. Certain types, such as `BOOLEAN`, cannot be used as primary key columns.
 - Currently, Kudu tables are not interchangeable between Impala and Hive the way other kinds of Impala tables are. Although the metadata for Kudu tables is stored in the metastore database, currently Hive cannot access Kudu tables.
 - The `INSERT` statement works for Kudu tables. The organization of the Kudu data makes it more efficient than with HDFS-backed tables to insert data in small batches, such as with the `INSERT . . . VALUES` syntax.
 - Some audit data is recorded for data governance purposes. All `UPDATE`, `DELETE`, and `UPSERT` statements are characterized as `INSERT` operations in the audit log. Currently, lineage metadata is not generated for `UPDATE` and `DELETE` operations on Kudu tables.
 - Currently, Kudu tables have limited support for Sentry:
 - Access to Kudu tables must be granted to roles as usual.

- Currently, access to a Kudu table through Sentry is “all or nothing”. You cannot enforce finer-grained permissions such as at the column level, or permissions on certain operations such as `INSERT`.
- Only users with `ALL` privileges on `SERVER` can create external Kudu tables.

Because non-SQL APIs can access Kudu data without going through Sentry authorization, currently the Sentry support is considered preliminary.

- Equality and `IN` predicates in Impala queries are pushed to Kudu and evaluated efficiently by the Kudu storage layer.
- **Security:**
 - Impala can take advantage of the S3 encrypted credential store, to avoid exposing the secret key when accessing data stored on S3.
- [\[IMPALA-1654\]](#) Several kinds of DDL operations can now work on a range of partitions. The partitions can be specified using operators such as `<`, `>=`, and `!=` rather than just an equality predicate applying to a single partition. This new feature extends the syntax of several clauses of the `ALTER TABLE` statement (`DROP PARTITION`, `SET [UN]CACHED`, `SET FILEFORMAT | SERDEPROPERTIES | TBLPROPERTIES`), the `SHOW FILES` statement, and the `COMPUTE INCREMENTAL STATS` statement. It does not apply to statements that are defined to only apply to a single partition, such as `LOAD DATA`, `ALTER TABLE ... ADD PARTITION`, `SET LOCATION`, and `INSERT` with a static partitioning clause.
- The `instr()` function has optional second and third arguments, representing the character to position to begin searching for the substring, and the Nth occurrence of the substring to find.
- Improved error handling for malformed Avro data. In particular, incorrect precision or scale for `DECIMAL` types is now handled.
- Impala debug web UI:
 - In addition to “inflight” and “finished” queries, the web UI now also includes a section for “queued” queries.
 - The `/sessions` tab now clarifies how many of the displayed sections are active, and lets you sort by **Expired** status to distinguish active sessions from expired ones.
- Improved stability when DDL operations such as `CREATE DATABASE` or `DROP DATABASE` are run in Hive at the same time as an Impala `INVALIDATE METADATA` statement.
- The “out of memory” error report was made more user-friendly, with additional diagnostic information to help identify the spot where the memory limit was exceeded.
- Improved disk space usage for Java-based UDFs. Temporary copies of the associated JAR files are removed when no longer needed, so that they do not accumulate across restarts of the `catalogd` daemon and potentially cause an out-of-space condition. These temporary files are also created in the directory specified by the `local_library_dir` configuration setting, so that the storage for these temporary files can be independent from any capacity limits on the `/tmp` filesystem.

New Features in Impala 2.7.x / CDH 5.9.x

- Performance improvements:
 - [\[IMPALA-3206\]](#) Speedup for queries against `DECIMAL` columns in Avro tables. The code that parses `DECIMAL` values from Avro now uses native code generation.
 - [\[IMPALA-3674\]](#) Improved efficiency in LLVM code generation can reduce codegen time, especially for short queries.
 - [\[IMPALA-2979\]](#) Improvements to scheduling on worker nodes, enabled by the `REPLICA_PREFERENCE` query option. See [REPLICA_PREFERENCE Query Option \(CDH 5.9 or higher only\)](#) for details.

- [\[IMPALA-1683\]](#) The `REFRESH` statement can be applied to a single partition, rather than the entire table. See [REFRESH Statement](#) and [Refreshing a Single Partition](#) for details.
- Improvements to the Impala web user interface:
 - [\[IMPALA-2767\]](#) You can now force a session to expire by clicking a link in the web UI, on the `/sessions` tab.
 - [\[IMPALA-3715\]](#) The `/memz` tab includes more information about Impala memory usage.
 - [\[IMPALA-3716\]](#) The **Details** page for a query now includes a **Memory** tab.
- [\[IMPALA-3499\]](#) Scalability improvements to the catalog server. Impala handles internal communication more efficiently for tables with large numbers of columns and partitions, where the size of the metadata exceeds 2 GiB.
- [\[IMPALA-3677\]](#) You can send a `SIGUSR1` signal to any Impala-related daemon to write a Breakpad minidump. For advanced troubleshooting, you can now produce a minidump without triggering a crash. See [Breakpad Minidumps for Impala \(CDH 5.8 or higher only\)](#) for details about the Breakpad minidump feature.
- [\[IMPALA-3687\]](#) The schema reconciliation rules for Avro tables have changed slightly for `CHAR` and `VARCHAR` columns. Now, if the definition of such a column is changed in the Avro schema file, the column retains its `CHAR` or `VARCHAR` type as specified in the SQL definition, but the column name and comment from the Avro schema file take precedence. See [Creating Avro Tables](#) for details about column definitions in Avro tables.
- [\[IMPALA-3575\]](#) Some network operations now have additional timeout and retry settings. The extra configuration helps avoid failed queries for transient network problems, to avoid hangs when a sender or receiver fails in the middle of a network transmission, and to make cancellation requests more reliable despite network issues.

New Features in Impala 2.6.x / CDH 5.8.x

- Improvements to Impala support for the Amazon S3 filesystem:
 - Impala can now write to S3 tables through the `INSERT` or `LOAD DATA` statements. See [Using Impala with the Amazon S3 Filesystem](#) for general information about using Impala with S3.
 - A new query option, `S3_SKIP_INSERT_STAGING`, lets you trade off between fast `INSERT` performance and slower `INSERTS` that are more consistent if a problem occurs during the statement. The new behavior is enabled by default. See [S3_SKIP_INSERT_STAGING Query Option \(CDH 5.8 or higher only\)](#) for details about this option.
- Performance improvements for the runtime filtering feature:
 - The default for the `RUNTIME_FILTER_MODE` query option is changed to `GLOBAL` (the highest setting). See [RUNTIME_FILTER_MODE Query Option \(CDH 5.7 or higher only\)](#) for details about this option.
 - The `RUNTIME_BLOOM_FILTER_SIZE` setting is now only used as a fallback if statistics are not available; otherwise, Impala uses the statistics to estimate the appropriate size to use for each filter. See [RUNTIME_BLOOM_FILTER_SIZE Query Option \(CDH 5.7 or higher only\)](#) for details about this option.
 - New query options `RUNTIME_FILTER_MIN_SIZE` and `RUNTIME_FILTER_MAX_SIZE` let you fine-tune the sizes of the Bloom filter structures used for runtime filtering. If the filter size derived from Impala internal estimates or from the `RUNTIME_FILTER_BLOOM_SIZE` falls outside the size range specified by these options, any too-small filter size is adjusted to the minimum, and any too-large filter size is adjusted to the maximum. See [RUNTIME_FILTER_MIN_SIZE Query Option \(CDH 5.8 or higher only\)](#) and [RUNTIME_FILTER_MAX_SIZE Query Option \(CDH 5.8 or higher only\)](#) for details about these options.
 - Runtime filter propagation now applies to all the operands of `UNION` and `UNION ALL` operators.
 - Runtime filters can now be produced during join queries even when the join processing activates the spill-to-disk mechanism.

See [Runtime Filtering for Impala Queries \(CDH 5.7 or higher only\)](#) for general information about the runtime filtering feature.

- Admission control and dynamic resource pools are enabled by default. See [Admission Control and Query Queuing](#) for details about admission control.
- Impala can now manually set column statistics, using the `ALTER TABLE` statement with a `SET COLUMN STATS` clause. See [ALTER TABLE SET COLUMN STATS](#) for details.
- Impala can now write lightweight “minidump” files, rather than large core files, to save diagnostic information when any of the Impala-related daemons crash. This feature uses the open source `breakpad` framework. See [Breakpad Minidumps for Impala \(CDH 5.8 or higher only\)](#) for details.
- New query options improve interoperability with Parquet files:
 - The `PARQUET_FALLBACK_SCHEMA_RESOLUTION` query option lets Impala locate columns within Parquet files based on column name rather than ordinal position. This enhancement improves interoperability with applications that write Parquet files with a different order or subset of columns than are used in the Impala table. See [PARQUET_FALLBACK_SCHEMA_RESOLUTION Query Option \(CDH 5.8 or higher only\)](#) for details.
 - The `PARQUET_ANNOTATE_STRINGS_UTF8` query option makes Impala include the UTF-8 annotation metadata for `STRING`, `CHAR`, and `VARCHAR` columns in Parquet files created by `INSERT` or `CREATE TABLE AS SELECT` statements. See [PARQUET_ANNOTATE_STRINGS_UTF8 Query Option \(CDH 5.8 or higher only\)](#) for details.

See [Using the Parquet File Format with Impala Tables](#) for general information about working with Parquet files.

- Improvements to security and reduction in overhead for secure clusters:
 - Overall performance improvements for secure clusters. (TPC-H queries on a secure cluster were benchmarked at roughly 3x as fast as the previous release.)
 - Impala now recognizes the `auth_to_local` setting, specified through the HDFS configuration setting `hadoop.security.auth_to_local`. This feature is disabled by default; to enable it, specify `--load_auth_to_local_rules=true` in the `impalad` configuration settings. See [Mapping Kerberos Principals to Short Names for Impala](#) for details.
 - Timing improvements in the mechanism for the `impalad` daemon to acquire Kerberos tickets. This feature spreads out the overhead on the KDC during Impala startup, especially for large clusters.
 - For Kerberized clusters, the Catalog service now uses the Kerberos principal instead of the operating system user that runs the `catalogd` daemon. This eliminates the requirement to configure a `hadoop.user.group.static.mapping.overrides` setting to put the OS user into the Sentry administrative group, on clusters where the principal and the OS user name for this user are different.
- Overall performance improvements for join queries, by using a prefetching mechanism while building the in-memory hash table to evaluate join predicates. See [PREFETCH_MODE Query Option \(CDH 5.8 or higher only\)](#) for the query option to control this optimization.
- The `impala-shell` interpreter has a new command, `SOURCE`, that lets you run a set of SQL statements or other `impala-shell` commands stored in a file. You can run additional `SOURCE` commands from inside a file, to set up flexible sequences of statements for use cases such as schema setup, ETL, or reporting. See [impala-shell Command Reference](#) for details and [Running Commands and SQL Statements in impala-shell](#) for examples.
- The `millisecond()` built-in function lets you extract the fractional seconds part of a `TIMESTAMP` value. See [Impala Date and Time Functions](#) for details.
- New built-in functions `base64encode()` and `base64decode()` let you encode arbitrary string values in plaintext format. See [Impala String Functions](#) for details.
- If an Avro table is created without column definitions in the `CREATE TABLE` statement, and columns are later added through `ALTER TABLE`, the resulting table is now queryable. Missing values from the newly added columns now default to `NULL`. See [Using the Avro File Format with Impala Tables](#) for general details about working with Avro files.

- The mechanism for interpreting `DECIMAL` literals is improved, no longer going through an intermediate conversion step to `DOUBLE`:
 - Casting a `DECIMAL` value to `TIMESTAMP DOUBLE` produces a more precise value for the `TIMESTAMP` than formerly.
 - Certain function calls involving `DECIMAL` literals now succeed, when formerly they failed due to lack of a function signature with a `DOUBLE` argument.
 - Faster runtime performance for `DECIMAL` constant values, through improved native code generation for all combinations of precision and scale.

See [DECIMAL Data Type](#) for details about the `DECIMAL` type.

- Improved type accuracy for `CASE` return values. If all `WHEN` clauses of the `CASE` expression are of `CHAR` type, the final result is also `CHAR` instead of being converted to `STRING`. See [Impala Conditional Functions](#) for details about the `CASE` function.
- Uncorrelated queries using the `NOT EXISTS` operator are now supported. Formerly, the `NOT EXISTS` operator was only available for correlated subqueries.
- Improved performance for reading Parquet files.
- Improved performance for **top-N** queries, that is, those including both `ORDER BY` and `LIMIT` clauses.
- Impala optionally skips an arbitrary number of header lines from text input files on HDFS based on the `skip.header.line.count` value in the `TBLPROPERTIES` field of the table metadata. See [Data Files for Text Tables](#) for details.
- Trailing comments are now allowed in queries processed by the `impala-shell` options `-q` and `-f`.
- Impala can run `COUNT` queries for RCFile tables that include complex type columns. See [Complex Types \(CDH 5.5 or higher only\)](#) for general information about working with complex types, and [ARRAY Complex Type \(CDH 5.5 or higher only\)](#), [MAP Complex Type \(CDH 5.5 or higher only\)](#), and [STRUCT Complex Type \(CDH 5.5 or higher only\)](#) for syntax details of each type.

New Features in Impala 2.5.x / CDH 5.7.x

Note: Impala 2.5.x is available as part of CDH 5.7.x and is not available for CDH 4. Cloudera does not intend to release future versions of Impala for CDH 4 outside patch and maintenance releases if required. Given the end-of-maintenance status for CDH 4, Cloudera recommends all customers to migrate to a recent CDH 5 release.

- Dynamic partition pruning. When a query refers to a partition key column in a `WHERE` clause, and the exact set of column values are not known until the query is executed, Impala evaluates the predicate and skips the I/O for entire partitions that are not needed. For example, if a table was partitioned by year, Impala would apply this technique to a query such as `SELECT c1 FROM partitioned_table WHERE year = (SELECT MAX(year) FROM other_table)`.

The dynamic partition pruning optimization technique lets Impala avoid reading data files from partitions that are not part of the result set, even when that determination cannot be made in advance. This technique is especially valuable when performing join queries involving partitioned tables. For example, if a join query includes an `ON` clause and a `WHERE` clause that refer to the same columns, the query can find the set of column values that match the `WHERE` clause, and only scan the associated partitions when evaluating the `ON` clause.

Dynamic partition pruning is controlled by the same settings as the runtime filtering feature. By default, this feature is enabled at a medium level, because the maximum setting can use slightly more memory for queries than in previous releases. To fully enable this feature, set the query option `RUNTIME_FILTER_MODE=GLOBAL`.

- Runtime filtering. This is a wide-ranging set of optimizations that are especially valuable for join queries. Using the same technique as with dynamic partition pruning, Impala uses the predicates from `WHERE` and `ON` clauses to

determine the subset of column values from one of the joined tables could possibly be part of the result set. Impala sends a compact representation of the filter condition to the hosts in the cluster, instead of the full set of values or the entire table.

By default, this feature is enabled at a medium level, because the maximum setting can use slightly more memory for queries than in previous releases. To fully enable this feature, set the query option `RUNTIME_FILTER_MODE=GLOBAL`.

This feature involves some new query options: `RUNTIME_FILTER_MODE`, `MAX_NUM_RUNTIME_FILTERS`, `RUNTIME_BLOOM_FILTER_SIZE`, `RUNTIME_FILTER_WAIT_TIME_MS`, and `DISABLE_ROW_RUNTIME_FILTERING`.

- More efficient use of the HDFS caching feature, to avoid hotspots and bottlenecks that could occur if heavily used cached data blocks were always processed by the same host. By default, Impala now randomizes which host processes each cached HDFS data block, when cached replicas are available on multiple hosts. (Remember to use the `WITH REPLICATION` clause with the `CREATE TABLE` or `ALTER TABLE` statement when enabling HDFS caching for a table or partition, to cache the same data blocks across multiple hosts.) The new query option `SCHEDULE_RANDOM_REPLICA` lets you fine-tune the interaction with HDFS caching even more.
- The `TRUNCATE TABLE` statement now accepts an `IF EXISTS` clause, making `TRUNCATE TABLE` easier to use in setup or ETL scripts where the table might or might not exist.
- Improved performance and reliability for the `DECIMAL` data type:
 - Using `DECIMAL` values in a `GROUP BY` clause now triggers the native code generation optimization, speeding up queries that group by values such as prices.
 - Checking for overflow in `DECIMAL` multiplication is now substantially faster, making `DECIMAL` a more practical data type in some use cases where formerly `DECIMAL` was much slower than `FLOAT` or `DOUBLE`.
 - Multiplying a mixture of `DECIMAL` and `FLOAT` or `DOUBLE` values now returns the `DOUBLE` rather than `DECIMAL`. This change avoids some cases where an intermediate value would underflow or overflow and become `NULL` unexpectedly.
- For UDFs written in Java, or Hive UDFs reused for Impala, Impala now allows parameters and return values to be primitive types. Formerly, these things were required to be one of the “Writable” object types.
- Performance improvements for HDFS I/O. Impala now caches HDFS file handles to avoid the overhead of repeatedly opening the same file.
- Performance improvements for queries involving nested complex types. Certain basic query types, such as counting the elements of a complex column, now use an optimized code path.
- Improvements to the memory reservation mechanism for the Impala admission control feature. You can specify more settings, such as the timeout period and maximum aggregate memory used, for each resource pool instead of globally for the Impala instance. The default limit for concurrent queries (the `max requests` setting) is now unlimited instead of 200. The Cloudera Manager user interface for admission control has been reworked, with the settings available under the **Dynamic Resource Pools** window.
- Performance improvements related to code generation. Even in queries where code generation is not performed for some phases of execution (such as reading data from Parquet tables), Impala can still use code generation in other parts of the query, such as evaluating functions in the `WHERE` clause.
- Performance improvements for queries using aggregation functions on high-cardinality columns. Formerly, Impala could do unnecessary extra work to produce intermediate results for operations such as `DISTINCT` or `GROUP BY` on columns that were unique or had few duplicate values. Now, Impala decides at run time whether it is more efficient to do an initial aggregation phase and pass along a smaller set of intermediate data, or to pass raw intermediate data back to next phase of query processing to be aggregated there. This feature is known as **streaming pre-aggregation**. In case of performance regression, this feature can be turned off using the `DISABLE_STREAMING_PREAGGREGATIONS` query option.
- Spill-to-disk feature now always recommended. In earlier releases, the spill-to-disk feature could be turned off using a pair of configuration settings, `enable_partitioned_aggregation=false` and

`enable_partitioned_hash_join=false`. The latest improvements in the spill-to-disk mechanism, and related features that interact with it, make this feature robust enough that disabling it is now no longer needed or supported. In particular, some new features in CDH 5.7 / Impala 2.5 and higher do not work when the spill-to-disk feature is disabled.

- Improvements to scripting capability for the `impala-shell` command, through user-specified substitution variables that can appear in statements processed by `impala-shell`:
 - The `--var` command-line option lets you pass key-value pairs to `impala-shell`. The shell can substitute the values into queries before executing them, where the query text contains the notation `${var:varname}`. For example, you might prepare a SQL file containing a set of DDL statements and queries containing variables for database and table names, and then pass the applicable names as part of the `impala-shell -f filename` command.
 - The `SET` and `UNSET` commands within the `impala-shell` interpreter now work with user-specified substitution variables, as well as the built-in query options. The two kinds of variables are divided in the `SET` output. As with variables defined by the `--var` command-line option, you refer to the user-specified substitution variables in queries by using the notation `${var:varname}` in the query text. Because the substitution variables are processed by `impala-shell` instead of the `impalad` backend, you cannot define your own substitution variables through the `SET` statement in a JDBC or ODBC application.
- Performance improvements for query startup. Impala better parallelizes certain work when coordinating plan distribution between `impalad` instances, which improves startup time for queries involving tables with many partitions on large clusters, or complicated queries with many plan fragments.
- Performance and scalability improvements for tables with many partitions. The memory requirements on the coordinator node are reduced, making it substantially faster and less resource-intensive to do joins involving several tables with thousands of partitions each.
- Whitelisting for access to internal APIs. For applications that need direct access to Impala APIs, without going through the HiveServer2 or Beeswax interfaces, you can specify a list of Kerberos users who are allowed to call those APIs. By default, the `impala` and `hdfs` users are the only ones authorized for this kind of access. Any users not explicitly authorized through the `internal_principals_whitelist` configuration setting are blocked from accessing the APIs. This setting applies to all the Impala-related daemons, although currently it is primarily used for HDFS to control the behavior of the catalog server.
- Improvements to Impala integration and usability for Hue. (The code changes are actually on the Hue side.)
 - The list of tables now refreshes dynamically.
- Usability improvements for case-insensitive queries. You can now use the operators `ILIKE` and `IREGEXP` to perform case-insensitive wildcard matches or regular expression matches, rather than explicitly converting column values with `UPPER` or `LOWER`.
- Performance and reliability improvements for DDL and insert operations on partitioned tables with a large number of partitions. Impala only re-evaluates metadata for partitions that are affected by a DDL operation, not all partitions in the table. While a DDL or insert statement is in progress, other Impala statements that attempt to modify metadata for the same table wait until the first one finishes.
- Reliability improvements for the `LOAD DATA` statement. Previously, this statement would fail if the source HDFS directory contained any subdirectories at all. Now, the statement ignores any hidden subdirectories, for example `_impala_insert_staging`.
- A new operator, `IS [NOT] DISTINCT FROM`, lets you compare values and always get a `true` or `false` result, even if one or both of the values are `NULL`. The `IS NOT DISTINCT FROM` operator, or its equivalent `<=>` notation, improves the efficiency of join queries that treat key values that are `NULL` in both tables as equal.
- Security enhancements for the `impala-shell` command. A new option, `--ldap_password_cmd`, lets you specify a command to retrieve the LDAP password. The resulting password is then used to authenticate the `impala-shell` command with the LDAP server.

- The `CREATE TABLE AS SELECT` statement now accepts a `PARTITIONED BY` clause, which lets you create a partitioned table and insert data into it with a single statement.
- User-defined functions (UDFs and UDAFs) written in C++ now persist automatically when the `catalogd` daemon is restarted. You no longer have to run the `CREATE FUNCTION` statements again after a restart.
- User-defined functions (UDFs) written in Java can now persist when the `catalogd` daemon is restarted, and can be shared transparently between Impala and Hive. You must do a one-time operation to recreate these UDFs using new `CREATE FUNCTION` syntax, without a signature for arguments or the return value. Afterwards, you no longer have to run the `CREATE FUNCTION` statements again after a restart. Although Impala does not have visibility into the UDFs that implement the Hive built-in functions, user-created Hive UDFs are now automatically available for calling through Impala.
- Reliability enhancements for memory management. Some aggregation and join queries that formerly might have failed with an out-of-memory error due to memory contention, now can succeed using the spill-to-disk mechanism.
- The `SHOW DATABASES` statement now returns two columns rather than one. The second column includes the associated comment string, if any, for each database. Adjust any application code that examines the list of databases and assumes the result set contains only a single column.
- A new optimization speeds up aggregation operations that involve only the partition key columns of partitioned tables. For example, a query such as `SELECT COUNT(DISTINCT k), MIN(k), MAX(k) FROM t1` can avoid reading any data files if `T1` is a partitioned table and `K` is one of the partition key columns. Because this technique can produce different results in cases where HDFS files in a partition are manually deleted or are empty, you must enable the optimization by setting the query option `OPTIMIZE_PARTITION_KEY_SCANS`.
- The `DESCRIBE` statement can now display metadata about a database, using the syntax `DESCRIBE DATABASE db_name`.
- The `uuid()` built-in function generates an alphanumeric value that you can use as a guaranteed unique identifier. The uniqueness applies even across tables, for cases where an ascending numeric sequence is not suitable.

New Features in Impala 2.4.x / CDH 5.6.x

Note: Impala 2.4.0 is available as part of CDH 5.6.0 and is not available for CDH 4. Cloudera does not intend to release future versions of Impala for CDH 4 outside patch and maintenance releases if required. Given the end-of-maintenance status for CDH 4, Cloudera recommends all customers to migrate to a recent CDH 5 release.

- From a user perspective, the Impala features are the same as in CDH 5.5 / Impala 2.3.

New Features in Impala 2.3.x / CDH 5.5.x

Note: Impala 2.3.x is available as part of CDH 5.5.x and is not available for CDH 4. Cloudera does not intend to release future versions of Impala for CDH 4 outside patch and maintenance releases if required. Given the end-of-maintenance status for CDH 4, Cloudera recommends all customers to migrate to a recent CDH 5 release.

The following are the major new features in Impala 2.3.x. This major release, available as part of CDH 5.5.x, contains improvements to SQL syntax (particularly new support for complex types), performance, manageability, security.

- Complex data types: `STRUCT`, `ARRAY`, and `MAP`. These types can encode multiple named fields, positional items, or key-value pairs within a single column. You can combine these types to produce nested types with arbitrarily deep nesting, such as an `ARRAY` of `STRUCT` values, a `MAP` where each key-value pair is an `ARRAY` of other `MAP` values, and so on. Currently, complex data types are only supported for the Parquet file format.
- Column-level authorization lets you define access to particular columns within a table, rather than the entire table. This feature lets you reduce the reliance on creating views to set up authorization schemes for subsets of

information. See [Hive SQL Syntax for Use with Sentry](#) for background details, and [GRANT Statement \(CDH 5.2 or higher only\)](#) and [REVOKE Statement \(CDH 5.2 or higher only\)](#) for Impala-specific syntax.

- The `TRUNCATE TABLE` statement removes all the data from a table without removing the table itself.
- Nested loop join queries. Some join queries that formerly required equality comparisons can now use operators such as `<` or `>=`. This same join mechanism is used internally to optimize queries that retrieve values from complex type columns.
- Reduced memory usage and improved performance and robustness for spill-to-disk feature.
- Performance improvements for querying Parquet data files containing multiple row groups and multiple data blocks:
 - For files written by Hive, SparkSQL, and other Parquet MR writers and spanning multiple HDFS blocks, Impala now scans the extra data blocks locally when possible, rather than using remote reads.
 - Impala queries benefit from the improved alignment of row groups with HDFS blocks for Parquet files written by Hive, MapReduce, and other components in CDH 5.5 and higher. (Impala itself never writes multiblock Parquet files, so the alignment change does not apply to Parquet files produced by Impala.) These Parquet writers now add padding to Parquet files that they write to align row groups with HDFS blocks. The `parquet.writer.max-padding` setting specifies the maximum number of bytes, by default 8 megabytes, that can be added to the file between row groups to fill the gap at the end of one block so that the next row group starts at the beginning of the next block. If the gap is larger than this size, the writer attempts to fit another entire row group in the remaining space. Include this setting in the `hive-site` configuration file to influence Parquet files written by Hive, or the `hdfs-site` configuration file to influence Parquet files written by all non-Impala components.
- Many new built-in scalar functions, for convenience and enhanced portability of SQL that uses common industry extensions.

Math functions:

- ATAN2
- COSH
- COT
- DCEIL
- DEXP
- DFLOOR
- DLOG10
- DPOW
- DROUND
- DSQRT
- DTRUNC
- FACTORIAL, and corresponding `!` operator
- FPOW
- RADIANS
- RANDOM
- SINH
- TANH

String functions:

- BTRIM
- CHR
- REGEXP_LIKE
- SPLIT_PART

Date and time functions:

- INT_MONTHS_BETWEEN
- MONTHS_BETWEEN
- TIMEOFDAY
- TIMESTAMP_CMP

Bit manipulation functions:

- BITAND
- BITNOT
- BITOR
- BITXOR
- COUNTSET
- GETBIT
- ROTATELEFT
- ROTATERIGHT
- SETBIT
- SHIFLEFT
- SHIFTRIGHT

Type conversion functions:

- TYPEOF

The `effective_user()` function.

- New built-in analytic functions: `PERCENT_RANK`, `NTILE`, `CUME_DIST`.
- The `DROP DATABASE` statement now works for a non-empty database. When you specify the optional `CASCADE` clause, any tables in the database are dropped before the database itself is removed.
- The `DROP TABLE` and `ALTER TABLE DROP PARTITION` statements have a new optional keyword, `PURGE`. This keyword causes Impala to immediately remove the relevant HDFS data files rather than sending them to the HDFS trashcan. This feature can help to avoid out-of-space errors on storage devices, and to avoid files being left behind in case of a problem with the HDFS trashcan, such as the trashcan not being configured or being in a different HDFS encryption zone than the data files.
- The `impala-shell` command has a new feature for live progress reporting. This feature is enabled through the `--live_progress` and `--live_summary` command-line options, or during a session through the `LIVE_SUMMARY` and `LIVE_PROGRESS` query options.
- The `impala-shell` command also now displays a random “tip of the day” when it starts.
- The `impala-shell` option `-f` now recognizes a special filename `-` to accept input from stdin.
- Format strings for the `unix_timestamp()` function can now include numeric timezone offsets.
- Impala can now run a specified command to obtain the password to decrypt a private-key PEM file, rather than having the private-key file be unencrypted on disk.
- Impala components now can use SSL for more of their internal communication. SSL is used for communication between all three Impala-related daemons when the configuration option `ssl_server_certificate` is enabled. SSL is used for communication with client applications when the configuration option `ssl_client_ca_certificate` is enabled.

Currently, you can only use one of server-to-server TLS/SSL encryption or Kerberos authentication. This limitation is tracked by the issue [IMPALA-2598](#).

- Improved flexibility for intermediate data types in user-defined aggregate functions (UDAFs).

In CDH 5.5.2 / Impala 2.3.2, the bug fix for [IMPALA-2598](#) removes the restriction on using both Kerberos and SSL for internal communication between Impala components.

New Features in Impala 2.2.x for CDH 5.4.3 and 5.4.4

No new features added to the Impala code. The certification of Impala with EMC Isilon under CDH 5.4.4 means that now you can query data stored on Isilon storage devices through Impala. See [Installing Cloudera Manager and CDH with Isilon](#) for details. The same level of Impala is included with both CDH 5.4.3 and 5.4.4.

Note: The Impala 2.2.x maintenance releases now use the CDH 5.4.x numbering system rather than increasing the Impala version numbers. Impala 2.2 and higher are not available under CDH 4.

New Features in Impala 2.2.x / CDH 5.4.x

Note: Impala 2.2.0 is available as part of CDH 5.4.0 and is not available for CDH 4. Cloudera does not intend to release future versions of Impala for CDH 4 outside patch and maintenance releases if required. Given the end-of-maintenance status for CDH 4, Cloudera recommends all customers to migrate to a recent CDH 5 release.

The following are the major new features in Impala 2.2.x. This release, available as part of CDH 5.4.x, contains improvements to performance, manageability, security, and SQL syntax.

- Several improvements to date and time features enable higher interoperability with Hive and other database systems, provide more flexibility for handling time zones, and future-proof the handling of `TIMESTAMP` values:
 - The `WITH REPLICATION` clause for the `CREATE TABLE` and `ALTER TABLE` statements lets you control the replication factor for HDFS caching for a specific table or partition. By default, each cached block is only present on a single host, which can lead to CPU contention if the same host processes each cached block. Increasing the replication factor lets Impala choose different hosts to process different cached blocks, to better distribute the CPU load.
 - Startup flags for the `impalad` daemon enable a higher level of compatibility with `TIMESTAMP` values written by Hive, and more flexibility for working with date and time data using the local time zone instead of UTC. To enable these features, set the `impalad` startup flags `-use_local_tz_for_unix_timestamp_conversions=true` and `-convert_legacy_hive_parquet_utc_timestamps=true`.

The `-use_local_tz_for_unix_timestamp_conversions` setting controls how the `unix_timestamp()`, `from_unixtime()`, and `now()` functions handle time zones. By default (when this setting is turned off), Impala considers all `TIMESTAMP` values to be in the UTC time zone when converting to or from Unix time values. When this setting is enabled, Impala treats `TIMESTAMP` values passed to or returned from these functions to be in the local time zone. When this setting is enabled, take particular care that all hosts in the cluster have the same timezone settings, to avoid inconsistent results depending on which host reads or writes `TIMESTAMP` data.

The `-convert_legacy_hive_parquet_utc_timestamps` setting causes Impala to convert `TIMESTAMP` values to the local time zone when it reads them from Parquet files written by Hive. This setting only applies to data using the Parquet file format, where Impala can use metadata in the files to reliably determine that the files were written by Hive. If in the future Hive changes the way it writes `TIMESTAMP` data in Parquet, Impala will automatically handle that new `TIMESTAMP` encoding.

See [TIMESTAMP Data Type](#) for details about time zone handling and the configuration options for Impala / Hive compatibility with Parquet format.
 - In Impala 2.2.0 and higher, built-in functions that accept or return integers representing `TIMESTAMP` values use the `BIGINT` type for parameters and return values, rather than `INT`. This change lets the date and time functions avoid an overflow error that would otherwise occur on January 19th, 2038 (known as the [“Year 2038 problem”](#) or [“Y2K38 problem”](#)). This change affects the `FROM_UNIXTIME()` and `UNIX_TIMESTAMP()`

functions. You might need to change application code that interacts with these functions, change the types of columns that store the return values, or add `CAST()` calls to SQL statements that call these functions.

See [Impala Date and Time Functions](#) for the current function signatures.

- The `SHOW FILES` statement lets you view the names and sizes of the files that make up an entire table or a specific partition. See [SHOW FILES Statement](#) for details.
- Impala can now run queries against Parquet data containing columns with complex or nested types, as long as the query only refers to columns with scalar types.
- Performance improvements for queries that include `IN()` operators and involve partitioned tables.
- The new `-max_log_files` configuration option specifies how many log files to keep at each severity level. The default value is 10, meaning that Impala preserves the latest 10 log files for each severity level (`INFO`, `WARNING`, and `ERROR`) for each Impala-related daemon (`impalad`, `statedored`, and `catalogd`). Impala checks to see if any old logs need to be removed based on the interval specified in the `logbufsecs` setting, every 5 seconds by default. See [Rotating Impala Logs](#) for details.
- Redaction of sensitive data from Impala log files. This feature protects details such as credit card numbers or tax IDs from administrators who see the text of SQL statements in the course of monitoring and troubleshooting a Hadoop cluster. See [Redacting Sensitive Information from Impala Log Files](#) for background information for Impala users, and [How to Enable Sensitive Data Redaction](#) for usage details.
- Lineage information is available for data created or queried by Impala. This feature lets you track who has accessed data through Impala SQL statements, down to the level of specific columns, and how data has been propagated between tables. See [Viewing Lineage Information for Impala Data](#) for background information for Impala users, [Managing Hive and Impala Lineage Properties](#) for usage details, and [Using the Lineage View](#) for how to interpret the lineage information.
- Impala tables and partitions can now be located on the Amazon Simple Storage Service (S3) filesystem, for convenience in cases where data is already located in S3 and you prefer to query it in-place. Queries might have lower performance than when the data files reside on HDFS, because Impala uses some HDFS-specific optimizations. Impala can query data in S3, but cannot write to S3. Therefore, statements such as `INSERT` and `LOAD DATA` are not available when the destination table or partition is in S3. See [Using Impala with the Amazon S3 Filesystem](#) for details.

Important:

Impala query support for Amazon S3 is included in CDH 5.4 / Impala 2.2, but is not supported or recommended for production use in this version.

- Improved support for HDFS encryption. The `LOAD DATA` statement now works when the source directory and destination table are in different encryption zones.
- Additional arithmetic function `mod()`. See [Impala Mathematical Functions](#) for details.
- Flexibility to interpret `TIMESTAMP` values using the UTC time zone (the traditional Impala behavior) or using the local time zone (for compatibility with `TIMESTAMP` values produced by Hive).
- Enhanced support for ETL using tools such as Flume. Impala ignores temporary files typically produced by these tools (filenames with suffixes `.copying` and `.tmp`).
- The CPU requirement for Impala, which had become more restrictive in Impala 2.0.x and 2.1.x, has now been relaxed.

The prerequisite for CPU architecture has been relaxed in Impala 2.2.0 and higher. From this release onward, Impala works on CPUs that have the SSSE3 instruction set. The SSE4 instruction set is no longer required. This relaxed requirement simplifies the upgrade planning from Impala 1.x releases, which also worked on SSSE3-enabled processors.

- Enhanced support for `CHAR` and `VARCHAR` types in the `COMPUTE STATS` statement.
- The amount of memory required during setup for “spill to disk” operations is greatly reduced. This enhancement reduces the chance of a memory-intensive join or aggregation query failing with an out-of-memory error.
- Several new conditional functions provide enhanced compatibility when porting code that uses industry extensions. The new functions are: `isfalse()`, `isnotfalse()`, `isnottrue()`, `istrue()`, `nonnullvalue()`, and `nullvalue()`. See [Impala Conditional Functions](#) for details.
- The Impala debug web UI now can display a visual representation of the query plan. On the `/queries` tab, select **Details** for a particular query. The **Details** page includes a **Plan** tab with a plan diagram that you can zoom in or out (using scroll gestures through mouse wheel or trackpad).

New Features in Impala 2.1.8 / CDH 5.3.10

This point release is exclusively a bug fix release.

Note: This Impala maintenance release is only available as part of CDH 5, not under CDH 4.

New Features in Impala 2.1.7 / CDH 5.3.9

This point release is exclusively a bug fix release.

Note: This Impala maintenance release is only available as part of CDH 5, not under CDH 4.

New Features in Impala 2.1.6 / CDH 5.3.8

This point release is exclusively a bug fix release.

Note: This Impala maintenance release is only available as part of CDH 5, not under CDH 4.

New Features in Impala 2.1.5 / CDH 5.3.6

This point release is exclusively a bug fix release.

Note: This Impala maintenance release is only available as part of CDH 5, not under CDH 4.

New Features in Impala 2.1.0 / CDH 5.3.0

This release contains the following enhancements to query performance and system scalability:

- Impala can now collect statistics for individual partitions in a partitioned table, rather than processing the entire table for each `COMPUTE STATS` statement. This feature is known as incremental statistics, and is controlled by the `COMPUTE INCREMENTAL STATS` syntax. (You can still use the original `COMPUTE STATS` statement for nonpartitioned tables or partitioned tables that are unchanging or whose contents are entirely replaced all at once.) See [COMPUTE STATS Statement](#) and [Table and Column Statistics](#) for details.
- Optimization for small queries lets Impala process queries that process very few rows without the unnecessary overhead of parallelizing and generating native code. Reducing this overhead lets Impala clear small queries quickly, keeping YARN resources and admission control slots available for data-intensive queries. The number of rows considered to be a “small” query is controlled by the `EXEC_SINGLE_NODE_ROWS_THRESHOLD` query option. See [EXEC_SINGLE_NODE_ROWS_THRESHOLD Query Option \(CDH 5.3 or higher only\)](#) for details.

- An enhancement to the statestore component lets it transmit heartbeat information independently of broadcasting metadata updates. This optimization improves reliability of health checking on large clusters with many tables and partitions.
- The memory requirement for querying gzip-compressed text is reduced. Now Impala decompresses the data as it is read, rather than reading the entire gzipped file and decompressing it in memory.

New Features in Impala 2.0.0 / CDH 5.2.0

The following are the major new features in Impala 2.0. This major release, available both with CDH 5.2 and for CDH 4, contains improvements to performance, scalability, security, and SQL syntax.

- Queries with joins or aggregation functions involving high volumes of data can now use temporary work areas on disk, reducing the chance of failure due to out-of-memory errors. When the required memory for the intermediate result set exceeds the amount available on a particular node, the query automatically uses a temporary work area on disk. This “spill to disk” mechanism is similar to the `ORDER BY` improvement from Impala 1.4. For details, see [SQL Operations that Spill to Disk](#).
- Subquery enhancements:
 - Subqueries are now allowed in the `WHERE` clause, for example with the `IN` operator.
 - The `EXISTS` and `NOT EXISTS` operators are available. They are always used in conjunction with subqueries.
 - The `IN` and `NOT IN` queries can now operate on the result set from a subquery, not just a hardcoded list of values.
 - Uncorrelated subqueries let you compare against one or more values for equality, `IN`, and `EXISTS` comparisons. For example, you might use `WHERE` clauses such as `WHERE column = (SELECT MAX(some_other_column) FROM table)` or `WHERE column IN (SELECT some_other_column FROM table WHERE conditions)`.
 - Correlated subqueries let you cross-reference values from the outer query block and the subquery.
 - Scalar subqueries let you substitute the result of single-value aggregate functions such as `MAX()`, `MIN()`, `COUNT()`, or `AVG()`, where you would normally use a numeric value in a `WHERE` clause.

For details about subqueries, see [Subqueries in Impala SELECT Statements](#). For information about new and improved operators, see [EXISTS Operator](#) and [IN Operator](#).

- Analytic functions such as `RANK()`, `LAG()`, `LEAD()`, and `FIRST_VALUE()` let you analyze sequences of rows with flexible ordering and grouping. Existing aggregate functions such as `MAX()`, `SUM()`, and `COUNT()` can also be used in an analytic context. See [Impala Analytic Functions](#) for details. See [Impala Aggregate Functions](#) for enhancements to existing aggregate functions.
- New data types provide greater compatibility with source code from traditional database systems:
 - `VARCHAR` is like the `STRING` data type, but with a maximum length. See [VARCHAR Data Type \(CDH 5.2 or higher only\)](#) for details.
 - `CHAR` is like the `STRING` data type, but with a precise length. Short values are padded with spaces on the right. See [CHAR Data Type \(CDH 5.2 or higher only\)](#) for details.
- Security enhancements:
 - Formerly, Impala was restricted to using either Kerberos or LDAP / Active Directory authentication within a cluster. Now, Impala can freely accept either kind of authentication request, allowing you to set up some hosts with Kerberos authentication and others with LDAP or Active Directory. See [Using Multiple Authentication Methods with Impala](#) for details.
 - `GRANT` statement. See [GRANT Statement \(CDH 5.2 or higher only\)](#) for details.
 - `REVOKE` statement. See [REVOKE Statement \(CDH 5.2 or higher only\)](#) for details.
 - `CREATE ROLE` statement. See [CREATE ROLE Statement \(CDH 5.2 or higher only\)](#) for details.
 - `DROP ROLE` statement. See [DROP ROLE Statement \(CDH 5.2 or higher only\)](#) for details.
 - `SHOW ROLES` and `SHOW ROLE GRANT` statements. See [SHOW Statement](#) for details.
 - To complement the HDFS encryption feature, a new Impala configuration option, `--disk_spill_encryption` secures sensitive data from being observed or tampered with when temporarily stored on disk.

The new security-related SQL statements work along with the Sentry authorization framework. See [Enabling Sentry Authorization for Impala](#) for details.

- Impala can now read compressed text files compressed by gzip, bzip, or Snappy. These files do not require any special table settings to work in an Impala text table. Impala recognizes the compression type automatically based on file extensions of `.gz`, `.bz2`, and `.snappy` respectively. These types of compressed text files are intended for convenience with existing ETL pipelines. Their non-splittable nature means they are not optimal for high-performance parallel queries. See [Using gzip, bzip2, or Snappy-Compressed Text Files](#) for details.
- Query hints can now use comment notation, `/* +hint_name */` or `-- +hint_name`, at the same places in the query where the hints enclosed by `[]` are recognized. This enhancement makes it easier to reuse Impala queries on other database systems. See [Optimizer Hints in Impala](#) for details.
- A new query option, `QUERY_TIMEOUT_S`, lets you specify a timeout period in seconds for individual queries.

The working of the `--idle_query_timeout` configuration option is extended. If no `QUERY_OPTION_S` query option is in effect, `--idle_query_timeout` works the same as before, setting the timeout interval. When the `QUERY_OPTION_S` query option is specified, its maximum value is capped by the value of the `--idle_query_timeout` option.

That is, the system administrator sets the default and maximum timeout through the `--idle_query_timeout` startup option, and then individual users or applications can set a lower timeout value if desired through the `QUERY_TIMEOUT_S` query option. See [Setting Timeout Periods for Daemons, Queries, and Sessions](#) and [QUERY_TIMEOUT_S Query Option \(CDH 5.2 or higher only\)](#) for details.

- New functions `VAR_SAMP()` and `VAR_POP()` are aliases for the existing `VARIANCE_SAMP()` and `VARIANCE_POP()` functions.
- A new date and time function, `DATE_PART()`, provides similar functionality to `EXTRACT()`. You can also call the `EXTRACT()` function using the SQL-99 syntax, `EXTRACT(unit FROM timestamp)`. These enhancements simplify the porting process for date-related code from other systems. See [Impala Date and Time Functions](#) for details.
- New approximation features provide a fast way to get results when absolute precision is not required:
 - The `APPX_COUNT_DISTINCT` query option lets Impala rewrite `COUNT(DISTINCT)` calls to use `NDV()` instead, which speeds up the operation and allows multiple `COUNT(DISTINCT)` operations in a single query. See [APPX_COUNT_DISTINCT Query Option \(CDH 5.2 or higher only\)](#) for details.

The `APPX_MEDIAN()` aggregate function produces an estimate for the median value of a column by using sampling. See [APPX_MEDIAN Function](#) for details.

- Impala now supports a `DECODE()` function. This function works as a shorthand for a `CASE()` expression, and improves compatibility with SQL code containing vendor extensions. See [Impala Conditional Functions](#) for details.
- The `STDDEV()`, `STDDEV_POP()`, `STDDEV_SAMP()`, `VARIANCE()`, `VARIANCE_POP()`, `VARIANCE_SAMP()`, and `NDV()` aggregate functions now all return `DOUBLE` results rather than `STRING`. Formerly, you were required to `CAST()` the result to a numeric type before using it in arithmetic operations.
- The default settings for Parquet block size, and the associated `PARQUET_FILE_SIZE` query option, are changed. Now, Impala writes Parquet files with a size of 256 MB and an HDFS block size of 256 MB. Previously, Impala attempted to write Parquet files with a size of 1 GB and an HDFS block size of 1 GB. In practice, Impala used a conservative estimate of the disk space needed for each Parquet block, leading to files that were typically 512 MB anyway. Thus, this change will make the file size more accurate if you specify a value for the `PARQUET_FILE_SIZE` query option. It also reduces the amount of memory reserved during `INSERT` into Parquet tables, potentially avoiding out-of-memory errors and improving scalability when inserting data into Parquet tables.
- Anti-joins are now supported, expressed using the `LEFT ANTI JOIN` and `RIGHT ANTI JOIN` clauses. These clauses returns results from one table that have no match in the other table. You might use this type of join in the same sorts of use cases as the `NOT EXISTS` and `NOT IN` operators. See [Joins in Impala SELECT Statements](#) for details.

- The `SET` command in `impala-shell` has been promoted to a real SQL statement. You can now set query options such as `PARQUET_FILE_SIZE`, `MEM_LIMIT`, and `SYNC_DDL` within JDBC, ODBC, or any other kind of application that submits SQL without going through the `impala-shell` interpreter. See [SET Statement](#) for details.
- The `impala-shell` interpreter now reads settings from an optional configuration file, named `$HOME/.impalarc` by default. See [impala-shell Configuration File](#) for details.
- The library used for regular expression parsing has changed from Boost to Google RE2. This implementation change adds support for non-greedy matches using the `. * ?` notation. This and other changes in the way regular expressions are interpreted means you might need to re-test queries that use functions such as `regexp_extract()` or `regexp_replace()`, or operators such as `REGEXP` or `RLIKE`. See [Apache Impala Incompatible Changes and Limitations](#) on page 1925 for those details.

New Features in Impala 1.4.0 / CDH 5.1.0

The following are the major new features in Impala 1.4.

- The `DECIMAL` data type lets you store fixed-precision values, for working with currency or other fractional values where it is important to represent values exactly and avoid rounding errors. This feature includes enhancements to built-in functions, numeric literals, and arithmetic expressions.
- On CDH 5, Impala can take advantage of the HDFS caching feature to “pin” entire tables or individual partitions in memory, to speed up queries on frequently accessed data and reduce the CPU overhead of memory-to-memory copying. When HDFS files are cached in memory, Impala can read the cached data without any disk reads, and without making an additional copy of the data in memory. Other Hadoop components that read the same data files also experience a performance benefit.
- Impala can now use Sentry-based authorization based either on the original policy file, or on rules defined by `GRANT` and `REVOKE` statements issued through Hive. See [Enabling Sentry Authorization for Impala](#) for details.
- For interoperability with Parquet files created through other Hadoop components, such as Pig or MapReduce jobs, you can create an Impala table that automatically sets up the column definitions based on the layout of an existing Parquet data file.
- `ORDER BY` queries no longer require a `LIMIT` clause. If the size of the result set to be sorted exceeds the memory available to Impala, Impala uses a temporary work space on disk to perform the sort operation.
- LDAP connections can be secured through either SSL or TLS.
- The following new built-in scalar and aggregate functions are available:
 - A new built-in function, `EXTRACT()`, returns one date or time field from a `TIMESTAMP` value.
 - A new built-in function, `TRUNC()`, truncates date/time values to a particular granularity, such as year, month, day, hour, and so on.
 - `ADD_MONTHS()` built-in function, an alias for the existing `MONTHS_ADD()` function.
 - A new built-in function, `ROUND()`, rounds `DECIMAL` values to a specified number of fractional digits.
 - Several built-in aggregate functions for computing properties for statistical distributions: `STDDEV()`, `STDDEV_SAMP()`, `STDDEV_POP()`, `VARIANCE()`, `VARIANCE_SAMP()`, and `VARIANCE_POP()`.
 - Several new built-in functions, such as `MAX_INT()`, `MIN_SMALLINT()`, and so on, let you conveniently check whether data values are in an expected range. You might be able to switch a column to a smaller type, saving memory during processing.
 - New built-in functions, `IS_INF()` and `IS_NAN()`, check for the special values infinity and “not a number”. These values could be specified as `inf` or `nan` in text data files, or be produced by certain arithmetic expressions.
- The `SHOW PARTITIONS` statement displays information about the structure of a partitioned table.

- New configuration options for the `impalad` daemon let you specify initial memory usage for all queries. The initial resource requests handled by Llama and YARN can be expanded later if needed, avoiding unnecessary over-allocation and reducing the chance of out-of-memory conditions.
- The Impala `CREATE TABLE` statement now has a `STORED AS AVRO` clause, allowing you to create Avro tables through Impala.
- New `impalad` configuration options let you fine-tune the calculations Impala makes to estimate resource requirements for each query. These options can help avoid problems due to overconsumption due to too-low estimates, or underutilization due to too-high estimates.
- A new `SUMMARY` command in the `impala-shell` interpreter provides a high-level summary of the work performed at each stage of the explain plan. The summary is also included in output from the `PROFILE` command.
- Performance improvements for the `COMPUTE STATS` statement:
 - The `NDV` function is speeded up through native code generation.
 - Because the `NULL` count is not currently used by the Impala query planner, in Impala 1.4.0 and higher, `COMPUTE STATS` does not count the `NULL` values for each column. (The `#Nulls` field of the stats table is left as `-1`, signifying that the value is unknown.)
- Performance improvements for partition pruning. This feature reduces the time spent in query planning, for partitioned tables with thousands of partitions. Previously, Impala typically queried tables with up to approximately 3000 partitions. With the performance improvement in partition pruning, now Impala can comfortably handle tables with tens of thousands of partitions.
- The documentation provides additional guidance for planning tasks.
- The `impala-shell` interpreter now supports UTF-8 characters for input and output. You can control whether `impala-shell` ignores invalid Unicode code points through the `--strict_unicode` option. (Although this option is removed in Impala 2.0.)

New Features in Impala 1.3.2 / CDH 5.0.4

No new features. This point release is exclusively a bug fix release for the IMPALA-1019 issue related to HDFS caching.

Note: Impala 1.3.2 is only available as part of CDH 5.0.4, not under CDH 4.

New Features in Impala 1.3.1 / CDH 5.0.3

This point release is primarily a vehicle to deliver bug fixes. Any new features are minor changes resulting from fixes for performance, reliability, or usability issues.

Because 1.3.1 is the first 1.3.x release for CDH 4, if you are on CDH 4, also consult [New Features in Impala 1.3.0 / CDH 5.0.0](#) on page 1893 for more features that are new to you.

Note:

- The Impala 1.3.1 release is available for both CDH 4 and CDH 5. This is the first release in the 1.3.x series for CDH 4.

- A new `impalad` startup option, `--insert_inherit_permissions`, causes Impala `INSERT` statements to create each new partition with the same HDFS permissions as its parent directory. By default, `INSERT` statements create directories for new partitions using default HDFS permissions. See [INSERT Statement](#) for examples of `INSERT` statements for partitioned tables.
- The `SHOW FUNCTIONS` statement now displays the return type of each function, in addition to the types of its arguments. See [SHOW Statement](#) for examples.

- You can now specify the clause `FIELDS TERMINATED BY '\0'` with a `CREATE TABLE` statement to use text data files that use ASCII 0 (`\0`) characters as a delimiter. See [Using Text Data Files with Impala Tables](#) for details.
- In Impala 1.3.1 and higher, the `REGEXP` and `RLIKE` operators now match a regular expression string that occurs anywhere inside the target string, the same as if the regular expression was enclosed on each side by `.*`. See [REGEXP Operator](#) for examples. Previously, these operators only succeeded when the regular expression matched the entire target string. This change improves compatibility with the regular expression support for popular database systems. There is no change to the behavior of the `regexp_extract()` and `regexp_replace()` built-in functions.

New Features in Impala 1.3.0 / CDH 5.0.0

Note:

- The Impala 1.3.1 release is available for both CDH 4 and CDH 5. This is the first release in the 1.3.x series for CDH 4.

- The admission control feature lets you control and prioritize the volume and resource consumption of concurrent queries. This mechanism reduces spikes in resource usage, helping Impala to run alongside other kinds of workloads on a busy cluster. It also provides more user-friendly conflict resolution when multiple memory-intensive queries are submitted concurrently, avoiding resource contention that formerly resulted in out-of-memory errors. See [Admission Control and Query Queuing](#) for details.
- Enhanced `EXPLAIN` plans provide more detail in an easier-to-read format. Now there are four levels of verbosity: the `EXPLAIN_LEVEL` option can be set from 0 (most concise) to 3 (most verbose). See [EXPLAIN Statement](#) for syntax and [Understanding Impala Query Performance - EXPLAIN Plans and Query Profiles](#) for usage information.
- The `TIMESTAMP` data type accepts more kinds of input string formats through the `UNIX_TIMESTAMP` function, and produces more varieties of string formats through the `FROM_UNIXTIME` function. The documentation now also lists more functions for date arithmetic, used for adding and subtracting `INTERVAL` expressions from `TIMESTAMP` values. See [Impala Date and Time Functions](#) for details.
- New conditional functions, `NULLIF()`, `NULLIFZERO()`, and `ZEROIFNULL()`, simplify porting SQL containing vendor extensions to Impala. See [Impala Conditional Functions](#) for details.
- New utility function, `CURRENT_DATABASE()`. See [Impala Miscellaneous Functions](#) for details.
- Integration with the YARN resource management framework. Only available in combination with CDH 5. This feature makes use of the underlying YARN service, plus an additional service (Llama) that coordinates requests to YARN for Impala resources, so that the Impala query only proceeds when all requested resources are available. See [Resource Management for Impala](#) for full details.

On the Impala side, this feature involves some new startup options for the `impalad` daemon:

- `-enable_rm`
- `-llama_host`
- `-llama_port`
- `-llama_callback_port`
- `-cgroup_hierarchy_path`

For details of these startup options, see [Modifying Impala Startup Options](#).

This feature also involves several new or changed query options that you can set through the `impala-shell` interpreter and apply within a specific session:

- `MEM_LIMIT`: the function of this existing option changes when Impala resource management is enabled.
- `REQUEST_POOL`: a new option. (Renamed to `RESOURCE_POOL` in Impala 1.3.0.)
- `V_CPU_CORES`: a new option.
- `RESERVATION_REQUEST_TIMEOUT`: a new option.

For details of these query options, see [impala-shell Query Options for Resource Management](#).

New Features in Impala 1.2.4

Note: Impala 1.2.4 works with CDH 4. It is primarily a bug fix release for Impala 1.2.3, plus some performance enhancements for the catalog server to minimize startup and DDL wait times for Impala deployments with large numbers of databases, tables, and partitions.

- On Impala startup, the metadata loading and synchronization mechanism has been improved and optimized, to give more responsiveness when starting Impala on a system with a large number of databases, tables, or partitions. The initial metadata loading happens in the background, allowing queries to be run before the entire process is finished. When a query refers to a table whose metadata is not yet loaded, the query waits until the metadata for that table is loaded, and the load operation for that table is prioritized to happen first.
- Formerly, if you created a new table in Hive, you had to issue the `INVALIDATE METADATA` statement (with no table name) which was an expensive operation that reloaded metadata for all tables. Impala did not recognize the name of the Hive-created table, so you could not do `INVALIDATE METADATA new_table` to get the metadata for just that one table. Now, when you issue `INVALIDATE METADATA table_name`, Impala checks to see if that name represents a table created in Hive, and if so recognizes the new table and loads the metadata for it. Additionally, if the new table is in a database that was newly created in Hive, Impala also recognizes the new database.
- If you issue `INVALIDATE METADATA table_name` and the table has been dropped through Hive, Impala will recognize that the table no longer exists.
- New startup options let you control the parallelism of the metadata loading during startup for the `catalogd` daemon:
 - `--load_catalog_in_background` makes Impala load and cache metadata using background threads after startup. It is `true` by default. Previously, a system with a large number of databases, tables, or partitions could be unresponsive or even time out during startup.
 - `--num_metadata_loading_threads` determines how much parallelism Impala devotes to loading metadata in the background. The default is 16. You might increase this value for systems with huge numbers of databases, tables, or partitions. You might lower this value for busy systems that are CPU-constrained due to jobs from components other than Impala.

New Features in Impala 1.2.3

Note: Impala 1.2.3 works with CDH 4 and with CDH 5 beta 2. The resource management feature requires CDH 5 beta.

Impala 1.2.3 contains exactly the same feature set as Impala 1.2.2. Its only difference is one additional fix for compatibility with Parquet files generated outside of Impala by components such as Hive, Pig, or MapReduce.

New Features in Impala 1.2.2

Note: Impala 1.2.2 works with CDH 4. Its feature set is a superset of features in the Impala 1.2.0 beta, with the exception of resource management, which relies on CDH 5.

Impala 1.2.2 includes new features for performance, security, and flexibility. The major enhancements over 1.2.1 are performance related, primarily for join queries.

New user-visible features include:

- Join order optimizations. This highly valuable feature automatically distributes and parallelizes the work for a join query to minimize disk I/O and network traffic. The automatic optimization reduces the need to use query hints or to rewrite join queries with the tables in a specific order based on size or cardinality. The new `COMPUTE STATS` statement gathers statistical information about each table that is crucial for enabling the join optimizations. See [Performance Considerations for Join Queries](#) for details.
- `COMPUTE STATS` statement to collect both table statistics and column statistics with a single statement. Intended to be more comprehensive, efficient, and reliable than the corresponding Hive `ANALYZE TABLE` statement, which collects statistics in multiple phases through MapReduce jobs. These statistics are important for query planning for join queries, queries on partitioned tables, and other types of data-intensive operations. For optimal planning of join queries, you need to collect statistics for each table involved in the join. See [COMPUTE STATS Statement](#) for details.
- Reordering of tables in a join query can be overridden by the `STRAIGHT_JOIN` operator, allowing you to fine-tune the planning of the join query if necessary, by using the original technique of ordering the joined tables in descending order of size. See [Overriding Join Reordering with STRAIGHT_JOIN](#) for details.
- The `CROSS JOIN` clause in the `SELECT` statement to allow Cartesian products in queries, that is, joins without an equality comparison between columns in both tables. Because such queries must be carefully checked to avoid accidental overconsumption of memory, you must use the `CROSS JOIN` operator to explicitly select this kind of join. See [Cross Joins and Cartesian Products with the CROSS JOIN Operator](#) for examples.
- The `ALTER TABLE` statement has new clauses that let you fine-tune table statistics. You can use this technique as a less-expensive way to update specific statistics, in case the statistics become stale, or to experiment with the effects of different data distributions on query planning.
- LDAP username/password authentication in JDBC/ODBC. See [Enabling LDAP Authentication for Impala](#) for details.
- [GROUP_CONCAT\(\)](#) aggregate function to concatenate column values across all rows of a result set.
- The `INSERT` statement now accepts hints, `[SHUFFLE]` and `[NOSHUFFLE]`, to influence the way work is redistributed during `INSERT . . . SELECT` operations. The hints are primarily useful for inserting into partitioned Parquet tables, where using the `[SHUFFLE]` hint can avoid problems due to memory consumption and simultaneous open files in HDFS, by collecting all the new data for each partition on a specific node.
- Several built-in functions and operators are now overloaded for more numeric data types, to reduce the requirement to use `CAST()` for type coercion in `INSERT` statements. For example, the expression `2+2` in an `INSERT` statement formerly produced a `BIGINT` result, requiring a `CAST()` to be stored in an `INT` variable. Now, addition, subtraction, and multiplication only produce a result that is one step “bigger” than their arguments, and numeric and conditional functions can return `SMALLINT`, `FLOAT`, and other smaller types rather than always `BIGINT` or `DOUBLE`.
- New `fnv_hash()` built-in function for constructing hashed values. See [Impala Mathematical Functions](#) for details.
- The clause `STORED AS PARQUET` is accepted as an equivalent for `STORED AS PARQUETFILE`. This more concise form is recommended for new code.

Because Impala 1.2.2 builds on a number of features introduced in 1.2.1, if you are upgrading from an older 1.1.x release straight to 1.2.2, also review [New Features in Impala 1.2.1](#) on page 1895 to see features such as the `SHOW TABLE STATS` and `SHOW COLUMN STATS` statements, and user-defined functions (UDFs).

New Features in Impala 1.2.1

Note: Impala 1.2.1 works with CDH 4. Its feature set is a superset of features in the Impala 1.2.0 beta, with the exception of resource management, which relies on CDH 5.

Impala 1.2.1 includes new features for security, performance, and flexibility.

New user-visible features include:

- `SHOW TABLE STATS table_name` and `SHOW COLUMN STATS table_name` statements, to verify that statistics are available and to see the values used during query planning.
- `CREATE TABLE AS SELECT` syntax, to create a new table and transfer data into it in a single operation.
- `OFFSET` clause, for use with the `ORDER BY` and `LIMIT` clauses to produce “paged” result sets such as items 1-10, then 11-20, and so on.
- `NULLS FIRST` and `NULLS LAST` clauses to ensure consistent placement of `NULL` values in `ORDER BY` queries.
- New [built-in functions](#): `least()`, `greatest()`, `initcap()`.
- New aggregate function: `ndv()`, a fast alternative to `COUNT(DISTINCT col)` returning an approximate result.
- The `LIMIT` clause can now accept a numeric expression as an argument, rather than only a literal constant.
- The `SHOW CREATE TABLE` statement displays the end result of all the `CREATE TABLE` and `ALTER TABLE` statements for a particular table. You can use the output to produce a simplified setup script for a schema.
- The `--idle_query_timeout` and `--idle_session_timeout` options for `impalad` control the time intervals after which idle queries are cancelled, and idle sessions expire. See [Setting Timeout Periods for Daemons, Queries, and Sessions](#) for details.
- User-defined functions (UDFs). This feature lets you transform data in very flexible ways, which is important when using Impala as part of an ETL or ELT pipeline. Prior to Impala 1.2, using UDFs required switching into Hive. Impala 1.2 can run scalar UDFs and user-defined aggregate functions (UDAs). Impala can run high-performance functions written in C++, or you can reuse existing Hive functions written in Java.

You create UDFs through the `CREATE FUNCTION` statement and drop them through the `DROP FUNCTION` statement. See [User-Defined Functions \(UDFs\)](#) for instructions about coding, building, and deploying UDFs, and [CREATE FUNCTION Statement](#) and [DROP FUNCTION Statement](#) for related SQL syntax.

- A new service automatically propagates changes to table data and metadata made by one Impala node, sending the new or updated metadata to all the other Impala nodes. The automatic synchronization mechanism eliminates the need to use the `INVALIDATE METADATA` and `REFRESH` statements after issuing Impala statements such as `CREATE TABLE`, `ALTER TABLE`, `DROP TABLE`, `INSERT`, and `LOAD DATA`.

For even more precise synchronization, you can enable the [SYNC DDL](#) query option before issuing a `DDL`, `INSERT`, or `LOAD DATA` statement. This option causes the statement to wait, returning only after the catalog service has broadcast the applicable changes to all Impala nodes in the cluster.

Note:

Because the catalog service only monitors operations performed through Impala, `INVALIDATE METADATA` and `REFRESH` are still needed on the Impala side after creating new tables or loading data through the Hive shell or by manipulating data files directly in HDFS. Because the catalog service broadcasts the result of the `REFRESH` and `INVALIDATE METADATA` statements to all Impala nodes, when you do need to use those statements, you can do so a single time rather than on every Impala node.

This service is implemented by the `catalogd` daemon. See [The Impala Catalog Service](#) for details.

- `CREATE TABLE ... AS SELECT` syntax, to create a table and copy data into it in a single operation. See [CREATE TABLE Statement](#) for details.
- The `CREATE TABLE` and `ALTER TABLE` statements have new clauses `TBLPROPERTIES` and `WITH SERDEPROPERTIES`. The `TBLPROPERTIES` clause lets you associate arbitrary items of metadata with a particular table as key-value pairs. The `WITH SERDEPROPERTIES` clause lets you specify the serializer/deserializer (SerDes) classes that read and write data for a table; although Impala does not make use of these properties, sometimes particular values are needed for Hive compatibility. See [CREATE TABLE Statement](#) and [ALTER TABLE Statement](#) for details.

- Delegation support lets you authorize certain OS users associated with applications (for example, hue), to submit requests using the credentials of other users. Only available in combination with CDH 5. See [Configuring Impala Delegation for Hue and BI Tools](#) for details.
- Enhancements to `EXPLAIN` output. In particular, when you enable the new `EXPLAIN_LEVEL` query option, the `EXPLAIN` and `PROFILE` statements produce more verbose output showing estimated resource requirements and whether table and column statistics are available for the applicable tables and columns. See [EXPLAIN Statement](#) for details.
- `SHOW CREATE TABLE` summarizes the effects of the original `CREATE TABLE` statement and any subsequent `ALTER TABLE` statements, giving you a `CREATE TABLE` statement that will re-create the current structure and layout for a table.
- The `LIMIT` clause for queries now accepts an arithmetic expression, in addition to numeric literals.

New Features in Impala 1.2.0 (Beta)

Note: The Impala 1.2.0 beta release only works in combination with the beta version of CDH 5. The Impala 1.2.0 software is bundled together with the CDH 5 beta 1 download.

The Impala 1.2.0 beta includes new features for security, performance, and flexibility.

New user-visible features include:

- User-defined functions (UDFs). This feature lets you transform data in very flexible ways, which is important when using Impala as part of an ETL or ELT pipeline. Prior to Impala 1.2, using UDFs required switching into Hive. Impala 1.2 can run scalar UDFs and user-defined aggregate functions (UDAs). Impala can run high-performance functions written in C++, or you can reuse existing Hive functions written in Java.

You create UDFs through the `CREATE FUNCTION` statement and drop them through the `DROP FUNCTION` statement. See [User-Defined Functions \(UDFs\)](#) for instructions about coding, building, and deploying UDFs, and [CREATE FUNCTION Statement](#) and [DROP FUNCTION Statement](#) for related SQL syntax.

- A new service automatically propagates changes to table data and metadata made by one Impala node, sending the new or updated metadata to all the other Impala nodes. The automatic synchronization mechanism eliminates the need to use the `INVALIDATE METADATA` and `REFRESH` statements after issuing Impala statements such as `CREATE TABLE`, `ALTER TABLE`, `DROP TABLE`, `INSERT`, and `LOAD DATA`.

Note:

Because this service only monitors operations performed through Impala, `INVALIDATE METADATA` and `REFRESH` are still needed on the Impala side after creating new tables or loading data through the Hive shell or by manipulating data files directly in HDFS. Because the catalog service broadcasts the result of the `REFRESH` and `INVALIDATE METADATA` statements to all Impala nodes, when you do need to use those statements, you can do so a single time rather than on every Impala node.

This service is implemented by the `catalogd` daemon. See [The Impala Catalog Service](#) for details.

- Integration with the YARN resource management framework. Only available in combination with CDH 5. This feature makes use of the underlying YARN service, plus an additional service (Llama) that coordinates requests to YARN for Impala resources, so that the Impala query only proceeds when all requested resources are available. See [Resource Management for Impala](#) for full details.

On the Impala side, this feature involves some new startup options for the `impalad` daemon:

- `-enable_rm`
- `-llama_host`
- `-llama_port`

- llama_callback_port
- cgroup_hierarchy_path

For details of these startup options, see [Modifying Impala Startup Options](#).

This feature also involves several new or changed query options that you can set through the `impala-shell` interpreter and apply within a specific session:

- MEM_LIMIT: the function of this existing option changes when Impala resource management is enabled.
- YARN_POOL: a new option. (Renamed to RESOURCE_POOL in Impala 1.3.0.)
- V_CPU_CORES: a new option.
- RESERVATION_REQUEST_TIMEOUT: a new option.

For details of these query options, see [impala-shell Query Options for Resource Management](#).

- CREATE TABLE ... AS SELECT syntax, to create a table and copy data into it in a single operation. See [CREATE TABLE Statement](#) for details.
- The CREATE TABLE and ALTER TABLE statements have a new TBLPROPERTIES clause that lets you associate arbitrary items of metadata with a particular table as key-value pairs. See [CREATE TABLE Statement](#) and [ALTER TABLE Statement](#) for details.
- Delegation support lets you authorize certain OS users associated with applications (for example, hue), to submit requests using the credentials of other users. Only available in combination with CDH 5. See [Configuring Impala Delegation for Hue and BI Tools](#) for details.
- Enhancements to EXPLAIN output. In particular, when you enable the new EXPLAIN_LEVEL query option, the EXPLAIN and PROFILE statements produce more verbose output showing estimated resource requirements and whether table and column statistics are available for the applicable tables and columns. See [EXPLAIN Statement](#) for details.

New Features in Impala 1.1.1

Impala 1.1.1 includes new features for security and stability.

New user-visible features include:

- Additional security feature: auditing. New startup options for `impalad` let you capture information about Impala queries that succeed or are blocked due to insufficient privileges. To take full advantage of this feature with Cloudera Manager, upgrade to Cloudera Manager 4.7 or higher. For details, see [Impala Security Overview](#).
- Parquet data files generated by Impala 1.1.1 are now compatible with the Parquet support in Hive. See [Apache Impala Incompatible Changes and Limitations](#) on page 1925 for the procedure to update older Impala-created Parquet files to be compatible with the Hive Parquet support.
- Additional improvements to stability and resource utilization for Impala queries.
- Additional enhancements for compatibility with existing file formats.

New Features in Impala 1.1

Impala 1.1 includes new features for security, performance, and usability.

New user-visible features include:

- Extensive new security features, built on top of the Sentry open source project. Impala now supports fine-grained authorization based on roles. A policy file determines which privileges on which schema objects (servers, databases, tables, and HDFS paths) are available to users based on their membership in groups. By assigning privileges for views, you can control access to table data at the column level. For details, see [Impala Security Overview](#).
- Impala 1.1 works with Cloudera Manager 4.6 or higher. To use Cloudera Manager to manage authorization for the Impala web UI (the web pages served from port 25000 by default), use Cloudera Manager 4.6.2 or higher.
- Impala can now create, alter, drop, and query views. Views provide a flexible way to set up simple aliases for complex queries; hide query details from applications and users; and simplify maintenance as you rename or

reorganize databases, tables, and columns. See the overview section [Overview of Impala Views](#) and the statements [CREATE VIEW Statement](#), [ALTER VIEW Statement](#), and [DROP VIEW Statement](#).

- Performance is improved through a number of automatic optimizations. Resource consumption is also reduced for Impala queries. These improvements apply broadly across all kinds of workloads and file formats. The major areas of performance enhancement include:
 - Improved disk and thread scheduling, which applies to all queries.
 - Improved hash join and aggregation performance, which applies to queries with large build tables or a large number of groups.
 - Dictionary encoding with Parquet, which applies to Parquet tables with short string columns.
 - Improved performance on systems with SSDs, which applies to all queries and file formats.
- Some new built-in functions are implemented: [translate\(\)](#) to substitute characters within strings, [user\(\)](#) to check the login ID of the connected user.
- The new `WITH` clause for `SELECT` statements lets you simplify complicated queries in a way similar to creating a view. The effects of the `WITH` clause only last for the duration of one query, unlike views, which are persistent schema objects that can be used by multiple sessions or applications. See [WITH Clause](#).
- An enhancement to `DESCRIBE` statement, `DESCRIBE FORMATTED table_name`, displays more detailed information about the table. This information includes the file format, location, delimiter, ownership, external or internal, creation and access times, and partitions. The information is returned as a result set that can be interpreted and used by a management or monitoring application. See [DESCRIBE Statement](#).
- You can now insert a subset of columns for a table, with other columns being left as all `NULL` values. Or you can specify the columns in any order in the destination table, rather than having to match the order of the corresponding columns in the source. `VALUES` clause. This feature is known as “column permutation”. See [INSERT Statement](#).
- The new `LOAD DATA` statement lets you load data into a table directly from an HDFS data file. This technique lets you minimize the number of steps in your ETL process, and provides more flexibility. For example, you can bring data into an Impala table in one step. Formerly, you might have created an external table where the data files are not entirely under your control, or copied the data files to Impala data directories manually, or loaded the original data into one table and then used the `INSERT` statement to copy it to a new table with a different file format, partitioning scheme, and so on. See [LOAD DATA Statement](#).
- Improvements to Impala-HBase integration:
 - New query options for HBase performance: [HBASE_CACHE_BLOCKS](#) and [HBASE_CACHING](#).
 - Support for binary data types in HBase tables. See [Supported Data Types for HBase Columns](#) for details.
- You can issue `REFRESH` as a SQL statement through any of the programming interfaces that Impala supports. `REFRESH` formerly had to be issued as a command through the `impala-shell` interpreter, and was not available through a JDBC or ODBC API call. As part of this change, the functionality of the `REFRESH` statement is divided between two statements. In Impala 1.1, `REFRESH` requires a table name argument and immediately reloads the metadata; the new `INVALIDATE METADATA` statement works the same as the Impala 1.0 `REFRESH` did: the table name argument is optional, and the metadata for one or all tables is marked as stale, but not actually reloaded until the table is queried. When you create a new table in the Hive shell or through a different Impala node, you must enter `INVALIDATE METADATA` with no table parameter before you can see the new table in `impala-shell`. See [REFRESH Statement](#) and [INVALIDATE METADATA Statement](#).

New Features in Impala 1.0.1

The primary enhancements in Impala 1.0.1 are internal, for compatibility with the new Cloudera Manager 4.6 release. Try out the new **Impala Query Monitoring** feature in Cloudera Manager 4.6, which requires Impala 1.0.1.

New user-visible features include:

- The `VALUES` clause lets you `INSERT` one or more rows using literals, function return values, or other expressions. For performance and scalability, you should still use `INSERT ... SELECT` for bringing large quantities of data into an Impala table. The `VALUES` clause is a convenient way to set up small tables, particularly for initial testing of SQL features that do not require large amounts of data. See [VALUES Clause](#) for details.
- The `-B` and `-o` options of the `impala-shell` command can turn query results into delimited text files and store them in an output file. The plain text results are useful for using with other Hadoop components or Unix tools. In

benchmark tests, it is also faster to produce plain rather than pretty-printed results, and write to a file rather than to the screen, giving a more accurate picture of the actual query time.

- Several bug fixes. See [Issues Fixed in the 1.0.1 Release](#) on page 2457 for details.

New Features in Impala 1.0

This version has multiple performance improvements and adds the following functionality:

- Several bug fixes. See [Issues Fixed in the 1.0 GA Release](#) on page 2458.
- [ALTER TABLE](#) statement.
- [Hints](#) to allow specifying a particular join strategy.
- [REFRESH](#) for a single table.
- Dynamic resource management, allowing high concurrency for Impala queries.

New Features in Version 0.7 of the Impala Beta Release

This version has multiple performance improvements and adds the following functionality:

- Several bug fixes. See [Issues Fixed in Version 0.7 of the Beta Release](#) on page 2460.
- Support for the Parquet file format. For more information on file formats, see [How Impala Works with Hadoop File Formats](#).
- Added support for Avro.
- Support for the memory limits. For more information, see the example on modifying memory limits in [Modifying Impala Startup Options](#).
- Bigger and faster joins through the addition of partitioned joins to the already supported broadcast joins.
- Fully distributed aggregations.
- Fully distributed top-n computation.
- Support for creating and altering tables.
- Support for GROUP BY with floats and doubles.

In this version, both CDH 4.1 and 4.2 are supported, but due to performance improvements added, we highly recommend you use CDH 4.2 or higher to see the full benefit. If you are using Cloudera Manager, version 4.5 is required.

New Features in Version 0.6 of the Impala Beta Release

- Several bug fixes. See [Issues Fixed in Version 0.6 of the Beta Release](#) on page 2461.
- Added support for Impala on SUSE and Debian/Ubuntu. Impala is now supported on:
 - RHEL5.7/6.2 and Centos5.7/6.2
 - SUSE 11 with Service Pack 1 or higher
 - Ubuntu 10.04/12.04 and Debian 6.03
- Cloudera Manager 4.5 and CDH 4.2 support Impala 0.6.
- Support for the RCFfile file format. For more information on file formats, see [Understanding File Formats](#).

New Features in Version 0.5 of the Impala Beta Release

- Several bug fixes. See [Issues Fixed in Version 0.5 of the Beta Release](#) on page 2462.
- Added support for a JDBC driver that allows you to access Impala from a Java client. To use this feature, follow the instructions in [Configuring Impala to Work with JDBC](#) to install the JDBC driver JARs on the client machine and modify the `CLASSPATH` on the client to include the JARs.

New Features in Version 0.4 of the Impala Beta Release

- Several bug fixes. See [Issues Fixed in Version 0.4 of the Beta Release](#) on page 2462.
- Added support for Impala on RHEL5.7/Centos5.7. Impala is now supported on RHEL5.7/6.2 and Centos5.7/6.2.
- Cloudera Manager 4.1.3 supports Impala 0.4.
- The Impala debug webserver now has the ability to serve static files from `${IMPALA_HOME}/www`. This can be disabled by setting `--enable_webserver_doc_root=false` on the command line. As a result, Impala now

uses the Twitter Bootstrap library to style its debug webpages, and the `/queries` page now tracks the last 25 queries run by each Impala daemon.

- Additional metrics available on the Impala Debug Webpage.

New Features in Version 0.3 of the Impala Beta Release

- Several bug fixes. See [Issues Fixed in Version 0.3 of the Beta Release](#) on page 2463.
- The `state-store-service` binary has been renamed `statestored`.
- The location of the Impala configuration files has changed from the `/usr/lib/impala/conf` directory to the `/etc/impala/conf` directory.

New Features in Version 0.2 of the Impala Beta Release

- Several bug fixes. See [Issues Fixed in Version 0.2 of the Beta Release](#) on page 2463.
- **Added Default Query Options** Default query options override all default QueryOption values when starting `impalad`. The format is:

```
-default_query_options='key=value;key=value'
```

What's New in Apache Kudu

This topic includes the release notes for all generally available versions (GA) of Apache Kudu.

Schema Design and Usage Limitations

The [Apache Kudu Known Issues](#) on page 2019 and [Usage Limitations](#) topics describes known issues and limitations with respect to schema design, integration with Apache Impala, and security in Kudu, as of the current release.

Kudu 1.7.0 / CDH 5.16.1 Release Notes

The release of Kudu in CDH 5.16.1 is based on Apache Kudu 1.7 with a few additional changes highlighted in these release notes.

Wire protocol compatibility, client library compatibility, incompatible changes and the issues stay the same as described in [Kudu 1.7.0 / CDH 5.15.0 Release Notes](#) on page 1902.

New Features in Kudu 1.7.0 / CDH 5.16.1

- The scan request timeout was added to Kudu scan token API.
- Two new configuration parameters have been added to the Spark connector to allow better tuning to avoid scan timeouts under high load: `socketReadTimeoutMs` and `scanRequestTimeout`
- The `kudu tablet unsafe_replace_tablet` tool was added to replace a tablet with a new one. Use this tool to recover a table when one of its tablets has permanently lost all replicas. The data in the replaced tablet is lost, so this tool should only be used as a last resort.
- Two new tools allow superusers to retrieve all the values of command line flags from remote Kudu processes: `kudu tserver get_flags` and `kudu master get_flags`. The `get_flag` tools support filtering the returned flags by tag. By default, they will return only flags that were explicitly set.
- A new CLI tool for manual data rebalancing can be used to redistribute table replicas among tablet servers. The rebalancing tool can be run via `kudu cluster rebalance` sub-command. Using the new tool, it's possible to rebalance Kudu clusters running CDH 5.12 (Kudu 1.4.0) and newer.

Optimizations and Improvements in Kudu 1.7.0 / CDH 5.16.1

- An optimization was added to improve the performance when scanning tables with large consecutive runs of deleted rows. For example, users may use `DELETE` all rows in a table or partition before re-adding them, or they may delete all data corresponding to some prefix of the primary key.
- The default timeout for starting tablet copy was increased from 3 to 30 seconds to make automatic tablet re-replication more robust when there is a heavy disk activity on the target server. Also, corresponding tablet server's flag `--tablet_copy_begin_session_timeout_ms` is now available as an advanced option.
- The `kudu cluster ksck` tool has been significantly enhanced.

- `ksck` now checks master health and consensus status, displays any unsafe or hidden flags set in the cluster, and produces a summary of the Kudu versions running on the master and tablet servers.
- `ksck` now supports JSON output, both in pretty-printed and compact form.
- The output format is controlled by the `-ksck_format` flag.
- The output of `kudu local_replica dump rowset` is now more human-readable.

Kudu 1.7.0 / CDH 5.15.0 Release Notes

New Features in Kudu 1.7.0 / CDH 5.15.0

- Kudu now supports the decimal column type. The decimal type is a numeric data type with fixed scale and precision suitable for financial and other arithmetic calculations where the imprecise representation and rounding behavior of float and double make those types impractical. The decimal type is also useful for integers larger than int64 and cases with fractional values in a primary key. See [Decimal Type](#) for more details.
- The strategy Kudu uses for automatically healing tablets which have lost a replica due to server or disk failures has been improved. The new re-replication strategy, or replica management scheme, first adds a replacement tablet replica before evicting the failed one. With the previous replica management scheme, the system first evicts the failed replica and then adds a replacement. The new replica management scheme allows for much faster recovery of tablets in scenarios where one tablet server goes down and then returns back shortly after 5 minutes or so. The new scheme also provides substantially better overall stability on clusters with frequent server failures. See [KUDU-1097](#) for more information.
- The `kudu fs update_dirs` tool now supports removing directories. Unless the `--force` flag is specified, Kudu will not allow the removal of a directory across which tablets are configured to spread data. If specified, all tablet replicas configured to use that directory will fail upon starting up and be replicated elsewhere, provided a majority exists elsewhere.
- Users can use the new `--fs_metadata_dir` to specify the directory in which to place tablet-specific metadata. It is recommended that this be placed on a high-performance drive with high bandwidth and low latency, such as a solid-state drive. If not specified, metadata will be placed in the directory specified by `--fs_wal_dir`, or in the directory specified by the first entry of `--fs_data_dirs` if metadata already exists there from an earlier deployment. Kudu does not automatically move existing metadata based on this configuration.
- `READ_YOUR_WRITES` is a new scan read mode. You can specify `READ_YOUR_WRITES` when creating a new scanner in C++, Java, and Python clients. If this mode is used, the client performs a read such that it follows all previously known writes and reads from this client. Reads in this mode ensure "read-your-writes" and "read-your-reads" session guarantees while minimizing latency caused by waiting for outstanding write transactions to complete. Note that this is still an experimental feature which may be stabilized in future releases.
- The tablet server web UI scans dashboard (`/scans`) has been improved with several new features:
 - Shows the most recently completed scans
 - Pseudo-SQL scan descriptor that concisely shows the selected columns and applied predicates
 - More complete, better documented scan statistics
- Kudu daemons now expose a web page `/stacks` which dumps the current stack trace of every thread running in the server. This information can be helpful when diagnosing performance issues.

Optimizations and Improvements in Kudu 1.7.0 / CDH 5.15.0

- By default, each tablet replica now stripes data blocks across three data directories instead of all data directories. This decreases the likelihood that any given tablet is affected in the event of a single disk failure. No substantial performance impact is expected due to this feature based on performance testing. This change only affects new replicas created after upgrading to Kudu 1.7.
- Kudu servers previously offered the ability to enable a separate metrics log which stores periodic snapshots of all metrics available on a server. This functionality is now available as part of a more general "diagnostics log" which is enabled by default. The diagnostics log includes periodic dumps of server metrics as well as collections of thread stack traces. The default configuration ensures that no more than 640MB of diagnostics logs are retained, and typically the space consumption is significantly less due to compression. The format and contents of this log file are documented in the [Apache Kudu Administration](#).

- The handling of errors in the synchronous Java client has been improved so that when an exception is thrown, the stack trace indicates the correct location where the client function was invoked rather than a call stack of an internal worker thread. The original call stack from the worker thread is available as a *suppressed exception*.
- The logging of errors in the Java client has been improved to exclude exception stack traces for expected scenarios such as failure to connect to a server in a cluster. Instead, only a single line informational message will be logged in such cases to aid in debugging.
- The Java client now uses a predefined prioritized list of TLS ciphers when establishing an encrypted connection to Kudu servers. This cipher list matches the list of ciphers preferred for server-to-server communication and ensures that the most efficient and secure ciphers are preferred. When the Kudu client is running on Java 8 or newer, this provides a substantial speed-up to read and write performance.
- Reporting for the `kudu cluster kscck` tool has been updated so tablets and tables with on-going tablet copies are shown as *recovering*. Additional reporting changes have been made to make various common scenarios, particularly tablet copies, less alarming.
- The performance of inserting rows containing many string or binary columns has been improved, especially in the case of highly concurrent write workloads.
- By default, Spark tasks that scan Kudu are now able to scan non-leader replicas. This allows Spark to more easily schedule `kudu-spark` tasks local to the data. You can disable this behavior by passing `leader_only` to the `kudu.scanLocality` option.
- The number of OS threads used in the steady state and during bursts of activity, such as in Raft leader elections triggered by a node failure, has been drastically reduced and should no longer exceed the value of `ulimit -u`. It should no longer be necessary to increase the value of `ulimit -u` or of `/proc/sys/kernel/threads-max` in order to run a Kudu tablet server in most cases. See [KUDU-1913](#) for more information.
- An issue where sparse column predicates could cause excessive data-block reads has been fixed. Previously in certain scans with sparsely matching predicates on multiple columns, Kudu read and decoded the same data blocks many times. This improvement typically results in a 5-10x performance increase for the affected scans. See [KUDU-2231](#) for more information.
- The efficiency and on-disk size of large updated values has been improved. This improves update-heavy workloads which overwrite large (1KiB+) values. See [KUDU-2253](#) for more information.

Wire Protocol Compatibility

Kudu 1.7.0 / CDH 5.15.0 is wire-compatible with previous versions of Kudu:

- Kudu 1.7 clients can connect to servers running Kudu 1.0 or later. If the client uses features that are not available on the target server, an error is returned.
- Rolling upgrade to Kudu 1.7 has not been sufficiently tested. We recommend against rolling upgrades in Kudu. You should shut down all nodes in the cluster, upgrade the software, and then restart the daemons on the new version.
- Kudu 1.0 clients may connect to servers running Kudu 1.7 with the exception of the below-mentioned restrictions regarding secure clusters.

The authentication features introduced in Kudu 1.3 place the following limitations on wire compatibility between Kudu 1.7 and versions earlier than 1.3:

- If a Kudu 1.7 cluster is configured with authentication or encryption is set to `required`, clients older than Kudu 1.3 are unable to connect.
- If a Kudu 1.7 cluster is configured with authentication and encryption is set to `optional` or `disabled`, older clients are still able to connect.

Client Library Compatibility

- The Kudu 1.7 Java client library is API- and ABI-compatible with Kudu 1.6. Applications written against Kudu 1.6 compile and run against the Kudu 1.7 client library and vice-versa.
- The Kudu 1.7 C++ client is API- and ABI-forward-compatible with Kudu 1.6. Applications written and compiled against the Kudu 1.6 client library run without modification against the Kudu 1.7 client library. Applications written and compiled against the Kudu 1.7 client library run without modification against the Kudu 1.6 client library.
- The Kudu 1.7 Python client is API-compatible with Kudu 1.6. Applications written against Kudu 1.6 continue to run against the Kudu 1.7 client and vice-versa.

- Kudu 1.7 clients that attempt to create a table with a decimal column on a target server running Kudu 1.6 or earlier receive an error response. Similarly Kudu clients running Kudu 1.6 or earlier result in an error when attempting to access any table containing a decimal column.

Kudu 1.7.0 / CDH 5.15.0 Incompatible Changes

- The newly introduced replica management scheme is not compatible with the old scheme, so it is not possible to run pre-1.7 Kudu masters with 1.7 Kudu tablet servers or vice versa. This is a server-side incompatibility only and it does not affect client compatibility. Kudu clients of prior versions are compatible with upgraded Kudu clusters:
 - Kudu masters of 1.7 version do not register Kudu tablet servers of 1.6 and prior versions.
 - Kudu tablet servers of 1.7 version does not work with Kudu masters of 1.6 and prior versions.
- The format of the previously-optional metrics log has changed to include a human-readable timestamp on each line. The path of the log file has also changed with the word “diagnostics” replacing the word “metrics” in the file name. The metrics log has been optimized to only include those metrics which have changed in between successive samples, and to not include entity attributes such as tablet partition information in the log. See [KUDU-2297](#) for more information.

Kudu 1.6.0 / CDH 5.14.2 Release Notes

New Features in Kudu 1.6.0 / CDH 5.14.2

- Cloudera Manager now supports installing Kudu as part of the Express Wizard installation.
- Cloudera Manager has improved monitoring of Kudu node health. Cloudera Manager will indicate whether the health of the service is concerning or bad according to the number of master or tablet server roles that are not running.

Kudu 1.6.0 / CDH 5.14.0 Release Notes

Apache Kudu 1.6.0 / CDH 5.14.0 is the first Kudu release to be supported with Cloudera Manager 5.14.x and CDH 5.14.x. Any future Kudu 1.6.x maintenance releases will be supported by corresponding CDH and Cloudera Manager 5.14.x maintenance releases.

New Features in Kudu 1.6.0 / CDH 5.14.0

- The disk failure tolerance feature is enabled by default on tablet servers, and the capability was extended to handle data directory failures at runtime. In the event of a runtime disk failure, any tablets with data on a failed disk will be shut down and restarted on another tablet server. By default, tablets are striped across all available disks. Note that the first configured data directory and the WAL directory cannot currently tolerate disk failures. This will be further improved in future Kudu releases.
- Kudu servers can now adopt new data directories via the `kudu fs update_dirs` tool. The new directory will be used by new tablet replicas only. Removing directories is not yet supported ([KUDU-2202](#)).
- Kudu servers have two new flags to control the webui TLS/HTTPS settings: `--webserver_tls_ciphers` and `--webserver_tls_min_protocol`. These flags allow the advertised TLS ciphers and TLS protocol versions to be configured. Additionally, the webserver now excludes insecure legacy ciphers by default ([KUDU-2190](#)).

Optimization and Improvements in Kudu 1.6.0 / CDH 5.14.0

- Kudu servers can now tolerate short interruptions in NTP clock synchronization. NTP synchronization is still required when any Kudu daemon starts up. If NTP synchronization is not available, diagnostic information is now logged to help pinpoint the issue ([KUDU-1578](#)).
- Tablet server startup time has been improved significantly on servers containing large numbers of blocks.
- The log block manager now performs disk data deletion in batches. This optimization can significantly reduce the time taken to delete data on a tablet.
- The usage of sensitive data redaction flag has been changed. By setting the `--redact=log` flag, redaction will be disabled in the web UI but retained for server logs. Alternatively, `--redact=none` can be used to disable redaction completely.

- The Spark DataSource integration now can take advantage of scan locality for better scan performance. The scan will take place at the closest replica instead of going to the leader.
- Various optimizations were made to reduce the 99th percentile latency of writes on tablet servers. This can also improve throughput on certain write workloads, particularly on larger clusters.
- You can configure Kudu to ignore the system-wide `auth_to_local` mappings configured in `/etc/krb5.conf` by setting the configuration flag `--use_system_auth_to_local=false` ([KUDU-2198](#)).
- The performance of the compaction scheduler has been improved. In previous versions, certain types of time series workloads could cause compaction scheduling to take tens of seconds. These workloads now schedule compactions an order of magnitude more efficiently.
- The compaction scheduler has been improved to avoid running a compaction when the benefit of that compaction is extremely small.
- Tablet servers now consider the health of all replicas of a tablet before deciding to evict one. This can improve stability of the Kudu cluster after experiencing multiple simultaneous daemon failures ([KUDU-2048](#)).
- Several performance improvements have been made to the Kudu master, particularly in concurrency of clients opening tables. This should improve performance in highly concurrent workloads.
- The on-disk size metric for a tablet now includes all data and metadata. Previously, it excluded WAL segments and consensus metadata ([KUDU-1755](#)).
- Added a verbose mode for the `kudu cluster ksck` command to enable output of detailed information on the cluster's metadata, even when no errors are detected.

Wire Protocol Compatibility

Kudu 1.6.0 is wire-compatible with previous versions of Kudu:

- Kudu 1.6 clients may connect to servers running Kudu 1.0 or later. If the client uses features that are not available on the target server, an error will be returned.
- Rolling upgrade between Kudu 1.5 and Kudu 1.6 servers may be possible though has not been sufficiently tested. Users are encouraged to shut down all nodes in the cluster, upgrade the software, and then restart the daemons on the new version.
- Kudu 1.0 clients may connect to servers running Kudu 1.6 with the exception of the below-mentioned restrictions regarding secure clusters.

The authentication features introduced in Kudu 1.3 place the following limitations on wire compatibility between Kudu 1.6 and versions earlier than 1.3:

- If a Kudu 1.6 cluster is configured with authentication or encryption set to "required", clients older than Kudu 1.3 will be unable to connect.
- If a Kudu 1.6 cluster is configured with authentication and encryption set to "optional" or "disabled", older clients will still be able to connect.

Client Library Compatibility

- The Kudu 1.6 Java client library is API- and ABI-compatible with Kudu 1.5. Applications written against Kudu 1.5 will compile and run against the Kudu 1.6 client library and vice-versa.
- The Kudu 1.6 C++ client is API- and ABI-forward-compatible with Kudu 1.5. Applications written and compiled against the Kudu 1.5 client library will run without modification against the Kudu 1.6 client library. Applications written and compiled against the Kudu 1.6 client library will run without modification against the Kudu 1.5 client library.
- The Kudu 1.6 Python client is API-compatible with Kudu 1.5. Applications written against Kudu 1.5 will continue to run against the Kudu 1.6 client and vice-versa.

Kudu 1.6.0 / CDH 5.13.2 Release Notes

New Features in Kudu 1.6.0 / CDH 5.13.2

- **New Command-line Debugging Tool** - The `kudu fs list` command line tool replaces exploratory usages of `kudu fs dump` and `kudu local_replica dump`. Output is formatted with default pretty-printing with options to output in CSV and JSON for scripts. Results can easily be filtered to a specific table, tablet, column, rowset, or block using flags. The tool can output many different fields: `table`, `table-id`, `tablet-id`, `partition`, `rowset-id`, `block-id`, `block-kind`, `column`, `column-id`, `cfile-data-type`, `cfile-encoding`, `cfile-compression`, `cfile-num-values`, `cfile-size`, `cfile-incompatible-features`, `cfile-compatible-features`, `cfile-min-key`, `cfile-max-key`, and `cfile-delta-stats`.

Kudu 1.5.0 / CDH 5.13.0 Release Notes

Apache Kudu 1.5.0 / CDH 5.13.0 is the first Kudu release to be supported with Cloudera Manager 5.13.x and CDH 5.13.x. Any future Kudu 1.5.x maintenance releases will be supported by corresponding CDH and Cloudera Manager 5.13.x maintenance releases.

New Features in Kudu 1.5.0 / CDH 5.13.0

- **Integrated into CDH** - Starting with Apache Kudu 1.5.0 / CDH 5.13.0, Kudu is fully integrated into CDH and ships as part of the CDH parcel and packages. On a cluster managed by Cloudera Manager, Kudu will be installed as part of CDH and does not need to be installed separately.
- **Kudu Web UI Improvements** - Kudu server web UIs have a new configuration dashboard (`/config`) which provides a high level summary of important security configuration values, such as whether RPC authentication is required, or web server HTTPS encryption is enabled. Other types of configuration will be added in future releases.
- **New Command-line Tools** - The `kudu` command line tool has two new features:
 - `kudu tablet change_config move_replica` - This tool moves a tablet replica from one tablet server to another, under the condition that the tablet is healthy. An operator can use this tool to rebalance tablet replicas between tablet servers.
 - `kudu local_replica data_size` - This tool summarizes the space usage of a tablet, breaking it down by type of file, column, and rowset.

Optimizations and Improvements in Kudu 1.5.0 / CDH 5.13.0

- The log block manager now performs disk synchronization in batches. This optimization can significantly reduce the time taken to copy tablet data from one server to another; in one case tablet copy time is reduced by 35%. It also improves the general performance of flushes and compactions.
- A new feature referred to as "tombstoned voting" is added to the Raft consensus subsystem to allow tablet replicas in the `TABLET_DATA_TOMBSTONED` state to vote in tablet leader elections. This feature increases Kudu's stability and availability by improving the likelihood that Kudu will be able to self-heal in more edge-case scenarios, such as when tablet copy operations fail. See [KUDU-871](#) for details.
- The tablet on-disk size metric has been made more accurate. Previously, the metric included only REDO deltas; it now counts all deltas. Additionally, the metric includes the size of bloomfiles, ad hoc indexes, and the tablet superblock. WAL segments and consensus metadata are still not counted. The latter is very small compared to the size of data, but the former may be significant depending on the workload (this will be resolved in a future release).
- The number of threads used by the Kudu tablet server has been further reduced. Previously, each follower tablet replica used a dedicated thread to detect leader tablet replica failures, and each leader replica used one dedicated thread per follower to send Raft heartbeats to that follower. The work performed by these dedicated threads has been reassigned to other threads. Other improvements were made to facilitate better thread sharing by tablets. For the purpose of capacity planning, expect the Kudu tablet server to create one thread for every five "cold" (i.e. those not servicing writes) tablets, and an additional three threads for every "hot" tablet. This will be further improved upon in future Kudu releases.

Wire Protocol Compatibility

Kudu 1.5.0 is wire-compatible with previous versions of Kudu:

- Kudu 1.5 clients may connect to servers running Kudu 1.0 or later. If the client uses features that are not available on the target server, an error will be returned.
- Rolling upgrade between Kudu 1.4 and Kudu 1.5 servers is believed to be possible though has not been sufficiently tested. Users are encouraged to shut down all nodes in the cluster, upgrade the software, and then restart the daemons on the new version.
- Kudu 1.0 clients may connect to servers running Kudu 1.5 with the exception of the below-mentioned restrictions regarding secure clusters.

The authentication features introduced in Kudu 1.3 place the following limitations on wire compatibility between Kudu 1.5 and versions earlier than 1.3:

- If a Kudu 1.5 cluster is configured with authentication or encryption set to "required", clients older than Kudu 1.3 will be unable to connect.
- If a Kudu 1.5 cluster is configured with authentication and encryption set to "optional" or "disabled", older clients will still be able to connect.

Client Library Compatibility

- The Kudu 1.5 Java client library is API- and ABI-compatible with Kudu 1.4. Applications written against Kudu 1.4 will compile and run against the Kudu 1.5 client library and vice-versa, unless one of the following newly added APIs is used:
- The Kudu 1.5 C++ client is API- and ABI-forward-compatible with Kudu 1.4. Applications written and compiled against the Kudu 1.4 client library will run without modification against the Kudu 1.5 client library. Applications written and compiled against the Kudu 1.5 client library will run without modification against the Kudu 1.4 client library.
- The Kudu 1.5 Python client is API-compatible with Kudu 1.4. Applications written against Kudu 1.4 will continue to run against the Kudu 1.5 client and vice-versa.

Known Issues and Limitations in Kudu 1.5.0 / CDH 5.13.0

For a complete list of known issues for Apache Kudu, see [Apache Kudu Known Issues](#) on page 2019.

Kudu 1.4.0 / CDH 5.12.1 Release Notes

Apache Kudu 1.4.0 / CDH 5.12.1 is a bug-fix release which includes the following fixes:

- [KUDU-2085](#) - Fixed a bug that caused crashes when seeking past the end of prefix-encoded blocks.
- [KUDU-2087](#) - Fixed an issue where Kudu would fail to start when Kerberos was enabled in FreeIPA-configured deployments.
- [KUDU-2053](#) - Fixed a race condition in the Java `RequestTracker`.
- [KUDU-2049](#) - Fixed an issue where scans on RLE-encoded integer columns would sometimes cause CHECK failures due to the CHECK condition being too strict.
- [KUDU-2052](#) - Kudu now uses `XFS_IOC_UNRESVSP64_ioctl` to punch holes on xfs filesystems. This fixes an issue with slow startup times on xfs when hole punching was done via `fallocate()`.
- [KUDU-1956](#) - Kudu will no longer crash if faced with a race condition when selecting rowsets for compaction.

Kudu 1.4.0 / CDH 5.12.0 Release Notes

Apache Kudu 1.4.0 / CDH 5.12.0 release is the first Kudu release to be supported with Cloudera Manager 5.12.x and CDH 5.12.x. Any future Kudu 1.4.x maintenance releases will be supported by corresponding CDH and Cloudera Manager 5.12.x maintenance releases.

New Features in Kudu 1.4.0 / CDH 5.12.0

- The C++ and Java client libraries now support the ability to alter the storage attributes (for example, encoding and compression) and default value of existing columns. Additionally, it is now possible to rename a column which is part of a table's primary key.
- The C++ client library now includes an experimental `KuduPartitioner` API which can be used to efficiently map rows to their associated partitions and hosts. This can be used to achieve better locality or distribution of writes in client applications.
- The Java client library now supports enabling fault tolerance on scanners. Fault tolerant scanners are able to transparently recover from concurrent server crashes at the cost of some performance overhead. See the [Java API documentation](#) for more details on usage.
- Kudu 1.4.0 includes the optional ability to compute, store, and verify checksums on all pieces of data stored on a server. Prior versions only performed checksums on certain portions of the stored data. This feature is not enabled by default since it makes a backward-incompatible change to the on-disk formats and thus prevents downgrades.
- **Kudu Command Line Tools**
 - The `kudu` command line tool now includes a new advanced administrative command, `kudu remote_replica unsafe_change_config`. This command can be used to force a tablet to perform an unsafe change of its Raft replication configuration. This can then be used to recover from scenarios such as a loss of a majority of replicas, at the risk of losing edits.
 - A new `kudu fs check` command can be used to perform various offline consistency checks on the local on-disk storage of a Kudu Tablet Server or Master. In addition to detecting various inconsistencies or corruptions, it can also detect and remove data blocks that are no longer referenced by any tablet but were not fully removed from disk due to a crash or a bug in prior versions of Kudu.
 - The `kudu` command line tool can now be used to list the addresses and identifiers of the servers in the cluster using either `kudu master list` or `kudu tserver list`.

For a complete list of Kudu's command line tools and usage information, see the [Command Line Reference documentation](#).

Optimizations and Improvements in Kudu 1.4.0 / CDH 5.12.0

- `kudu cluster ksck` now detects and reports new classes of inconsistencies and issues. In particular, it is better able to detect cases where a configuration change such as a replica eviction or addition is pending but is unable to be committed. It also properly detects and reports cases where a tablet has no elected leader.
- The default size for Write Ahead Log (WAL) segments has been reduced from 64MB to 8MB. Additionally, in the case that all replicas of a tablet are fully up to date and data has been flushed from memory, servers will now retain only a single WAL segment rather than two. These changes are expected to reduce the average consumption of disk space on the configured WAL disk by 16x, as well as improve the startup speed of tablet servers by reducing the number and size of WAL segments that need to be re-read.
- The default on-disk storage system used by Kudu servers (Log Block Manager) has been improved to compact its metadata and remove dead containers. This compaction and garbage collection occurs only at startup. Thus, the first startup after upgrade is expected to be longer than usual, and subsequent restarts should be shorter.
- The usability of the Kudu web interfaces has been improved, particularly for cases where a server hosts many tablets or a table has many partitions. Pages that list tablets now include a top-level summary of tablet status and show the complete list under a toggleable section.
- The maintenance manager features improved utilization of the configured maintenance threads. Previously, maintenance work would only be scheduled a maximum of 4 times per second, but now maintenance work will be scheduled immediately whenever any configured thread is available. This can improve the throughput of write-heavy workloads.
- The maintenance manager aggressively schedules flushes of in-memory data when memory consumption crosses 60 percent of the configured process-wide memory limit. The backpressure mechanism which begins to throttle client writes was also adjusted to not begin throttling until memory consumption reaches 80 percent of the configured limit. These two changes together result in improved write throughput, more consistent latency, and fewer timeouts due to memory exhaustion.
- Many performance improvements were made to improve write performance. Applications which send large batches of writes to Kudu should see substantially improved throughput in Kudu 1.4.0.

- Several improvements were made to reduce the memory consumption of Kudu Tablet Servers which hold large volumes of data. The specific amount of memory saved varies depending on workload, but the expectation is that approximately 350MB of excess peak memory usage has been eliminated per TB of data stored.
- The number of threads used by the Kudu Tablet Server has been reduced. Previously, each tablet used a dedicated thread to append to its WAL. Those threads now automatically stop running if there is no activity on a given tablet for a short period of time.

Fixed Issues in Kudu 1.4.0 / CDH 5.12.0

- [KUDU-2020](#) - Fixed an issue where re-replication after a failure would proceed significantly slower than expected. This bug caused many tablets to be unnecessarily copied multiple times before successfully being considered re-replicated, resulting in significantly more network and IO bandwidth usage than expected. Mean time to recovery on clusters with large amounts of data is improved by up to 10x by this fix.
- [KUDU-1982](#) - Fixed an issue where the Java client would call `NetworkInterface.getByInetAddress` very often, causing performance problems particularly on Windows where this function can be quite slow.
- [KUDU-1755](#) - Improved the accuracy of the `on_disk_size` replica metrics to include the size consumed by bloom filters, primary key indexes, superbloc metadata, and delta files. Note that because the size metric is now more accurate, the reported values are expected to increase after upgrading to Kudu 1.4.0. This does not indicate that replicas are using more space after the upgrade; rather, it is now accurately reporting the amount of space that has always been used.
- [KUDU-1192](#) - Kudu servers will now periodically flush their log messages to disk even if no `WARNING`-level messages have been logged. This makes it easier to tail the logs to see progress output during normal startup.

Wire Protocol Compatibility in Kudu 1.4.0 / CDH 5.12.0

- Kudu 1.4.0 clients can connect to servers running Kudu 1.0.0 or later. If the client uses features that are not available on the target server, an error will be returned.
- Kudu 1.0.0 clients can connect to servers running Kudu 1.4.0 with the exception of the restrictions on secure clusters mentioned further on in this list.
- Rolling upgrade between Kudu 1.3.0 and Kudu 1.4.0 servers is believed to be possible though it has not been sufficiently tested. Users are encouraged to shut down all nodes in the cluster, upgrade the software, and then restart the daemons on the new version.
- The authentication features introduced in Kudu 1.3.0 place the following limitations on wire compatibility between Kudu 1.4.0 and versions earlier than 1.3.0:
 - If a Kudu 1.4.0 cluster is configured with authentication or encryption set to `required`, clients older than Kudu 1.3.0 will be unable to connect.
 - If a Kudu 1.4.0 cluster is configured with authentication and encryption set to `optional` or `disabled`, older clients will still be able to connect.

Incompatible Changes in Kudu 1.4.0 / CDH 5.12.0

Kudu servers, by default, will now only allow unencrypted or unauthenticated connections from trusted subnets, which are private networks (127.0.0.0/8, 10.0.0.0/8, 172.16.0.0/12, 192.168.0.0/16, 169.254.0.0/16) and local subnets of all local network interfaces. Unencrypted or unauthenticated connections from publicly routable IPs will be rejected, even if encryption and authentication are not configured.

The trusted subnets can be configured using the `--trusted_subnets` flag, which can be set to IP blocks represented in CIDR notation separated by comma. Set it to `'0.0.0.0/0'` to allow unauthenticated connections from all remote IP addresses. However, if network access is not otherwise restricted by a firewall, malicious users may be able to gain unauthorized access. This can be mitigated if authentication and encryption are configured to be required.

Client Library Compatibility

- **Java** - The Kudu 1.4.0 Java client library is API- and ABI-compatible with Kudu 1.3.0. Applications written against Kudu 1.3.0 will compile and run against the Kudu 1.4.0 client library and vice-versa, unless one of the following newly-added APIs is used:
 - `[Async]KuduScannerBuilder.setFaultTolerant(...)`

- **New methods** in `AlterTableOptions`: `removeDefault`, `changeDefault`, `changeDesiredBlockSize`, `changeEncoding`, `changeCompressionAlgorithm`
 - `KuduClient.updateLastPropagatedTimestamp`
 - `KuduClient.getLastPropagatedTimestamp`
 - **New getters** in `PartialRow`: `getBoolean`, `getByte`, `getShort`, `getInt`, `getLong`, `getFloat`, `getDouble`, `getString`, `getBinaryCopy`, `getBinary`, `isNull`, `isSet`.
- **C++** - The Kudu 1.4.0 C++ client is API- and ABI-forward-compatible with Kudu 1.3.0. Applications written and compiled against the Kudu 1.3.0 client library will run without modification against the Kudu 1.4.0 client library. Applications written and compiled against the Kudu 1.4.0 client library will run without modification against the Kudu 1.3.0 client library unless they use one of the following new APIs:
 - `KuduPartitionerBuilder`
 - `KuduPartitioner`
 - `KuduScanner::SetRowFormatFlags` (unstable API)
 - `KuduScanBatch::direct_data`, `KuduScanBatch::indirect_data` (unstable API)
 - **Python** - The Kudu 1.4.0 Python client is API-compatible with Kudu 1.3.0. Applications written against Kudu 1.3.0 will continue to run against the Kudu 1.4.0 client and vice-versa.

Known Issues and Limitations in Kudu 1.4.0 / CDH 5.12.0

For a complete list of schema design and usage limitations for Apache Kudu, see [Apache Kudu Known Issues](#) on page 2019.

Kudu 1.3.0 / CDH 5.11.2 Release Notes

Apache Kudu 1.3.0 / CDH 5.11.2 is a bug-fix release which includes the following fixes:

- [KUDU-2053](#) - Fixed a race condition in the Java `RequestTracker`.
- [KUDU-2049](#) - Fixed an issue where scans on RLE-encoded integer columns would sometimes cause CHECK failures due to the CHECK condition being too strict.
- [KUDU-1963](#) - Fixed an issue where the Java client misdiagnoses an error and logs a `NullPointerException` when a connection is closed by client while a negotiation is in progress.
- [KUDU-1853](#) - Fixed an issue where data blocks could be orphaned after a failed tablet copy.

Kudu 1.3.0 / CDH 5.11.1 Release Notes

Apache Kudu 1.3.0 / CDH 5.11.1 is a bug-fix release which includes the following fixes:

- [KUDU-1999](#) - Fixed an issue where the Kudu Spark connector would fail to kinit with the principal and keytab provided to a job.
- [KUDU-1993](#) - Fixed a validation issue with grouped gflags.
- [KUDU-1981](#) - Fixed an issue where Kudu server components would fail to start on machines with fully-qualified domain names longer than 64 characters when security was enabled. This was due to hard-coded restrictions in the OpenSSL library.
- [KUDU-1607](#) - Fixed a case in which a tablet replica on a tablet server could retain blocks of data which prevented it from being fully deleted.
- [KUDU-1933](#) - Fixed an issue in which a tablet server would crash and fail to restart after a single tablet received more than two billion write operations.

Kudu 1.3.0 / CDH 5.11.0 Release Notes

Note: Apache Kudu 1.3.0 / CDH 5.11.0 release is the first Kudu release to be supported with Cloudera Manager 5.11.x and CDH 5.11.x. Any future Kudu 1.3.x maintenance releases will be supported by corresponding CDH and Cloudera Manager 5.11.x maintenance releases.

New Features in Kudu 1.3.0 / CDH 5.11.0

- The Kudu CSD is now included in Cloudera Manager. Manual installation of the Kudu CSD is not required.
- Kudu 1.3 supports strong authentication using Kerberos. This feature allows users to authenticate themselves to Kudu using Kerberos tickets, and also provides mutual authentication of servers using Kerberos credentials stored in keytabs.
- Added support for encryption of data on the network using Transport Layer Security (TLS). Kudu will now use TLS to encrypt all network traffic between clients and servers as well as any internal traffic among servers, with the exception of traffic determined to be within a localhost network connection. Encryption is enabled by default whenever it can be determined that both the client and server support the feature.
- Added support for coarse-grained service-level authorization checks for access to the cluster. The operator may set up lists of permitted users who may act as administrators and as clients of the cluster. Combined with the strong authentication feature described above, this can enable a secure environment for some use cases. Note that fine-grained access control, for example table-level or column-level, is not yet supported.
- A background task was added to tablet servers that removes historical versions of data that have fallen behind the configured data retention time. This reduces disk space usage in all workloads, but particularly in those with a higher volume of updates or upserts. After upgrading, you might see disk usage go down a lot.
- Kudu now incorporates Google Breakpad, a library that writes crash reports in the case of a server crash. These reports can be found by default under the `minidumps` directory, or within a configured log directory, and can be useful during bug diagnosis.
- As of Kudu 1.3, multi-word flags can use a dash '-' separator in lieu of the underscore '_' separator. For example, the `--memory_limit_hard_bytes` flag can now be specified as `--memory-limit-hard-bytes`, or even `--memory_limit-hard_bytes`.

Optimizations and Improvements in Kudu 1.3.0 / CDH 5.11.0

- Kudu servers will now change the file permissions of data directories and contained data files based on a new configuration flag `--umask`. As a result, after upgrading, permissions on disk may be more restrictive than in previous versions. The new default configuration improves data security.
- Kudu web UIs will now redact strings that might include sensitive user data. For example, the monitoring page, which shows in-progress scans, no longer includes the scanner predicate values. The tracing and RPC diagnostics endpoints no longer include contents of RPCs, which may include table data.
- By default, Kudu now reserves 1% of each configured data volume as free space. If a volume is seen to have less than 1% of disk space free, Kudu stops writing to that volume to avoid completely filling up the disk.
- The default encoding for numeric columns (`int`, `float`, and `double`) has been changed to `BIT_SHUFFLE`. The default encoding for `binary` and `string` columns has been changed to `DICT_ENCODING`. Dictionary encoding automatically falls back to the old default (`PLAIN`) when cardinality is too high to be effectively encoded. These new defaults match the default behavior of other storage mechanisms, such as Apache Parquet, and are likely to perform better out of the box.

Existing tables with `AUTO_ENCODING`-configured columns will only be encoded during `DiskRowSet` compactions, or if new data is written to them. New tables and columns will have the new defaults.

- Kudu now uses `LZ4` compression when writing its Write Ahead Log (WAL). This improves write performance and stability for many use cases.
- Kudu now uses `LZ4` compression when writing delta files. This can improve both read and write performance as well as save substantial disk usage, especially for workloads involving a high number of updates or upserts containing compressible data.

Existing delta files will not get compressed until they are compacted. New files on both old and new tables alike will be compressed.

- The Kudu API now supports the ability to express `IS NULL` and `IS NOT NULL` predicates on scanners. The Spark DataSource integration will take advantage of these new predicates when possible.

- Both C++ and Java clients have been optimized to prune partitions more effectively when performing scans using the `IN (...)` predicate.
- The exception messages produced by the Java client are now truncated to a maximum length of 32KB.

Fixed Issues in Kudu 1.3.0 / CDH 5.11.0

- [KUDU-1968](#) - Fixed an issue in which the tablet server would delete an incorrect set of data blocks after an aborted attempt to copy a tablet from another server. This would produce data loss in unrelated tablets.
- [KUDU-1962](#) - Fixed a `NullPointerException` in the Java client in the case that the Kudu master is overloaded at the time the client requests location information. This could cause client applications to hang indefinitely regardless of configured timeouts.
- [KUDU-1893](#) - Fixed a critical bug in which wrong results would be returned when evaluating predicates applied to columns added using the `ALTER TABLE` operation.
- [KUDU-1905](#) - Fixed an issue where Kudu would crash after reinserts that resulted in an empty change list. This occurred in cases where the primary key was composed of all columns.
- [KUDU-1899](#) - Fixed a crash that occurred after inserting a row with an empty string as the single-column primary key.
- [KUDU-1904](#) - Fixed a potential crash when performing random reads against a column using RLE encoding and containing long runs of NULL values.
- [KUDU-1856](#) - Fixed an issue in which disk space could be leaked by Kudu servers storing data on partitions using the XFS file system. Any leaked disk space will now be automatically recovered upon upgrade.
- [KUDU-1888](#), [KUDU-1906](#) - Fixed multiple issues in the Java client where operation callbacks would never be triggered, causing the client to hang.

Wire Protocol Compatibility

Kudu 1.3.0 is wire-compatible with previous versions of Kudu:

- Kudu 1.3.0 clients can connect to servers running Kudu 1.0.0. If the client uses features that are not available on the target server, an error will be returned.
- Kudu 1.0.0 clients can connect to servers running Kudu 1.3.0 with the exception of the below-mentioned restrictions regarding secure clusters.
- Rolling upgrade between Kudu 1.2.0 and Kudu 1.3.0 servers is believed to be possible though has not been sufficiently tested. Users are encouraged to shut down all nodes in the cluster, upgrade the software, and then restart the daemons on the new version.

Security - The authentication features introduced in Kudu 1.3.0 place the following limitations on wire compatibility with older versions:

- If a Kudu 1.3.0 cluster is configured with authentication or encryption set to `required`, older clients will not be able to connect.
- If a Kudu 1.3.0 cluster is configured with authentication and encryption set to `optional` or `disabled`, older clients will still be able to connect.

Incompatible Changes in Kudu 1.3.0 / CDH 5.11.0

- Due to storage format changes in Kudu 1.3, downgrading from Kudu 1.3 to earlier versions is not supported. After upgrading to Kudu 1.3, attempting to restart with an earlier version will result in an error.
- In order to support running MapReduce and Spark jobs on secure clusters, these frameworks now connect to the cluster at job submission time to retrieve authentication credentials which can later be used by the tasks to be spawned. This means that the process submitting jobs to Kudu clusters must have direct access to that cluster.

- The embedded web servers in Kudu processes now specify the `X-Frame-Options: DENY` HTTP header which prevents embedding of Kudu web pages in HTML `iframe` elements.

Client Library Compatibility

- **Java** - The Kudu 1.3.0 Java client library is API- and ABI-compatible with Kudu 1.2.0. Applications written against Kudu 1.2.0 will compile and run against the Kudu 1.3.0 client library and vice-versa, unless one of the following newly-added APIs is used:
 - `[Async]KuduClient.exportAuthenticationCredentials(...)` (unstable API)
 - `[Async]KuduClient.importAuthenticationCredentials(...)` (unstable API)
 - `[Async]KuduClient.getMasterAddressesAsString()`
 - `KuduPredicate.newIsNotNullPredicate()`
 - `KuduPredicate.newIsNullPredicate()`
- **C++** - The Kudu 1.3.0 C++ client is API- and ABI-forward-compatible with Kudu 1.2.0. Applications written and compiled against the Kudu 1.2.0 client library will run without modification against the Kudu 1.3.0 client library. Applications written and compiled against the Kudu 1.3.0 client library will run without modification against the Kudu 1.2.0 client library unless they use one of the following new APIs:
 - `kudu::DisableOpenSSLInitialization()`
 - `KuduClientBuilder::import_authentication_credentials(...)`
 - `KuduClient::ExportAuthenticationCredentials(...)`
 - `KuduClient::NewIsNotNullPredicate(...)`
 - `KuduClient::NewIsNullPredicate(...)`
- **Python** - The Kudu 1.3.0 Python client is API-compatible with Kudu 1.2.0. Applications written against Kudu 1.2.0 will continue to run against the Kudu 1.3.0 client and vice-versa.

Known Issues and Limitations in Kudu 1.3.0 / CDH 5.11.0

For a complete list of schema design and usage limitations for Apache Kudu, see [Apache Kudu Known Issues](#) on page 2019.

Kudu 1.2.0 / CDH 5.10.2 Release Notes

Apache Kudu 1.2.x / CDH 5.10.2 includes the following fixed issues.

- [KUDU-1933](#) - Fixed an issue that truncated the 64-bit log index in the OpId to 32 bits, causing overflow of the log index.
- [KUDU-1607](#) - Fixed an issue where Kudu could not delete failed tablets using the `DROP TABLE` command.
- [KUDU-1905](#) - Allow reinserts on tables when all columns are part of the primary key.
- [KUDU-1893](#) - Made a fix to avoid incorrect NULL results and ensure evaluation of predicates for columns added after table creation.

Kudu 1.2.0 / CDH 5.10.1 Release Notes

Apache Kudu 1.2.x / CDH 5.10.1 includes the following fixed issues.

- [KUDU-1904](#) - Fixed a bug where RLE columns with only NULL values would crash on scan.
- [KUDU-1899](#) - Fixed an issue where tablet servers would crash after inserting an empty string primary key ("").
- [KUDU-1851](#) - Fixed an issue with the Python client which would crash whenever a `TableAlterer` is instantiated directly.
- [KUDU-1852](#) - `KuduTableAlterer` will no longer crash when given `nullptr` range bound arguments.
- [KUDU-1821](#) - Improved warnings when the catalog manager starts.

Kudu 1.2.0 / CDH 5.10.0 Release Notes

Note: Apache Kudu 1.2.0 / CDH 5.10.0 release is the first Kudu release to be supported with Cloudera Manager 5.10.0 and CDH 5.10.0. Any future Kudu 1.2.0 maintenance releases will likely be supported by corresponding CDH and Cloudera Manager 5.10.x maintenance releases.

Apache Kudu 1.2.x / CDH 5.10.0 includes the following new features, fixed issues, and changes.

New Features and Improvements in Kudu 1.2.0 / CDH 5.10.0

See also [Issues resolved for Kudu 1.2.0](#) and [Git changes between 1.1.x and 1.2.x](#).

New Features

- Kudu clients and servers now redact user data such as cell values from log messages, Java exception messages, and Status strings. User metadata such as table names, column names, and partition bounds are not redacted.
- Kudu's ability to provide consistency guarantees has been substantially improved:
 - Replicas now correctly track their "safe timestamp". This timestamp is the maximum timestamp at which reads are guaranteed to be repeatable.
 - A scan created using the `SCAN_AT_SNAPSHOT` mode will now either wait for the requested snapshot to be "safe" at the replica being scanned, or be re-routed to a replica where the requested snapshot is "safe". This ensures that all such scans are repeatable.
 - Kudu Tablet Servers now properly retain historical data when a row with a given primary key is inserted and deleted, followed by the insertion of a new row with the same key. Previous versions of Kudu would not retain history in such situations. This allows the server to return correct results for snapshot scans with a timestamp in the past, even in the presence of such "reinsertion" scenarios.
 - The Kudu clients now automatically retain the timestamp of their latest successful read or write operation. Scans using the `READ_AT_SNAPSHOT` mode without a client-provided timestamp automatically assign a timestamp higher than the timestamp of their most recent write. Writes also propagate the timestamp, ensuring that sequences of operations with causal dependencies between them are assigned increasing timestamps. Together, these changes allow clients to achieve read-your-writes consistency, and also ensure that snapshot scans performed by other clients return causally-consistent results.
- User data in log files is now redacted by default.
- Kudu servers now automatically limit the number of log files being stored. By default, 10 log files will be retained at each severity level.

Optimizations and Improvements

- The logging in the Java and `cpp` clients has been substantially quieted. Clients no longer log messages in normal operation unless there is some kind of error.
- The `cpp` client now includes a `KuduSession::SetErrorBufferSize` API which can limit the amount of memory used to buffer errors from asynchronous operations.
- The Java client now fetches tablet locations from the Kudu Master in batches of 1000, increased from batches of 10 in prior versions. This can substantially improve the performance of Spark and Impala queries running against Kudu tables with large numbers of tablets.
- Table metadata lock contention in the Kudu Master was substantially reduced. This improves the performance of tablet location lookups on large clusters with a high degree of concurrency.
- Lock contention in the Kudu Tablet Server during high-concurrency write workloads was also reduced. This can reduce CPU consumption and improve performance when a large number of concurrent clients are writing to a smaller number of servers.
- Lock contention when writing log messages has been substantially reduced. This source of contention could cause high tail latencies on requests, and when under high load could contribute to cluster instability such as election storms and request timeouts.
- The `BITSHUFFLE` column encoding has been optimized to use the `AVX2` instruction set present on processors including Intel(R) Haswell and later. Scans on `BITSHUFFLE`-encoded columns are now up to 30% faster.

- The `kudu` tool now accepts hyphens as an alternative to underscores when specifying actions. For example, `kudu local-replica copy-from-remote` may be used as an alternative to `kudu local_replica copy_from_remote`.

Issues Fixed in Kudu 1.2.0 / CDH 5.10.0

See [Issues resolved for Kudu 1.2.0](#) and [Git changes between 1.1.x and 1.2.x](#).

- [KUDU-1508](#) - Fixed a long-standing issue in which running Kudu on `ext4` file systems could cause file system corruption. While this issue has been known to still manifest in certain rare cases, the corruption is harmless and can be repaired as part of a regular `fsck`. Switching from `ext4` to `xfss` will also solve the problem.
- [KUDU-1399](#) - Implemented an LRU cache for open files, which prevents running out of file descriptors on long-lived Kudu clusters. By default, Kudu will limit its file descriptor usage to half of its configured `ulimit`.
- [Gerrit #5192](#) - Fixed an issue which caused data corruption and crashes in the case that a table had a non-composite (single-column) primary key, and that column was specified to use `DICT_ENCODING` or `BITSHUFFLE` encodings. If a table with an affected schema was written in previous versions of Kudu, the corruption will not be automatically repaired; users are encouraged to re-insert such tables after upgrading to Kudu 1.2 or later.
- [Gerrit #5541](#) - Fixed a bug in the Spark `KuduRDD` implementation which could cause rows in the result set to be silently skipped in some cases.
- [KUDU-1551](#) - Fixed an issue in which the tablet server would crash on restart in the case that it had previously crashed during the process of allocating a new WAL segment.
- [KUDU-1764](#) - Fixed an issue where Kudu servers would leak approximately 16-32MB of disk space for every 10GB of data written to disk. After upgrading to Kudu 1.2 or later, any disk space leaked in previous versions will be automatically recovered on startup.
- [KUDU-1750](#) - Fixed an issue where the API to drop a range partition would drop any partition with a matching lower `_or_` upper bound, rather than any partition with matching lower `_and_` upper bound.
- [KUDU-1766](#) - Fixed an issue in the Java client where equality predicates which compared an integer column to its maximum possible value (e.g. `Integer.MAX_VALUE`) would return incorrect results.
- [KUDU-1780](#) - Fixed the `kudu-client` Java artifact to properly shade classes in the `com.google.thirdparty` namespace. The lack of proper shading in prior releases could cause conflicts with certain versions of Google Guava.
- [Gerrit #5327](#) - Fixed shading issues in the `kudu-flume-sink` Java artifact. The sink now expects that Hadoop dependencies are provided by Flume, and properly shades the Kudu client's dependencies.
- Fixed a few issues using the Python client library from Python 3.

Incompatible Changes in Kudu 1.2.0 / CDH 5.10.0

Apache Kudu 1.2.0 introduces the following incompatible changes:

- The replication factor of tables is now limited to a maximum of 7. In addition, it is no longer allowed to create a table with an even replication factor.
- The `GROUP_VARINT` encoding is now deprecated. Kudu servers have never supported this encoding, and now the client-side constant has been deprecated to match the server's capabilities.
- **Client Library Compatibility**
 - The Kudu 1.2 Java client is API- and ABI-compatible with Kudu 1.1. Applications written against Kudu 1.1 will compile and run against the Kudu 1.2 client and vice-versa.
 - The Kudu 1.2 `cpp` client is API- and ABI-forward-compatible with Kudu 1.1. Applications written and compiled against the Kudu 1.1 client will run without modification against the Kudu 1.2 client. Applications written and compiled against the Kudu 1.2 client will run without modification against the Kudu 1.1 client unless they use one of the following new APIs:
 - `kudu::DisableSaslInitialization()`
 - `KuduSession::SetErrorBufferSize(...)`
 - The Kudu 1.2 Python client is API-compatible with Kudu 1.1. Applications written against Kudu 1.1 will continue to run against the Kudu 1.2 client and vice-versa.

Known Issues and Limitations in Kudu 1.2.0 / CDH 5.10.0

- [KUDU-1893](#) - Certain query results incorrectly include rows with null values for predicates.
Solution - Upgrade to the latest maintenance release.
- **Schema and Usage Limitations** - For a complete list of schema design and usage limitations for Apache Kudu, see [Apache Kudu Known Issues](#) on page 2019.

Incompatible Changes and Limitations

Important:

For changes in operating system support and other major requirements, see [CDH and Cloudera Manager Supported Operating Systems](#) on page 20.

Apache Avro Incompatible Changes and Limitations

See [Apache Avro](#) on page 1848 section of [What's New In CDH 5.2.x](#) on page 1848 for two changes that could possibly affect you when you upgrade to CDH 5.2.0.

Apache Crunch Incompatible Changes and Limitations

The following changes introduced in CDH 5.2 are not backward compatible:

- The `MemPipeline` now checks to ensure that any `DoFns` that are passed to it are serializable. This is designed to catch non-serializable `DoFns` during testing.
- Scala's `Iterable` has been replaced by `TraversableOnce` inside `Scrunch flatMap` functions in order to support functions that return `Iterators`.

CDH 5.4.0 introduces new HBase APIs, which will probably require some changes to Crunch code developed against HBase 0.96 APIs. For more information, see the section on [Apache Crunch](#) on page 1839 under "What's New in CDH 5.4.0".

Apache DataFu Incompatible Changes and Limitations

- Upgraded from version 0.4 to 1.1.0 (this upgrade is not backwards compatible).
- Removed `ApplyQuantiles`, `AliasBagFields`.
- Renamed package `datafu.pig.numbers` to `datafu.pig.random`.
- Renamed package `datafu.pig.bag.sets` to `datafu.pig.sets`.
- Renamed `TimeCount` to `SessionCount`, moved to `datafu.pig.sessions`.

Apache Flume Incompatible Changes and Limitations

The CDH Flume version requires to be matched to a minimum Kafka version. This means that if you upgrade to Kafka 2.2, you need to upgrade brokers as well as clients.

- In CDH 5.7 and higher, the Flume connector to Kafka only works with Kafka 2.0 and higher.
- In CDH 5.14 and higher, the Flume connector to Kafka only works with Kafka 2.2 and higher.

We recommend that you have the Kafka broker running the same or newer version as the client.

Apache Hadoop Incompatible Changes and Limitations

Hadoop Common

The following incompatible changes have been introduced in CDH 5:

- [HADOOP-12672](#) introduced a change to the behavior of RPC timeouts. Because of this change, a `NoSuchMethodError` exception may occur if the `hadoop-common.jar` is present on the classpath with a newer version of the `hadoop-hdfs.jar`s. This can happen when deploying JARs to the distributed cache or reordering classpaths with flags, such as `mapreduce.job.user.classpath.first` or `hbase.use.dynamic.jars`.

Cloudera Issue: CDH-69462

Affected versions: Upgrades from CDH 5.11.0 to 5.11.1 or 5.11.2; upgrades from CDH 5.10.0 or 5.10.1 to 5.10.2

Workaround: Ensure that all client jars have the same maintenance release dot version for all Hadoop jars. Cloudera uses the following pattern for versions: major.minor.maintenance. For example, the maintenance version for CDH 5.11.2 is 2.

HDFS

The following incompatible changes have been introduced in CDH 5:

- [HADOOP-14014](#), [HADOOP-14814](#): API incompatibility introduced in the `FsServerDefaults` class
 - **Affected Versions:** CDH 5.12.0, 5.12.1, 5.12.2, 5.13.0, and 5.13.1
 - **Workaround:** Upgrade to CDH 5.13.2 or 5.14
- HDFS FUSE does not support ACL.
 - **Affected Versions:** All CDH 5 versions
 - **Cloudera Bug:** CDH-60847
- CDH-53734, [HDFS-7933](#):
In CDH5.10.0 and higher, the output of the `fsck` command changed to also contain information about decommissioned replicas, and therefore if you try to parse the output of `fsck`, the parser could fail.
- CDH-54432, [HADOOP-11385](#):
In CDH 5.12.0 and higher, `JMXJSONServlet` replaced JSONP output with Cross-origin resource sharing (CORS) to prevent potential cross-site scripting attacks. External applications relying on the existing output may need to be updated because the new output is not compatible.
- CDH-26136, [HDFS-6962](#): ACL inheritance conflicts with `umaskmode`.
 - **Affected Versions:** CDH5.5.6, CDH5.7.5, CDH5.7.6, CDH5.8.4, CDH5.8.5, and CDH 5.9.1 and higher
- CDH-42931, [HDFS-6434](#) Default permission for creating file should be 644 for `WebHdfs/HttpFS`.
 - **Affected Versions:** CDH5.5.5, CDH5.5.6, CDH5.7.3, CDH5.7.4, CDH5.7.5, CDH5.7.6, CDH5.8.2, CDH5.8.3, CDH5.8.4, CDH5.8.5, and CDH 5.9.0 and higher
- [HDFS-9085](#) Show renewer information in `DelegationTokenIdentifier#toString`.
 - **Affected Versions:** CDH5.4.11 CDH5.5.5 CDH5.5.6 CDH5.7.2 CDH5.7.3 CDH5.7.4 CDH5.7.5 CDH5.7.6 CDH5.8.2 CDH5.8.3 CDH5.8.4 CDH5.8.5, and CDH 5.9.0 and higher
- The `getSnapshottableDirListing()` method returns `null` when there are no snapshottable directories. This is a change from CDH 5 Beta 2 where the method returns an empty array instead.
- Files named `.snapshot` or `.reserved` must not exist within HDFS.
- [HADOOP-10020](#): Disable symlinks temporarily.
 - **Affected Versions:** All CDH 5 versions
- [HDFS-2832](#) - The HDFS internal layout version has changed between CDH 5 Beta 1 and CDH 5 Beta 2, so a file system upgrade is required to move an existing Beta 1 cluster to Beta 2.
- [HDFS-4451](#): HDFS balancer command returns exit code 0 on success instead of 1.
 - **Affected Versions:** All CDH 5 versions

- [HDFS-4594](#): WebHDFS open sets Content-Length header to what is specified by length parameter rather than how much data is actually returned.
 - **Affected Versions:** All CDH 5 versions
 - **Impact:** In CDH 5, Content-Length header will contain the number of bytes actually returned, rather than the request length.
- [HDFS-4659](#): Support setting execution bit for regular files.
 - **Affected Versions:** All CDH 5 versions
 - **Impact:** In CDH 5, files copied out of `copyToLocal` may now have the executable bit set if it was set when they were created or copied into HDFS.
- [HDFS-4997](#) - `libhdfs` functions now return correct error codes in `errno` in case of an error, instead of always returning 255.
 - **Affected Versions:** All CDH 5 versions
- [HDFS-5138](#) - The `-finalize` NameNode startup option has been removed. To finalize an in-progress upgrade, you should instead use the `hdfs dfsadmin -finalizeUpgrade` command while your NameNode is running, or while both NameNodes are running in a High Availability setup.
 - **Affected Versions:** All CDH 5 versions
- [HDFS-7279](#) - In CDH 5.5.0 and higher, DataNode WebHDFS implementation uses Netty as an HTTP server instead of Jetty.
- [HADOOP-13508](#) - In CDH 5.11 and higher, the behavior of `org.apache.hadoop.fs.permission.FsPermission#FsPermission(String mode)` changed to fix a bug in parsing sticky bits. The new behavior may cause incompatible changes if an application depends on the original behavior.
- [HDFS-11056](#) - CDH 5.5.6 and 5.9.1 fixed a critical block corruption bug, but the fix introduced a new bug. Specifically, DataNodes may accumulate too many open file descriptors for deleted meta files over time. The bug is fixed in newer versions, including CDH5.9.2 and CDH5.10.0
Workaround: Restart DataNodes.
- [HADOOP-14104](#) - In CDH 5.12.0 and higher, the client always asks the NameNode for the KMS provider path. When HDFS high availability is used and the nameservices share a name, Cloudera Manager's Backup and Disaster Recovery replication fails.
Workaround: Use unique names for the nameservices.
 - **Affected versions::** CDH 5.12.x, CDH 5.13.x, 5.14.x

Change in High-Availability Support

In CDH 5, the only high-availability (HA) implementation is Quorum-based storage; shared storage using NFS is no longer supported.

MapReduce

Important: There is no separate tarball for MRv1. Instead, the MRv1 binaries, examples, and other contents are delivered in the Hadoop tarball itself. The scripts for running MRv1 are in the `bin-mapreduce1` directory in the tarball, and the MRv1 examples are in the `examples-mapreduce1` directory. You need to do some additional configuration; follow the directions below.

To use MRv1 from a tarball installation, complete the following steps:

1. Extract the files from the tarball.

Note: In the steps that follow, *install_dir* is the name of the directory into which you extracted the files.

2. Create a symbolic link as follows:

```
ln -s install_dir/bin-mapreduce1 install_dir/share/hadoop/mapreduce1/bin
```

3. Create a second symbolic link as follows:

```
ln -s install_dir/etc/hadoop-mapreduce1 install_dir/share/hadoop/mapreduce1/conf
```

4. Set the HADOOP_HOME and HADOOP_CONF_DIR environment variables in your execution environment as follows:

```
$ export HADOOP_HOME=install_dir/share/hadoop/mapreduce1
$ export HADOOP_CONF_DIR=$HADOOP_HOME/conf
```

5. Copy your existing `start-dfs.sh` and `stop-dfs.sh` scripts to *install_dir*/bin-mapreduce1

6. For convenience, add *install_dir*/bin to the PATH variable in your execution environment.

Apache MapReduce 2.0 (YARN) Incompatible Changes

The following incompatible changes occurred for Apache MapReduce 2.0 (YARN) between CDH 4.x and CDH 5 Beta 2:

- The CATALINA_BASE variable no longer determines whether a component is configured for YARN or MRv1. Use the `alternatives` command instead, and make sure CATALINA_BASE is not set.
- [YARN-1288](#) - YARN Fair Scheduler ACL change. Root queue defaults to everybody, and other queues default to nobody.
- YARN High Availability configurations have changed. Configuration keys have been renamed among other changes.
- The YARN_HOME property has been changed to HADOOP_YARN_HOME.
- Note the following changes to configuration properties in `yarn-site.xml`:
 - The value of `yarn.nodemanager.aux-services` should be changed from `mapreduce.shuffle` to `mapreduce_shuffle`.
 - `yarn.nodemanager.aux-services.mapreduce.shuffle.class` has been renamed to `yarn.nodemanager.aux-services.mapreduce_shuffle.class`
 - `yarn.resourcemanager.resourcemanager.connect.max.wait.secs` has been renamed to `yarn.resourcemanager.connect.max-wait.secs`
 - `yarn.resourcemanager.resourcemanager.connect.retry_interval.secs` has been renamed to `yarn.resourcemanager.connect.retry-interval.secs`
 - `yarn.resourcemanager.am.max-retries` is renamed to `yarn.resourcemanager.am.max-attempts`
 - The YARN_HOME environment variable used in the `yarn.application.classpath` has been renamed to HADOOP_YARN_HOME. Make sure you include `$HADOOP_YARN_HOME/*,$HADOOP_YARN_HOME/lib/*` in the classpath.

Changed default location of container executor binary

The default location of container-executor binary and .cfg files was changed to `/var/lib/yarn-ce`. It used to be `/opt/cloudera/parcels/<CDH_parcel_version>`.

Apache MapReduce 2.0 (YARN) Limitations

YARN rolling log aggregation not supported

Cloudera does not support YARN rolling log aggregation.

DockerContainerExecutor not supported in YARN

Cloudera does not support DockerContainerExecutor in YARN.

Node Manager configuration for YARN

A Spark on YARN job launches (with a ProcessBuilder shell executable) a Sqoop job with:

```
yarn jar /data/home/.../infaLib/sqoop-1.4.6-client.jar import -libjars \
file:///data/home/.../lib/avro-mapred-1.7.5-hadoop2.jar --connect
jdbc:oracle:thin:@*****:1521 \
--username ***** -m 1 --as-avrodatafile --columns CUSTOMER_ID,ORDER_ID,... --table
ORDERS \
--target-dir hdfs://0.0.0.0:8020/user/.../d9b49b82_0f2e_41d3_bb31_ad6ff28aa966 \
--password-file *****
```

This command appears to work fine from the command line, using the default configuration files from `/etc/hadoop/conf`. However, when you launch it from the Spark application (with a ProcessBuilder shell exec), configuration from the Cloudera parcel directory is picked up instead, and the job fails with the following error:

```
Log Length: 88
Error: Could not find or load main class org.apache.hadoop.mapreduce.v2.app.MRAppMaster
```

Workaround

To correct this issue:

1. Open the default `etc/hadoop/conf/mapred-site.xml`.
2. Copy the excerpt with the `mapreduce.application.classpath` property.
3. Go to the YARN NodeManager configuration page in Cloudera Manager.
4. Paste the excerpt in the **NodeManager Advanced Configuration Snippet** field. For example:

```
<property>
<name>mapreduce.application.classpath</name>
<value>$HADOOP_CLIENT_CONF_DIR,$HADOOP_CONF_DIR,$HADOOP_COMMON_HOME/,
$HADOOP_COMMON_HOME/lib/,$HADOOP_HDFS_HOME/,$HADOOP_HDFS_HOME/lib/,
$HADOOP_YARN_HOME/,$HADOOP_YARN_HOME/lib/
</value>
</property>
```

Apache HBase Incompatible Changes and Limitations

Compatibility Notes for CDH 5

This section contains information that is relevant for all releases within the CDH 5 family. See the sections below for information which pertains to specific releases within CDH 5. If you are upgrading through more than one version (for instance, from CDH 5.0 to CDH 5.2), read the sections for each version, as most of the information listed applies to the given version and newer releases.

General Notes

- FilterBase no longer implements `Writable`. This means that you do not need to implement `readFields()` and `write()` methods when writing your own custom fields. Instead, put this logic into the `toByteArray` and `parseFrom` methods. See [this page](#) for an example.
- The default number of retained cell versions is reduced from 3 to 1. To increase the number of versions, you can specify the `VERSIONS` option at table creation or by altering existing tables. Starting with CDH 5.2, you can specify a global default number of versions, which will be applied to all newly created tables where the number of versions is not otherwise specified, by setting `hbase.column.max.version` to the desired number of versions in `hbase-site.xml`.
- In CDH 5 prior to 5.1.3, a Put submitted with a `KeyValue, KeyValue.Type.Delete` does not delete the cell. In CDH 5.1.3, this behavior is changed, so that a Put submitted with a `KeyValue, KeyValue.Type.Delete` does delete the cell. This fix is provided in [HBASE-11788](#).
- Cloudera does not provide support for user-provided custom coprocessors of any kind.

Operator API Changes

- [HBASE-6553](#) - Removed Avro Gateway. This feature was less robust and not used as much as the Thrift gateways. It has been removed upstream.
- HBase provides a metrics framework based on JMX beans. Between HBase 0.94 and 0.96, the metrics framework underwent many changes. Some beans were added and removed, some metrics were moved from one bean to another, and some metrics were renamed or removed. Click [here](#) to download the CSV spreadsheet which provides a mapping.

User API Changes

- The HBase User API (Get, Put, Result, Scanner etc; see [Apache HBase API documentation](#)) has evolved and attempts have been made to make sure the HBase Clients are source code compatible and thus should recompile without needing any source code modifications. This cannot be guaranteed however, since with the conversion to ProtoBufs, some relatively obscure APIs have been removed. Rudimentary efforts have also been made to preserve recompile compatibility with advanced APIs such as Filters and Coprocessors. These advanced APIs are still evolving and our guarantees for API compatibility are weaker here.
- As of 0.96, the User API has been marked and all attempts at compatibility in future versions will be made. A version of the javadoc that only contains the User API can be found [here](#).
- Other changes to CDH 5 HBase that require the upgrade include:
 - [HBASE-8015](#): The HBase Namespaces feature has changed HBase HDFS file layout.
 - [HBASE-4451](#): Renamed ZooKeeper nodes.
 - [HBASE-8352](#): HBase snapshots are now saved to the `/<hbase>/ .hbase-snapshot` dir instead of the `/ .snapshot` dir. This should be handled before upgrading HDFS.
 - [HBASE-7660](#): Removed support for HFile V1. All internal HBase files in the HFile v1 format must be converted to the HFile v2 format.
 - [HBASE-6170/HBASE-8909](#) - The `hbase.regionserver.lease.period` configuration parameter has been deprecated. Use `hbase.client.scanner.timeout.period` instead.

Compatibility Notes for CDH 5.15

The Admin interface has added methods for querying maintenance status within the cluster around split and merges. Downstream users who implement their own version of this interface will need to update their source code to account for the new methods. Downstream users who merely make use of Admin instances returned from the HBase API are not impacted.

Compatibility Notes for CDH 5.13

As a part of providing independent timeout tuning for reads and writes in HBASE-15866, the Table interface has added getter and setter methods. Downstream users who implement their own version of this interface will need to update their source code to include these methods. Downstream users who merely make use of Table instances returned from the HBase API are not impacted.

Compatibility Notes for CDH 5.12

There is a new `getTime` metric, - `*_region_*_metric_getTime`, that shows the time spent in gets, in milliseconds.

Compatibility Notes for CDH 5.9

- The default RPC scheduler has been changed from 'deadline' to 'fifo'. To reenble 'deadline', set `hbase.ipc.server.callqueue.type` to `deadline` in the `hbase-site.xml` file.
- Apache HBase no longer includes XSS defense or encoding for filters. Due to licensing issues, HBase no longer includes a prior XSS defense nor an encoding for filters. Additionally, several dependencies have been removed. Downstream users relying on transitive inclusion of the following will need to directly rely on the appropriate dependency themselves: jsr305 (from the FindBugs project), Apache Commons Fileupload, nekohtml, beanshell core, Apache xml graphics, OWASP antisamy, OWASP esapi, Xalan, Apache Xerces, and Xom.

Compatibility Notes for CDH 5.8

- HBase now ensures the jsr305 implementation from the findbugs project is not included in its binary artifacts or the compile / runtime dependencies of its user facing modules. Downstream users that rely on this jar will need to update their dependencies.
- HBase no longer includes Xerces implementation jars that were previously included via transitive dependencies. Downstream users relying on HBase for these artifacts will need to update their dependencies.
- This issue reverts fixes designed to prevent malicious content from rendering in HBase's UIs. Specifically, these changes shipped in 1.1.4+ and 1.2.0+. They were removed due to licensing issues discovered in the dependencies they introduced. Their implementation and those dependencies have been removed from HBase! Removal of these dependencies is against the strict definition of our version compatibility guidelines. However, inclusion of non-Apache approved licenses cannot be tolerated. Implementation of these fixes using an Apache-appropriate means is tracked in [HBASE-16328](#).

Compatibility Notes for CDH 5.7

- Cloudera recommends not using the new advanced configuration option `hbase.regionserver.hostname`, added in HBase 1.2 (CDH 5.7.0), which allows you to specify a separate external-facing hostname for a RegionServer.

Compatibility Notes for CDH 5.4

- The ports used by Apache HBase 1.0 changed from the 600XX range to the 160XX range. HBase in CDH reverted the change, and continues to use the 600XX port range, to maintain compatibility.
- If you used visibility labels prior to CDH 5.4 and assigned superuser privileges to HBase users by adding the `system` label to their set of labels, these users will no longer be superusers in CDH 5.4. To be sure that cached credentials are cleared, use the HBase Shell command `clear_auths <username>`, for each affected user. To grant users superuser privileges, add them to the **HBase Superusers** group in Cloudera Manager, or add them to the `hbase.superuser` property in `hbase-site.xml`, and restart the HMaster.
- `HTrace` is experimental in CDH 5.4.0. Artifacts and package names cannot be relied upon.
- Jersey was updated from 1.8 to 1.9. This has the following implications.
 - The Jersey version is now consistent with Apache HBase and other CDH components.
 - If your project relies upon `jersey-server`, you may need to make modifications.
- Curator in Hadoop was updated from 2.6.0 to 2.7.1. This has the following implications for HBase.
 - `PathUtils.validatePath(String)` changed return types, which will cause runtime errors for code compiled against the older version.
 - The `SharedCountReader` and `SharedValueReader` interfaces each added a method, which will cause compilation errors for code made to use the old version.
- `commons-codec` was upgraded from 1.7 to 1.9. This has the following implications for HBase.
 - The class `org.apache.commons.codec.net.QuotedPrintableCodec` has a constructor that throws additional exceptions. See the [API reference](#) for details.
- `commons-logging` was updated from version 1.1.1. to 1.2. This has the following implications for HBase.
 - `org.apache.commons.logging.LogSource.setLogImplementation(String)` no longer throws `ExceptionInInitializerError`, which may change behavior of code that expects it.
- CDH reverted API changes in HBase 1.0 which broke compatibility with HBase in CDH 5.0, 5.1, 5.2, and 5.3. If you have written applications using Apache HBase 1.0 APIs, you may need to modify these applications to run in CDH 5.4.

Differences between CDH 5.4 HBase 1.0 and Apache HBase 1.0:

- CDH 5.4.0 keeps `commons-math` at version 2.1 to maintain compatibility with earlier CDH releases, whereas Apache HBase 1.0 uses `commons-math 2.2`.
- CDH 5.4.0 keeps Netty at version 3 to maintain compatibility with earlier CDH releases, whereas Apache HBase 1.0 uses Netty 4.

Compatibility Notes for CDH 5.3

- The `Put` class no longer implements `Writable`. Instead, you can change the definition to `WritableComparable` if you have only Puts, or `WritableComparable` if you have a mix of Puts, Gets, and Deletes.

Compatibility Notes for CDH 5.2

- In HBase in CDH 5.1, the default value for `hbase.security.access.early_out` was set to `false`. In CDH 5.2, the default value has been changed to `true`. When set to `true`, if a user is not granted access to a column family qualifier, the `AccessController` immediately throws an `AccessDeniedException`. This change to the default behavior will affect users who enabled HFile version 3 and the `AccessController` coprocessor in CDH 5.1, and then upgrade to CDH 5.2. In this case, if you prefer `hbase.security.access.early_out` to be disabled, explicitly set it to `false` in `hbase-site.xml`.
- Starting with CDH 5.2, you can specify a global default number of versions, which will be applied to all newly created tables where the number of versions is not otherwise specified, by setting `hbase.column.max.version` to the desired number of versions in `hbase-site.xml`.
- HBase in CDH 5.2 differs from Apache HBase 0.98.6 in that CDH does not include [HBASE-11546](#), which provides ZooKeeper-less region assignment. CDH omits this feature because it is an incompatible change that prevents an upgraded cluster from being rolled back to a previous version.

Developer Interface Changes

- HBase 0.98.5 removed `ClientSmallScanner` from the public API. HBase in CDH 5.2 restores the constructor to maintain backward compatibility, but in future releases of HBase, this class will no longer be public. You should change your code to use the `Scan.setSmall(true)` method instead.

Compatibility Notes for CDH 5.1

General Notes

- [HBASE-8218](#) changes `AggregationClient` by replacing the `byte[] tablename` parameters with `HTable table`. This means that coprocessors compiled against CDH 5.0.x won't run or compile in CDH 5.1 and later.
- In CDH 5.1 and later, `delete*` methods of the `Delete` class of the HBase Client API use the timestamp from the constructor, the same behavior as the `Put` class. (In previous versions, the `delete*` methods ignored the constructor's timestamp, and used the value of `HConstants.LATEST_TIMESTAMP`. This behavior was different from the behavior of the `add()` methods of the `Put` class.) See [HBASE-10964](#).
- In CDH 5.1 and newer, HBase introduces a new snapshot format ([HBASE-7987](#)). A snapshot created in HBase 0.98 cannot be read by HBase 0.96. HBase 0.98 can read snapshots produced in previous versions of HBase, and no conversion is necessary.
- In CDH 5.1, the default value for `hbase.security.access.early_out` was changed from `true` to `false`. A setting of `true` means that if a user is not granted access to a column family qualifier, the `AccessController` immediately throws an `AccessDeniedException`. *This behavior change was reverted for CDH 5.2.*

Developer Interface Changes

- `HTablePool` is no longer supported in CDH 5.1 and later. The `HConnection` object is the replacement. You create the connection once and pass it around, as with the old table pool.

```
HConnection connection = HConnectionManager.createConnection(config);
HTableInterface table = connection.getTable(tableName);
table.put(put);
table.close();
connection.close();
```

You can set the `hbase.hconnection.threads.max` property in `hbase-site.xml` to control the pool size or you can pass an `ExecutorService` to `HConnectionManager.createConnection()`.

```
ExecutorService pool = ...;
HConnection connection = HConnectionManager.createConnection(conf, pool);
```

Compatibility Notes for CDH 5 Beta Releases

**Warning:**

CDH 5 Beta 1 and Beta 2 are not intended for production use, and have been superseded by official releases in the CDH 5 family.

The HBase client from CDH 5 Beta 1 is not wire compatible with CDH 5 Beta 2 because of changes introduced in [HBASE-9612](#). As a consequence, CDH 5 Beta 1 users will not be able to execute a rolling upgrade to CDH 5 Beta 2 (or later). This patch unifies the way the HBase clients make requests and simplifies the internals, but breaks wire compatibility. Developers may need to recompile applications built upon the CDH 5 Beta 1 API.

As of CDH 5 Beta 1 (HBase 0.95), the value of `hbase.regionserver.checksum.verify` defaults to `true`; in earlier releases the default is `false`.

Compatibility between CDH Beta and Apache HBase Releases

- Apache HBase 0.95.2 is not wire compatible with CDH 5 Beta 1 HBase 0.95.2.
- Apache HBase 0.96.x should be wire compatible with CDH 5 Beta 2 HBase 0.96.1.1.

Apache Hive Incompatible Changes and Limitations

Note: As of CDH 5, HCatalog is part of Apache Hive; incompatible changes in HCatalog are included below.

Metastore schema upgrade: CDH 5.2.0 includes Hive version 0.13.1. Upgrading from an earlier Hive version to Hive 0.13.1 or later requires a metastore schema upgrade.

**Warning:**

You must upgrade the metastore schema before starting the new version of Hive. Failure to do so may result in metastore corruption.

CDH 5 includes a new offline tool called `schematool`; Cloudera recommends you use this tool to upgrade your metastore schema.

Hive upgrade: Upgrading Hive from an earlier CDH 5.x release to CDH 5.2 or later, requires several manual steps. Follow the upgrade guide closely.

Incompatible changes between any earlier CDH version and CDH 5.4.x:

- CDH 5.2.0 and later clients cannot communicate with CDH 5.1.x and earlier servers. This means that you must upgrade the server before the clients.
- As of CDH 5.2.0, `DESCRIBE DATABASE` returns additional fields: `owner_name` and `owner_type`. The command will continue to behave as expected if you identify the field you're interested in by its (string) name, but could produce unexpected results if you use a numeric index to identify the field(s).
- CDH 5.2.0 implements [HIVE-6248](#), which includes some backward-incompatible changes to the HCatalog API.
- The CDH 5.2 Hive JDBC driver is not wire-compatible with the CDH 5.1 version of HiveServer2. Make sure you upgrade Hive clients and all other Hive hosts in tandem: the server first, and then the clients.
- HiveServer 1 is deprecated as of CDH 5.3, and will be removed in a future release of CDH. Users of HiveServer 1 should upgrade to HiveServer 2 as soon as possible.

- `org.apache.hcatalog` is deprecated as of CDH 5.3. All client-facing classes were moved from `org.apache.hcatalog` to `org.apache.hive.hcatalog` as of CDH 5.0 and the deprecated classes in `org.apache.hcatalog` will be removed altogether in a future release. If you are still using `org.apache.hcatalog`, you should move to `org.apache.hive.hcatalog` immediately.
- **Date partition columns:** as of Hive version 13, implemented in CDH 5.2, Hive validates the format of dates in partition columns, if they are stored as dates. A partition column with a date in invalid form can neither be used nor dropped once you upgrade to CDH 5.2 or higher. To avoid this problem, do one of the following:
 - Fix any invalid dates before you upgrade. Hive expects dates in partition columns to be in the form `YYYY-MM-DD`.
 - Store dates in partition columns as strings or integers.

You can use the following SQL query to find any partition-column values stored as dates:

```
SELECT "DBS"."NAME", "TBLS"."TBL_NAME", "PARTITION_KEY_VALS"."PART_KEY_VAL"
FROM "PARTITION_KEY_VALS"
INNER JOIN "PARTITIONS" ON "PARTITION_KEY_VALS"."PART_ID" = "PARTITIONS"."PART_ID"
INNER JOIN "PARTITION_KEYS" ON "PARTITION_KEYS"."TBL_ID" = "PARTITIONS"."TBL_ID"
INNER JOIN "TBLS" ON "TBLS"."TBL_ID" = "PARTITIONS"."TBL_ID"
INNER JOIN "DBS" ON "DBS"."DB_ID" = "TBLS"."DB_ID"
AND "PARTITION_KEYS"."INTEGER_IDX" = "PARTITION_KEY_VALS"."INTEGER_IDX"
AND "PARTITION_KEYS"."PKEY_TYPE" = 'date';
```

- **Decimal precision and scale:** As of CDH 5.4, Hive support for decimal precision and scale changes as follows:
 1. When `decimal` is used as a type, it means `decimal(10, 0)` rather than a precision of 38 with a variable scale.
 2. When Hive is unable to determine the precision and scale of a decimal type (for example in the case of non-generic User-Defined Function (UDF) that has an `evaluate()` method that returns `decimal`), a precision and scale of `(38, 18)` is assumed. In previous versions, a precision of 38 and a variable scale were assumed. Cloudera recommends you develop generic UDFs instead, and specify exact precision and scale.
 3. When a decimal value is assigned or cast to a different decimal type, rounding is used to handle cases in which the precision of the value is greater than that of the target decimal type, as long as the integer portion of the value can be preserved. In previous versions, if the value's precision was greater than 38 (the only allowed precision for the `decimal` type), the value was set to null, regardless of whether the integer portion could be preserved.
- **Deprecation of HivePassThrough serde formats:** As of CDH 5.4, [HIVE-8910](#) changes how the storage handler uses the `HivePassThroughOutputFormat` class. It removes the empty default constructor, which breaks `org.apache.hadoop.util.ReflectionUtils.newInstance` and throws a `NoSuchMethodException`. The workaround is to re-create the Hive tables without HivePassThrough serde formats.

Hue Incompatible Changes and Limitations

- You will need to upgrade any custom applications after you upgrade to CDH 5.4.0.
- All CDH 5 versions of Hue work only with the default system Python version of the operating system it is being installed on. For example, on RHEL/CentOS 6, you need Python 2.6 to start Hue.

Note: RHEL 5 and CentOS 5 users will have to download Python 2.6 from the EPEL repository.

Apache Impala Incompatible Changes and Limitations

The Impala version covered by this documentation library contains the following incompatible changes. These are things such as file format changes, removed features, or changes to implementation, default configuration, dependencies, or prerequisites that could cause issues during or after an Impala upgrade.

Even added SQL statements or clauses can produce incompatibilities, if you have databases, tables, or columns whose names conflict with the new keywords.

Incompatible Changes Introduced in CDH 5.14.x / Impala 2.11.x

The following new or changed behaviors could cause issues during upgrades or cause changed behavior from prior releases, possibly requiring changes to source code:

- In the [impala] section of the `.impalarc` file, you can specify 0 or 1 wherever a Boolean value is required. Under the [impala.query_options] section, values that are expected to be Boolean must be `true`, `false`, 0, or 1, otherwise Impala reports an error. Formerly, unrecognized Boolean values would only cause a warning.
- Arithmetic expressions involving both `DECIMAL` and `FLOAT` or `DOUBLE` arguments now produce results of `DECIMAL` type instead of `DOUBLE`.

For the full list of issues closed in this release, including any that introduce behavior changes or incompatibilities, see the [changelog for CDH 5.14](#).

Incompatible Changes Introduced in CDH 5.13.x / Impala 2.10.x

The following new or changed behaviors could cause issues during upgrades or cause changed behavior from prior releases, possibly requiring changes to source code:

- The buffer pool feature changes the way memory is allocated during a query, and the thresholds at which operators within a query might spill to disk. Although in general the result is less memory usage and less spilling, it is possible that some queries that worked before (even if those queries were slow and inefficient) might now fail, requiring you to adjust query options related to the buffer pool. In particular, if a table contains rows whose total data size is greater than 512 KB, you must increase the setting for the `MAX_ROW_SIZE` query option.

After upgrading to CDH 5.13 / Impala 2.10, follow the instructions in [Handling Large Rows During Upgrade to CDH 5.13 / Impala 2.10 or Higher](#) to check if your queries are affected by these changes and to modify your configuration settings if so. This advice is especially important for any users who have increased the `--read_size` configuration setting from its default value of 8 MB.

For the full list of issues closed in this release, including any that introduce behavior changes or incompatibilities, see the [changelog for CDH 5.13](#).

Incompatible Changes Introduced in CDH 5.12.x / Impala 2.9.x

For the full list of issues closed in this release, including any that introduce behavior changes or incompatibilities, see the [changelog for CDH 5.12](#).

Impala Incompatible Changes Introduced in CDH 5.11.x / Impala 2.9.x

Because the core Impala functionality in CDH 5.11.x is very close to that of CDH 5.10.x, there are no new incompatible changes for this release.

Impala Incompatible Changes Introduced in CDH 5.10.x / Impala 2.8.x

- Llama support is removed completely from Impala. Related flags (`--enable_rm`) and query options (such as `V_CPU_CORES`) remain but do not have any effect.
If `--enable_rm` is passed to Impala, a warning is printed to the log on startup.
- The syntax related to Kudu tables includes a number of new reserved words, such as `COMPRESSION`, `DEFAULT`, and `ENCODING`, that might conflict with names of existing tables, columns, or other identifiers from older Impala versions. See [Impala Reserved Words](#) for the full list of reserved words.
- The DDL syntax for Kudu tables, particularly in the `CREATE TABLE` statement, is different from the special `impala_next` fork that was previously used for accessing Kudu tables from Impala:
 - The `DISTRIBUTE BY` clause is now `PARTITIONED BY`.
 - The `INTO N BUCKETS` clause is now `PARTITIONS N`.
 - The `SPLIT ROWS` clause is replaced by different syntax for specifying the ranges covered by each partition.

- The `DESCRIBE` output for Kudu tables includes several extra columns.
- Non-primary-key columns can contain `NULL` values by default. The `SHOW CREATE TABLE` output for these columns displays the `NULL` attribute. There was a period during early experimental versions of Impala + Kudu where non-primary-key columns had the `NOT NULL` attribute by default.
- The `IGNORE` keyword that was present in early experimental versions of Impala + Kudu is no longer present. The behavior of the `IGNORE` keyword is now the default: DML statements continue with warnings, instead of failing with errors, if they encounter conditions such as “primary key already exists” for an `INSERT` statement or “primary key already deleted” for a `DELETE` statement.
- The replication factor for Kudu tables must be an odd number.
- A UDF compiled into an LLVM IR bitcode module (`.bc`) might encounter a runtime error when native code generation is turned off by setting the query option `DISABLE_CODEGEN=1`. This issue also applies when running a built-in or native UDF with more than 20 arguments. See [IMPALA-4432](#) for details. As a workaround, either turn native code generation back on with the query option `DISABLE_CODEGEN=0`, or use the regular UDF compilation path that does not produce an IR module.

Impala Incompatible Changes Introduced in CDH 5.9.x / Impala 2.7.x

- Bug fixes related to parsing of floating-point values (IMPALA-1731 and IMPALA-3868) can change the results of casting strings that represent invalid floating-point values. For example, formerly a string value beginning or ending with `inf`, such as `1.23inf` or `infinite`, now are converted to `NULL` when interpreted as a floating-point value. Formerly, they were interpreted as the special “infinity” value when converting from string to floating-point. Similarly, now only the string `NaN` (case-sensitive) is interpreted as the special “not a number” value. String values containing multiple dots, such as `3. .141` or `3.1.4.1`, are now interpreted as `NULL` rather than being converted to valid floating-point values.

Impala Incompatible Changes Introduced in CDH 5.8.x / Impala 2.6.x

- The default for the `RUNTIME_FILTER_MODE` query option is changed to `GLOBAL` (the highest setting).
- The `RUNTIME_BLOOM_FILTER_SIZE` setting is now only used as a fallback if statistics are not available; otherwise, Impala uses the statistics to estimate the appropriate size to use for each filter.
- Admission control and dynamic resource pools are enabled by default. When upgrading from an earlier release, you must turn on these settings yourself if they are not already enabled. See [Admission Control and Query Queuing](#) for details about admission control.
- Impala reserves some new keywords, in preparation for support for Kudu syntax: `buckets`, `delete`, `distribute`, `hash`, `ignore`, `split`, and `update`.
- For Kerberized clusters, the Catalog service now uses the Kerberos principal instead of the operating system user that runs the `catalogd` daemon. This eliminates the requirement to configure a `hadoop.user.group.static.mapping.overrides` setting to put the OS user into the Sentry administrative group, on clusters where the principal and the OS user name for this user are different.
- The mechanism for interpreting `DECIMAL` literals is improved, no longer going through an intermediate conversion step to `DOUBLE`:
 - Casting a `DECIMAL` value to `TIMESTAMP DOUBLE` produces a more precise value for the `TIMESTAMP` than formerly.
 - Certain function calls involving `DECIMAL` literals now succeed, when formerly they failed due to lack of a function signature with a `DOUBLE` argument.
- Improved type accuracy for `CASE` return values. If all `WHEN` clauses of the `CASE` expression are of `CHAR` type, the final result is also `CHAR` instead of being converted to `STRING`.

- The initial release of CDH 5.7 / Impala 2.5 sometimes has a higher peak memory usage than in previous releases while reading Parquet files. The following query options might help to reduce memory consumption in the Parquet scanner:
 - Reduce the number of scanner threads, for example: `set num_scanner_threads=30`
 - Reduce the batch size, for example: `set batch_size=512`
 - Increase the memory limit, for example: `set mem_limit=64g`

You can track the status of the fix for this issue at [IMPALA-3662](#).

- The `S3_SKIP_INSERT_STAGING` query option, which is enabled by default, increases the speed of `INSERT` operations for S3 tables. The speedup applies to regular `INSERT`, but not `INSERT OVERWRITE`. The tradeoff is the possibility of inconsistent output files left behind if a node fails during `INSERT` execution. See [S3_SKIP_INSERT_STAGING Query Option \(CDH 5.8 or higher only\)](#) for details.

Certain features are turned off by default, to avoid regressions or unexpected behavior following an upgrade. Consider turning on these features after suitable testing:

- Impala now recognizes the `auth_to_local` setting, specified through the HDFS configuration setting `hadoop.security.auth_to_local`. This feature is disabled by default; to enable it, specify `--load_auth_to_local_rules=true` in the `impalad` configuration settings.
- A new query option, `PARQUET_ANNOTATE_STRINGS_UTF8`, makes Impala include the UTF-8 annotation metadata for `STRING`, `CHAR`, and `VARCHAR` columns in Parquet files created by `INSERT` or `CREATE TABLE AS SELECT` statements.
- A new query option, `PARQUET_FALLBACK_SCHEMA_RESOLUTION`, lets Impala locate columns within Parquet files based on column name rather than ordinal position. This enhancement improves interoperability with applications that write Parquet files with a different order or subset of columns than are used in the Impala table.

Impala Incompatible Changes Introduced in CDH 5.7.x / Impala 2.5.x

- The admission control default limit for concurrent queries (the `max requests` setting) is now unlimited instead of 200.
- Multiplying a mixture of `DECIMAL` and `FLOAT` or `DOUBLE` values now returns `DOUBLE` rather than `DECIMAL`. This change avoids some cases where an intermediate value would underflow or overflow and become `NULL` unexpectedly. The results of multiplying `DECIMAL` and `FLOAT` or `DOUBLE` might now be slightly less precise than before. Previously, the intermediate types and thus the final result depended on the exact order of the values of different types being multiplied, which made the final result values difficult to reason about.
- Previously, the `_` and `%` wildcard characters for the `LIKE` operator would not match characters on the second or subsequent lines of multi-line string values. The fix for issue [IMPALA-2204](#) causes the wildcard matching to apply to the entire string for values containing embedded `\n` characters. This could cause different results than in previous Impala releases for identical queries on identical data.
- Formerly, all Impala UDFs and UDAs required running the `CREATE FUNCTION` statements to re-create them after each `catalogd` restart. In CDH 5.7 / Impala 2.5 and higher, functions written in C++ are persisted across restarts, and the requirement to re-create functions only applies to functions written in Java. Adapt any function-reloading logic that you have added to your Impala environment.
- `CREATE TABLE LIKE` no longer inherits HDFS caching settings from the source table.
- The `SHOW DATABASES` statement now returns two columns rather than one. The second column includes the associated comment string, if any, for each database. Adjust any application code that examines the list of databases and assumes the result set contains only a single column.

- The output of the `SHOW FUNCTIONS` statement includes two new columns, showing the kind of the function (for example, `BUILTIN`) and whether or not the function persists across catalog server restarts. For example, the `SHOW FUNCTIONS` output for the `_impala_builtins` database starts with:

```

+-----+-----+-----+-----+
| return type | signature | binary type | is |
| persistent | | | |
+-----+-----+-----+-----+
| BIGINT | abs(BIGINT) | BUILTIN | true |
| DECIMAL(*,*) | abs(DECIMAL(*,*)) | BUILTIN | true |
| DOUBLE | abs(DOUBLE) | BUILTIN | true |
| ... | | | |

```

Impala Incompatible Changes Introduced in CDH 5.6.x / Impala 2.4.x

The Impala feature set for CDH 5.6 is the same as for CDH 5.5. Therefore, there are no incompatible changes for Impala introduced in CDH 5.6.

Impala Incompatible Changes Introduced in CDH 5.5.x / Impala 2.3.x

Note:

The use of the Llama component for integrated resource management within YARN is no longer supported with CDH 5.5 / Impala 2.3 and higher. The Llama support code is removed entirely in CDH 5.10 / Impala 2.8 and higher.

For clusters running Impala alongside other data management components, you define static service pools to define the resources available to Impala and other components. Then within the area allocated for Impala, you can create dynamic service pools, each with its own settings for the Impala admission control feature.

- If Impala encounters a Parquet file that is invalid because of an incorrect magic number, the query skips the file. This change is caused by the fix for issue [IMPALA-2130](#). Previously, Impala would attempt to read the file despite the possibility that the file was corrupted.
- Previously, calls to overloaded built-in functions could treat parameters as `DOUBLE` or `FLOAT` when no overload had a signature that matched the exact argument types. Now Impala prefers the function signature with `DECIMAL` parameters in this case. This change avoids a possible loss of precision in function calls such as `greatest(0, 99999.8888)`; now both parameters are treated as `DECIMAL` rather than `DOUBLE`, avoiding any loss of precision in the fractional value. This could cause slightly different results than in previous Impala releases for certain function calls.
- Formerly, adding or subtracting a large interval value to a `TIMESTAMP` could produce a nonsensical result. Now when the result goes outside the range of `TIMESTAMP` values, Impala returns `NULL`.
- Formerly, it was possible to accidentally create a table with identical row and column delimiters. This could happen unintentionally, when specifying one of the delimiters and using the default value for the other. Now an attempt to use identical delimiters still succeeds, but displays a warning message.
- Formerly, Impala could include snippets of table data in log files by default, for example when reporting conversion errors for data values. Now any such log messages are only produced at higher logging levels that you would enable only during debugging.

Impala Incompatible Changes Introduced in CDH 5.4.x

Note: Impala 2.2.0 is available as part of CDH 5.4.0 and is not available for CDH 4. Cloudera does not intend to release future versions of Impala for CDH 4 outside patch and maintenance releases if required. Given the end-of-maintenance status for CDH 4, Cloudera recommends all customers to migrate to a recent CDH 5 release.

Changes to File Handling

Impala queries ignore files with extensions commonly used for temporary work files by Hadoop tools. Any files with extensions `.tmp` or `.copying` are not considered part of the Impala table. The suffix matching is case-insensitive, so for example Impala ignores both `.copying` and `.COPYING` suffixes.

The log rotation feature in Impala 2.2.0 and higher means that older log files are now removed by default. The default is to preserve the latest 10 log files for each severity level, for each Impala-related daemon. If you have set up your own log rotation processes that expect older files to be present, either adjust your procedures or change the Impala `-max_log_files` setting.

Changes to Prerequisites

The prerequisite for CPU architecture has been relaxed in Impala 2.2.0 and higher. From this release onward, Impala works on CPUs that have the SSE3 instruction set. The SSE4 instruction set is no longer required. This relaxed requirement simplifies the upgrade planning from Impala 1.x releases, which also worked on SSE3-enabled processors.

Incompatible Changes Introduced in CDH 5.3.x

Changes to Prerequisites

Currently, Impala 2.1.x does not function on CPUs without the SSE4.1 instruction set. This minimum CPU requirement is higher than in previous versions, which relied on the older SSE3 instruction set. Check the CPU level of the hosts in your cluster before upgrading to CDH 5.3 / Impala 2.1.

Changes to Output Format

The “small query” optimization feature introduces some new information in the `EXPLAIN` plan, which you might need to account for if you parse the text of the plan output.

New Reserved Words

New SQL syntax introduces additional reserved words: `FOR`, `GRANT`, `REVOKE`, `ROLE`, `ROLES`, `INCREMENTAL`.

Incompatible Changes Introduced in Impala 2.0.5 / CDH 5.2.6

No incompatible changes.

Note: Impala 2.0.5 is available as part of CDH 5.2.6, not under CDH 4.

Incompatible Changes Introduced in Impala 2.0.4 / CDH 5.2.5

No incompatible changes.

Note: Impala 2.0.4 is available as part of CDH 5.2.5, not under CDH 4.

Incompatible Changes Introduced in Impala 2.0.3 / CDH 5.2.4

Note: Impala 2.0.3 is available as part of CDH 5.2.4, not under CDH 4.

Incompatible Changes Introduced in Impala 2.0.2 / CDH 5.2.3

No incompatible changes.

Note: Impala 2.0.2 is available as part of CDH 5.2.3, not under CDH 4.

Incompatible Changes Introduced in Impala 2.0.1 / CDH 5.2.1

- The `INSERT` statement has always left behind a hidden work directory inside the data directory of the table. Formerly, this hidden work directory was named `.impala_insert_staging`. In Impala 2.0.1 and later, this directory name is changed to `_impala_insert_staging`. (While HDFS tools are expected to treat names beginning either with underscore and dot as hidden, in practice names beginning with an underscore are more widely supported.) If you have any scripts, cleanup jobs, and so on that rely on the name of this work directory, adjust them to use the new name.
- The `abs()` function now takes a broader range of numeric types as arguments, and the return type is the same as the argument type.
- Shorthand notation for character classes in regular expressions, such as `\d` for digit, are now available again in regular expression operators and functions such as `regexp_extract()` and `regexp_replace()`. Some other differences in regular expression behavior remain between Impala 1.x and Impala 2.x releases. See [Incompatible Changes Introduced in Impala 2.0.0 / CDH 5.2.0](#) on page 1931 for details.

Incompatible Changes Introduced in Impala 2.0.0 / CDH 5.2.0

Changes to Prerequisites

Currently, Impala 2.0.x does not function on CPUs without the SSE4.1 instruction set. This minimum CPU requirement is higher than in previous versions, which relied on the older SSSE3 instruction set. Check the CPU level of the hosts in your cluster before upgrading to CDH 5.2 / Impala 2.0.

Changes to Query Syntax

The new syntax where query hints are allowed in comments causes some changes in the way comments are parsed in the `impala-shell` interpreter. Previously, you could end a `--` comment line with a semicolon and `impala-shell` would treat that as a no-op statement. Now, a comment line ending with a semicolon is passed as an empty statement to the Impala daemon, where it is flagged as an error.

Impala 2.0 and later uses a different support library for regular expression parsing than in earlier Impala versions. Now, Impala uses the [Google RE2 library](#) rather than Boost for evaluating regular expressions. This implementation change causes some differences in the allowed regular expression syntax, and in the way certain regex operators are interpreted. The following are some of the major differences (not necessarily a complete list):

- `. * ?` notation for non-greedy matches is now supported, where it was not in earlier Impala releases.
- By default, `^` and `$` now match only begin/end of buffer, not begin/end of each line. This behavior can be overridden in the regex itself using the `m` flag.
- By default, `.` does not match newline. This behavior can be overridden in the regex itself using the `s` flag.
- `\z` is not supported.

- < and > for start of word and end of word are not supported.
- Lookahead and lookbehind are not supported.
- Shorthand notation for character classes, such as `\d` for digit, is not recognized. (This restriction is lifted in Impala 2.0.1, which restores the shorthand notation.)

Changes to Output Format

In Impala 2.0 and later, `user ()` returns the full Kerberos principal string, such as `user@example.com`, in a Kerberized environment.

The changed format for the user name in secure environments is also reflected where the user name is displayed in the output of the `PROFILE` command.

In the output from `SHOW FUNCTIONS`, `SHOW AGGREGATE FUNCTIONS`, and `SHOW ANALYTIC FUNCTIONS`, arguments and return types of arbitrary `DECIMAL` scale and precision are represented as `DECIMAL(*,*)`. Formerly, these items were displayed as `DECIMAL(-1,-1)`.

Changes to Query Options

The `PARQUET_COMPRESSION_CODEC` query option has been replaced by the `COMPRESSION_CODEC` query option.

Changes to Configuration Options

The meaning of the `--idle_query_timeout` configuration option is changed, to accommodate the new `QUERY_TIMEOUT_S` query option. Rather than setting an absolute timeout period that applies to all queries, it now sets a maximum timeout period, which can be adjusted downward for individual queries by specifying a value for the `QUERY_TIMEOUT_S` query option. In sessions where no `QUERY_TIMEOUT_S` query option is specified, the `--idle_query_timeout` timeout period applies the same as in earlier versions.

The `--strict_unicode` option of `impala-shell` was removed. To avoid problems with Unicode values in `impala-shell`, define the following locale setting before running `impala-shell`:

```
export LC_CTYPE=en_US.UTF-8
```

New Reserved Words

Some new SQL syntax requires the addition of new reserved words: `ANTI`, `ANALYTIC`, `OVER`, `PRECEDING`, `UNBOUNDED`, `FOLLOWING`, `CURRENT`, `ROWS`, `RANGE`, `CHAR`, `VARCHAR`.

Changes to Data Files

The default Parquet block size for Impala is changed from 1 GB to 256 MB. This change could have implications for the sizes of Parquet files produced by `INSERT` and `CREATE TABLE AS SELECT` statements.

Although older Impala releases typically produced files that were smaller than the old default size of 1 GB, now the file size matches more closely whatever value is specified for the `PARQUET_FILE_SIZE` query option. Thus, if you use a non-default value for this setting, the output files could be larger than before. They still might be somewhat smaller than the specified value, because Impala makes conservative estimates about the space needed to represent each column as it encodes the data.

When you do not specify an explicit value for the `PARQUET_FILE_SIZE` query option, Impala tries to keep the file size within the 256 MB default size, but Impala might adjust the file size to be somewhat larger if needed to accommodate the layout for *wide* tables, that is, tables with hundreds or thousands of columns.

This change is unlikely to affect memory usage while writing Parquet files, because Impala does not pre-allocate the memory needed to hold the entire Parquet block.

Incompatible Changes Introduced in Impala 1.4.4 / CDH 5.1.5

No incompatible changes.

Note: Impala 1.4.4 is available as part of CDH 5.1.5, not under CDH 4.

Incompatible Changes Introduced in Impala 1.4.3 / CDH 5.1.4

No incompatible changes. The TLS/SSL security fix does not require any change in the way you interact with Impala.

Note: Impala 1.4.3 is available as part of CDH 5.1.4, and under CDH 4.

Incompatible Changes Introduced in Impala 1.4.2 / CDH 5.1.3

None. Impala 1.4.2 is purely a bug-fix release. It does not include any incompatible changes.

Note: Impala 1.4.2 is only available as part of CDH 5.1.3, not under CDH 4.

Incompatible Changes Introduced in Impala 1.4.1 / CDH 5.1.2

None. Impala 1.4.1 is purely a bug-fix release. It does not include any incompatible changes.

Incompatible Changes Introduced in Impala 1.4.0 / CDH 5.1.0

- There is a slight change to required security privileges in the Sentry framework. To create a new object, now you need the `ALL` privilege on the parent object. For example, to create a new table, view, or function requires having the `ALL` privilege on the database containing the new object.
- With the ability of `ORDER BY` queries to process unlimited amounts of data with no `LIMIT` clause, the query options `DEFAULT_ORDER_BY_LIMIT` and `ABORT_ON_DEFAULT_LIMIT_EXCEEDED` are now deprecated and have no effect.
- There are some changes to the list of reserved words. The following keywords are new:
 - `API_VERSION`
 - `BINARY`
 - `CACHED`
 - `CLASS`
 - `PARTITIONS`
 - `PRODUCED`
 - `UNCACHED`

The following were formerly reserved keywords, but are no longer reserved:

- `COUNT`
 - `GROUP_CONCAT`
 - `NDV`
 - `SUM`
- The fix for issue [IMPALA-973](#) changes the behavior of the `INVALIDATE METADATA` statement regarding nonexistent tables. In Impala 1.4.0 and higher, the statement returns an error if the specified table is not in the metastore database at all. It completes successfully if the specified table is in the metastore database but not yet recognized by Impala, for example if the table was created through Hive. Formerly, you could issue this statement for a completely nonexistent table, with no error.

Incompatible Changes Introduced in Impala 1.3.3 / CDH 5.0.5

No incompatible changes. The TLS/SSL security fix does not require any change in the way you interact with Impala.

Note: Impala 1.3.3 is only available as part of CDH 5.0.5, not under CDH 4.

Incompatible Changes Introduced in Impala 1.3.2 / CDH 5.0.4

With the fix for IMPALA-1019, you can use HDFS caching for files that are accessed by Impala.

Note: Impala 1.3.2 is only available as part of CDH 5.0.4, not under CDH 4.

Incompatible Changes Introduced in Impala 1.3.1 / CDH 5.0.3

- In Impala 1.3.1 and higher, the `REGEXP` and `RLIKE` operators now match a regular expression string that occurs anywhere inside the target string, the same as if the regular expression was enclosed on each side by `.*`. See [REGEXP Operator](#) for examples. Previously, these operators only succeeded when the regular expression matched the entire target string. This change improves compatibility with the regular expression support for popular database systems. There is no change to the behavior of the `regexp_extract()` and `regexp_replace()` built-in functions.
- The result set for the `SHOW FUNCTIONS` statement includes a new first column, with the data type of the return value.

Incompatible Changes Introduced in Impala 1.3.0 / CDH 5.0.0

- The `EXPLAIN_LEVEL` query option now accepts numeric options from 0 (most concise) to 3 (most verbose), rather than only 0 or 1. If you formerly used `SET EXPLAIN_LEVEL=1` to get detailed explain plans, switch to `SET EXPLAIN_LEVEL=3`. If you used the mnemonic keyword (`SET EXPLAIN_LEVEL=verbose`), you do not need to change your code because now level 3 corresponds to `verbose`.
- The keyword `DECIMAL` is now a reserved word. If you have any databases, tables, columns, or other objects already named `DECIMAL`, quote any references to them using backticks (```) to avoid name conflicts with the keyword.

Note: Although the `DECIMAL` keyword is a reserved word, currently Impala does not support `DECIMAL` as a data type for columns.

- The query option formerly named `YARN_POOL` is now named `REQUEST_POOL` to reflect its broader use with the Impala admission control feature.
- There are some changes to the list of reserved words.
 - The names of aggregate functions are no longer reserved words, so you can have databases, tables, columns, or other objects named `AVG`, `MIN`, and so on without any name conflicts.
 - The internal function names `DISTINCTPC` and `DISTINCTPCSA` are no longer reserved words, although `DISTINCT` is still a reserved word.
 - The keywords `CLOSE_FN` and `PREPARE_FN` are now reserved words.
- The HDFS property `dfs.client.file-block-storage-locations.timeout` was renamed to `dfs.client.file-block-storage-locations.timeout.millis`, to emphasize that the unit of measure is milliseconds, not seconds. Impala requires a timeout of at least 10 seconds, making the minimum value for this setting 10000. On systems not managed by Cloudera Manager, you might need to edit the `hdfs-site.xml` file in the Impala configuration directory for the new name and minimum value.

Incompatible Changes Introduced in Impala 1.2.4

There are no incompatible changes introduced in Impala 1.2.4.

Previously, after creating a table in Hive, you had to issue the `INVALIDATE METADATA` statement with no table name, a potentially expensive operation on clusters with many databases, tables, and partitions. Starting in Impala 1.2.4, you can issue the statement `INVALIDATE METADATA table_name` for a table newly created through Hive. Loading the metadata for only this one table is faster and involves less network overhead. Therefore, you might revisit your setup DDL scripts to add the table name to `INVALIDATE METADATA` statements, in cases where you create and populate the tables through Hive before querying them through Impala.

Incompatible Changes Introduced in Impala 1.2.3

Because the feature set of Impala 1.2.3 is identical to Impala 1.2.2, there are no new incompatible changes. See [Incompatible Changes Introduced in Impala 1.2.2](#) on page 1935 if you are upgrading from Impala 1.2.1 or 1.1.x.

Incompatible Changes Introduced in Impala 1.2.2

The following changes to SQL syntax and semantics in Impala 1.2.2 could require updates to your SQL code, or schema objects such as tables or views:

- With the addition of the `CROSS JOIN` keyword, you might need to rewrite any queries that refer to a table named `CROSS` or use the name `CROSS` as a table alias:

```
-- Formerly, 'cross' in this query was an alias for t1
-- and it was a normal join query.
-- In 1.2.2 and higher, CROSS JOIN is a keyword, so 'cross'
-- is not interpreted as a table alias, and the query
-- uses the special CROSS JOIN processing rather than a
-- regular join.
select * from t1 cross join t2...

-- Now if CROSS is used in other context such as a table or column name,
-- use backticks to escape it.
create table `cross` (x int);
select * from `cross`;
```

- Formerly, a `DROP DATABASE` statement in Impala would not remove the top-level HDFS directory for that database. The `DROP DATABASE` has been enhanced to remove that directory. (You still need to drop all the tables inside the database first; this change only applies to the top-level directory for the entire database.)
- The keyword `PARQUET` is introduced as a synonym for `PARQUETFILE` in the `CREATE TABLE` and `ALTER TABLE` statements, because that is the common name for the file format. (As opposed to `SequenceFile` and `RCFile` where the “File” suffix is part of the name.) Documentation examples have been changed to prefer the new shorter keyword. The `PARQUETFILE` keyword is still available for backward compatibility with older Impala versions.
- New overloads are available for several operators and built-in functions, allowing you to insert their result values into smaller numeric columns such as `INT`, `SMALLINT`, `TINYINT`, and `FLOAT` without using a `CAST()` call. If you remove the `CAST()` calls from `INSERT` statements, those statements might not work with earlier versions of Impala.

Because many users are likely to upgrade straight from Impala 1.x to Impala 1.2.2, also read [Incompatible Changes Introduced in Impala 1.2.1](#) on page 1935 for things to note about upgrading to Impala 1.2.x in general.

Incompatible Changes Introduced in Impala 1.2.1

The following changes to SQL syntax and semantics in Impala 1.2.1 could require updates to your SQL code, or schema objects such as tables or views:

- In Impala 1.2.1 and higher, all `NULL` values come at the end of the result set for `ORDER BY ... ASC` queries, and at the beginning of the result set for `ORDER BY ... DESC` queries. In effect, `NULL` is considered greater than all other values for sorting purposes. The original Impala behavior always put `NULL` values at the end, even for `ORDER BY ... DESC` queries. The new behavior in Impala 1.2.1 makes Impala more compatible with other popular database systems. In Impala 1.2.1 and higher, you can override or specify the sorting behavior for `NULL` by adding the clause `NULLS FIRST` or `NULLS LAST` at the end of the `ORDER BY` clause.

The new `catalogd` service might require changes to any user-written scripts that stop, start, or restart Impala services, install or upgrade Impala packages, or issue `REFRESH` or `INVALIDATE METADATA` statements:

- See [Setting Up Apache Impala Using the Command Line](#), [Upgrading Impala](#) and [Starting Impala](#), for usage information for the `catalogd` daemon.
- The `REFRESH` and `INVALIDATE METADATA` statements are no longer needed when the `CREATE TABLE`, `INSERT`, or other table-changing or data-changing operation is performed through Impala. These statements are still needed if such operations are done through Hive or by manipulating data files directly in HDFS, but in those cases the statements only need to be issued on one Impala node rather than on all nodes. See [REFRESH Statement](#) and [INVALIDATE METADATA Statement](#) for the latest usage information for those statements.
- See [The Impala Catalog Service](#) for background information on the `catalogd` service.

Incompatible Changes Introduced in Impala 1.2.0 (Beta)

There are no incompatible changes to SQL syntax in Impala 1.2.0 (beta).

Because Impala 1.2.0 is bundled with the CDH 5 beta download and depends on specific levels of Apache Hadoop components supplied with CDH 5, you can only install it in combination with the CDH 5 beta.

The new `catalogd` service might require changes to any user-written scripts that stop, start, or restart Impala services, install or upgrade Impala packages, or issue `REFRESH` or `INVALIDATE METADATA` statements:

- See [Setting Up Apache Impala Using the Command Line](#), [Upgrading Impala](#) and [Starting Impala](#), for usage information for the `catalogd` daemon.
- The `REFRESH` and `INVALIDATE METADATA` statements are no longer needed when the `CREATE TABLE`, `INSERT`, or other table-changing or data-changing operation is performed through Impala. These statements are still needed if such operations are done through Hive or by manipulating data files directly in HDFS, but in those cases the statements only need to be issued on one Impala node rather than on all nodes. See [REFRESH Statement](#) and [INVALIDATE METADATA Statement](#) for the latest usage information for those statements.
- See [The Impala Catalog Service](#) for background information on the `catalogd` service.

The new resource management feature interacts with both YARN and Llama services, which are available in CDH 5. These services are set up for you automatically in a Cloudera Manager (CM) environment. For information about setting up the YARN and Llama services, see the instructions for [YARN](#) and [Llama](#) in the *CDH 5 Documentation*.

Incompatible Changes Introduced in Impala 1.1.1

There are no incompatible changes in Impala 1.1.1.

Previously, it was not possible to create Parquet data through Impala and reuse that table within Hive. Now that Parquet support is available for Hive 10, reusing existing Impala Parquet data files in Hive requires updating the table metadata. Use the following command if you are already running Impala 1.1.1:

```
ALTER TABLE table_name SET FILEFORMAT PARQUETFILE;
```

If you are running a level of Impala that is older than 1.1.1, do the metadata update through Hive:

```
ALTER TABLE table_name SET SERDE 'parquet.hive.serde.ParquetHiveSerDe';  
ALTER TABLE table_name SET FILEFORMAT  
  INPUTFORMAT "parquet.hive.DeprecatedParquetInputFormat"  
  OUTPUTFORMAT "parquet.hive.DeprecatedParquetOutputFormat";
```

Impala 1.1.1 and higher can reuse Parquet data files created by Hive, without any action required.

As usual, make sure to upgrade the Impala LZO support package to the latest level at the same time as you upgrade the Impala server.

Incompatible Change Introduced in Impala 1.1

- The `REFRESH` statement now requires a table name; in Impala 1.0, the table name was optional. This syntax change is part of the internal rework to make `REFRESH` a true Impala SQL statement so that it can be called through the JDBC and ODBC APIs. `REFRESH` now reloads the metadata immediately, rather than marking it for update the next time any affected table is accessed. The previous behavior, where omitting the table name caused a refresh of the entire Impala metadata catalog, is available through the new `INVALIDATE METADATA` statement. `INVALIDATE METADATA` can be specified with a table name to affect a single table, or without a table name to affect the entire metadata catalog; the relevant metadata is reloaded the next time it is requested during the processing for a SQL statement. See [REFRESH Statement](#) and [INVALIDATE METADATA Statement](#) for the latest details about these statements.

Incompatible Changes Introduced in Impala 1.0

- If you use LZO-compressed text files, when you upgrade Impala to version 1.0, also update the `impala-lzo-cdh4` to the latest level. See [Using LZO-Compressed Text Files](#) for details.
- Cloudera Manager 4.5.2 and higher only supports Impala 1.0 and higher, and vice versa. If you upgrade to Impala 1.0 or higher managed by Cloudera Manager, you must also upgrade Cloudera Manager to version 4.5.2 or higher. If you upgrade from an earlier version of Cloudera Manager, and were using Impala, you must also upgrade Impala to version 1.0 or higher. The beta versions of Impala are no longer supported as of the release of Impala 1.0.

Cloudera Distribution of Apache Kafka Incompatible Changes and Limitations

Flume shipped with CDH 5.6.0 can only send data to Kafka 2.0 and higher via unsecured transport

To take advantage of security additions in Kafka 2.0 and higher, upgrade to CDH 5.7.0.

Topic Blacklist Removed

The MirrorMaker **Topic blacklist** setting has been removed in Cloudera Distribution of Kafka 2.x and higher.

Avoid Data Loss Option Removed

The **Avoid Data Loss** option from earlier releases has been removed in Kafka 2.x in favor of automatically setting the following properties.

1. Producer settings
 - `acks=all`
 - `retries=max integer`
 - `max.block.ms=max long`
2. Consumer setting
 - `auto.commit.enable=false`
3. MirrorMaker setting
 - `abort.on.send.failute=true`

Kite Incompatible Changes and Limitations

Kite in CDH has been rebased on the 1.0 release upstream. This breaks backward compatibility with existing APIs. The APIs are documented at <http://kitesdk.org/docs/1.0.0/apidocs/index.html>. For more information, see [What's New In CDH 5.4.x](#) on page 1838.

Apache Kudu Incompatible Changes and Limitations

See the Apache Kudu [New Features and Changes](#) topic for any incompatible changes introduced in each release.

For a complete list of limitations in the latest release of Apache Kudu, see [Apache Kudu Usage Limitations](#).

For limitations in older versions (Kudu 1.4.0 and lower), see the documentation for previous versions of [Apache Kudu \(1.4.0 and lower\)](#).

Llama Incompatible Changes and Limitations

Note: Llama no longer supported:

Although Impala can be used together with YARN via simple configuration of Static Service Pools in Cloudera Manager, the use of the general-purpose component Llama for integrated resource management between Impala and YARN is no longer supported as of CDH 5.5 / Impala 2.3. Please contact your Cloudera account team if this impacts a previously deployed system.

The following changes have made in the Llama API to help solve synchronization problems:

- As of CDH 5.1, the Reserve API requires you to provide the `reservationId` as part of the request. In previous releases, the `reservationId` was auto-generated and returned to the user.

The `TLLamaAMReservationRequest` has an additional field called `reservation_id` which needs to be initialized to a UUID value. If you do not set this field, the request will result in an error with the error code set to `ErrorCode.RESERVATION_NO_ID_PROVIDED`.

- The Expand API now requires you to provide the `expansionId` as part of the request. In previous releases, the `expansionId` was auto-generated and returned to the user.

The `TLLamaAMReservationExpansionRequest` has an additional field called `expansion_id` which needs to be initialized to a UUID value. If you do not set this field, the request will result in an error with the error code set to `ErrorCode.EXPANSION_NO_EXPANSION_ID_PROVIDED`

Apache Mahout Incompatible Changes and Limitations

CDH 5.1 introduces the following incompatible changes.

Minor changes in behavior:

- [MAHOUT-1368](#)

The `org.apache.mahout.math.stats.OnlineSummarizer` algorithm has changed, potentially leading to different results.

- [MAHOUT-1392](#)

The streaming `KMeans` implementation has changed in how it outputs centroids when run outside of a Hadoop cluster.

- [MAHOUT-1565](#)

Major Developer API changes

- [MAHOUT-1296](#):

The following implementations have been removed:

- Clustering:
 - `DirichletMeanShift`
 - `MinHash`
 - `Eigencuts in o.a.m.clustering.spectral.eigencuts`
- Classification:
 - `WinnowPerceptron`
 - `Frequent Pattern Mining`

- Collaborative Filtering:
 - All recommenders in `o.a.m.cf.taste.impl.recommender.knn`
 - `TreeClusteringRecommender` in `o.a.m.cf.taste.impl.recommender`
 - SlopeOne implementations in `o.a.m.cf.taste.hadoop.slopeone` and `o.a.m.cf.taste.impl.recommender.slopeone`
 - Distributed pseudo recommender in `o.a.m.cf.taste.hadoop.pseudo`
- [MAHOUT-1362](#):
The `examples/bin/build-reuters.sh` script has been removed.

Minor Developer API changes

- [MAHOUT-1280](#):
Some SSVD support code, such as `UpperTriangularMatrix`, has been moved to `mahout-math`.
- [MAHOUT-1363](#):
Scala-related math code has been moved into an `org.apache.mahout.math.scalabindings` sub-package.

Minor packaging changes

- [MAHOUT-1382](#):
Move to Guava 16.
- [MAHOUT-1364](#):
Update to require Lucene 4.6.1.

Apache Oozie Incompatible Changes and Limitations

As of CDH 5.2.0, a new [Hive 2 Action](#) allows Oozie to run HiveServer2 scripts. Using the Hive Action with HiveServer2 is now deprecated; you should switch to the new Hive 2 Action as soon as possible.

CDH 5.4.0 introduces sharelib packaging changes: the sharelib was previously shipped as a pair of tarballs, `oozie-sharelib-yarn.tar.gz` and `oozie-sharelib-mr1.tar.gz`. As of CDH 5.4.0, it is shipped as a pair of directories, `oozie-sharelib-yarn` and `oozie-sharelib-mr1`. They are still installed in `/usr/lib/oozie/` in a packages distribution, and in `/lib/oozie` in a parcels distribution.

Apache Pig Incompatible Changes and Limitations

- Apache Pig has been upgraded from version 0.11 to 0.12.
- A custom UDF must return the schema as a tuple with exactly one field.
- Added the `In`, `CASE` and `Assert` keywords; They cannot be used as variables or UDF names any more.

Cloudera Search Incompatible Changes and Limitations

General Limitations of Cloudera Search

- Cloudera Search supports one instance of the Apache Solr service on each host in a cluster. Using multiple Solr instances on a host is not supported.
- If multiple Solr instances are configured to depend on the same Sentry service, it is not possible to create unique Solr Sentry privileges per Solr deployment. Since privileges are enforced in all Solr instances simultaneously, you cannot add distinct privileges that apply to one Solr cluster, but not to another.
- **Converting existing file-based Sentry authorization policy files to permissions in the Sentry service does not support preserving case-sensitive role or group names**

The file-based model allows case-sensitive role names. During conversion, all roles and groups are converted to lower case.

- If a policy-file conversion will change the case of roles or groups, a warning is presented. Policy conversion can proceed, but if you have enabled document-level security and use role names as your tokens, you must re-index using the new lower case role names after conversion is complete.
- If a policy-file conversion will change the case of roles or groups, creating a name collision, an error occurs and conversion cannot occur. In such a case, you must eliminate the collisions before proceeding. For example, you could rename or delete the roles or groups that cause a collision.

Incompatible Changes Between Cloudera Search for CDH 5.8 and Previous Versions of Cloudera Search

- **Converting existing file-based Sentry authorization policy files to permissions in the Sentry service does not support preserving case-sensitive role or group names**

The file-based model allows case-sensitive role names. During conversion, all roles and groups are converted to lower case.

- If a policy-file conversion will change the case of roles or groups, a warning is presented. Policy conversion can proceed, but if you have enabled document-level security and use role names as your tokens, you must re-index using the new lower case role names after conversion is complete.
- If a policy-file conversion will change the case of roles or groups, creating a name collision, an error occurs and conversion cannot occur. In such a case, you must eliminate the collisions before proceeding. For example, you could rename or delete the roles or groups that cause a collision.

Incompatible Changes Between Cloudera Search for CDH 5.5 and Previous Versions of Cloudera Search

- **Using MapReduceIndexerTool with configurations that require an `updateRequestProcessorChain` may fail unless an alternate configuration is specified**

With Search for CDH 5.5, the MapReduceIndexerTool uses a default `solrconfig.xml` that is appropriate for most collection configurations. With this configuration, the MapReduceIndexerTool can index data even if Sentry is enabled. This default configuration does not include any `updateRequestProcessorChains`; if your configuration requires an `updateRequestProcessorChain`, you can configure the MapReduceIndexerTool to use the configuration from ZooKeeper by specifying `--use-zk-solrconfig.xml` or from local disk by specifying `--solr-home-dir`.

Incompatible Changes Between Cloudera Search for CDH 5.4 and Previous Versions of Cloudera Search

- **HDFS locality metrics are disabled by default**

HDFS locality metrics are disabled by default in CDH 5.4.8 and higher because they can generate numerous HDFS calls, negatively affecting performance. Performance degradation is more common in production-scale environments that include rapidly changing indexes. To re-enable these metrics, add the following to the directory config in `solrconfig.xml`:

```
<directoryFactory name="DirectoryFactory"
class="${solr.directoryFactory:org.apache.solr.core.HdfsDirectoryFactory}">
  <bool name="solr.hdfs.locality.metrics.enabled">true</bool>
</directoryFactory>
```

- **CloudSolrServer and LBHttpSolrServer no longer declare `MalformedURLException` as thrown from their constructors**

As a result of this change, compilation failures against the 4.10.3 Solr libraries may fail. To avoid this issue, make relevant source code changes, such as removing catch phrases related to `MalformedURLException`, and then recompile the application.

Related JIRA: Solr-5555

- **The `solrJ` client `JavaBinCodec` serializes unknown objects differently**

Starting with Search for CDH 5.4.0, Search moves from Solr 4.4 to Solr 4.1.0. With Solr 4.4, JavaBinCodec serialized unknown Java objects as `obj.toString()`. In Solr 4.10.0, JavaBinCodec serializes unknown Java objects as `obj.getClass().getName() + ':' + obj.toString()`.

As a result, the same objects may produce different results when serialized with CDH 5.4 and higher compared with objects serialized with CDH 5.3 and lower.

- **Parsing using `schema.xml` creates an init error when `<dynamicField/>` declarations include `default` or `required` attributes**

In previous releases, these attributes were ignored. If init errors occur when upgrading with an existing `schema.xml`, remove the `default` or `required` attributes. After removing these attributes, Search functions as it did before upgrading.

Related JIRA: SOLR-5227.

- **Indexing documents with terms that exceed Lucene's `MAX_TERM_LENGTH` registers errors**

In previous releases, terms that exceeded the length limit were silently ignored. To make Search function as it did in previous releases—silently ignoring longer terms—use `solr.LengthFilterFactory` in all of your Analyzers.

Related JIRA: LUCENE-5472.

- **The `fieldType` configuration `docValuesFormat="Disk"` is no longer supported**

If your `schema.xml` contains `fieldTypes` using `docValuesFormat="Disk"`, modify the file to remove the `docValuesFormat` attribute and optimize your index to rewrite to the default codec. Make these changes before upgrading to CDH 5.4.

Related JIRA: LUCENE-5761.

- **UpdateRequestExt has been removed**

Use `UpdateRequest` instead.

Related JIRA: SOLR-4816.

- **Parsing `schema.xml` registers errors when multiple values exist where only a single value is permitted.**

With previous releases, when multiple values existed where only a single value was permitted, one value was silently chosen. In CDH 5.4, if multiple values exist where only a single value is supported, configuration parsing fails. The extra values must be removed.

Related JIRAs: SOLR-4953, SOLR-5108.

Incompatible Changes Between Cloudera Search for CDH 5.2 and Cloudera Search for CDH 5.3

Some packaging changes were made that have consequences for `CrunchIndexerTool` start-up scripts. If those startup scripts include the following line:

```
export myDriverJar=$(find $myDriverJarDir -maxdepth 1 -name \
'*.*jar' ! -name '*-job.jar' ! -name '*-sources.jar')
```

That line in those scripts should be changed as follows:

```
export myDriverJar=$(find $myDriverJarDir -maxdepth 1 -name \
'search-crunch-*.jar' ! -name '*-job.jar' ! -name '*-sources.jar')
```

Incompatible changes between Cloudera Search for CDH 5 Beta 2 and Older Versions of Cloudera Search

The following incompatible changes occurred between Cloudera Search for CDH 5 beta 2 and older versions of Cloudera Search, including both lower versions of Cloudera Search for CDH 5 and Cloudera Search 1.x:

- Supported values for the `--reducers` option of the `MapReduceIndexer` tool change with the release of Search for CDH 5 beta 2. To use one reducer per output shard, 0 is used in Search 1.x and Search for CDH 5 beta 1. With the release of Search for CDH 5 beta 2, -2 is used for one reducer per output shard. Because of this change,

commands using `--reducers 0` that were written for previous Search releases do not continue to work in the same way after upgrading to Search for CDH 5 beta 2. After upgrading to Search for CDH 5 beta 2, using `--reducers 0` results in an exception stating that zero is an illegal value.

Apache Sentry Incompatible Changes

The compatibility notes for Sentry are listed below, organized by CDH version.

Compatibility Notes for CDH 5.13.x

CDH 5.13.0 introduces high availability for Sentry. Although you can still use Sentry with a flat file database, if you want to configure high availability for Sentry, the Sentry service must use by a relational database.

Compatibility Notes for CDH 5.3.x

As of CDH 5.3, `MSCK REPAIR TABLE` now requires `ALL` privileges for the table (previously this statement required `ALL` privileges on the parent database for the table).

Compatibility Notes for CDH 5.2.x

Upgrading Sentry from a release earlier than CHD 5.2 to CDH 5.2 or later entails a schema upgrade to the Sentry database.

Compatibility Notes for CDH 5.1.x

CDH 5.1 introduces a new privilege model in Sentry. This introduces a backward incompatible change for Impala. Creating a new object now requires the `ALL` privilege on the parent object. For example, creating a database now requires server-level privileges (previously needed database-level) and creating a table requires database-level privileges (previously needed table-level).

Apache Spark Incompatible Changes and Limitations

- If you have uploaded the Spark assembly JAR file to HDFS, you must upload the new version of the file each time you upgrade Spark to a new *minor* CDH release (for example, any CDH 5.2, 5.3, 5.4, or 5.5 release). You may also need to modify the configured path for the file; see the instructions under the CDH 5.2 section.
- **CDH 5.5**
 - Dynamic allocation is enabled by default but is not compatible with streaming. For streaming jobs, if you specify `--num-executors`, then dynamic allocation is implicitly disabled. To be safe, you can explicitly disable dynamic allocation using: `spark.dynamicAllocation.enabled = false`
 - The CDH 5.5 version of Spark 1.5 differs from the Apache Spark 1.5 release in using Akka version 2.2.3, the version used by Spark 1.1 and CDH 5.2. Apache Spark 1.5 uses Akka version 2.3.11.
- **CDH 5.4**
 - The CDH 5.4 version of Spark 1.3 differs from the Apache Spark 1.3 release in using Akka version 2.2.3, the version used by Spark 1.1 and CDH 5.2. Apache Spark 1.3 uses Akka version 2.3.4.
- **CDH 5.3**
 - Spark 1.2, on which CDH 5.3 is based, does not expose a transitive dependency on the Guava library. As a result, projects that use Guava but do not explicitly add it as a dependency will need to be modified: the dependency must be added to the project and also packaged with the job.
 - The CDH 5.3 version of Spark 1.2 differs from the Apache Spark 1.2 release in using Akka version 2.2.3, the version used by Spark 1.1 and CDH 5.2. Apache Spark 1.2 uses Akka version 2.3.4.
- **CDH 5.2**
 - The configured paths for `spark.eventLog.dir`, `spark.history.fs.logDirectory`, and the `SPARK_JAR` environment variable have changed in a way that may not be backward-compatible. By default, those paths now refer to the local filesystem. To make sure everything works as before, modify the paths as follows:
 - For HDFS, if this is not a federated cluster, prepend `hdfs:` to the path.

- For HDFS in a federated cluster, prepend `viewfs:` to the path.

Alternatively, you can prepend the value of `fs.defaultFS`, set in `core-site.xml` in the HDFS configuration.

- The following changes may affect existing applications:
 - The default for I/O compression is now Snappy (changed from LZF).
 - PySpark now performs external spilling during aggregations.
- The following Spark-related artifacts are no longer published as part of the Cloudera repository:
 - `spark-assembly`: The `spark-assembly` JAR is used internally by Spark distributions when running Spark applications and should not be referenced directly. Instead, projects should add dependencies for those parts of the Spark project that are being used, for example, `spark-core`.
 - `spark-yarn`
 - `spark-tools`
 - `spark-examples`
 - `spark-repl`

• CDH 5.1

- Before you can run Spark in standalone mode, you must set the `spark.master` property in `/etc/spark/conf/spark-defaults.conf`, as follows:

```
spark.master=spark://MASTER_IP:MASTER_PORT
```

where `MASTER_IP` is the IP address of the host the Spark master is running on and `MASTER_PORT` is the port.

This setting means that all jobs will run in standalone mode by default; you can override the default on the command line.

- Includes changes that will enable Spark to avoid breaking compatibility in the future. As a result, most applications will require a recompile to run against Spark 1.0, and some will require changes in source code. The details are as follows:
 - This release has two changes in the core Scala API:
 - The `cogroup` and `groupByKey` operators now return an `Iterator` over their values instead of a `Seq`. This change means that the set of values corresponding to a particular key need not all reside in memory at the same time.
 - `SparkContext.jarOfClass` now returns `Option[String]` instead of `Seq[String]`.
 - Spark Java APIs have been updated to accommodate Java 8 lambdas. See [Migrating from pre-1.0 Versions of Spark](#) for more information.

Apache Sqoop Incompatible Changes and Limitations

- The Sqoop `import-mainframe` feature is not supported in CDH at all.
- Sqoop 2 is deprecated. Cloudera recommends using Sqoop 1. Upgrading Sqoop 2 from an earlier release to CDH 5.2.0 and later entails a schema upgrade to the repository database. For details, see [Upgrading Sqoop 2](#).

Apache Whirr Incompatible Changes and Limitations

The Apache Software Foundation has voted to terminate the Whirr project. Whirr is deprecated in CDH 5 and will be removed altogether in a future release.

Apache ZooKeeper Incompatible Changes and Limitations

There are no known incompatible changes between CDH 4 and CDH 5.

Known Issues in CDH 5

Operating System Known Issues

Known issues and workarounds related to operating systems are listed below.

Kerberos credentials cache issue on keyring-enabled configurations

Some operating system configurations use keyring as the default storage for the Kerberos credential cache. This configuration may cause authentication failures for various components, indicated by the error:

```
GSS initiate failed [Caused by GSSEException: No valid credentials provided (Mechanism level: Failed to find any Kerberos tgt)]
```

Affected OS/version: 5.x

Cloudera Bug: CDH-70529

Workaround: Use a file-based Kerberos credentials cache configuration in `krb5.conf`. For details, refer to [SUSE Linux Enterprise Server 12 \(SLES12\) and Kerberos Credential Cache Issue](#) on page 1947.

YARN failure due to Debian 8 kernel limitation

The Linux kernel for Debian 8 (Jessie) does not support the `cgroup` setting for `cpu.cfs_period_us` and causes failures such as that shown in the log message below:

```
...DATE TIME FATAL NodeManager
Error starting NodeManager
org.apache.hadoop.yarn.exceptions.YarnRuntimeException: Failed to initialize container
executor
at
org.apache.hadoop.yarn.server.nodemanager.NodeManager.serviceInit(NodeManager.java:269)
at org.apache.hadoop.service.AbstractService.init(AbstractService.java:163)
...
```

Bug: [Debian 805498](#)

Cloudera Bug: CDH-57554

Linux kernel security patch and CDH services crashes

After applying a recent Linux kernel security patch for [CVE-2017-1000364](#), CDH services that use the JSVC set of libraries crash with a Java Virtual Machine (JVM) error such as:

```
A fatal error has been detected by the Java Runtime Environment:
SIGBUS (0x7) at pc=0x00007fe91ef6cebc, pid=30321, tid=0x00007fe930c67700
```

Cloudera services for HDFS and Impala cannot start after applying the patch.

Important: If you have not upgraded your Linux kernel using the distribution's patch for CVE-2017-1000364, do **not** apply the patch.

Commonly used Linux distributions are shown in the table below. However, the issue affects any CDH release that runs on RHEL, CentOS, Oracle Linux, SUSE Linux, or Ubuntu and that has had the Linux kernel security patch for CVE-2017-1000364 applied.

If you have already applied the patch for your OS according to the advisories for CVE-2017-1000364, apply the kernel update that contains the fix for your operating system (some of which are listed in the table). If you cannot apply the kernel update, you can workaround the issue by increasing the Java thread stack size as detailed in the steps below.

Distribution	Advisories for CVE-2017-1000364	Advisory updates
Oracle Linux 6	ELSA-2017-1486	Oracle has fixed this problem in ELSA-2017-1723 .
Oracle Linux 7	ELSA-2017-1484	Oracle has also added the fix for Oracle Linux 7 in ELBA-2017-1674 .
RHEL 6	RHSA-2017-1486	RedHat has fixed this problem for RHEL 6, marked this as outdated and superseded by RHSA-2017-1723 .
RHEL 7	RHSA-2017-1484	RedHat has fixed this problem for RHEL 7 and has marked this patch as outdated and superseded by RHBA-2017-1674 .
SUSE	CVE-2017-1000364	SUSE has also fixed this problem and the patch names are included in this same advisory.
Ubuntu 14.04	USN-3335-1	Fixed in USN-3338-2 .

Workaround

If you cannot apply the kernel update, you can set the Java thread stack size to `-Xss1280k` for the affected services using the appropriate Java configuration option or the environment advanced configuration snippet, as detailed below.

For role instances that have specific Java configuration options properties:

1. Log in to Cloudera Manager Admin Console.
2. Select **Clusters > Impala**, and then click the **Configuration** tab.
3. Type `java` in the search field to display Java related configuration parameters. The **Java Configuration Options for Catalog Server** property field displays. Type `-Xss1280k` in the entry field, adding to any existing settings.
4. Click **Save Changes**.
5. Navigate to the HDFS service by selecting **Clusters > HDFS**.
6. Click the **Configuration** tab.
7. Click the Scope filter **DataNode**. The **Java Configuration Options for DataNode** field displays among the properties listed. Enter `-Xss1280k` into the field, adding to any existing properties.
8. Click **Save Changes**.
9. Select the Scope filter **NFS Gateway**. The **Java Configuration Options for NFS Gateway** field displays among the properties listed. Enter `-Xss1280k` into the field, adding to any existing properties.
10. Click **Save Changes**.
11. Restart the affected roles (or configure the safety valves in next section and restart when finished with all configurations).

For role instances that do not have specific Java configuration options:

1. Log in to Cloudera Manager Admin Console.
2. Select **Clusters > Impala**, and then click the **Configuration** tab.
3. Click the Scope filter **Impala Daemon** and Category filter **Advanced**.
4. Type `impala daemon environment` in the search field to find the safety valve entry field.
5. In the **Impala Daemon Environment Advanced Configuration Snippet (Safety Valve)**, enter:

```
JAVA_TOOL_OPTIONS=-Xss1280K
```

6. Click **Save Changes**.
7. Click the Scope filter **Impala StateStore** and Category filter **Advanced**.
8. In the **Impala StateStore Environment Advanced Configuration Snippet (Safety Valve)**, enter:

```
JAVA_TOOL_OPTIONS=-Xss1280K
```

9. Click **Save Changes**.

- 10 Restart the affected roles.

The table below summarizes the parameters that can be set for the affected services:

Service	Settable Java Configuration Option
HDFS DataNode	Java Configuration Options for DataNode
HDFS NFS Gateway	Java Configuration Options for NFS Gateway
Impala Catalog Server	Java Configuration Options for Catalog Server
Impala Daemon	Impala Daemon Environment Advanced Configuration Snippet (Safety Valve)
	JAVA_TOOL_OPTIONS=-Xss1280K
Impala StateStore	Impala StateStore Environment Advanced Configuration Snippet (Safety Valve)
	JAVA_TOOL_OPTIONS=-Xss1280K

Cloudera Bug: CDH-55771

Some OS versions reject weak ciphers for TLS

For some OS configurations, the `curl` command cannot connect to certain CDH services that run on Apache Tomcat when the cluster has been configured for TLS/SSL. Specifically, HttpFS, KMS, Oozie, and Solr services reject connection attempts because the default cipher configuration uses weak temporary server keys (based on Diffie-Hellman key exchange protocol).

Affected OS/version: Linux distributions that use network security services (nss) library version 3.28.4-3.el6_9, including Oracle Linux 6.x, RHEL 6.x, CentOS 6.x. These conflict with Tomcat 6.0.48, which is included with CDH 5.11. The issue has been resolved in CDH 5.11.1.

Workaround: Override the default cipher configuration using all the ciphers from the list below. Only commas separate each cipher, and there are no line endings or other characters in this list.

- For clusters not managed by Cloudera Manager, enter this list in the appropriate configuration file for the service (see the "Not managed" column in the table below). Restart the service.

- For clusters managed by Cloudera Manager, [follow the steps below](#).

Service	Cluster managed by Cloudera Manager		Not managed
	Configuration property	Environment variable	Configuration file
HttpFS	HttpFS Environment Advanced Configuration Snippet (Safety Valve)	HTTPFS_SSL_CIPHERS	/etc/hadoop-httpfs/conf/httpfs-env.sh
KMS	Key Management Server Environment Advanced Configuration Snippet (Safety Valve)	KMS_SSL_CIPHERS	/etc/hadoop-kms/conf/kms-env.sh
Oozie	Oozie Server Environment Advanced Configuration Snippet	OOZIE_HTTPS_CIPHERS	/etc/oozie/conf/oozie-env.sh
Solr	Solr Server Environment Advanced Configuration Snippet	SOLR_CIPHERS_CONFIG	/etc/default/solr

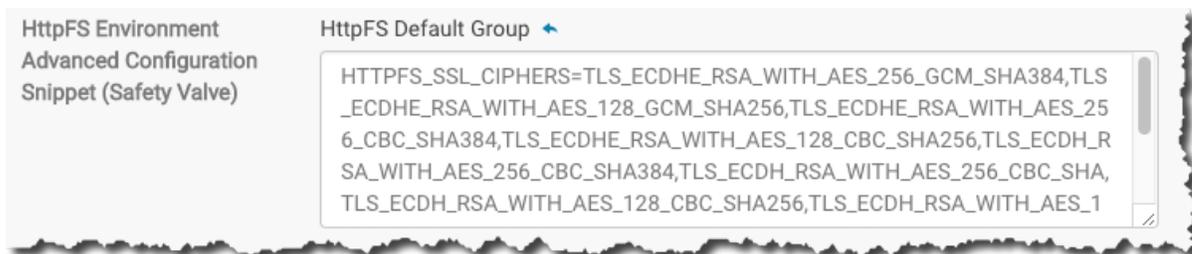

To override the ciphers on Cloudera Manager clusters:

1. Log into Cloudera Manager Admin Console.
2. Search for the advanced configuration snippet name ("Configuration property") for each respective service role.

3. Enter the appropriate environment variable in the entry field.
4. Copy the list from here:

```
HTTPEFS_SSL_CIPHERS=TLS_ECDHE_RSA_WITH_AES_256_GCM_SHA384,TLS_ECDHE_RSA_WITH_AES_128_GCM_SHA256,TLS_ECDHE_RSA_WITH_AES_256_CBC_SHA384,TLS_ECDHE_RSA_WITH_AES_128_CBC_SHA256,TLS_ECDH_RSA_WITH_AES_256_CBC_SHA,TLS_ECDH_RSA_WITH_AES_128_CBC_SHA256,TLS_ECDH_RSA_WITH_AES_1
```

5. Paste as the setting for the environment variable. For example, overriding HttpFS is as follows:

6. Restart the service.

Cloudera Bugs: CDH-52109, CDH-49236

SUSE Linux Enterprise Server 12 (SLES12) and Kerberos Credential Cache Issue

Cloudera has become aware of a conflict in the handling of the Kerberos credential cache in SLES12 that can result in the following error:

```
Credential cache directory /run/user/uid does not exist
```

The issue is caused by a change in SLES12 `systemd` and the location of Kerberos credentials cache for user accounts. This issue may emerge when password-less accounts, such as `impala` or `flume`, for example, are executed using `sudo -u user` or `su - user` and the system attempts to retrieve the credential from the cache.

Workaround:

To work around this issue, add the following line to your system's Kerberos configuration file (`/etc/krb5.conf`), in the `[libdefaults]` section:

```
[libdefaults]
default_ccache_name = FILE:/tmp/krb5cc_%{uid}
...
```

For clusters managed by Cloudera Manager Server:

1. Log in to Cloudera Manager Admin Console.
2. Click the **Administration** tab and select **Settings** from the drop-down menu.
3. Select **Kerberos** for the **Category** filter.
4. Type the word "safety" in the Search field to find the Advanced Configuration Snippet (Safety Valve) settings for Kerberos.
5. Enter the name=value pair for the property as shown here:

6. Click **Save Changes**.

Cloudera Bugs: OPSAPS-34167, OPSAPS-41158

Random JVM Hangs on RHEL 6.6 (Kernels 3.14-3.17)

User Java processes—HBase RegionServers, HDFS DataNodes—can deadlock and hang for no apparent reason.

Impact: A Java application or daemon hangs. A `jstack`, or attaching a debugger, can unblock the process.

Workaround:

Upgrade the operating system to one with kernel version 3.18 or later; for example, RHEL 6.6z and later. For information on checking your RHEL kernel version, see <http://www.cyberciti.biz/faq/centos-redhat-rhel-6-kernel-version/>. In RHEL, the issue has been fixed recently in kernel-2.6.32-504.16.2.el6 update (April 21, <https://rhn.redhat.com/errata/RHSA-2015-0864.html>). The following example shows how to check for the fix:

```
% rpm -qp --changelog kernel-2.6.32-504.16.2.el6.x86_64.rpm | grep 'Ensure  
get_futex_key_refs() always implies a barrier'
```

Other distributions running kernel versions 3.14-3.17 may be affected.

For more information, see <https://groups.google.com/forum/#!topic/mechanical-sympathy/QbmpZxp6C64>

Cloudera Bug: TSB-63

Leap-Second Events

Note: The [next leap-second event](#) is unknown at this time. The last leap-second event occurred on December 16, 2016 at 23:59:60 UTC.

Impact: After a leap-second event, Java applications (including CDH services) using older Java and Linux kernel versions, may consume almost 100% CPU. See <https://access.redhat.com/articles/15145>.

Leap-second events are tied to the time synchronization methods of the Linux kernel, the Linux distribution and version, and the Java version used by applications running on affected kernels.

Although Java is increasingly agnostic to system clock progression (and less susceptible to a kernel's mishandling of a leap-second event), using JDK 7 or 8 should prevent issues at the CDH level (for CDH components that use the Java Virtual Machine).

Immediate action required:

(1) Ensure that the kernel is up to date.

- **RHEL5/6/7, CentOS 5/6/7** - 2.6.32-298 or higher
- **Ubuntu Trusty 14.04 LTS** - No action required
- **Ubuntu Precise 12.04 LTS** - 3.2.0-29.46 or higher
- **Debian Jessie (8.x)** - No action required
- **Debian Wheezy (7.x)** - 3.2.29-1 or higher
- **Oracle Enterprise Linux (OEL)** - Kernels built in 2013 or later
- **SLES11 (SP2, SP3 and SP4)**
 - **SP2** - 3.0.38-0.5 or higher
 - **SP3 and SP4** - No action required
- **SLES12** - No action required.

(2) Ensure that your Java JDKs are current (especially if the kernel is not up to date and cannot be upgraded).

- **Java 7** - At least jdk-1.7.0_65
- **Java 8** - No action required.

(3) Ensure that your systems use either NTP or PTP synchronization.

For systems not using time synchronization, update both the OS tzdata and Java tzdata packages to the tzdata-2016g version, at a minimum. For OS tzdata package updates, contact OS support or check updated OS repositories. For Java tzdata package updates, see Oracle's [Timezone Updater Tool](#).

Cloudera Bugs: CDH-44788, TSB-189

Performance Known Issues

Important: For best practices, and solutions to known performance problems, see [Optimizing Performance in CDH](#).

Install and Upgrade Known Issues

Upgrade to CDH 5.13 or higher Requires Pre-installation of Spark 2.1 or Spark 2.2

If your cluster has Spark 2.0 or Spark 2.1 installed and you want to upgrade to CDH 5.13 or higher, you must first upgrade to Spark 2.1 release 2 or later before upgrading CDH. To install these versions of Spark, do the following before running the CDH Upgrade Wizard:

1. Install the Custom Service Descriptor (CSD) file. See

- [Installing Spark 2.1](#)
- [Installing Spark 2.2](#)

Note:

Spark 2.2 requires that JDK 1.8 be deployed throughout the cluster. JDK 1.7 is not supported for Spark 2.2.

See [Step 2: Install Java Development Kit](#).

2. Download, distribute, and activate the Parcel for the version of Spark that you are installing:

- **Spark 2.1 release 2:** The parcel name includes "cloudera2" in its name.
- **Spark 2.2 release 1:** The parcel name includes "cloudera1" in its name.

See [Managing Parcels](#).

Affected versions: CDH 5.13.0 and higher

Cloudera bug: CDH-56775

Flume Kafka client incompatible changes in CDH 5.8

Due to the change of offset storage from ZooKeeper to Kafka in the CDH 5.8 Flume Kafka client, data might not be consumed by the Flume agents, or might be duplicated (if `kafka.auto.offset.reset=smallest`) during an upgrade to CDH 5.8.

Workaround: See [Upgrading to CDH 5.8 When Using the Flume Kafka Client](#)

Cloudera Bug: TSB-173

Upgrades to CDH 5.4.1 from Releases Earlier than 5.4.0 May Fail

Problem: Because of a change in the implementation of the NameNode metadata upgrade mechanism, upgrading to CDH 5.4.1 from a version lower than 5.4.0 can take an inordinately long time. In a cluster with NameNode high availability (HA) configured and a large number of edit logs, the upgrade can fail, with errors indicating a timeout in the pre-upgrade step on JournalNodes.

What to do:

To avoid the problem: Do not upgrade to CDH 5.4.1; upgrade to CDH 5.4.2 instead.

If you experience the problem: If you have already started an upgrade and seen it fail, contact Cloudera Support. This problem involves no risk of data loss, and manual recovery is possible.

If you have already completed an upgrade to CDH 5.4.1, or are installing a new cluster: In this case you are not affected and can continue to run CDH 5.4.1.

Potential job failures during YARN rolling upgrades to CDH 5.3.4

Problem: A MapReduce security fix introduced a compatibility issue that results in job failures during YARN rolling upgrades from CDH 5.3.3 to CDH 5.3.4.

Cloudera Bug: CDH-28680

Release affected: CDH 5.3.4

Release containing the fix: CDH 5.3.5

Workarounds: You can use any one of the following workarounds for this issue:

- Upgrade to CDH 5.3.5.
- Restart any jobs that might have failed during the upgrade.
- Explicitly set the version of MapReduce to be used so it is picked on a per-job basis.
 1. Update the YARN property, **MR Application Classpath** (`mapreduce.application.classpath`), either in Cloudera Manager or in the `mapred-site.xml` file. Remove all existing values and add a new entry: `<parcel-path>/lib/hadoop-mapreduce/*`, where `<parcel-path>` is the absolute path to the parcel installation. For example, the default installation path for the CDH 5.3.3 parcel would be: `/opt/cloudera/parcels/CDH-5.3.3-1.cdh5.3.3.p0.5/lib/hadoop-mapreduce/*`.
 2. Wait until jobs submitted with the above client configuration change have run to completion.
 3. Upgrade to CDH 5.3.4.
 4. Update the **MR Application Classpath** (`mapreduce.application.classpath`) property to point to the new CDH 5.3.4 parcel.

Do *not* delete the old parcel until after all jobs submitted prior to the upgrade have finished running.

NameNode Incorrectly Reports Missing Blocks During Rolling Upgrade

Problem: During a rolling upgrade to any of the releases listed below, the NameNode may report missing blocks after rolling back multiple DataNodes. This is caused by a race condition with block reporting between the DataNode and the NameNode. No permanent data loss occurs, but data can be unavailable for up to six hours before the problem corrects itself.

Releases affected: CDH 5.0.6, 5.1.5, 5.2.5, 5.3.3, 5.4.1, 5.4.2

What to do:

To avoid the problem: Cloudera advises skipping the affected releases and installing a release containing the fix. For example, do not upgrade to CDH 5.4.2; upgrade to CDH 5.4.3 instead.

The releases containing the fix are: CDH 5.3.4, 5.4.3

If you have already completed an upgrade to an affected release, or are installing a new cluster: You can continue to run the release, or upgrade to a release that is not affected.

Upgrading to CDH 5.4 or later requires an HDFS upgrade

Upgrading to CDH 5.4.0 or later from an earlier CDH 5 release requires an HDFS upgrade, and upgrading from a release earlier than CDH 5.2.0 requires additional steps. See [Upgrading from an Earlier CDH 5 Release to the Latest Release](#) for further information. See also [What's New In CDH 5.4.x](#) on page 1838.

JDK Does Not Have Up-to-date tzdata

The Europe/Moscow time zone has changed. This time zone change is not incorporated into JDK lower than 8u31 and 7u75. Cloudera ships JDK7u67, which does not reflect these `tzdata` updates. If you run UDF related to time zone conversion, you receive incorrect results.

Workaround: Upgrade to JDK version 8u31 or 7u75.

Extra step needed on Ubuntu Trusty if you add the Cloudera repository

If you install or upgrade CDH on Ubuntu Trusty using the command line, and add the Cloudera repository yourself (rather than using the "1-click Install" method) you need to perform an additional step to ensure that you get the CDH version of ZooKeeper, rather than the version that is bundled with Trusty.

Cloudera Bug: CDH-23569

Upgrading `hadoop-kms` from 5.2.x and 5.3.x releases fails on SLES

Upgrading `hadoop-kms` fails on SLES when you try to upgrade an existing version from 5.2.x releases earlier than 5.2.4, and from 5.3.x releases earlier than 5.3.2.

Cloudera Bug: CDH-25053

Must build native libraries when installing from tarballs

When installing Hadoop from Cloudera tarballs, you must build your own native libraries. The tarballs do not include libraries that are built for the different distributions and architectures.

Installing from tarballs is deprecated and will be removed from CDH in a future release.

Cloudera Bugs: CDH-7304, CDH-5623

Apache Avro Known Issues

Avro Null Defaults Do Not Work in Partitioned Hive Tables

When querying Hive tables created with Avro recursive schemas, Hive silently drops recursive fields. Any attempt to serialize data which exploits recursive schemas results in dropped fields and throws an exception.

Affected Versions: For all versions of CDH 5, Hive does not support Avro recursive schemas in Hive tables.

Cloudera Bug: CDH-72545

Bug: [HIVE-10187](#)

Workaround: To workaround this issue, modify the Avro schema by removing the recursive section.

Addressed in: Avro recursive schemas for Hive tables are supported in CDH 6 and later.

Apache Flume Known Issues

Flume Kafka client incompatible changes in CDH 5.8

Due to the change of offset storage from ZooKeeper to Kafka in the CDH 5.8 Flume Kafka client, data might not be consumed by the Flume agents, or might be duplicated (if `kafka.auto.offset.reset=smallest`) during an upgrade to CDH 5.8.

Cloudera Bug: TSB-173

Workaround: See [Upgrading to CDH 5.8 When Using the Flume Kafka Client](#)

Hive sink support

Flume does not provide a native sink that stores the data that can be directly consumed by Hive.

Bug: [FLUME-1008](#)

Cloudera Bug: CDH-3912

Workaround: None

Fast Replay does not work with encrypted File Channel

If an encrypted file channel is set to use fast replay, the replay will fail and the channel will fail to start.

Bug: [FLUME-1885](#)

Cloudera Bug: CDH-8017, CDH-10115.

Workaround: Disable fast replay for the encrypted channel by setting `use-fast-replay` to false.

Apache Hadoop Known Issues

This page includes known issues and related topics, including:

Deprecated Properties

Several Hadoop and HDFS properties have been deprecated as of Hadoop 2.0.0 (Hadoop 0.23.1, CDH 4 Beta) and later. For details, see [Deprecated Properties](#).

Hadoop Common

KMS Load Balancing Provider Fails to invalidate Cache on Key Delete

The KMS Load balancing Provider has not been correctly invalidating the cache on key delete operations. The failure to invalidate the cache on key delete operations can result in the possibility that data can be leaked from the framework for a short period of time based on the value of the `hadoop.kms.current.key.cache.timeout.ms` property. Its default value is 30,000ms. When the KMS is deployed in an HA pattern the `KMSLoadBalancingProvider` class will only send the delete operation to one KMS role instance in a round-robin fashion. The code lacks a call to invalidate the cache across all instances and can leave key information including the metadata and key stored (the deleted key) in the cache on one or more KMS instances up to the key cache timeout.

Apache Issue:

- [HADOOP-17208](#)
- [HADOOP-17304](#)

Products affected:

- CDH
- HDP
- CDP

Releases affected:

- CDH 5.x
- CDH 6.x
- CDP 7.0.x
- CDP 7.1.4 and earlier
- HDP 2.6 and later

Users affected: Customers with Data-at-rest encryption enabled that have more than 1 kms role instance and the services Key Cache enabled.

Impact: Key Meta-data and Key material may remain active within the service cache.

Severity: Medium

Action required:

- CDH customers: Upgrade to CDP 7.1.5 or request a patch
- HDP customers: Request a patch

Knowledge article: For the latest update on this issue see the corresponding Knowledge article: [TSB 2020-434: KMS Load Balancing Provider Fails to invalidate Cache on Key Delete](#)

Zip Slip Vulnerability

“Zip Slip” is a widespread arbitrary file overwrite critical vulnerability, which typically results in remote command execution. It was discovered and responsibly disclosed by the Snyk Security team ahead of a public disclosure on June 5, 2018, and affects thousands of projects.

Cloudera has analyzed our use of zip-related software, and has determined that only Apache Hadoop is vulnerable to this class of vulnerability in CDH 5. This has been fixed in upstream Hadoop as CVE-2018-8009.

Products affected: Hadoop

Releases affected:

- CDH 5.12.x and all prior releases
- CDH 5.13.0, 5.13.1, 5.13.2, 5.13.3
- CDH 5.14.0, 5.14.2, 5.14.3
- CDH 5.15.0

Users affected: All

Date of detection: April 19, 2018

Detected by: Snyk

Severity: High

Impact: Zip Slip is a form of directory traversal that can be exploited by extracting files from an archive. The premise of the directory traversal vulnerability is that an attacker can gain access to parts of the file system outside of the target folder in which they should reside. The attacker can then overwrite executable files and either invoke them remotely or wait for the system or user to call them, thus achieving remote command execution on the victim’s machine. The vulnerability can also cause damage by overwriting configuration files or other sensitive resources, and can be exploited on both client (user) machines and servers.

CVE: CVE-2018-8009

Immediate action required: Upgrade to a version that contains the fix.

Addressed in release/refresh/patch: CDH 5.14.4, CDH 5.15.1

For the latest update on this issue, see the corresponding Knowledge article:

TSB: 2018-307: Zip Slip Vulnerability

[Apache Hadoop MapReduce Job History Server \(JHS\) vulnerability CVE-2017-15713](#)

A vulnerability in Hadoop’s Job History Server allows a cluster user to expose private files owned by the user running the MapReduce Job History Server (JHS) process. See <http://seclists.org/oss-sec/2018/q1/79> for reference.

Products affected: Apache Hadoop MapReduce

Releases affected: All releases prior to CDH 5.12.0. CDH 5.12.0, CDH 5.12.1, CDH 5.12.2, CDH 5.13.0, CDH 5.13.1, CDH 5.14.0

Users affected: Users running the MapReduce Job History Server (JHS) daemon

Date/time of detection: November 8, 2017

Detected by: Man Yue Mo of lgtm.com

Severity (Low/Medium/High): High

Impact: The vulnerability allows a cluster user to expose private files owned by the user running the MapReduce Job History Server (JHS) process. The malicious user can construct a configuration file containing XML directives that reference sensitive files on the MapReduce Job History Server (JHS) host.

CVE: CVE-2017-15713

Immediate action required: Upgrade to a release where the issue is fixed.

Addressed in release/refresh/patch: CDH 5.13.2, 5.14.2

[Hadoop LdapGroupsMapping does not support LDAPS for self-signed LDAP server](#)

Hadoop LdapGroupsMapping does not work with LDAP over SSL (LDAPS) if the LDAP server certificate is self-signed. This use case is currently not supported even if Hadoop User Group Mapping LDAP TLS/SSL Enabled, Hadoop User Group Mapping LDAP TLS/SSL Truststore, and Hadoop User Group Mapping LDAP TLS/SSL Truststore Password are filled properly.

Bug: [HADOOP-12862](#)

Affected Versions: All CDH 5 versions.

Workaround: None.

HDFS

[CVE-2018-1296 Permissive Apache Hadoop HDFS listXAttr Authorization Exposes Extended Attribute Key/Value Pairs](#)

AHDFS exposes extended attribute key/value pairs during listXAttrs, verifying only path-level search access to the directory rather than path-level read permission to the referent.

Products affected: Apache HDFS

Releases affected:

- CDH 5.4.0 - 5.15.1, 5.16.0
- CDH 6.0.0, 6.0.1, 6.1.0

Users affected: Users who store sensitive data in extended attributes, such as users of HDFS encryption.

Date/time of detection: December 12, 2017

Detected by: Rushabh Shah, Yahoo! Inc., Hadoop committer

Severity (Low/Medium/High): Medium

Impact: HDFS exposes extended attribute key/value pairs during listXAttrs, verifying only path-level search access to the directory rather than path-level read permission to the referent. This affects features that store sensitive data in extended attributes.

CVE: CVE-2018-1296

Immediate action required:

- Upgrade: Update to a version of CDH containing the fix.
- Workaround: If a file contains sensitive data in extended attributes, users and admins need to change the permission to prevent others from listing the directory that contains the file.

Addressed in release/refresh/patch:

- CDH 5.15.2, 5.16.1
- CDH 6.1.1, 6.2.0

Clusters running CDH 5.16.1, 6.1.0, or 6.1.1 can lose some HDFS file permissions any time the NameNode is restarted

When a cluster is upgraded to 5.16.1, 6.1.0, or 6.1.1 roles with SELECT and/or INSERT privileges on an Impala database or table will have the REFRESH privilege added as part of the upgrade process. HDFS ACLs for roles with the REFRESH privilege get set with empty permissions whenever the NameNode is restarted. This can cause any jobs or queries run by users within affected roles to fail because they will no longer be able to access affected Impala database or tables.

Products Affected: HDFS and components that access files in HDFS

Affected Versions: CDH 5.16.1, 6.1.0, 6.1.1

Users Affected: Clusters with Impala and HDFS ACLs managed by Sentry upgrading from any release to CDH 5.16.1, 6.1.0, and 6.1.1.

Severity (Low/Medium/High): High

Root Cause and Impact: The new privilege REFRESH was introduced in CDH 5.16 and 6.1 and applies to Impala databases and tables. When a cluster is upgraded to 5.16.1, 6.1.0, or 6.1.1, roles with SELECT or INSERT privileges on an Impala database or table will have the REFRESH privilege added during the upgrade.

HDFS ACLs for roles with the REFRESH privilege get set with empty permissions whenever the NameNode is restarted. The NameNode is restarted during the upgrade.

For example if a group `appdev` is in role `appdev_role` and has SELECT access to the Impala table "project" the HDFS ACLs prior to the upgrade would look similar to:

```
group: appdev
group: :r--
```

After the upgrade the HDFS ACLs will be set with no permissions and will look like this:

```
group: appdev
group: :---
```

Any jobs or queries run by users within affected roles will fail because they will no longer be able to access affected Impala database or tables. This impacts any SQL client accessing the affected databases and tables. For example, if a Hive client is used to access a table created in Impala it will also fail. Jobs accessing the files directly through HDFS, e.g. via Spark, will also be impacted.

The HDFS ACLs will get reset whenever the NameNode is restarted.

Immediate action required: If possible, do not upgrade to releases CDH 5.16.1, 6.1.0, or 6.1.1 if Impala is used and Sentry manages HDFS ACLs within your environment. Subsequent CDH releases will resolve the problem with a product fix under [SENTRY-2490](#).

If an upgrade is being considered, reach out to your account team to discuss other possibilities, and to receive additional insight into future product release schedules.

If an upgrade must be executed, contact Cloudera Support indicating the upgrade plan and why an upgrade is being executed. Options are available to assist with the upgrade if necessary.

Addressed in release/refresh/patch: Patches for 5.16.1, 6.1.0 and 6.1.1 are available for major supported operating systems. Customers are encouraged to contact Cloudera Support for a patch. The patch should be applied immediately after upgrade to any of the affected versions.

The fix for this TSB will be included in 6.1.2, 6.2.0, 5.16.2, and 5.17.0.

Potential data corruption due to race conditions between concurrent block read and write

Under rare conditions when an HDFS file is open for write, an application reading the same HDFS blocks might read up-to-date block data of the partially written file, while reading a stale checksum that corresponds to the block data before the latest write. The block is incorrectly declared corrupt as a result. Normally the HDFS NameNode schedules additional replica for the same block from other replicas if a replica is corrupted, but if the frequency of concurrent write and read is high enough, there is a small probability that all replicas of a block can be declared corrupt, and the file becomes corrupt and unrecoverable as well.

DataNode might print error log such as the following:

```
2017-10-18 11:23:46,627 ERROR org.apache.hadoop.hdfs.server.datanode.DataNode:
ip-168-61-2-30:50010:DataXceiver error processing WRITE_BLOCK operation src:
/168.61.2.32:48163 dst: /168.61.12.31:50010
java.io.IOException: Terminating due to a checksum error.java.io.IOException: Unexpected
checksum mismatch while writing
BP-1666924250-168.61.12.36-1494235758065:blk_1084584428_5057054 from /168.61.12.32:48163
at
org.apache.hadoop.hdfs.server.datanode.BlockReceiver.receivePacket(BlockReceiver.java:604)
at
org.apache.hadoop.hdfs.server.datanode.BlockReceiver.receiveBlock(BlockReceiver.java:894)
at org.apache.hadoop.hdfs.server.datanode.DataXceiver.writeBlock(DataXceiver.java:794)
at org.apache.hadoop.hdfs.protocol.datatransfer.Receiver.opWriteBlock(Receiver.java:169)
at org.apache.hadoop.hdfs.protocol.datatransfer.Receiver.processOp(Receiver.java:106)
at org.apache.hadoop.hdfs.server.datanode.DataXceiver.run(DataXceiver.java:246)
at java.lang.Thread.run(Thread.java:745)
```

The bug is fixed by HDFS-11056, HDFS-11160 and HDFS-11229.

Products Affected: HDFS

Affected Versions:

- All CDH 5.4 releases and lower
- CDH 5.5.0, 5.5.1, 5.5.2, 5.5.4, 5.5.5
- CDH 5.6.0, 5.6.1
- CDH 5.7.0, 5.7.1, 5.7.2, 5.7.3, 5.7.4, 5.7.5
- CDH 5.8.0, 5.8.2, 5.8.3
- CDH 5.9.0, 5.9.1

Users Affected: Workloads that require reading a file while it's being concurrently written to HDFS.

Severity (Low/Medium/High): Low

Impact: If the workload requires reading and writing the same file concurrently, there is a small probability that all replicas of a block can be declared corrupt, and the file becomes corrupt as well.

Immediate action required: Customers are advised to upgrade to a CDH version containing the fix if the workloads are susceptible to this bug.

Fixed in Versions:

- CDH 5.5.6 and higher
- CDH 5.7.6 and higher
- CDH 5.8.4 and higher
- CDH 5.9.2 and higher
- CDH 5.10.0 and higher

[Cannot re-encrypt an encryption zone if a previous re-encryption on it was canceled](#)

When canceling a re-encryption on an encryption zone, the status of the re-encryption may continue to show "Processing". When this occurs, future re-encrypt commands for this encryption zone will fail inside the NameNode, and the re-encryption will never complete.

Cloudera Bug: CDH-59073

Affected Versions: CDH 5.13.0

Fixed in Versions: CDH 5.13.1 and higher

Workaround: To halt, or remove the "Processing" status for the encryption zone, re-issue the cancel re-encryption command on the encryption zone. If a new re-encryption command is required for this encryption zone, restart the NameNode before issuing the command.

Potential Block Corruption and Data Loss During Pipeline Recovery

A bug in the HDFS block pipeline recovery code can cause blocks to be unrecoverable due to miscalculation of the block checksum. On a busy cluster where data is written and flushed frequently, when a write pipeline recovery occurs, a node newly added to the write pipeline may calculate the checksum incorrectly. This miscalculation is very rare, but when it does occur, the replica becomes corrupted and data can be lost if all replicas are simultaneously affected.

Bug: [HDFS-4660](#), [HDFS-9220](#)

Detecting this known issue requires correlating multiple log messages. Below is an example DataNode log error message captured at the time of block creation:

```
java.io.IOException: Terminating due to a checksum error.java.io.IOException:
Unexpected checksum mismatch while writing
BP-1800173197-10.x.y.z-1444425156296:blk_1170125248_96458336 from /10.x.y.z
```

Important: Absence of error messages in the DataNode logs does not necessarily mean that the issue did not occur.

This issue affects these versions of CDH:

- CDH 5.0.0, 5.0.1, 5.0.2, 5.0.3, 5.0.4, 5.0.5, 5.0.6
- CDH 5.1.0, 5.1.2, 5.1.3, 5.1.4, 5.1.5
- CDH 5.2.0, 5.2.1, 5.2.3, 5.2.4, 5.2.5, 5.2.6
- CDH 5.3.0, 5.3.1, 5.3.2, 5.3.3, 5.3.4, 5.3.5, 5.3.7, 5.3.8, 5.3.9, 5.3.10
- CDH 5.4.0, 5.4.1, 5.4.2, 5.4.3, 5.4.4, 5.4.5, 5.4.7, 5.4.8, 5.4.9, 5.4.10
- CDH 5.5.0, 5.5.1

Workaround: None. Upgrade to a CDH version that includes the fix: CDH 5.4.11, CDH 5.5.2, CDH 5.6.0 and higher.

Important: Upgrading does not fix existing corrupted block replicas. The HDFS block scanner runs every three weeks and captures "Checksum failed" WARN messages in the DataNode log. Look for these to identify and repair corrupted block replicas.

Users affected: All users running the affected CDH versions and using the HDFS file system.

Severity (Low/Medium/High): High

Impact: Potential loss of block data.

Immediate action required: Upgrade to a CDH version that includes the fix, specifically:

- CDH 5.4.11, CDH 5.5.2, CDH 5.6.0 and higher

DiskBalancer Occasionally Emits False Error Messages

Diskbalancer occasionally emits false error messages. For example:

```
2016-08-03 11:01:41,788 ERROR org.apache.hadoop.hdfs.server.datanode.DiskBalancer:
Disk Balancer is not enabled.
```

You can safely ignore this error message if you are not using DiskBalancer.

Affected Versions: CDH 5.8.1 and below.

Fixed in Versions: CDH 5.8.2 and higher.

Bug: [HDFS-10588](#)

Workaround: Use the following command against all DataNodes to suppress DiskBalancer logs:

```
hadoop daemonlog -setlevel <host:port> org.apache.hadoop.hdfs.server.datanode.DiskBalancer FATAL
```

Another workaround is to suppress the warning by setting the log level of DiskBalancer to FATAL. Add the following to `log4j.properties` (DataNode Logging Advanced Configuration Snippet (Safety Valve)) and restart your DataNodes:

```
log4j.logger.org.apache.hadoop.hdfs.server.datanode.DiskBalancer = FATAL
```

Upgrade Requires an HDFS Upgrade

Upgrading from any release earlier than CDH 5.2.0 to CDH 5.2.0 or later requires an HDFS Upgrade.

Optimizing HDFS Encryption at Rest Requires Newer openssl Library on Some Systems

CDH 5.3 implements the **Advanced Encryption Standard New Instructions** (AES-NI), which provide substantial performance improvements. To get these improvements, you need a recent version of `libcrypto.so` on HDFS and MapReduce client hosts that is, any host from which you originate HDFS or MapReduce requests. Many OS versions have an older version of the library that does not support AES-NI.

See [HDFS Transparent Encryption](#) in the *Encryption* section of the *Cloudera Security* guide for instructions for obtaining the right version.

Other HDFS Encryption Known Issues

Potentially Incorrect Initialization Vector Calculation in HDFS Encryption

A mathematical error in the calculation of the Initialization Vector (IV) for encryption and decryption in HDFS could cause data to appear corrupted when read. The IV is a 16-byte value input to encryption and decryption ciphers. The calculation of the IV implemented in HDFS was found to be subtly different from that used by Java and OpenSSL cryptographic routines. The result is that data could possibly appear to be corrupted when it is read from a file inside an Encryption Zone.

Fortunately, the probability of this occurring is extremely small. For example, the maximum size of a file in HDFS is 64 TB. This enormous file would have a 1-in-4-million chance of hitting this condition. A more typically sized file of 1 GB would have a roughly 1-in-274-billion chance of hitting the condition.

Affected Versions: CDH 5.2.1 and below

Fixed in Versions: CDH 5.3.0 and higher

Cloudera Bug: CDH-23618

Workaround: If you are using the experimental HDFS encryption feature in CDH 5.2, upgrade to CDH 5.3 and verify the integrity of all files inside an Encryption Zone.

DistCp between unencrypted and encrypted locations fails

By default, DistCp compares checksums provided by the filesystem to verify that data was successfully copied to the destination. However, when copying between unencrypted and encrypted locations, the filesystem checksums will not match since the underlying block data is different.

Affected Versions: CDH 5.2.1 and below.

Fixed in Versions: CDH 5.2.2 and higher.

Bug: [HADOOP-11343](#)

Workaround: Specify the `-skipcrccheck` and `-update` distcp flags to avoid verifying checksums.

Cannot move encrypted files to trash

With HDFS encryption enabled, you cannot move encrypted files or directories to the trash directory.

Affected Versions: All CDH 5 versions

Bug: [HDFS-6767](#)

Workaround: To remove encrypted files/directories, use the following command with the `-skipTrash` flag specified to bypass trash.

```
rm -r -skipTrash /testdir
```

HDFS NFS gateway and CDH installation (using packages) limitation

HDFS NFS gateway works as shipped ("out of the box") only on RHEL-compatible systems, but not on SLES, Ubuntu, or Debian. Because of a bug in native versions of `portmap/rpcbind`, the HDFS NFS gateway does not work out of the box on SLES, Ubuntu, or Debian systems when CDH has been installed from the command-line, using packages. It does work on supported versions of RHEL-compatible systems on which `rpcbind-0.2.0-10.el6` or later is installed, and it does work if you use Cloudera Manager to install CDH, or if you start the gateway as root.

Bug: [731542](#) (Red Hat), [823364](#) (SLES), [594880](#) (Debian)

Workarounds and caveats:

- On Red Hat and similar systems, make sure `rpcbind-0.2.0-10.el6` or later is installed.
- On SLES, Debian, and Ubuntu systems, do one of the following:
 - Install CDH using Cloudera Manager; *or*
 - As of CDH 5.1, start the NFS gateway as root; *or*
 - [Start the NFS gateway without using packages](#); *or*
 - You can use the gateway by running `rpcbind` in insecure mode, using the `-i` option, but keep in mind that this allows anyone from a remote host to bind to the portmap.

HDFS does not currently provide ACL support for the NFS gateway

Affected Versions: All CDH 5 versions

Bug: [HDFS-6949](#)

Cloudera Bug: CDH-26921

No error when changing permission to 777 on `.snapshot` directory

Snapshots are read-only; running `chmod 777` on the `.snapshots` directory does not change this, but does not produce an error (though other illegal operations do).

Affected Versions: All CDH 5 versions

Bug: [HDFS-4981](#)

Cloudera Bug: CDH-13062

Workaround: None

Snapshot operations are not supported by ViewFileSystem

Affected Versions: All CDH 5 versions

Cloudera Bug: CDH-12600

Workaround: None

Snapshots do not retain directories' quotas settings

Affected Versions: All CDH 5 versions

Bug: [HDFS-4897](#)

Workaround: None

Permissions for `dfs.namenode.name.dir` incorrectly set.

Hadoop daemons should set permissions for the `dfs.namenode.name.dir` (or `dfs.name.dir`) directories to `drwx-----` (700), but in fact these permissions are set to the file-system default, usually `drwxr-xr-x` (755).

Affected Versions: All CDH 5 versions

Bug: [HDFS-2470](#)

Workaround: Use `chmod` to set permissions to 700.

`hadoop fsck -move` does not work in a cluster with host-based Kerberos

Affected Versions: All CDH 5 versions

Cloudera Bug: CDH-7017

Workaround: Use `hadoop fsck -delete`

HttpFS cannot get delegation token without prior authenticated request

A request to obtain a delegation token cannot initiate an SPNEGO authentication sequence; it must be accompanied by an authentication cookie from a prior SPNEGO authentication sequence.

Affected Versions: CDH 5.1 and below

Fixed in Versions: CDH 5.2 and higher

Bug: [HDFS-3988](#)

Cloudera Bug: CDH-8144

Workaround: Make another WebHDFS request (such as `GETHOMEDIR`) to initiate an SPNEGO authentication sequence and then make the delegation token request.

`DistCp` does not work between a secure cluster and an insecure cluster in some cases

See the upstream bug reports for details.

Affected Versions: All CDH 5 versions

Bug: [HDFS-7037](#), [HADOOP-10016](#), [HADOOP-8828](#)

Cloudera Bug: CDH-14945, CDH-18779

Workaround: None

Port configuration required for `DistCp` to `Hftp` from secure cluster (SPNEGO)

To copy files using `DistCp` to `Hftp` from a secure cluster using SPNEGO, you must configure the `dfs.https.port` property on the client to use the HTTP port (50070 by default).

Affected Versions: All CDH 5 versions

Bug: [HDFS-3983](#)

Cloudera Bug: CDH-8118

Workaround: Configure `dfs.https.port` to use the HTTP port on the client

Non-HA DFS Clients do not attempt reconnects

This problem means that streams cannot survive a NameNode restart or network interruption that lasts longer than the time it takes to write a block.

Affected Versions: All CDH 5 versions

Bug: [HDFS-4389](#)

Cloudera Bug: CDH-10415

DataNodes may become unresponsive to block creation requests

DataNodes may become unresponsive to block creation requests from clients when the directory scanner is running.

Affected Versions: CDH 5.2.1 and below

Fixed in Versions: CDH 5.2.2 and higher

Bug: [HDFS-7489](#)

Workaround: Disable the directory scanner by setting `dfs.datanode.directoryscan.interval` to `-1`.

The active NameNode will not accept an `fsimage` sent from the standby during rolling upgrade

The result is that the NameNodes fail to checkpoint until the upgrade is finalized.

Note: Rolling upgrade is supported only for clusters managed by Cloudera Manager; you cannot do a rolling upgrade in a command-line-only deployment.

Affected Versions: CDH 5.3.7 and below

Fixed in Versions: CDH 5.3.8 and higher

Bug: [HDFS-7185](#)

Workaround: None.

Block report can exceed maximum RPC buffer size on some DataNodes

On a DataNode with a large number of blocks, the block report may exceed the maximum RPC buffer size.

Affected Versions: All CDH 5 versions

Bug: None

Workaround: Increase the value `ipc.maximum.data.length` in `hdfs-site.xml`:

```
<property>
  <name>ipc.maximum.data.length</name>
  <value>268435456</value>
</property>
```

Misapplied user-limits setting possible

The `ulimits` setting in `/etc/security/limits.conf` is applied to the wrong user when security is enabled.

Affected Versions: CDH 5.2.0 and below

Bug: [DAEMON-192](#)

Anticipated Resolution: None

Workaround: To increase the `ulimits` applied to DataNodes, you must change the `ulimit` settings for the root user, not the `hdfs` user.

LAZY_PERSIST storage policy is experimental and not supported

Using this storage policy could potentially lead to data loss.

Affected versions: All CDH 5 versions

Bug: [HDFS-8229](#)

Workaround: None

MapReduce2, YARN

NodeManager fails because of the changed default location of container executor binary

The default location of container-executor binary and .cfg files was changed to `/var/lib/yarn-ce`. It used to be `/opt/cloudera/parcels/<CDH_parcel_version>`. Because of this change, if you did not have the mount options `-noexec` and `-nosuid` set on `/opt`, the NodeManager can fail to start up as these options are set on `/var`.

Affected versions CDH 5.16.1, All CDH 6 versions

Workaround: Either remove the `-noexec` and `-nosuid` mount options on `/var` or change the container-executor binary and .cdf path using the `CMF_YARN_SAFE_CONTAINER_EXECUTOR_DIR` environment variable.

YARN scheduler queue ACLs are not checked when performing MoveApplicationAcrossQueues operations

The YARN `moveApplicationAcrossQueues` operation does not check ACLs on the target queue. This allows a user to move an application to a queue that the user has no access to.

Affected Versions: All CDH 5 versions

Fixed Versions: CDH 6.0.0

Bug: YARN-5554

Cloudera Bug: CDH-43327

Workaround: N/A

Hadoop YARN Privilege Escalation CVE-2016-6811

A vulnerability in Hadoop YARN allows a user who can escalate to the yarn user the ability to possibly run arbitrary commands as the root user.

Products affected: Hadoop YARN

Releases affected:

- CDH 5.12.x and all prior releases
- CDH 5.13.0, 5.13.1, 5.13.2, 5.13.3
- CDH 5.14.0, 5.14.2, 5.14.3
- CDH 5.15.0

Users affected: Users running the Hadoop YARN service.

Detected by: Freddie Rice

Severity: High

Impact: The vulnerability allows a user who has access to a node in the cluster running a YARN NodeManager and who can escalate to the yarn user, the ability to run arbitrary commands as the root user even if the user is not allowed to escalate directly to the root user.

CVE: CVE-2016-6811

Upgrade: Upgrade to a release where the issue is fixed.

Workaround: The vulnerability can be mitigated by restricting access to the nodes where the YARN NodeManagers are deployed, and by removing su access to the yarn user and by making sure no one other than the yarn user is a member of the yarn group. Please consult with your internal system administration team and adhere to your internal security policy when evaluating the feasibility of the above mitigation steps.

Addressed in release/refresh/patch: CDH 5.14.4, 5.15.1

For the latest update on this issue, see the corresponding Knowledge article:

TSB: 2018-309: Hadoop YARN privilege escalation

Missing results in Hive, Spark, Pig, Custom MapReduce jobs, and other Java applications when filtering Parquet data written by Impala

Apache Hive and Apache Spark rely on Apache Parquet's `parquet-mr` Java library to perform filtering of Parquet data stored in row groups. Those row groups contain statistics that make the filtering efficient without having to examine every value within the row group.

Recent versions of the `parquet-mr` library contain a bug described in [PARQUET-1217](#). This bug causes filtering to behave incorrectly if only some of the statistics for a row group are written. Starting in CDH 5.13, Apache Impala populates statistics in this way for Parquet files. As a result, Hive and Spark may incorrectly filter Parquet data that is written by Impala.

In CDH 5.13, Impala started writing Parquet's `null_count` metadata field without writing the `min` and `max` fields. This is valid, but it triggers the [PARQUET-1217](#) bug in the predicate push-down code of the Parquet Java library (`parquet-mr`). If the `null_count` field is set to a non-zero value, `parquet-mr` assumes that `min` and `max` are also set and reads them without checking whether they are actually there. If those fields are not set, `parquet-mr` reads their default value instead.

For integer SQL types, the default value is 0, so `parquet-mr` incorrectly assumes that the `min` and `max` values are both 0. This causes the problem when filtering data. Unless the value 0 itself matches the search condition, all row groups are discarded due to the incorrect `min/max` values, which leads to missing results.

Affected Products: The Parquet Java library (`parquet-mr`) and by extension, all Java applications reading Parquet files, including, but not limited to:

- Hive
- Spark
- Pig
- Custom MapReduce jobs

Affected Versions:

- CDH 5.13.0, 5.13.1, 5.13.2, and 5.14.0
- CDS 2.2 Release 2 Powered by Apache Spark and earlier releases on CDH 5.13.0 and later

Who Is Affected: Anyone writing Parquet files with Impala and reading them back with Hive, Spark, or other Java-based components that use the `parquet-mr` libraries for reading Parquet files.

Severity (Low/Medium/High): High

Impact: Parquet files containing null values for integer fields written by Impala produce missing results in Hive, Spark, and other Java applications when filtering by the integer field.

Immediate Action Required:

- **Upgrade**

You should upgrade to one of the fixed maintenance releases mentioned below.

- **Workaround**

This issue can be avoided at the price of performance by disabling predicate push-down optimizations:

- In Hive, use the following `SET` command:

```
SET hive.optimize.ppd = false;
```

- In Spark, disable the following configuration setting:

```
--conf spark.sql.parquet.filterPushdown=false
```

Addressed in the Following Releases:

- CDH 5.13.3 and higher
- CDH 5.14.2 and higher

- CDH 5.15.0 and higher
- CDS 2.3 Release 2 and higher

For the latest update on this issue, see the corresponding Knowledge Base article:

[TSB:2018-300: Missing results in Hive, Spark, Pig, and other Java applications when filtering Parquet data written by Impala](#)

Apache Hadoop Yarn Fair Scheduler might stop assigning containers when preemption is on

In CDH 5.11.0 the preemption code was updated to improve preemption behavior. Further changes were implemented in CDH 5.11.1 and CDH 5.12.0 to fix a remaining issue as described in [YARN-6432](#) (FairScheduler: Reserve preempted resources for corresponding applications). This fix resulted in two possible side effects:

- A race condition that results in the Fair Scheduler making duplicate reservations. The duplicate reservations are never released and can result in an integer overflow stopping container assignments.
- A possible deadlock in the event processing of the Fair Scheduler. This will stop all updates in the Resource Manager.

Both side effects will ultimately cause the Fair Scheduler to stop processing resource requests.

Without the change from YARN-6432 the resources that are released after being preempted are not reserved for the starved application. This could result in scheduler assigning the preempted container to any application, not just the starved application. If no reservations are made on the node for the starved application preemption will be less effective in solving the resource starvation.

Products affected: YARN

Releases affected: CDH 5.11.1, 5.12.0

Users affected: Users who have YARN configured with the FairScheduler and have turned preemption on.

Severity (Low/Medium/High): Low

Impact: The Resource Manager will accept application but no application will change state or get container assigned and thus progress.

Immediate action required:

- If you have not upgraded to the affected release and preemption in the FairScheduler is in use, avoid upgrading to the affected releases.
- If you have already upgraded to the affected releases, choose from the following options:
 - Upgrade to CDH 5.11.2 or 5.12.1
 - Turn off preemption

Fixed in Versions: CDH 5.11.2 and 5.12.1

Yarn's Continuous Scheduling can cause slowness in Oozie

When Continuous Scheduling is enabled in Yarn, this can cause slowness in Oozie due to long delays in communicating with Yarn. In Cloudera Manager 5.9.0 and higher, `Enable Fair Scheduler Continuous Scheduler` is turned off by default.

Affected Versions: All CDH 5 versions

Bug: None

Cloudera Bug: CDH-60788

Workaround: Turn off `Enable Fair Scheduler Continuous Scheduling` in Cloudera Manager's Yarn Configuration. To keep equivalent benefits of this feature, turn on `Fair Scheduler Assign Multiple Tasks`.

Rolling upgrades to 5.11.0 and 5.11.1 may cause application failures

Affected Versions: CDH versions that can be upgraded to 5.11.0 or 5.11.1

Fixed in Versions: CDH 5.11.2 and higher

Bug: None

Cloudera Bug: CDH-55284, TSB-241

Workaround: Upgrade to 5.11.2 or higher.

[Name resolution issues can result in unresponsive Web UI and REST endpoints](#)

Name resolution issues can cause the Web UI or the RM REST endpoints to consume all ResourceManager request handling threads, leaving the Web UI and REST endpoints unresponsive.

Fixed in Versions: CDH 5.10.0 and higher

Bug: [YARN-4767](#)

Cloudera Bug: CDH-45597

Workaround: Restart the ResourceManager or kill the application that is being accessed or waiting for the ResourceManager to complete the job.

[Loss of connection to the Zookeeper cluster can cause problems with the ResourceManagers](#)

Loss of connection to the Zookeeper cluster can cause the ResourceManagers to be in active-active state for an extended period of time.

Fixed in Versions: CDH 5.10.0 and higher

Bug: [YARN-5677](#), [YARN-5694](#)

Cloudera Bug: CDH-45210

Workaround: None.

[If the YARN user is granted access to all keys in KMS, then files localized from an encryption zone can be world readable](#)

If the YARN user is granted access to all keys in KMS, then files localized from an encryption zone can be world readable.

Fixed in Versions: CDH 5.7.7, 5.8.5, 5.9.2, 5.10.1, 5.11.0 and higher.

Bug: None

Cloudera Bug: CDH-47377

Workaround: Make sure files in an encryption zone do not have world-readable files modes if they are going to be localized.

[Zookeeper outage can cause the ResourceManagers to exit](#)

Fixed in Versions: CDH 5.12.0 and higher

Bug: [YARN-3742](#)

Cloudera Bug: CDH-47439

Workaround: None.

[FairScheduler might not Assign Containers](#)

Under certain circumstances, turning on `Fair Scheduler Assign Multiple Tasks`

(`yarn.scheduler.fair.assignmultiple`) causes the scheduler to stop assigning containers to applications.

Possible symptoms are that running applications show no progress, and new applications do not start, staying in an `Assigned` state, despite the availability of free resources on the cluster.

Affected Versions: CDH 5.5.0, CDH-5.5.1, CDH-5.5.2, CDH-5.5.3, CDH-5.5.4, CDH-5.5.5, CDH-5.5.6, CDH-5.6.0, and CDH-5.6.1

Fixed in Versions: CDH 5.7.0 and higher

Bug: [YARN-4477](#)

Cloudera Bug: CDH-36686

Workaround: Turn off `Fair Scheduler Assign Multiple Tasks` (`yarn.scheduler.fair.assignmultiple`) and restart the ResourceManager.

FairScheduler: AMs can consume all vCores leading to a livelock

When using FAIR policy with the FairScheduler, Application Masters can consume all vCores which may lead to a livelock.

Fixed in Versions: CDH 5.7.3 and higher, except for CDH 5.8.0 and CDH 5.8.1

Bug: [YARN-4866](#)

Cloudera Bug: CDH-37529

Workaround: Use Dominant Resource Fairness (DRF) instead of FAIR; or make sure that the cluster has enough vCores in proportion to the memory.

NodeManager mount point mismatch (YARN)

NodeManager may select a `cgroups` (Linux control groups) mount point that is not accessible to user `yarn`, resulting in failure to start up. The mismatch occurs because YARN uses `cgroups` in mount point `/run/lxcfs/controllers`, while Cloudera Manager typically configures `cgroups` at `/sys/fs/cgroups`. This issue has occurred on Ubuntu 16.04 systems.

Fixed in Versions: CDH 5.11.1 and higher

Bug: [YARN-6433](#)

Cloudera Bug: CDH-52263

Workaround: Look through your YARN logs to identify the failing mount point, and unmount it:

```
$ umount errant_mount_point
```

You can also:

1. `apt-get remove lxcfs`
2. Reboot the node

JobHistory URL mismatch after server relocation

After moving the JobHistory Server to a new host, the URLs listed for the JobHistory Server on the ResourceManager web UI still point to the old JobHistory Server. This affects existing jobs only. New jobs started after the move are not affected.

Affected Versions: All CDH 5 versions.

Workaround: For any existing jobs that have the incorrect JobHistory Server URL, there is no option other than to allow the jobs to roll off the history over time. For new jobs, make sure that all clients have the updated `mapred-site.xml` that references the correct JobHistory Server.

Starting an unmanaged ApplicationMaster may fail

Starting a custom Unmanaged ApplicationMaster may fail due to a race in getting the necessary tokens.

Affected Versions: CDH 5.1.5 and below.

Fixed in Versions: CDH 5.2 and higher.

Bug: [YARN-1577](#)

Cloudera Bug: CDH-17405

Workaround: Try to get the tokens again; the custom unmanaged ApplicationMaster should be able to fetch the necessary tokens and start successfully.

Moving jobs between queues not persistent after restart

CDH 5 adds the capability to move a submitted application to a different scheduler queue. This queue placement is not persisted across ResourceManager restart or failover, which resumes the application in the original queue.

Affected Versions: All CDH 5 versions.

Bug: [YARN-1558](#)

Cloudera Bug: CDH-17408

Workaround: After ResourceManager restart, re-issue previously issued move requests.

Encrypted shuffle may fail (MRv2, Kerberos, TLS)

In MRv2, if the `LinuxContainerExecutor` is used (usually as part of Kerberos security), and `hadoop.ssl.enabled` is set to `true` (see [Configuring Encrypted Shuffle, Encrypted Web UIs, and Encrypted HDFS Transport](#)), then the encrypted shuffle does not work and the submitted job fails.

Affected Versions: All CDH 5 versions.

Bug: [MAPREDUCE-4669](#)

Cloudera Bug: CDH-8036

Workaround: Use encrypted shuffle with Kerberos security without encrypted web UIs, or use encrypted shuffle with encrypted web UIs without Kerberos security.

ResourceManager-to-Application Master HTTPS link fails

In MRv2 (YARN), if `hadoop.ssl.enabled` is set to `true` (use HTTPS for web UIs), then the link from the ResourceManager to the running MapReduce Application Master fails with an HTTP Error 500 because of a PKIX exception.

A job can still be run successfully, and, when it finishes, the link to the job history does work.

Affected Versions: CDH versions before 5.1.0.

Fixed Versions: CDH 5.1.0

Bug: [YARN-113](#)

Cloudera Bug: CDH-8014

Workaround: Do not use encrypted web UIs.

History link in ResourceManager web UI broken for killed Spark applications

When a Spark application is killed, the history link in the ResourceManager web UI does not work.

Workaround: To view the history for a killed Spark application, see the Spark HistoryServer web UI instead.

Affected Versions: All CDH versions

Apache Issue: None

Cloudera Issue: CDH-49165

Routable IP address required by ResourceManager

ResourceManager requires routable `host:port` addresses for `yarn.resourcemanager.scheduler.address`, and does not support using the wildcard `0.0.0.0` address.

Bug: None

Cloudera Bug: CDH-6808

Workaround: Set the address, in the form `host:port`, either in the client-side configuration, or on the command line when you submit the job.

Amazon S3 copy may time out

The Amazon S3 filesystem does not support renaming files, and performs a copy operation instead. If the file to be moved is very large, the operation can time out because S3 does not report progress to the TaskTracker during the operation.

Bug: [MAPREDUCE-972](#)

Cloudera Bug: CDH-17955

Workaround: Use `-Dmapred.task.timeout=15000000` to increase the MR task timeout.

Out-of-memory errors may occur with Oracle JDK 1.8

The total JVM memory footprint for JDK8 can be larger than that of JDK7 in some cases. This may result in out-of-memory errors.

Bug: None

Workaround: Increase max default heap size (`-Xmx`). In the case of MapReduce, for example, increase **Reduce Task Maximum Heap Size** in Cloudera Manager (`mapred.reduce.child.java.opts`, or `mapreduce.reduce.java.opts` for YARN) to avoid out-of-memory errors during the shuffle phase.

MapReduce JAR file renamed (CDH 5.4.0)

As of CDH 5.4.0, `hadoop-test.jar` has been renamed to `hadoop-test-mr1.jar`. This JAR file contains the `mrbench`, `TestDFSIO`, and `nnbench` tests.

Bug: None

Cloudera Bug: CDH-26521

Workaround: None.

Jobs in pool with DRF policy will not run if root pool is FAIR

If a child pool using DRF policy has a parent pool using Fairshare policy, jobs submitted to the child pool do not run.

Affected Versions: All CDH 5 versions.

Bug: [YARN-4212](#)

Cloudera Bug: CDH-31358

Workaround: Change parent pool to use DRF.

Jobs with encrypted spills do not recover if the AM goes down

The fix to [CVE-2015-1776](#) leads to not having enough information to recover a job should the Application Master fail. Releases with this security fix cannot tolerate Application Master failures.

Affected Versions: All CDH 5 versions.

Bug: [MAPREDUCE-6638](#)

Cloudera Bug: CDH-37412

Workaround: None. Fix to come in a later release.

Large TeraValidate data sets can fail with MapReduce

In a cluster using MapReduce, TeraValidate fails when run over large TeraGen/TeraSort data sets (1TB and larger) with an `IndexOutOfBoundsException`. Smaller data sets do not show this issue.

Affected Versions: CDH 5.3.7 and lower

Fixed in Versions: CDH 5.3.8 and higher

Bug: [MAPREDUCE-6481](#)

Cloudera Bug: CDH-31871

Workaround:None.

MapReduce job failure and rolling upgrade (CDH 5.6.0)

MapReduce jobs might fail during a rolling upgrade to or from CDH 5.6.0. Cloudera recommends that you avoid doing rolling upgrades to CDH 5.6.0.

Bug: None

Cloudera Bug: CDH-38587

Workaround: Restart failed jobs.

Unsupported Features

The following features are not currently supported:

- **FileSystemRMStateStore:** Cloudera recommends you use `ZKRMStateStore` (ZooKeeper-based implementation) to store the ResourceManager's internal state for recovery on restart or failover. Cloudera does not support the use of `FileSystemRMStateStore` in production.
- **ApplicationTimelineServer (also known as Application History Server):** Cloudera does not support ApplicationTimelineServer v1. ApplicationTimelineServer v2 is under development and Cloudera does not currently support it.
- **Scheduler Reservations:** Scheduler reservations are currently at an experimental stage, and Cloudera does not support their use in production.
- **Scheduler node-labels:** Node-labels are currently experimental with CapacityScheduler. Cloudera does not support their use in production.
- **CapacityScheduler.** This is deprecated and will be removed from CDH in a future version.

MapReduce1

Oozie workflows not recovered after JobTracker failover on a secure cluster

Delegation tokens created by clients (via `JobClient#getDelegationToken()`) do not persist when the JobTracker [fails over](#). This limitation means that Oozie workflows will not be recovered successfully in the event of a failover on a secure cluster.

Bug: None

Cloudera Bug: CDH-8913

Workaround: Re-submit the workflow.

Hadoop Pipes should not be used in secure clusters

Hadoop Pipes should not be used in secure clusters. A shared password used by the framework for parent-child communications in the clear. A malicious user could intercept that password and potentially use it to access private data in a running application.

Bug: None

No JobTracker becomes active if both JobTrackers are migrated to other hosts

If JobTrackers in an High Availability configuration are shut down, migrated to new hosts, then restarted, no JobTracker becomes active. The logs show a `Mismatched address` exception.

Bug: None

Cloudera Bug: CDH-11801

Workaround: After shutting down the JobTrackers on the original hosts, and before starting them on the new hosts, delete the ZooKeeper state using the following command:

```
$ zkCli.sh rmr /hadoop-ha/<logical name>
```

Hadoop Pipes may not be usable in an MRv1 Hadoop installation done through tarballs

Under MRv1, MapReduce's C++ interface, Hadoop Pipes, may not be usable with a Hadoop installation done through tarballs unless you build the C++ code on the operating system you are using.

Bug: None

Cloudera Bug: CDH-7304

Workaround: Build the C++ code on the operating system you are using. The C++ code is present under `src/c++` in the tarball.

Apache HBase Known Issues

Except for version-specific sections, these issues affect each release of CDH.

Corruption of HBase data stored with MOB feature on upgrade from CDH 5 and HDP 2

CDH 5 and HDP 2 supported the HBase MOB feature prior to that feature making it into an upstream release. When the feature was finalized in the upstream community a different serialization format was used for MOB related configuration settings. CDH 6, HDP 3, and some versions of CDP used this newer serialization format.

When a CDH5 or HDP2 cluster is upgraded to CDH 6, HDP 3 or CDP, this difference in serialization formats causes HBase to incorrectly interpret MOB related configurations. A more severe incorrect interpretation results in the HBase cluster treating the MOB feature as disabled. Clients attempting to read values that were stored in the MOB system will get back HBase internals from the MOB system rather than the underlying data. Additionally, snapshot data which is migrated from CDH 5 and HDP 2 clusters into CDH 6, HDP 3, or CDP clusters may also cause MOB data to be unavailable in the same manner.

If clients perform read-modify-write workloads without recognizing that the value is not what they would expect then the cell value will not be fixed even if the MOB feature is turned back on. For example, using the cell level grant command in the hbase-shell will read cells, update the cell level ACLs on each, and then write the updated cell back to HBase; doing this grant while HBase believes the MOB features is off for a column family with MOB data corrupts any granted cells.

Symptoms:

- MOB configs in table descriptions and HBase web UIs show binary strings instead of sensible values.
- Reading MOB cells results in unexpected values that look like a int followed by a MOB filename.
- If the `IS_MOB` configuration is fixed but `MOB_THRESHOLD` is not, then regions with such configuration settings will fail to open with a `NumberFormatException`.

Products affected:

- CDH
- HDP

Releases affected:

- CDH 5.x
- HDP 2.x

Users affected: Those who use the MOB feature in the affected releases and are planning an upgrade to CDH 6, HDP 3, or CDP Private Cloud.

Severity (Low/Medium/High): High

Impact: Potential data corruption risk for upgrading customers.

Immediate action required:

- **As part of upgrading a cluster that makes use of the MOB feature you must:**
 1. Prior to shutting down the cluster for upgrade, disable any tables which use the MOB feature (look for table descriptions that have column families with `IS_MOB => true`.)

2. Follow normal upgrade steps.
3. Describe any tables which use the MOB feature to confirm that the configuration settings are not correctly displayed.
4. Alter any tables and set the needed MOB configuration settings anew.
5. Describe the tables to confirm the settings show up correctly.
6. Enable the tables.

- **Snapshots**

Snapshots created on MOB-enabled tables prior to upgrade or exported from a CDH 5 and HDP 2 will also result in incorrect `MOB_THRESHOLD` value in the upgraded system.

1. Export a snapshot to a remote filesystem location.
2. Contact Cloudera Support to obtain a tool and instructions to correct the snapshot, *prior* to importing the snapshot into the CDH 6, HDP 3 or CDP HBase filesystem root directory.
3. Use the `clone_snapshot` or the `restore_snapshot` command in HBase on a snapshot originally created in CDH 5 and HDP 2.

- **Repair**

If you have updated a cluster with the MOB feature and data was corrupted prior to correcting the MOB configuration, you can perform a repair using the HFiles still stored in the MOB area of HDFS:

1. Stop all client access.
2. Disable table.
3. Move the table's `mobdir` to `tmp` directory somewhere else in hdfs:

```
hdfs dfs -mv /hbase/mobdir/data/default/<tablename>/<mob region>/
/hbase/.tmp/reload-<table>/
```

4. Enable table.
5. Bulkload `tmp mobdir` from #3:

```
hbase org.apache.hadoop.hbase.tool.LoadIncrementalHFiles /hbase/.tmp/reload/<mob
region> <table_name>
```

6. Verify data.

- **Things to note:**

- The bulkload should be quick as it is moving the file from the `tmp` location into the table data location.
- This process only repair if cell updates did not change timestamp, if it did, you need to delete the cell prior to bulkload.
- As mentioned, bulk loading moves files, it is suggested that you make additional copies rather than just a move to `tmpdir`. This requires more space on HDFS during the process.
- Restored data will not be `mobdir` until compaction occurs. You can run normal compaction or wait until it happens on its own.
- ACLs updates made between upgrade and running the alter for `IS_MOB/MOB_THRESHOLD` will be lost.

Knowledge article: For the latest update on this issue see the corresponding Knowledge article: [TSB 2021-465: Corruption of HBase data stored with MOB feature on upgrade from CDH 5 and HDP 2](#)

HBase suffers data loss during system recovery when a custom WAL directory is configured

[HBASE-20723](#) covers a critical data loss bug. It is present when an HBase deployment is configured to use a non-default location for storing its write-ahead-log. If `hbase.wal.dir` is set to a different location than `hbase.rootdir`, then the recovery process will mistakenly believe there are no edits to replay in the event of process failure of a region server.

Products affected: HBase

Releases affected:

- CDH 5.11.x-5.14.x
- CDH 5.15.0, 5.15.1
- CDH 6.0.0

User affected: Anyone setting the configuration value `hbase.wal.dir` to a setting other than the default. For Cloudera Manager users, this would require setting a safety valve for the `hbase-site.xml` file.

User with non-default setting can determine if they are affected by looking for INFO log messages that indicates edits have been skipped. The following is an example of such message:

```
2018-06-12 22:08:40,455 INFO [RS_LOG_REPLAY_OPS-wn2-duohba:16020-0-Writer-1]
wal.WALSplitter: This region's directory doesn't exist:
hdfs://mycluster/walontest/data/default/tb1/b7fd7db5694eb71190955292b3ff7648. It is very
likely that it was already split so it's safe to discard those edits.
```

Note that the above message is normally harmless, but in this specific edge case the recovery code is looking at the incorrect location to determine region status.

Severity (Low/Medium/High): High

Impact: Data loss is unrecoverable once write-ahead-logs have been deleted as part of routine system processes. There is one exception, if the cluster uses data center replication to ship edits to another cluster and that cluster had not experienced similar data loss.

Immediate action required: Upgrade to a CDH version with the fix.

Addressed in release/refresh/patch: CDH 5.15.2 and higher, CDH 5.16.1 and higher; CDH 6.0.1 and higher

Knowledge article: For the latest update on this issue see the corresponding Knowledge article - [TSB 2019-320: HBase suffers data loss during system recovery when a custom WAL directory is configured](#)

Potential privilege escalation for user of HBase “Thrift 1” API Server over HTTP CVE-2018-8025

CVE-2018-8025 describes an issue in Apache HBase that affects the optional “Thrift 1” API server when running over HTTP. There is a race-condition that could lead to authenticated sessions being incorrectly applied to users, e.g. one authenticated user would be considered a different user or an unauthenticated user would be treated as an authenticated user.

Products affected: HBase Thrift Server

Releases affected:

- CDH 5.4.x - 5.12.x
- CDH 5.13.0, 5.13.1, 5.13.2, 5.13.3
- CDH 5.14.0, 5.14.2, 5.14.3
- CDH 5.15.0

Fixed versions:

- CDH 5.14.4
- CDH 5.15.1

Users affected: Users with the HBase Thrift 1 service role installed and configured to work in “thrift over HTTP” mode. For example, those using Hue with HBase impersonation enabled.

Severity: High

Potential privilege escalation.

CVE: CVE-2018-8025

Immediate action required: Upgrade to a CDH version with the fix, or, disable the HBase Thrift-over-HTTP service. Disabling the HBase Thrift-over-HTTP service will render Hue impersonation inoperable and all HBase access via Hue will be performed using the “hue” user instead of the authenticated user.

Knowledge article: For the latest update on this issue see the corresponding Knowledge article - TSB: 2018-315: Potential privilege escalation for user of HBase “Thrift 1” API Server over HTTP

Known Issues In CDH 5.12.0

IOException from Timeouts

CDH 5.12.0 includes the fix [HBASE-16604](#), where the internal scanner that retries in case of IOException from timeouts could potentially miss data. Java clients were properly updated to account for the new behavior, but thrift clients will now see exceptions where the previous missing data would be.

Workaround: Create a new scanner and retry the operation when encountering this issue.

Known Issues In CDH 5.7.0

Unsupported Features of Apache HBase 1.2

- Although Apache HBase 1.2 allows replication of `hbase:meta`, this feature is not supported by Cloudera and should not be used on CDH clusters until further notice.
- The [FIFO compaction policy](#) has not been thoroughly tested and is not supported in CDH 5.7.0.
- Although Apache HBase 1.2 adds a new permissive mode to allow mixed secure and insecure clients, this feature is not supported by Cloudera and should not be used on CDH clusters until further notice.

The `ReplicationCleaner` process can abort if its connection to ZooKeeper is inconsistent.

Bug: [HBASE-15234](#)

If the connection with ZooKeeper is inconsistent, the `ReplicationCleaner` may abort, and the following event will be logged by the HMaster:

```
WARN org.apache.hadoop.hbase.replication.master.ReplicationLogCleaner: Aborting
ReplicationLogCleaner
because Failed to get list of replicators
```

Unprocessed WALs will accumulate.

Fixed in Versions: CDH 5.3.10 , 5.4.11, 5.5.4, 5.6.1, 5.7.1, 5.8.0, 5.9.0 and above.

Workaround: Restart the HMaster occasionally. The `ReplicationCleaner` will restart if necessary and process the unprocessed WALs.

`IntegrationTestReplication` fails if replication does not finish before the verify phase begins.

Bug: None.

During `IntegrationTestReplication`, if the `verify` phase starts before the `replication` phase finishes, the test will fail because the target cluster does not contain all of the data. If the HBase services in the target cluster does not have enough memory, long garbage-collection pauses might occur

Workaround: Use the `-t` flag to set the timeout value before starting verification.

Cloudera has tested the performance impact of using HDFS encryption with HBase. The overall overhead of HDFS encryption on HBase performance is in the range of 3 to 4% for both read and update workloads. Scan performance has not been thoroughly tested.

Known Issues in CDH 5.6.0

The `ReplicationCleaner` process can abort if its connection to ZooKeeper is inconsistent.

Bug: [HBASE-15234](#)

If the connection with ZooKeeper is inconsistent, the `ReplicationCleaner` may abort, and the following event will be logged by the HMaster:

```
WARN org.apache.hadoop.hbase.replication.master.ReplicationLogCleaner: Aborting
ReplicationLogCleaner
because Failed to get list of replicators
```

Unprocessed WALs will accumulate.

Fixed in Versions: CDH 5.3.10, 5.4.11, 5.5.4, 5.6.1, 5.7.1, 5.8.0, 5.9.0 and above.

Workaround: Restart the HMaster occasionally. The `ReplicationCleaner` will restart if necessary and process the unprocessed WALs.

`ExportSnapshot` or `DistCp` operations may fail on the Amazon `s3a://` protocol.

Bug: None.

`ExportSnapshot` or `DistCP` operations may fail on on AWS when using certain JDK 8 versions, due to an incompatibility between the AWS Java SDK 1.9.x and the `joda-time` date-parsing module.

Workaround: Use `joda-time` 2.8.1 or higher, which is included in AWS Java SDK 1.10.1 or higher.

Reverse scans do not work when Bloom blocks or leaf-level inode blocks are present.

Bug: [HBASE-14283](#)

Because the `seekBefore()` method calculates the size of the previous data block by assuming that data blocks are contiguous, and HFile v2 and higher store Bloom blocks and leaf-level inode blocks with the data, reverse scans do not work when Bloom blocks or leaf-level inode blocks are present when HFile v2 or higher is used.

Fixed in Versions: CDH 5.3.9, 5.4.9, 5.5.2, 5.6.0, 5.7.0, 5.8.0, 5.9.0 and above.

Workaround: None.

Known Issues In CDH 5.5.1

The `ReplicationCleaner` process can abort if its connection to ZooKeeper is inconsistent.

Bug: [HBASE-15234](#)

If the connection with ZooKeeper is inconsistent, the `ReplicationCleaner` may abort, and the following event will be logged by the HMaster:

```
WARN org.apache.hadoop.hbase.replication.master.ReplicationLogCleaner: Aborting
ReplicationLogCleaner
because Failed to get list of replicators
```

Unprocessed WALs will accumulate.

Fixed in Versions: CDH 5.3.10, 5.4.11, 5.5.4, 5.6.1, 5.7.1, 5.8.0, 5.9.0 and above.

Workaround: Restart the HMaster occasionally. The `ReplicationCleaner` will restart if necessary and process the unprocessed WALs.

Extra steps must be taken when upgrading from CDH 4.x to CDH 5.5.1.

The fix for TSB 2015-98 disables legacy object serialization. This will cause direct upgrades on HBase clusters from CDH 4.x to CDH 5.5.1 to fail if one of the workarounds below is not used.

Bug: [HBASE-14799](#)

Cloudera Bug: CDH-34565

Fixed in Versions: CDH 5.3.9, 5.4.9, 5.5.1, 5.6.0, 5.7.0, 5.8.0, 5.9.0 and above.

Workaround: Use one of the following workarounds to upgrade from CDH 4.x to CDH 5.1:

- Upgrade to a CDH 5 version prior to CDH 5.5.1, and then upgrade from that version to CDH 5.5.1, or
- Set the `hbase.allow.legacy.object.serialization` to `true` in the Advanced Configuration Snippet for `hbase-site.xml` if using Cloudera Manager, or directly in `hbase-site.xml` on an unmanaged cluster. Upgrade your cluster to CDH 5.5.1. Remove the `hbase.allow.legacy.object.serialization` property or set it to `false` after migration is complete.

Known Issues In CDH 5.5.0

An operating-system level tuning issue in RHEL7 causes significant latency regressions

There are two distinct causes for the regressions, depending on the workload:

- For a cached workload, the regression may be up to 11%, as compared to RHEL6. The cause relates to differences in the CPU's C-state (power saving state) behavior. With the same workload, the CPU is around 40% busier in RHEL7, and the CPU spends more time transitioning between C-states in RHEL7. Transitions out of deeper C-states add latency. When CPUs are configured to never enter a C-state lower than 1, RHEL7 is slightly faster than RHEL6 on the cached workload. The root cause is still under investigation and may be hardware-dependent.
- For an IO-bound workload, the regression may be up to 8%, even with common C-state settings. A 6% difference in average disk service time has been observed, which in turn seems to be caused by a 10% higher average read size at the drive on RHEL7. The read sizes issued by HBase are the same in both cases, so the root cause seems to be a change in the EXT4 filesystem or the Linux block IO later. The root cause is still under investigation.

Bug: None

Severity: Medium

Workaround: Avoid using RHEL 7 if you have a latency-critical workload. For a cached workload, consider tuning the C-state (power-saving) behavior of your CPUs.

A RegionServer under extreme duress due to back-to-back garbage collection combined with heavy load on HDFS can lock up while attempting to append to the WAL.

The RegionServer appears operational to ZooKeeper, and continues to host regions, but cannot complete any writes. The most obvious symptom is that all writes to regions on this RegionServer time out, and the RegionServer log shows no progress other than queuing of flushes that never complete. Log messages such as the following may occur:

```
124028 2015-11-14 05:54:48,659 WARN org.apache.hadoop.hbase.util.Sleeper: We slept
42911ms instead of 3000ms,
  this is likely due to a long garbage collecting pause and it's usually bad, see
http://hbase.#
124029 2015-11-14 05:54:48,659 WARN org.apache.hadoop.hbase.util.JvmPauseMonitor: Detected
pause in JVM or
  host machine (eg GC): pause of approximately 41110ms
```

```
1806 2015-11-14 04:58:09,952 INFO org.apache.hadoop.hbase.regionserver.wal.FSHLog:
Slow sync cost: 2734 ms, current pipeline:
[DatanodeInfoWithStorage[10.17.198.17:20002,DS-56e2cf88-f267-43a8-b964-b29858#
1807 2015-11-14 04:58:09,952 INFO org.apache.hadoop.hbase.regionserver.wal.FSHLog:
Slow sync cost: 2963 ms, current pipeline:
[DatanodeInfoWithStorage[10.17.198.17:20002,DS-56e2cf88-f267-43a8-b964-b29858#
```

Bug: [HBASE-14374](#)

Workaround: Restart the RegionServer. To avoid the problem, adjust garbage-collection settings, give the RegionServer more RAM, and reduce the load on HDFS.

Known Issues In CDH 5.4 and Higher

The `ReplicationCleaner` process can abort if its connection to ZooKeeper is inconsistent.

Bug: [HBASE-15234](#)

If the connection with ZooKeeper is inconsistent, the `ReplicationCleaner` may abort, and the following event will be logged by the HMaster:

```
WARN org.apache.hadoop.hbase.replication.master.ReplicationLogCleaner: Aborting
ReplicationLogCleaner
because Failed to get list of replicators
```

Unprocessed WALs will accumulate.

Fixed in Versions: CDH 5.3.10, 5.4.11, 5.5.4, 5.6.1, 5.7.1, 5.8.0, 5.9.0 and above.

Workaround: Restart the HMaster occasionally. The `ReplicationCleaner` will restart if necessary and process the unprocessed WALs.

Increments and `CheckAnd*` operations are much slower in CDH 5.4 and higher (since HBase 1.0.0) than in CDH 5.3 and earlier.

This is due to the unification of `mvcc` and `sequenceid` done in HBASE-8763.

Bug: [HBASE-14460](#)

Workaround: None

Known Issues In CDH 5.3 and Higher

Export to Azure Blob Storage (the `wasb://` or `wasbs://` protocol) is not supported.

Bug: [HADOOP-12717](#)

CDH 5.3 and higher supports Azure Blob Storage for some applications. However, a null pointer exception occurs when you specify a `wasb://` or `wasbs://` location in the `--copy-to` option of the `ExportSnapshot` command or as the output directory (the second positional argument) of the `Export` command.

Workaround: None.

Silent Data Loss in Apache HBase Replication

In deployments with slow or unreliable network links, HBase's cross-datacenter replication code may believe it has reached the end of a write-ahead-log prior to successfully parsing the entire file. The remaining content is ignored and never sent to destination clusters. Eventually, the write-ahead-logs are cleaned up as a normal part of HBase operations, preventing later manual recovery.

The issue is fixed by HBASE-15984, which detects when a parsing error has occurred prior to reaching the end of a write-ahead-log file and subsequently retries.

Products affected: HBase and Search

Releases affected: All CDH 5 releases prior to CDH 5.8.0

Users affected: Clusters where HBase replication is enabled.

Severity (Low/Medium/High): High

Impact: The destination cluster will fail to receive all updates, causing inconsistencies between clusters replicating data.

Immediate action required: Customers relying on HBase data center replication should upgrade to CDH 5.8.0 or higher.

Fixed in Versions: CDH 5.8.0 and higher.

HBase in CDH 5 Dependent on Protobuf 2.5

HBase has a transitive dependency on protobuf 2.5. Applications that process protobuf 3 messages generate an error:

```
NoClassDefFoundError: Could not initialize class org.apache.hadoop.hbase.util.ByteStringer
```

Workaround: In CDH 5.8 and higher, use the Apache Maven Shade Plugin to rename protobuf 3.0 packages in the byte code. The Java code looks the same and uses the original package name. However, the byte code contains a different name, so when the HBase client classes load protobuf 2.5, there are no conflicting classes.

Some HBase Features Not Supported in CDH 5

The following features, introduced upstream in HBase, are not supported in CDH 5:

- Visibility labels
- Transparent server-side encryption
- Stripe compaction
- Distributed log replay

Medium Object Blob (MOB) Data Loss of a Snapshot After MOB Compaction

When taking a snapshot of a Medium Object Blobs (MOBs)-enabled table, a race condition can cause data to be lost after a MOB compaction operation completes.

Normally, a table snapshot flushes each region in the table and builds a snapshot manifest with metadata pointing to all the contents of the snapshot. These snapshot manifests are later used to determine which data files can be safely removed after a compaction process. When taking a snapshot, each region's flush can happen in parallel since each region is independent of all the other regions.

When the MOB feature is enabled, there is a separate special MOB region that stores the MOB items. Prior to applying the referenced patch for HBASE-16841, the MOB region was treated as if it was also independent of the other regions. This was not the case – when regions were flushed in a MOB-enabled table, new MOB data may have been written into the special MOB region. Because new MOB data files may have been written out after the MOB region's contents were added to the manifest, some of the MOB data may not have been recorded in the snapshot manifest.

Snapshots on MOB enabled tables were not susceptible to data loss until after a MOB compaction is run. However, after a MOB compaction was run, the MOB data files that were not captured by the snapshot manifest may no longer have had references and were thus eligible for deletion and susceptible to data loss.

This issue is fixed by HBASE-16841.

Releases affected:

CDH 5.3.0, 5.3.1, 5.3.2, 5.3.3, 5.3.4, 5.3.5, 5.3.7, 5.3.8, 5.3.9, 5.3.10

CDH 5.4.0, 5.4.1, 5.4.2, 5.4.3, 5.4.4, 5.4.5, 5.4.7, 5.4.8, 5.4.9, 5.4.10, 5.4.11

CDH 5.5.0, 5.5.1, 5.5.2, 5.5.4, 5.5.5, 5.5.6

CDH 5.6.0, 5.6.1

CDH 5.7.0, 5.7.1, 5.7.2, 5.7.3, 5.7.4, 5.7.5

CDH 5.8.0, 5.8.1, 5.8.2, 5.8.3

CDH 5.9.0, 5.9.1

CDH 5.10.0

Users affected: Only HBase users who enable MOB and take snapshots. Snapshots on regular tables are not affected.

Severity (Low/Medium/High): High

Impact: MOB data may not be properly restored from a HBase Snapshot.

Immediate action required: Upgrade CDH to version 5.7.6, 5.8.4, 5.9.2, 5.10.1 or 5.11.0 and higher

Addressed in release/refresh/patch: Fixed in CDH 5.7.6, 5.8.4, 5.9.2, 5.10.1 or 5.11.0 and higher

Medium Object Blob (MOB) Data Loss After MOB Compaction

If you enable Medium Object Blobs (MOBs) on a table, data loss can occur after a MOB compaction.

When there are no outstanding scanners for HBase regions, by way of optimization, HBase drops cell sequence IDs during normal region compaction for MOB-enabled tables. If a file with no sequence IDs is compacted with an older file that has overlapping cells, the wrong cells may be returned on subsequent compactions. The result is incorrect MOB file references.

The problem manifests as an inability to Scan or Get values from these overlapping rows, and the following WARN-level messages appear in RegionServer logs:

```
WARN HStore Fail to read the cell, the mob file <file name> doesn't exist
java.io.FileNotFoundException: File does not exist:
```

This issue is fixed by HBASE-13922.

Releases affected:

CDH 5.3.0, 5.3.1, 5.3.2, 5.3.3, 5.3.4, 5.3.5, 5.3.7, 5.3.8, 5.3.9, 5.3.10

CDH 5.4.0, 5.4.1, 5.4.2, 5.4.3, 5.4.4, 5.4.5, 5.4.7, 5.4.8, 5.4.9, 5.4.10, 5.4.11

CDH 5.5.0, 5.5.1, 5.5.2, 5.5.4, 5.5.5

CDH 5.6.0, 5.6.1

Users affected: HBase users who enable MOB

Severity (Low/Medium/High): High

Impact: MOB data cannot be retrieved from HBase tables.

Immediate action required: Upgrade CDH to version 5.5.6 or 5.7.0 and higher

UnknownScannerException [Messages After Upgrade](#)

HBase clients may throw exceptions like the following after an HBase upgrade:

```
org.apache.hadoop.hbase.UnknownScannerException:
org.apache.hadoop.hbase.UnknownScannerException: Name: 10092964, already closed?
```

In this upgrade scenario, these messages are caused by restarting the RegionServer during the upgrade. Restart the HBase client to stop seeing the exceptions. The log message has been improved in CDH 5.8.0 and higher.

[HBase moves to Protoc 2.5.0](#)

This change may cause JAR conflicts with applications that have older versions of `protobuf` in their Java classpath.

Bug: None

Workaround: Update applications to use Protoc 2.5.0.

[HBase may not tolerate HDFS root directory changes](#)

While HBase is running, do not stop the HDFS instance running under it and restart it again with a different root directory for HBase.

Bug: None

Cloudera Bug: CDH-5697

Workaround: None

[AccessController postOperation problems in asynchronous operations](#)

When security and Access Control are enabled, the following problems occur:

- If a `Delete Table` fails for a reason other than missing permissions, the access rights are removed but the table may still exist and may be used again.

- If `hbaseAdmin.modifyTable()` is used to delete column families, the rights are not removed from the Access Control List (ACL) table. The `postOperation` is implemented only for `postDeleteColumn()`.
- If `Create Table` fails, full rights for that table persist for the user who attempted to create it. If another user later succeeds in creating the table, the user who made the failed attempt still has the full rights.

Bug: [HBASE-6992](#)

Cloudera Bug: CDH-8566

Workaround: None

Native library not included in tarballs

The native library that enables RegionServer page pinning on Linux is not included in tarballs. This could impair performance if you install HBase from tarballs.

Bug: None

Cloudera Bug: CDH-7304c

Workaround: Use parcels

Apache Hive Known Issues

This topic also contains:

- [Hive-on-Spark Known Issues](#)

CREATE TABLE EXTERNAL commands run very slowly on Amazon S3

When you run a `CREATE EXTERNAL TABLE` command on Amazon S3 storage, the command runs extremely slowly and might not complete. This usually occurs for tables that have pre-existing, nested data. There is no known workaround.

Affected Versions: CDH 5.15.0

Cloudera Bug: CDH-68833

Workaround: None

Addressed in release/refresh/patch: CDH 5.15.1 and later

Apache Hive vulnerabilities CVE-2018-1282 and CVE-2018-1284

This security bulletin covers two vulnerabilities discovered in Hive.

CVE-2018-1282: JDBC driver is susceptible to SQL injection attack if the input parameters are not properly cleaned

This vulnerability allows carefully crafted arguments to be used to bypass the argument-escaping and clean-up that the Apache Hive JDBC driver does with `PreparedStatement` objects.

If you use Hive in CDH, you have the option of using the Apache Hive JDBC driver or the Cloudera Hive JDBC driver, which is distributed by Cloudera for use with your JDBC applications. Cloudera strongly recommends that you use the Cloudera Hive JDBC driver and offers only limited support for the Apache Hive JDBC driver. If you use the Cloudera Hive JDBC driver you are *not* affected by this vulnerability.

Mitigation: Upgrade to use the [Cloudera Hive JDBC driver](#), or perform the following actions in your Apache Hive JDBC client code or application when dealing with user provided input in `PreparedStatement` objects:

- Avoid passing user input with the `PreparedStatement.setBinaryStream` method, and
- Sanitize user input for the `PreparedStatement.setString` method by replacing all occurrences of `\'` (backslash, single quotation mark) to `'` (single quotation mark).

Detected by: CVE-2018-1282 was detected by Bear Giles of Snaplogic

CVE-2018-1284: Hive UDF series `UDFXPathXXXX` allows users to pass carefully crafted XML to access arbitrary files

If Hive impersonation is disabled and / or Apache Sentry is used, a malicious user might use any of the Hive `xpath` UDFs to expose the contents of a file on the node that is running HiveServer2 which is owned by the HiveServer2 user (usually `hive`).

Mitigation: Upgrade to a release where this is fixed. If `xpath` functions are not currently used, disable them with Cloudera Manager by setting the `hive.server2.builtin.udf.blacklist` property to `xpath,xpath_short,xpath_int,xpath_long,xpath_float,xpath_double,xpath_number,xpath_string` in the **HiveServer2 Advanced Configuration Snippet (Safety Valve) for `hive-site.xml`**. For more information about setting this property to blacklist Hive UDFs, see [the Cloudera Documentation](#).

Products affected: Hive

Releases affected:

- CDH 5.12 and earlier
- CDH 5.13.0, 5.13.1, 5.13.2, 5.13.3
- CDH 5.14.0, 5.14.1, 5.14.2

Users affected: All

Severity (Low/Medium/High): High

Impact: SQL injection, compromise of the `hive` user account

CVE: CVE-2018-1282, CVE-2018-1284

Immediate action required: Upgrade to a CDH release with the fix or perform the above mitigations.

Addressed in the following releases:

- CDH 5.14.4 and higher
- CDH 5.15.0 and higher

For the latest update on these issues, see the corresponding Knowledge article:

[TSB 2018-299: Hive Vulnerabilities CVE-2018-1282 and CVE-2018-1284](#)

Missing results in Hive, Spark, Pig, Custom MapReduce jobs, and other Java applications when filtering Parquet data written by Impala

Apache Hive and Apache Spark rely on Apache Parquet's `parquet-mr` Java library to perform filtering of Parquet data stored in row groups. Those row groups contain statistics that make the filtering efficient without having to examine every value within the row group.

Recent versions of the `parquet-mr` library contain a bug described in [PARQUET-1217](#). This bug causes filtering to behave incorrectly if only some of the statistics for a row group are written. Starting in CDH 5.13, Apache Impala populates statistics in this way for Parquet files. As a result, Hive and Spark may incorrectly filter Parquet data that is written by Impala.

In CDH 5.13, Impala started writing Parquet's `null_count` metadata field without writing the `min` and `max` fields. This is valid, but it triggers the [PARQUET-1217](#) bug in the predicate push-down code of the Parquet Java library (`parquet-mr`). If the `null_count` field is set to a non-zero value, `parquet-mr` assumes that `min` and `max` are also set and reads them without checking whether they are actually there. If those fields are not set, `parquet-mr` reads their default value instead.

For integer SQL types, the default value is 0, so `parquet-mr` incorrectly assumes that the `min` and `max` values are both 0. This causes the problem when filtering data. Unless the value 0 itself matches the search condition, all row groups are discarded due to the incorrect `min/max` values, which leads to missing results.

Affected Products: The Parquet Java library (`parquet-mr`) and by extension, all Java applications reading Parquet files, including, but not limited to:

- Hive
- Spark

- Pig
- Custom MapReduce jobs

Affected Versions:

- CDH 5.13.0, 5.13.1, 5.13.2, and 5.14.0
- CDS 2.2 Release 2 Powered by Apache Spark and earlier releases on CDH 5.13.0 and later

Who Is Affected: Anyone writing Parquet files with Impala and reading them back with Hive, Spark, or other Java-based components that use the `parquet-mr` libraries for reading Parquet files.

Severity (Low/Medium/High): High

Impact: Parquet files containing null values for integer fields written by Impala produce missing results in Hive, Spark, and other Java applications when filtering by the integer field.

Immediate Action Required:

- **Upgrade**

You should upgrade to one of the fixed maintenance releases mentioned below.

- **Workaround**

This issue can be avoided at the price of performance by disabling predicate push-down optimizations:

- In Hive, use the following `SET` command:

```
SET hive.optimize.ppd = false;
```

- In Spark, disable the following configuration setting:

```
--conf spark.sql.parquet.filterPushdown=false
```

Addressed in the Following Releases:

- CDH 5.13.3 and higher
- CDH 5.14.2 and higher
- CDH 5.15.0 and higher
- CDS 2.3 Release 2 and higher

For the latest update on this issue, see the corresponding Knowledge Base article:

[TSB:2018-300: Missing results in Hive, Spark, Pig, and other Java applications when filtering Parquet data written by Impala](#)

Hive Replications Can Fail Intermittently

Hive replication jobs can fail intermittently during the first step of replication while exporting Hive metadata. When this happens, the following message displays in Cloudera Manager: **The remote command failed with error message: Hive Replication Export Step failed.** The likelihood that this error can occur increases with the length of time it takes to export Hive metadata. If you have a very large Hive deployment (those containing many tables and partitions), and/or environments in which the Hive metastore server is under-resourced, you are more likely to see this issue. However, having many tables and partitions or having an under-resourced Hive metastore server do not cause this issue. The problem is caused by a bug and the only solution is to upgrade to a later release. Cloudera strongly recommends upgrading to anyone running Hive Replication and using Cloudera Manager 5.13.0 or 5.13.1 versions.

Affected Products: Cloudera Manager

Affected Versions: Cloudera Manager 5.13.0, 5.13.1

Who is Affected: Anyone using Hive Replication

Severity (Low/Medium/High): High

Cause and Impact: A file is created during the Hive Export Phase, and is used by later phases, such as the Transfer/Import phases. Because of a bug, sometimes the file is overwritten by another process. Hive Replication can thus fail intermittently because of `FileNotFoundException`s. A retry may or may not resolve the issue. This issue can potentially affect some or all Hive replication schedules.

Workaround: Upgrade to Cloudera Manager 5.13.2, 5.14.1, or higher versions

Addressed in release/refresh/patch: Cloudera Manager 5.13.2, 5.14.1, or higher versions.

For the latest updates on this issue, see the following corresponding Knowledge Base article:

[TSB 2018-276: Hive Replications can fail intermittently in Cloudera Manager 5.13.0, 5.13.1 versions](#)

Slow or stalled queries under highly concurrent write workloads when Sentry + Hive are used, caused by a Hive metastore deadlock

In the affected releases, some workloads can cause a deadlock in the Hive metastore. There are internal automated mechanisms to recover from such deadlocks. However, in highly concurrent write-heavy workloads, recovery from the deadlock is slower than the buildup of pending queries or operations. Therefore, the Hive metastore spends a lot of time in the deadlocked state, leading to slow performance or hangs. This in turn impacts performance of HiveServer2 and query performance.

After upgrading to an affected release, if performance of your workloads has worsened dramatically or workloads have stalled, you might be encountering this issue. If MySQL or MariaDB are configured as the Hive metastore database, the following error message appears in the Hive metastore log file, which confirms this issue as the cause:

```
com.mysql.jdbc.exceptions.jdbc4.MySQLTransactionRollbackException: Lock wait
timeout exceeded; try restarting transaction
```

Note: On Oracle and PostgreSQL databases, this message is not printed to the log file, though the issue is database-agnostic.

Affected Versions: CDH 5.13.0, 5.13.1, 5.13.2, 5.14.0, and 5.14.1

Affected Components: When Hive and Sentry are running together

Who is Affected:

- If you are using an affected version of CDH and using Hive and Sentry, refer to the "Workaround" section below.
- If you are using an affected version, but are **not** using Hive **and** Sentry, no action is required.
- If you are not using an affected version and you are using Hive and Sentry, do not upgrade to an affected version of CDH.

Severity (Low/Medium/High): High

Impact: Slow performance of the Hive metastore or Hive queries and eventually the metastore hangs.

Workaround: To mitigate this issue, apply the following configuration changes:

1. In Cloudera Manager, go to your cluster > **Hive** service > **Configuration**, and search for **Hive Metastore Server Advanced Configuration Snippet (Safety Valve) for hive-site.xml**.
2. Click the plus sign (+) twice, and add the following values:
 - Set `hive.metastore.transactional.event.listeners` to an empty value.
 - Set `hive.metastore.event.listeners` to `org.apache.hive.hcatalog.listener.DbNotificationListener`
3. Restart the Hive metastore instances so the configuration changes can be applied.

The following figure shows the configuration details:

Hive Metastore Server Advanced Configuration Snippet (Safety Valve) for hive-site.xml	Hive Metastore Server Default Group	View as XML
Name	<input type="text" value="hive.metastore.transactional.event.listeners"/>	
Value	<input type="text" value="Value"/>	
Description	<input type="text" value="Description"/>	
	<input type="checkbox"/> Final	
Name	<input type="text" value="hive.metastore.event.listeners"/>	
Value	<input type="text" value="org.apache.hive.hcatalog.listener.DbNotificationListener"/>	
Description	<input type="text" value="Description"/>	
	<input type="checkbox"/> Final	

Applying this workaround may cause some DDL queries, such as queries where a table is dropped and a new table is created with the same name, to fail with unexpected `No valid privileges` errors. Re-run such queries to resolve this error.

If the issue persists after applying the above workaround, check the status of the following Knowledge Base article for the latest updates on this issue:

- [TSB 2018-294: Slow or stalled queries under highly concurrent write workloads when Sentry + Hive are used, caused by a Hive metastore deadlock](#)

Addressed in release/refresh/patch: CDH 5.13.3, CDH 5.14.2

Beeline fails with "Error: Unrecognized column type: UNIONTYPE"

When the following conditions are met, Beeline fails and returns the error `Error: Unrecognized column type: UNIONTYPE`:

- Submit a query with Beeline that returns data in the result set from columns that are set to the `UNIONTYPE` data type.
- Beeline option `--incremental=` is set to `true`. By default, this option is set to `false` in CDH.

Affected Version: CDH 5.14 and higher

Cloudera Bug: CDH-63768

Workaround: Set the Beeline option `--incremental=` to `false` on the command line. See [the Beeline documentation](#) for information about setting this option.

DirectSQL with PostgreSQL

Hive doesn't support Hive direct SQL queries with PostgreSQL database. It only supports this feature with MySQL, MariaDB, and Oracle. With PostgreSQL, direct SQL is disabled as a precaution because there have been issues reported upstream. For example, it has been reported that it is not possible to fall back on DataNucleus in case of some failures, plus some other non-standard behaviors. For more information, see [Hive Configuration Properties](#).

Affected Versions: CDH 5.13.0 and higher

Bug: None

Cloudera Bug: CDH-63059

Increase width of columns used for general configuration in the metastore

[HIVE-12274](#) was only partially backported to CDH. The HMS backend database changes are not included in CDH, as it would be a backward compatibility breaking change. The HMS schema won't be changed automatically during the update. It needs to be changed manually.

Affected Versions: CDH 5.13.0 and higher

Bug: [HIVE-12274](#)

Workaround: Change the HMS schema manually.

Hive SSL vulnerability bug disclosure

If you use Cloudera Hive JDBC drivers to connect your applications with HiveServer2, you are *not affected* if:

- SSL is *not* turned on, or
- SSL is turned on but only *non-self-signed* certificates are used.

If neither of the above statements describe your deployment, please read Security Bulletin [Apache Hive SSL Vulnerability Bug Disclosure](#) for further details.

Leak of threads from `getInputPaths` and `getInputSummary` thread pool can degrade HiveServer2 performance

The optimization made to `Utilities.getInputPaths()` method with [HIVE-15546](#) introduced a thread pool that is not shut down when its threads complete their work. This leads to a thread leak for each query that runs in HiveServer2 and the leaked threads are not removed automatically. When queries span multiple partitions, the number of threads spawned increases, but they are never reduced. After 10,000 threads are reached, HiveServer2 performance slows.

Affected Versions: CDH 5.11.0, 5.11.1, 5.11.2, 5.12.0, 5.12.1

Fixed in Versions: 5.12.2, 5.13.0 and higher

Bug: [HIVE-16949](#)

Cloudera Bug: CDH-57789

Resolution: Upgrade to a fixed version of CDH or use the workaround.

Workaround: Upgrading to a fixed version of CDH is the preferred resolution for this issue, but if that is not immediately possible, you can set the **Hive > Configuration > HiveServer2 > Performance > Input Listing Max Threads** property to 1 in Cloudera Manager for managed clusters. If your cluster is not managed, set `hive.exec.input.listing.max.threads=1` in the `hive-site.xml` file.

Important: Decreasing the value set for **Input Listing Max Threads** in Cloudera Manager or decreasing it for the `hive.exec.input.listing.max.threads` property in the `hive-site.xml` file might degrade performance of Hive on Amazon S3, but not for Hive on HDFS.

Hive metastore canary fails

The Hive metastore canary can fail in environments where the Hive-Sentry metastore plugin is deployed and where there are over one million Hive tables and partitions. In this situation, Sentry times out while waiting to receive a full snapshot from the Hive metastore.

Affected Versions: CDH 5.9.2, CDH 5.10.1, CDH 5.10.2, and CDH 5.11.1., 5.11.2, and CDH 5.12

Cloudera Bug: CDH-55255

Resolution: Use workaround.

Workaround: If your environment contains over one million Hive tables and partitions, before you upgrade to one of the affected versions, increase the Sentry timeout property for the metastore plugin to at least 10 to 20 minutes (600,000 to 1,200,000 ms). In Cloudera Manager, set the **Hive Service Advanced Configuration Snippet (Safety Valve) for sentry-site.xml** as follows:

- **Name:** `sentry.hdfs.service.client.server.rpc-connection-timeout`

- **Value:** 600000

After setting this safety valve, monitor your environment. If the Hive metastore canary continues to fail, increase the value by four-minute increments until Sentry can receive the full snapshot from the metastore. For example, if you set the safety valve to 600,000 ms and the canary fails, increase it to 840,000 ms. If it still fails, increase the value to 1,080,000 ms, and so on.

Hive Local Mode is not supported in production environments

Cloudera does not currently support the use of Hive Local Mode in production environments. This mode is set with the `hive.exec.mode.local.auto` property. Use this mode for testing purposes only.

Affected Versions: Not applicable.

Bug: None.

Workaround: None.

INSERT INTO overwrites EXTERNAL tables on the local filesystem

When EXTERNAL tables are located on the local filesystem (URIs beginning with `file://`), the INSERT INTO statement overwrites the table data. Defining EXTERNAL tables on the local filesystem is not a well-documented practice so its behavior is not well defined and is subject to change.

Affected Versions: CDH 5.10

Fixed in Version: CDH 5.10.1

Cloudera Bug: CDH-47856

Workaround: Change the table location from the local filesystem to an HDFS location.

Built-in version() function is not supported

Cloudera does not currently support the built-in `version()` function.

Affected Versions: Not applicable.

Cloudera Bug: CDH-40979

Workaround: None.

EXPORT and IMPORT commands fail for tables or partitions with data residing on Amazon S3

The EXPORT and IMPORT commands fail when the data resides on the Amazon S3 filesystem because the default Hive configuration restricts which file systems can be used for these statements.

Bug: None.

Resolution: Use workaround.

Workaround: Add S3 to the list of supported filesystems for EXPORT and IMPORT by setting the following property in the HiveServer2 Advanced Configuration Snippet (Safety Valve) for `hive-site.xml` in Cloudera Manager (select **Hive** service > **Configuration** > **HiveServer2**):

```
<property>
<name>hive.exim.uri.scheme.whitelist</name>
<value>hdfs,pfile,s3a</value>
</property>
```

Hive queries on MapReduce 1 cannot use Amazon S3 when the Cloudera Manager External Account feature is used

Hive queries that read or write data to Amazon S3 and use the Cloudera Manager External Account feature for S3 credential management do not work with MapReduce 1 (MRv1) because it is deprecated on CDH.

Cloudera Bug: CDH-45201

Resolution: Use workaround.

Workaround: Migrate your cluster from MRv1 to MRv2. See [Migrating from MapReduce \(MRv1\) to MapReduce \(MRv2\)](#).

ALTER PARTITION does not work on Amazon S3 or between S3 and HDFS

Cloudera recommends that you do not use `ALTER PARTITION` on S3 or between S3 and HDFS.

Cloudera Bug: CDH-42420

Hive cannot drop encrypted databases in cascade if trash is enabled

Affected Versions: CDH 5.7.0, 5.7.1, 5.7.2, 5.7.3, 5.7.4, 5.7.5, 5.7.6, 5.8.0, 5.8.1, 5.8.2, 5.8.3, 5.8.4, 5.8.5, 5.9.0, 5.9.1, 5.9.2, 5.10.0, 5.10.1, 5.11.0, 5.11.1

Fixed in Versions: CDH 5.7.7, 5.8.6, 5.9.3, 5.10.2, 5.11.2, 5.12.0

Bug: [HIVE-11418](#)

Cloudera Bug: CDH-29913

Workaround: Remove each table using the `PURGE` keyword (`DROP TABLE table PURGE`). After all tables are removed, remove the empty database (`DROP DATABASE database`).

Potential failure of "alter table <schema>.<table> rename to <schema>.<new_table_name>"

When Hive renames a managed table, it always creates the new renamed table directory under its database directory in order to preserve the database/table hierarchy. The renamed table directory is created under the default database.

Considering that the encryption of a filesystem is part of the evolution hardening of a system (where the system and the data contained in it already exist) and a database can be already created without the location set (because it is not strictly required) and the default database is outside the same encryption zone (or in a no-encryption zone) the alter table rename operation fails.

Affected Version: CDH 5.5 only

Cloudera Bug: CDH-63062

Resolution: Use workaround.

Workaround: Use the following statements:

```
CREATE DATABASE database_encrypted_zone LOCATION
'/hdfs/encrypted_path/database_encrypted_zone';
USE database_encrypted_zone;
```

```
CREATE TABLE rename_test_table LOCATION
'hdfs/encrypted_path/database_encrypted_zone/rename_test';
ALTER TABLE rename_test_table RENAME TO test_rename_table;
```

The renamed table is created under the default database.

Hive upgrade from CDH 5.0.5 fails on Debian 7.0 if a Sentry 5.0.x release is installed

Upgrading Hive from CDH 5.0.5 to CDH 5.4, 5.3 or 5.2 fails with the following error if a Sentry version later than 5.0.4 and earlier than 5.1.0 is installed. You will see an error such as the following:

```
: error processing
/var/cache/apt/archives/hive_0.13.1+cdh5.2.0+221-1.cdh5.2.0.p0.32~precise-cdh5.2.0_all.deb
  (--unpack):  trying to overwrite '/usr/lib/hive/lib/commons-lang-2.6.jar', which
is also
  in package sentry 1.2.0+cdh5.0.5
```

This is because of a conflict involving `commons-lang-2.6.jar`.

Cloudera Bug: CDH-25450

Workaround: Upgrade Sentry first and then upgrade Hive. Upgrading Sentry deletes all the JAR files that Sentry has installed under `/usr/lib/hive/lib` and installs them under `/usr/lib/sentry/lib` instead.

Hive creates an invalid table if you specify more than one partition with `alter table`

Hive (in all known versions from 0.7) allows you to configure multiple partitions with a single `alter table` command, but the configuration it creates is invalid for both Hive and Impala.

Bug: None

Resolution: Use workaround.

Workaround:

Correct results can be obtained by configuring each partition with its own `alter table` command in either Hive or Impala. For example, the following:

```
ALTER TABLE page_view ADD PARTITION (dt='2008-08-08', country='us') location
'/path/to/us/part080808' PARTITION
(dt='2008-08-09', country='us') location '/path/to/us/part080809';
```

should be replaced with:

```
ALTER TABLE page_view ADD PARTITION (dt='2008-08-08', country='us') location
'/path/to/us/part080808';
ALTER TABLE page_view ADD PARTITION (dt='2008-08-09', country='us') location
'/path/to/us/part080809';
```

Commands run against an Oracle backed metastore may fail

Commands run against an Oracle-backed Metastore fail with error:

```
javax.jdo.JDODataStoreException Incompatible data type for column TBLS.VIEW_EXPANDED_TEXT
: was CLOB (datastore),
but type expected was LONGVARCHAR (metadata). Please check that the type in the datastore
and the type specified in the MetaData are consistent.
```

This error may occur if the metastore is run on top of an Oracle database with the configuration property `datanucleus.validateColumns` set to `true`.

Bug: None

Workaround: Set `datanucleus.validateColumns=false` in the `hive-site.xml` configuration file.

Hive Web Interface is not supported

Cloudera no longer supports the Hive Web Interface because of inconsistent upstream maintenance of this project.

Bug: [DISTRO-77](#)

Resolution: Use workaround

Workaround: Use Hue and Beeswax instead of the Hive Web Interface.

Hive might need additional configuration to make it work in a federated HDFS cluster

Hive jobs normally move data from a temporary directory to a warehouse directory during execution. Hive uses `/tmp` as its temporary directory by default, and users usually configure `/user/hive/warehouse/` as the warehouse directory. Under Federated HDFS, `/tmp` and `/user` are configured as ViewFS mount tables, and so the Hive job will

actually try to move data between two ViewFS mount tables. Federated HDFS does not support this, and the job will fail with the following error:

```
Failed with exception Renames across Mount points not supported
```

Cloudera Bug: CDH-9430

Resolution: No software fix planned; use the workaround.

Workaround: Modify `/etc/hive/conf/hive-site.xml` to allow the temporary directory and warehouse directory to use the same ViewFS mount table. For example, if the warehouse directory is `/user/hive/warehouse`, add the following property to `/etc/hive/conf/hive-site.xml` so both directories use the ViewFS mount table for `/user`.

```
<property>
  <name>hive.exec.scratchdir</name>
  <value>/user/${user.name}/tmp</value>
</property>
```

Cannot create archive partitions with external HAR (Hadoop Archive) tables

`ALTER TABLE ... ARCHIVE PARTITION` is not supported on external tables.

Cloudera Bug: CDH-9638

Workaround: None

Setting `hive.optimize.skewjoin` to true causes long running queries to fail

Bug: None

Workaround: None

Object types Server and URI are not supported in "`SHOW GRANT ROLE roleName on OBJECT objectName`"

Cloudera Bug: CDH-19430

Workaround: Use `SHOW GRANT ROLE roleName` to list all privileges granted to the role.

Kerberized HS2 with LDAP authentication fails in a multi-domain LDAP case

In CDH 5.7, Hive introduced a feature to support HS2 with Kerberos plus LDAP authentication; but it broke compatibility with multi-domain LDAP cases on CDH 5.7.x and C5.8.x versions.

Affected Versions: CDH 5.7.1, CDH 5.8.0, and CDH 5.8.1

Fixed in Versions: CDH 5.7.2 and higher, CDH 5.8.2 and higher

Bug: [HIVE-13590](#).

Workaround: None.

With encrypted HDFS, 'drop database if exists `<db_name>` cascade' fails

Hive cannot drop encrypted databases in cascade if trash is enabled.

Affected Versions: CDH 5.7.0 - 5.7.6, CDH 5.8.0 - 5.8.5, CDH 5.9.0 - 5.9.2, CDH 5.10.0 - 5.10.1, CDH 5.11.0 - 5.11.1

Fixed in Versions: CDH 5.7.7, 5.8.6, 5.9.3, 5.10.2, 5.11.2, 5.12.0

Bug: [HIVE-11418](#)

Cloudera Bug: CDH-29913

Workaround: Remove each table, using the PURGE keyword (`DROP TABLE table PURGE`). After all tables are removed, remove the empty database (`DROP DATABASE database`).

HCatalog Known Issues

Note: As of CDH 5, HCatalog is part of Apache Hive.

WebHCatalog does not work in a Kerberos-secured federated cluster

Cloudera Bug: CDH-12416

Resolution: None planned.

Workaround: None

Hive-on-Spark (HoS) Known Issues

Hive on Spark queries are failing with "Timed out waiting for client to connect" for an unknown reason

If this exception is preceded by logs of the form "client.RpcRetryingCaller: Call exception...". Then this failure is due to an unavailable HBase service. On a secure cluster, spark-submit will try to obtain delegation tokens from HBase, even though HoS doesn't necessarily need them. So if HBase is unavailable, then spark-submit throws an exception.

Cloudera Bug: CDH-59591

Affected Versions: CDH 5.7.0 and higher

Workaround: Fix the HBase service, or set `spark.yarn.security.tokens.hbase.enabled` to `false`.

Intermittent inconsistent results for Hive-on-Spark with DECIMAL-type columns

Important: If you use Hive with MapReduce2 (YARN) as the execution engine you are unaffected.

SQL queries executed using Hive-on-Spark (HoS) can produce inconsistent results intermittently if they use a `GROUP BY` clause (user-defined aggregate functions, or UDAFs) on `DECIMAL` data type columns.

Hive queries are affected if all of the following conditions are met:

- Spark is used as the execution engine (`hive.execution.engine=spark`) in the Affected Versions listed below.
- The property `spark.executor.cores` is set to a value greater than 1.
- The query uses a UDAF that requires a `GROUP BY` clause on a `DECIMAL` data type column.

For example:

```
COUNT(DISTINCT<decimal_column_name>), SELECT SUM(<column>) GROUP BY<decimal_column>
```

You can use the `EXPLAIN` command to view the query execution plan to check for the presence of the `GROUP BY` clause on a `DECIMAL` data type column.

Bug: [HIVE-16257](#), [HIVE-12768](#)

Severity: High

Affected Versions:

- CDH 5.4.0, 5.4.1, 5.4.2, 5.4.3, 5.4.4, 5.4.5, 5.4.7, 5.4.8, 5.4.9, 5.4.10, 5.4.11
- CDH 5.5.0, 5.5.1, 5.5.2, 5.5.3, 5.5.4, 5.5.5, 5.5.6
- CDH 5.6.0, 5.6.1
- CDH 5.7.0, 5.7.1, 5.7.3, 5.7.4, 5.7.5, 5.7.6
- CDH 5.8.0, 5.8.1, 5.8.2, 5.8.3, 5.8.4
- CDH 5.9.0, 5.9.1

- CDH 5.10.0, 5.10.1

Resolution: Use the workaround or upgrade to a release that addresses this issue:

- CDH 5.8.5 and higher
- CDH 5.9.2 and higher
- CDH 5.11.0 and higher

Workaround: To fix this issue, set `spark.executor.cores=1` for sessions that run queries that use the `GROUP BY` clause on `DECIMAL` data type columns. This might cause performance degradation for some queries. Cloudera recommends that you run performance validations before setting this property.

You can set this with Cloudera Manager in HiveServer2 at the cluster level:

Warning: Setting `spark.executor.cores` to 1 at the cluster-level might impact unaffected queries in HoS (those that do not use UDAFs using the `GROUP BY` clause). Cloudera recommends that you run performance validations before setting this property.

1. In the Cloudera Manager Admin console, go to the Hive service, and select **Configuration>HiveServer2>Performance**.
2. In the **Search** text box, type `spark.executor.cores` and press Enter.
3. Set **Spark Executor Cores** to 1.
4. Click **Save Changes**.

Hive-on-Spark throws exception for a multi-insert with a join query

A multi-insert combined with a join query with Hive on Spark (Hos) sometimes throws an exception. It occurs only when multiple parts of the resultant operator tree are executed on the same executor by Spark.

Affected Versions: CDH 5.7.0

Fixed in Versions: CDH 5.7.1

Bug: [HIVE-13300](#)

Cloudera Bug: CDH-38458

Workaround: Run inserts one at a time.

NullPointerException thrown when a Spark session is reused to run a mapjoin

Some Hive-on-Spark (HoS) queries might fail with a `NullPointerException` if a Spark dependency is not set.

Affected Version: CDH 5.7.0

Bug: [HIVE-12616](#)

Cloudera Bug: CDH-38514

Workaround: Configure Hive to depend on the Spark (on YARN) service in Cloudera Manager.

Large Hive-on-Spark queries might fail in Spark tasks with `ExecutorLostFailure`

The root cause is `java.lang.OutOfMemoryError: Unable to acquire XX bytes of memory, got 0`. Spark executors can OOM because of a failure to correctly spill shuffle data from memory to disk.

Cloudera Bug: CDH-38642

Workaround: Run this query using MapReduce.

Hive-on-Spark2 is not Supported

Hive-on-Spark is a CDH component that has a dependency on Spark 1.6. Because CDH components do not have any dependencies on Spark 2, Hive-on-Spark does not work with the Cloudera Distribution of Apache Spark 2.

Hue Known Issues

High DDL usage in Hue Impala Editor may issue flood of INVALIDATE Calls

Issuing DDL statements using Hue's Impala editor or invoking Hue's "Refresh Cache" function in the left-side metadata browser results in Hue issuing INVALIDATE METADATA calls to the Impala service. This call is expensive and can result in a significant system impact, up to and including full system outage, when repeated in sufficient volume. This has been corrected in HUE-8882.

Components affected:

- Hue
- Impala

Products affected:

- Cloudera Enterprise 5
- Cloudera Enterprise 6

Releases affected:

- CDH 5.15.1, 5.15.2
- CDH 5.16.x
- CDH 6.1.1
- CDH 6.2.x
- CDH 6.3.0, 6.3.1, 6.3.2, 6.3.3

Users affected: End-users using Impala editor in Hue.

Severity: High

Impact: Users running DDL statements using the Hue Impala editor or invoking Hue's Refresh Cache function causes INVALIDATE METADATA commands to be sent to Impala. Impala's metadata invalidation is an expensive operation and could cause impact on the performance of subsequent queries, hence leading to the potential for significant impact on the entire cluster, including the potential for whole-system outage.

Action required:

- CDH 6.x customers: Upgrade to CDH 6.3.4 that contains the fix.
- CDH 5.x customers: Contact Cloudera Support for further assistance.

Apache Issue: [HUE-8882](#)

Knowledge Article: For the latest update on this issue see the corresponding Knowledge article: [Cloudera Customer Advisory: High DDL usage in Hue Impala Editor may issue flood of INVALIDATE Calls](#)

Hue Silently Disables StartTLS in LDAP Connections

There are two mechanisms to secure communication to an LDAP server. One is to use an 'ldaps' connection, where all traffic is encrypted inside a TLS tunnel - much like 'https'. The other is to use 'StartTLS', where traffic begins unencrypted in the "ldap" protocol and then upgrades itself to a TLS connection.

If StartTLS is enabled in the Hue configuration but the 'ldap_cert' parameter is not configured, then Hue silently disables StartTLS.

StartTLS will not be used for synchronization or import, even if StartTLS is enabled and the 'ldap_cert' parameter is set.

The result is that connections that the administrator assumes to be secured, using StartTLS, are not actually secure.

CVE: CVE-2019-19146

Date/time of detection: 22nd March, 2019

Detected by: Ben Gooley, Cloudera

Severity (Low/Medium/High): 8.8 High [CVSS AV:N/AC:L/PR:N/UI:R/S:U/C:H/I:H/A:H](#)

Products affected: CDH

Releases affected:

- CDH 5.x
- CDH 6.1.0
- CDH 6.1.1
- CDH 6.2.0
- CDH 6.2.1
- CDH 6.3.0

Users affected: All users who are using StartTLS enabled in the Hue configuration when using LDAP as Authentication Backend to login in Hue.

Impact: Sensitive data exposure.

Immediate action required:

- **Upgrade (recommended):** Update to a version of CDH containing the fix.
- **Workaround:** Use “ldaps” instead of “ldap” and StartTLS.

Addressed in release/refresh/patch: CDH 6.3.1 and above

Knowledge Article: For the latest update on this issue see the corresponding Knowledge article: [TSB 2020-371: Hue Silently Disables StartTLS in LDAP Connections](#)

Hue allows unsigned SAML assertions

If Hue receives an unsigned assertion, it continues to process it as valid. This means it is possible for an end-user to forge or remove the signature and manipulate a SAML assertion to gain access without a successful authentication.

Products affected: Hue, CDH

Releases affected:

- CDH 5.15.x and earlier
- CDH 5.16.0, 5.16.1
- CDH 6.0.x
- CDH 6.1.x

User affected: All users who are using SAML with Hue.

CVE: CVE-2019-14775

Date/time of detection: January 2019

Detected by: Joel Snape

Severity (Low/Medium/High): High

Impact:

This is a significant security risk as it allows anyone to fake their access validity and therefore access Hue, even if they should not have access. In more detail: if Hue receives an unsigned assertion, it continues to process it as valid. This means it is possible for an end-user to forge or remove the signature and manipulate a SAML assertion to gain access without a successful authentication.

CVE: CVE-2019-14775

Immediate action required:

- **Upgrade (recommended):** Upgrade to a version of CDH containing the fix.
- **Workaround:** None

Addressed in release/refresh/patch:

- CDH 5.16.2
- CDH 6.2.0

Oozie workflows cannot be clicked when opened from **Workflows > Editor > Workflows** in Hue 3

When you are using Hue 3, you cannot edit an Oozie workflow by clicking it when you navigate to **Workflows > Editor > Workflows**.

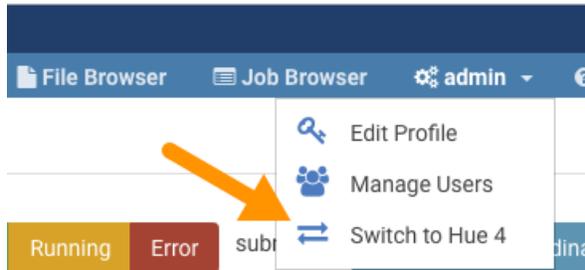

Affected Versions: CDH 5.15.x and later CDH 5.x versions

Fixed in Versions: No fix is planned for CDH 6.x as only Hue 4 is available

Cloudera Bug: CDH-70450

Workaround: Switch to Hue 4:

In the Hue user interface, click the **Administration** menu and select **Switch to Hue 4**:

Long delay in Impala metadata operations cause a 502 proxy error

A 502 error message appears when an Impala metadata operation, such as an Impala query compilation, takes several minutes. This causes Hue to timeout and throw a 502 error.

Affected Versions: CDH 5.12.x, 5.13.0, 5.13.1

Fixed in Versions: 5.14.0

Cloudera Bug: CDH-57588

Workaround: Configure the `ProxyTimeout` value parameter using the Advanced Configuration Snippet:

1. In the Cloudera Manager user interface, locate **Hue > Configuration**.
2. Using the search box, search for 'Load Balancer Advanced Configuration Snippet (Safety Valve) for httpd.conf'.
3. In the resulting text box, insert `ProxyTimeout 600` — this allows the Hue Load Balancer 600 seconds until timeout instead of the default 60.
4. Save and restart the Hue Load Balancer.
5. Export the results to excel again or rerun the Hive query from Hue UI.

Hue operations randomly fail and display a 502 error

Hue operations randomly fail.

Affected Versions: CDH 5.12.x, 5.13.0

Fixed in Versions: 5.14.0

Workaround: Make configuration changes to the Hue Load Balancer:

1. Find the Hue Load Balancer host by selecting **Host > All Host** and search for "Hue Load Balancer"
2. Navigate to the following directory on the Hue Load Balancer host: `/usr/share/cmf/hue/httpd/`.
3. Edit the `httpd.conf` file and add the following property after the `ProxyPass` property: `SetEnv proxy-initial-not-pooled 1`.

4. Inside the `<IfDefine Cloudera_HTTPD_USE_SSL>` block under the `SSLProtocol` property line, add the following properties:

```
SSLProxyProtocol all -SSLv2 -SSLv3
SSLCipherSuite
```

Cloudera Bug: CDH-57588

Hue does not start with MySQL and Ubuntu 12.04

In Ubuntu 12.04, the pip script file, `/usr/lib/python2.7/dist-packages/pkg_resources.py`, is unable to resolve required packages.

Affected Versions: All CDH 5 versions.

Cloudera Bug: CDH-54615

Fixed in Versions: No fix is planned. Recommend upgrading from Ubuntu 12.04

Workaround:

1. Log on to Cloudera Manager and go to **Hue > Configuration**.
2. Search for and set **Hue Service Advanced Configuration Snippet (Safety Valve) for hue_safety_valve.ini**:
`PYTHONPATH=/opt/cloudera/parcels/CDH/lib/hue/build/env/lib/python2.7/site-packages`
3. Click **Save Changes** and restart Hue.

Hue Load Balancer with TLS fails on peer Cloudera Navigator validation

The Hue load balancer may fail with TLS enabled and Apache HTTPD 2.4 or higher.

Affected Versions: CDH 5.11.0 and lower

Cloudera Bug: CDH-51352

Workaround:

1. Log on to Cloudera Manager and go to **Hue > Configuration**.
2. Search for and set **Load Balancer Advanced Configuration Snippet (Safety Valve) for httpd.conf**:

```
ProxyPreserveHost Off
```

3. Search for and set **Hue Service Advanced Configuration Snippet (Safety Valve) for hue_safety_valve.ini**:

```
[desktop]
use_x_forwarded_host=true
```

4. Click **Save Changes** and restart Hue.

HTTPD 2.4 breaks Hue high availability with SSLProxyPeerCN on

In HTTPD 2.2 and earlier versions, `SSLProxyPeerCN` is off. In HTTPD 2.4, `SSLProxyPeerCN` is turned on. This breaks Hue high availability and throws a proxy error.

Affected Versions: CDH 5.11.0 only

Workaround: Disable `SSLProxyCheckPeerCN` and `SSLProxyCheckPeerName` in `httpd.conf`:

1. Log on to Cloudera Manager and go to **Hue > Configuration**.
2. Search for **Load Balancer Advanced Configuration Snippet (Safety Valve) for httpd.conf**.
3. Disable proxy peer checks by entering:

```
SSLProxyCheckPeerCN off
SSLProxyCheckPeerName off
```

4. Click **Save changes** and restart Hue.

Icons Stop Rendering in IE11 Browser with HTTPS

When you use the back button in IE11 with https, some Hue graphics stop rendering. Add a load balancer to resolve.

Affected Versions: All CDH 5.x versions.

Cloudera Bug: CDH-52950

Workaround: Add a Hue Load Balancer:

1. Log on to Cloudera Manager and click **Hue**.
2. Select **Actions > Add Role Instances**.
3. Click **Select hosts** in the field under **Load Balancer**.
4. Select a host and click **OK**.
5. Check the Load Balancer box and select **Actions for Selected > Start > Start**.
6. Click **Save Changes** and restart Hue.

Hue does not support the Spark App

Hue does not currently support the Spark application.

Apache Impala Known Issues

The following sections describe known issues and workarounds in Impala, as of the current production release. This page summarizes the most serious or frequently encountered issues in the current release, to help you make planning decisions about installing and upgrading. Any workarounds are listed here. The bug links take you to the Impala issues site, where you can see the diagnosis and whether a fix is in the pipeline.

Note: The online issue tracking system for Impala contains comprehensive information and is updated in real time. To verify whether an issue you are experiencing has already been reported, or which release an issue is fixed in, search on the [Impala JIRA tracker](#).

For issues fixed in various Impala releases, see [Fixed Issues in Apache Impala](#) on page 2384.

Impala/Sentry security roles mismatch after Catalog Server restart

This issue occurs when Impala's Catalog Server is restarted without also restarting all the Impala Daemons.

Impala uses generated numeric identifiers for roles. These identifiers are regenerated during catalogd restarts, and the same role can get a different identifier, possibly used by a different role before restart. An impalad's metadata cache can contain old id + role pairs, and when it is updated with privileges with new role ids from the catalog, the privilege will be added to the wrong role; the one that previously had the same role id.

Products affected: Apache Impala

Releases affected:

- CDH 5.14.4 and all prior releases

Users affected: Impala users with authorization enabled.

Date/time of detection: 5th October, 2018

Severity (Low/Medium/High): 3.8 "Low"; [CVSS](#):3.0/AV:N/AC:H/PR:H/UI:R/S:U/C:L/I:L/A:L

Impact: Users may get privileges of unrelated users.

CVE: CVE-2019-16381

Immediate action required: Update to a version of CDH containing the fix.

Addressed in release/refresh/patch: CDH 5.15.0

Knowledge article: For the latest update on this issue see the corresponding Knowledge article: [TSB 2020-348: Impala/Sentry security roles mismatch after Catalog Server restart](#)

Timestamp type-casted to varchar in a binary predicate can produce incorrect result

In an Impala query the timestamp can be type-casted to a varchar of smaller length to convert a timestamp value to a date string. However, if such Impala query is used in a binary comparison against a string literal, it can produce incorrect results, because of a bug in the expression rewriting code. The following is an example of this:

```
> select * from (select cast('2018-12-11 09:59:37' as timestamp) as ts) tbl where cast(ts as varchar(10)) = '2018-12-11';
```

The output will have 0 rows.

Products affected: Apache Impala

Releases affected:

- CDH 5.15.0, 5.15.1, 5.15.2, 5.16.0, 5.16.1
- CDH 6.0.0, 6.0.1, 6.1.0, 6.1.1

For the latest update on this issue see the corresponding Knowledge article: [TSB 2019-358: Timestamp type-casted to varchar in a binary predicate can produce incorrect result](#)

XSS Cloudera Manager

Malicious Impala queries can result in Cross Site Scripting (XSS) when viewed in Cloudera Manager.

Products affected: Apache Impala

Releases affected:

- Cloudera Manager 5.13.x, 5.14.x, 5.15.1, 5.15.2, 5.16.1
- Cloudera Manager 6.0.0, 6.0.1, 6.1.0

Users affected: All Cloudera Manager Users

Date/time of detection: November 2018

Severity (Low/Medium/High): High

Impact: When a malicious user generates a piece of JavaScript in the impala-shell and then goes to the Queries tab of the Impala service in Cloudera Manager, that piece of JavaScript code gets evaluated, resulting in an XSS.

CVE: CVE-2019-14449

Immediate action required: There is no workaround, upgrade to the latest available maintenance release.

Addressed in release/refresh/patch:

- Cloudera Manager 5.16.2
- Cloudera Manager 6.0.2, 6.1.1, 6.2.0, 6.3.0

Impala Known Issues: Startup

These issues can prevent one or more Impala-related daemons from starting properly.

Problem retrieving FQDN causes startup problem on kerberized clusters

The method Impala uses to retrieve the host name while constructing the Kerberos principal is the `gethostname()` system call. This function might not always return the fully qualified domain name, depending on the network configuration. If the daemons cannot determine the FQDN, Impala does not start on a kerberized cluster.

This problem might occur immediately after an upgrade of a CDH cluster, due to changes in Cloudera Manager that supplies the `--hostname` flag automatically to the Impala-related daemons. (See the issue “hostname parameter is not passed to Impala catalog role” at [the Cloudera Manager Known Issues page](#).)

Bugs: [IMPALA-4978](#), [IMPALA-5253](#)

Severity: High

Resolution: The issue is expected to occur less frequently on systems with fixes for [IMPALA-4978](#), [IMPALA-5253](#), or both. Even on systems with fixes for both of these issues, the workaround might still be required in some cases.

Workaround: Test if a host is affected by checking whether the output of the `hostname` command includes the FQDN. On hosts where `hostname` only returns the short name, pass the command-line flag `--hostname=fully_qualified_domain_name` in the startup options of all Impala-related daemons.

Impala Known Issues: Crashes and Hangs

These issues can cause Impala to quit or become unresponsive.

Unable to view large catalog objects in catalogd Web UI

In `catalogd` Web UI, you can list metadata objects and view their details. These details are accessed via a link and printed to a string formatted using thrift's `DebugProtocol`. Printing large objects (> 1 GB) in Web UI can crash `catalogd`.

Bug: [IMPALA-6841](#)

Crash when querying tables with "\0" as a row delimiter

When querying a textfile-based Impala table that uses `\0` as a new line separator, Impala crashes.

The following sequence causes `impalad` to crash:

```
create table tab_separated(id bigint, s string, n int, t timestamp, b boolean)
  row format delimited
  fields terminated by '\t' escaped by '\\' lines terminated by '\000'
  stored as textfile;
select * from tab_separated; -- Done. 0 results.
insert into tab_separated (id, s) values (100, ''); -- Success.
select * from tab_separated; -- 20 second delay before getting "Cancelled due to unreachable
  impalad(s): xxxx:22000"
```

Bug: [IMPALA-6389](#)

Workaround: Use an alternative delimiter, e.g. `\001`.

Resolution: Fixed in Impala 2.13 and higher.

Altering Kudu table schema outside of Impala may result in crash on read

Creating a table in Impala, changing the column schema outside of Impala, and then reading again in Impala may result in a crash. Neither Impala nor the Kudu client validates the schema immediately before reading, so Impala may attempt to dereference pointers that aren't there. This happens if a string column is dropped and then a new, non-string column is added with the old string column's name.

Bug: [IMPALA-4828](#)

Severity: High

Workaround: Run the statement `REFRESH table_name` after any occasion when the table structure, such as the number, names, and data types of columns, are modified outside of Impala using the Kudu API.

Resolution: Fixed in CDH 5.12 / Impala 2.9 and higher.

Queries that take a long time to plan can cause webserver to block other queries

Trying to get the details of a query through the debug web page while the query is planning will block new queries that had not started when the web page was requested. The web UI becomes unresponsive until the planning phase is finished.

Bug: [IMPALA-1972](#)

Severity: High

Resolution: Fixed in CDH 5.12 / Impala 2.9 and higher.

Linking IR UDF module to main module crashes Impala

A UDF compiled as an LLVM module (.ll) could cause a crash when executed.

Bug: [IMPALA-4595](#)

Severity: High

Resolution: Fixed in CDH 5.10 / Impala 2.8 and higher.

Workaround: Compile the external UDFs to a .so library instead of a .ll IR module.

Secure Impala-Kudu clusters need to be restarted frequently

Due to KUDU-2264, secure, long-running Impala clusters on CDH 5.13.x and later will be unable to interact with Kudu tables after some time because the Kudu client used by Impala will no longer be able to authenticate with Kudu. The problem starts after the client's ticket can no longer be renewed, which is typically after 7 days. Restarting the Impala service will allow Impala to work with Kudu again.

Impala will begin failing to read or write Kudu tables with errors in the Impala daemon logs resembling:

```

Products Affected: Impala

Releases Affected: CDH 5.13.0, CDH 5.13.1, and CDH 5.14.0

Users Affected: Users running a secure cluster with Impala and Kudu.

Severity: Medium

Impact: Impala will not be able to query or write to Kudu tables until the service is restarted. The Impala service will need to be restarted periodically in order to continue being able to work with Kudu tables.

Immediate action required: To work around the issue, users can restart the Impala service at least once per ticket renewal period. This period is typically 7 days.

Resolution: Addressed in CDH 5.13.2, CDH 5.13.3, and CDH 5.14.2

Setting BATCH_SIZE query option too large can cause a crash

Using a value in the millions for the BATCH_SIZE query option, together with wide rows or large string values in columns, could cause a memory allocation of more than 2 GB resulting in a crash.

Bug: [IMPALA-3069](#)

Severity: High

Resolution: Fixed in CDH 5.9 / Impala 2.7 and higher.

Impala should not crash for invalid avro serialized data

Malformed Avro data, such as out-of-bounds integers or values in the wrong format, could cause a crash when queried.

Bug: [IMPALA-3441](#)

Severity: High

Resolution: Fixed in CDH 5.9.0 / Impala 2.7.0 and CDH 5.8.2 / Impala 2.6.2.

Queries may hang on server-to-server exchange errors

The `DataStreamSender::Channel::CloseInternal()` does not close the channel on an error. This causes the node on the other side of the channel to wait indefinitely, causing a hang.

Bug: [IMPALA-2592](#)

Resolution: Fixed in CDH 5.7.0 / Impala 2.5.0.

Impalad is crashing if udf jar is not available in hdfs location for first time

If the JAR file corresponding to a Java UDF is removed from HDFS after the Impala `CREATE FUNCTION` statement is issued, the `impalad` daemon crashes.

Bug: [IMPALA-2365](#)

Resolution: Fixed in CDH 5.7.0 / Impala 2.5.0.

Impala Known Issues: Performance

These issues involve the performance of operations such as queries or DDL statements.

Metadata operations block read-only operations on unrelated tables

Metadata operations that change the state of a table, like `COMPUTE STATS` or `ALTER RECOVER PARTITIONS`, may delay metadata propagation of unrelated unloaded tables triggered by statements like `DESCRIBE` or `SELECT` queries.

Bug: [IMPALA-6671](#)

Profile timers not updated during long-running sort

If you have a query plan with a long-running sort operation, e.g. minutes, the profile timers are not updated to reflect the time spent in the sort until the sort starts returning rows.

Bug: [IMPALA-5200](#)

Workaround: Slow sorts can be identified by looking at "Peak Mem" in the summary or "PeakMemoryUsage" in the profile. If a sort is consuming multiple GB of memory per host, it will likely spend a significant amount of time sorting the data.

Slow queries for Parquet tables with `convert_legacy_hive_parquet_utc_timestamps=true`

The configuration setting `convert_legacy_hive_parquet_utc_timestamps=true` uses an underlying function that can be a bottleneck on high volume, highly concurrent queries due to the use of a global lock while loading time zone information. This bottleneck can cause slowness when querying Parquet tables, up to 30x for scan-heavy queries. The amount of slowdown depends on factors such as the number of cores and number of threads involved in the query.

Note:

The slowdown only occurs when accessing `TIMESTAMP` columns within Parquet files that were generated by Hive, and therefore require the on-the-fly timezone conversion processing.

Bug: [IMPALA-3316](#)

Severity: High

Workaround: Store the `TIMESTAMP` values as strings in one of the following formats:

- `yyyy-MM-dd`
- `yyyy-MM-dd HH:mm:ss`
- `yyyy-MM-dd HH:mm:ss.SSSSSSSS`

The date can have the 1-9 digits in the fractional part.

Impala implicitly converts such string values to `TIMESTAMP` in calls to date/time functions.

Slow DDL statements for tables with large number of partitions

DDL statements for tables with a large number of partitions might be slow.

Bug: [IMPALA-1480](#)

Workaround: Run the DDL statement in Hive if the slowness is an issue.

Resolution: Fixed in CDH 5.7.0 / Impala 2.5.0.

Interaction of File Handle Cache with HDFS Appends and Short-Circuit Reads

If a data file used by Impala is being continuously appended or overwritten in place by an HDFS mechanism, such as `hdfs dfs -appendToFile`, interaction with the file handle caching feature in CDH 5.13 / Impala 2.10 and higher could cause short-circuit reads to sometimes be disabled on some DataNodes. When a mismatch is detected between the cached file handle and a data block that was rewritten because of an append, short-circuit reads are turned off on the affected host for a 10-minute period.

The possibility of encountering such an issue is the reason why the file handle caching feature is currently turned off by default. See [Scalability Considerations for NameNode Traffic with File Handle Caching](#) for information about this feature and how to enable it.

Bug: [HDFS-12528](#)

Severity: High

Workaround: Verify whether your ETL process is susceptible to this issue before enabling the file handle caching feature. You can set the `impalad` configuration option `unused_file_handle_timeout_sec` to a time period that is shorter than the HDFS setting `dfs.client.read.shortcircuit.streams.cache.expiry.ms`. (Keep in mind that the HDFS setting is in milliseconds while the Impala setting is in seconds.)

Resolution: Fixed in HDFS 2.10 and higher. Use the new HDFS parameter `dfs.domain.socket.disable.interval.seconds` to specify the amount of time that short circuit reads are disabled on encountering an error. The default value is 10 minutes (600 seconds). It is recommended that you set `dfs.domain.socket.disable.interval.seconds` to a small value, such as 1 second, when using the file handle cache. Setting `dfs.domain.socket.disable.interval.seconds` to 0 is not recommended as a non-zero interval protects the system if there is a persistent problem with short circuit reads.

Impala Known Issues: Usability

These issues affect the convenience of interacting directly with Impala, typically through the Impala shell or Hue.

[Impala shell tarball is not usable on systems with setuptools versions where '0.7' is a substring of the full version string](#)

For example, this issue could occur on a system using setuptools version 20.7.0.

Bug: [IMPALA-4570](#)

Severity: High

Resolution: Fixed in CDH 5.10 / Impala 2.8 and higher.

Workaround: Change to a setuptools version that does not have 0.7 as a substring.

Unexpected privileges in show output

Due to a timing condition in updating cached policy data from Sentry, the `SHOW` statements for Sentry roles could sometimes display out-of-date role settings. Because Impala rechecks authorization for each SQL statement, this discrepancy does not represent a security issue for other statements.

Bug: [IMPALA-3133](#)

Severity: High

Resolution: Fixed in CDH 5.8.0 / Impala 2.6.0 and CDH 5.7.1 / Impala 2.5.1.

Less than 100% progress on completed simple SELECT queries

Simple `SELECT` queries show less than 100% progress even though they are already completed.

Bug: [IMPALA-1776](#)

Unexpected column overflow behavior with INT datatypes

Impala does not return column overflows as `NULL`, so that customers can distinguish between `NULL` data and overflow conditions similar to how they do so with traditional database systems. Impala returns the largest or smallest value in the range for the type. For example, valid values for a `tinyint` range from -128 to 127. In Impala, a `tinyint` with a value of -200 returns -128 rather than `NULL`. A `tinyint` with a value of 200 returns 127.

Bug: [IMPALA-3123](#)

Resolution: Fixed in CDH 5.8.0 and higher / Impala 2.6.0

Impala Known Issues: JDBC and ODBC Drivers

These issues affect applications that use the JDBC or ODBC APIs, such as business intelligence tools or custom-written applications in languages such as Java or C++.

ImpalaODBC: Can not get the value in the `SQLGetData(m-x th column)` after the `SQLBindCol(m th column)`

If the ODBC `SQLGetData` is called on a series of columns, the function calls must follow the same order as the columns. For example, if data is fetched from column 2 then column 1, the `SQLGetData` call for column 1 returns `NULL`.

Bug: [IMPALA-1792](#)

Workaround: Fetch columns in the same order they are defined in the table.

Impala Known Issues: Security

These issues are related to security features, such as Kerberos authentication, Sentry authorization, encryption, auditing, and redaction.

Missing authorization in Apache Impala may allow data injection

A malicious user who is authenticated with Kerberos may have unauthorized access to internal services used by Impala to transfer intermediate data during query execution. If details of a running query (e.g. query ID, query plan) are available, a user can craft some RPC requests with custom software to inject data into a running query or end query execution prematurely, leading to wrong results of the query.

Products affected: Apache Impala

Releases affected: CDH 5.15.0, CDH 5.15.1

Users affected: Any users of Impala who have configured Kerberos security

Date/time of detection: Aug 21, 2018

Detected by: Cloudera, Inc.

Severity (Low/Medium/High): 4.5 "Medium";

CVSS: 3.0/AV:A/AC:H/PR:L/UI:R/S:U/C:N/I:H/A:N/E:P/RL:T/RC:C/IR:H/MAV:A/MAC:H/MPR:L/MUI:R

Impact: Data injection may lead to wrong results of queries.

CVE: CVE-2018-11785

Immediate action required: Upgrade to a version which contains the fix or as a workaround, disable KRPC by setting `--use_krpc=false` in the **Impala Command Line Argument Advanced Configuration Snippet (Safety Valve)**. The workaround will disable some improvements in stability and performance implemented in CDH 5.15.0 for highly concurrent workloads.

Addressed in release/refresh/patch: CDH 5.15.2, CDH 5.16.1 and higher

Impala does not support Heimdal Kerberos

Heimdal Kerberos is not supported in Impala.

Bug: [IMPALA-7072](#)

Affected Versions: All versions of Impala

Transient kerberos authentication error during table loading

A transient Kerberos error can cause a table to get into a bad state with an error: Failed to load metadata for table.

Bug: [IMPALA-4712](#)

Severity: High

Workaround: Resolve the Kerberos authentication problem and run `INVALIDATE METADATA` on the affected table.

In Impala with Sentry enabled, `REVOKE ALL ON SERVER` does not remove the privileges granted with the `GRANT` option

If you grant a role the `ALL` privilege at the `SERVER` scope with the `WITH GRANT OPTION` clause, you cannot revoke the privilege. Although the `SHOW GRANT ROLE` command will show that the privilege has been revoked immediately after you run the command, the `ALL` privilege will reappear when you run the `SHOW GRANT ROLE` command after Sentry refreshes.

Immediate Action Required: Once the privilege has been granted, the only way to remove it is to delete the role.

Affected Versions: CDH 6.0.0, CDH 6.0.1, CDH 5.15.0, CDH 5.15.1, CDH 5.14.x and all prior releases

Fixed Versions: CDH 5.16.1, CDH 5.15.2

Cloudera Issue: TSB-341

Malicious user can gain unauthorized access to Kudu table data via Impala

A malicious user with `ALTER` permissions on an Impala table can access any other Kudu table data by altering the table properties to make it “external” and then changing the underlying table mapping to point to other Kudu tables. This violates and works around the authorization requirement that creating a Kudu external table via Impala requires an `ALL` privilege at the server scope. This privilege requirement for `CREATE` commands is enforced to precisely avoid this scenario where a malicious user can change the underlying Kudu table mapping. The fix is to enforce the same privilege requirement for `ALTER` commands that would make existing non-external Kudu tables external.

Bug: [IMPALA-5638](#)

Severity: High

Workaround: A temporary workaround is to revoke `ALTER` permissions on Impala tables.

Resolution: Fixed in CDH 5.11.2 / Impala 2.10 and higher

Catalog server's kerberos ticket gets deleted after 'ticket_lifetime' on SLES11

On SLES11, after 'ticket_lifetime', the kerberos ticket gets deleted by the Java krb5 library.

Bug: [IMPALA-6726](#)

Severity: High

Workaround: On Impala 2.11.0, set `--use_kudu_kinit=false` in Impala startup flag.

On Impala 2.12.0, set `--use_kudu_kinit=false` and `--use_krpc=false` in Impala startup flags.

Kerberos tickets must be renewable

In a Kerberos environment, the `impalad` daemon might not start if Kerberos tickets are not renewable.

Workaround: Configure your KDC to allow tickets to be renewed, and configure `krb5.conf` to request renewable tickets.

Impala does not allow the use of insecure clusters with public IPs

Starting in CDH 5.15 / Impala 2.12, Impala, by default, will only allow unencrypted or unauthenticated connections from trusted subnets: `127.0.0.0/8`, `10.0.0.0/8`, `172.16.0.0/12`, `192.168.0.0/16`, `169.254.0.0/16`.

Unencrypted or unauthenticated connections from publicly routable IPs will be rejected.

The trusted subnets can be configured using the `--trusted_subnets` flag. Set it to `'0.0.0.0/0'` to allow unauthenticated connections from all remote IP addresses. However, if network access is not otherwise restricted by a firewall, malicious users may be able to gain unauthorized access.

Impala user not added to `/etc/passwd` when LDAP is enabled

When using Impala with LDAP enabled, a user may hit the following:

```
Not authorized: Client connection negotiation failed: client connection to 127.0.0.1:27000:
SASL(-1): generic failure: All-whitespace username.
```

The following sequence can lead to the `impala` user not being created in `/etc/passwd` on some machines on the cluster.

- Time 1: The `impala` user is not in LDAP. Impala was installed on machine 1, and the user `impala` is created in `/etc/passwd`.
- Time 2: The `impala` user is added to LDAP.
- Time 3: A new machine is added to the cluster. When adding Impala service to this new machine, adding the `impala` user will fail as it already exists in LDAP.

The consequence is that the `impala` user doesn't exist in `/etc/passwd` on the new machine, leading to the error above.

Workaround: Manually edit `/etc/passwd` to add the `impala` user

Bug: [IMPALA-7585](#)

Affected Versions: CDH 5.15

Fixed Version: CDH 5.15.2, CDH 6.1

Kerberos authentication fails with the reverse DNS lookup disabled

Kerberos authentication does not function correctly if `rdns = false` is configured in `krb5.conf`. If the flag `rdns = false`, when Impala tries to match principals, it will fail because Kerberos receives a SPN (Service Principal Name) with an IP address in it, but Impala expects a principal with a FQDN in it.

Bug: [IMPALA-7298](#)

Affected Versions: CDH 5.15

Workaround: Set the following flags in `krb5.conf`:

- `dns_canonicalize_hostname = true`
- `rdns = true`

Fixed Version: CDH 5.15.1

System-wide `auth_to_local` mapping not applied correctly to Kudu service account

Due to system `auth_to_local` mapping, the principal may be mapped to some local name.

When running with Kerberos enabled, you may hit the following error message where `<random-string>` is some random string which doesn't match the primary in the Kerberos principal.

```
WARNINGS: TransmitData() to X.X.X.X:27000 failed: Remote error: Not authorized:
{username='<random-string>', principal='impala/redacted'} is not allowed to access
DataStreamService
```

Bug: [KUDU-2198](#)

Affected Versions: CDH 5.15 and higher

Workaround: Start Impala with the `--use_system_auth_to_local=false` flag to ignore the system-wide `auth_to_local` mappings configured in `/etc/krb5.conf`.

Kudu client in Impala FE doesn't renew/reacquire Kerberos tickets

When using Kudu with Impala on a secure cluster, the Kerberos ticket used by Kudu can expire even though the ticket used by Impala is renewed. Impala is then unable to access Kudu until the `impalad` daemon is restarted.

Cloudera Bug: CDH-63934

Affected versions: CDH 5.13.0, CDH 5.13.1

Severity: High

Workaround: Set a very long Kerberos ticket lifetime, for example 1 year.

Resolution: Upgrade to CDH 5.13.2 or higher.

Authorization error for SHOW CREATE VIEW

The `SHOW CREATE VIEW` statement returns an authorization error when the view references built-in functions.

Bug: [IMPALA-7325](#)

Affected Versions: CDH 5.15.1 and lower

Workaround: Execute following statement from Impala as an admin user. *role* refers to the role of the user who needs to execute the `SHOW CREATE VIEW` statement.

```
GRANT SELECT ON DATABASE `_impala_builtins` TO role;
```

Resolution: Fixed in CDH 5.16.1 and higher.

Impala Known Issues: Resources

These issues involve memory or disk usage, including out-of-memory conditions, the spill-to-disk feature, and resource management features.

Handling large rows during upgrade to CDH 5.13 / Impala 2.10 or higher

After an upgrade to CDH 5.13 / Impala 2.10 or higher, users who process very large column values (long strings), or have increased the `--read_size` configuration setting from its default of 8 MB, might encounter capacity errors for some queries that previously worked.

Bug: [IMPALA-6028](#)

Severity: High

Resolution: After the upgrade, follow the instructions in [Handling Large Rows During Upgrade to CDH 5.13 / Impala 2.10 or Higher](#) to check if your queries are affected by these changes and to modify your configuration settings if so.

Configuration to prevent crashes caused by thread resource limits

Impala could encounter a serious error due to resource usage under very high concurrency. The error message is similar to:

```
F0629 08:20:02.956413 29088 llvm-codegen.cc:111] LLVM hit fatal error: Unable to allocate
section memory!
terminate called after throwing an instance of
'boost::exception_detail::clone_impl<boost::exception_detail::error_info_injector<boost::thread_resource_error>
>'
```

Bug: [IMPALA-5605](#)

Severity: High

Workaround:

In CDH 5.14 and lower versions, configure each host running an `impalad` daemon with the following settings:

```
echo 2000000 > /proc/sys/kernel/threads-max
echo 2000000 > /proc/sys/kernel/pid_max
echo 8000000 > /proc/sys/vm/max_map_count
```

In CDH 5.15 and higher versions, it is unlikely that you will hit the thread resource limit. Configure each host running an `impalad` daemon with the following setting:

```
echo 8000000 > /proc/sys/vm/max_map_count
```

To make the above settings durable, refer to your OS documentation. For example, on RHEL 6.x:

1. Add the following line to `/etc/sysctl.conf`:

```
vm.max_map_count=8000000
```

2. Run the following command:

```
sysctl -p
```

Memory usage when `compact_catalog_topic` flag enabled

The efficiency improvement from [IMPALA-4029](#) can cause an increase in size of the updates to Impala catalog metadata that are broadcast to the `impalad` daemons by the `statedored` daemon. The increase in catalog update topic size results in higher CPU and network utilization. By default, the increase in topic size is about 5-7%. If the `compact_catalog_topic` flag is used, the size increase is more substantial, with a topic size approximately twice as large as in previous versions.

Bug: [IMPALA-5500](#)

Severity: Medium

Workaround: Consider setting the `compact_catalog_topic` configuration setting to `false` until this issue is resolved.

Resolution: Fixed in CDH 5.12.1 and CDH 5.13.0 and higher / Impala 2.10

Kerberos initialization errors due to high memory usage

On a kerberized cluster with high memory utilization, `kinit` commands executed after every `'kerberos_reinit_interval'` may cause out-of-memory errors, because executing the command involves a fork of the Impala process. The error looks similar to the following:

```
Failed to obtain Kerberos ticket for principal: <varname>principal_details</varname>  
Failed to execute shell cmd: 'kinit -k -t <varname>keytab_details</varname>',  
error was: Error(12): Cannot allocate memory
```

Bug: [IMPALA-2294](#)

Severity: High

Workaround:

The following command changes the `vm.overcommit_memory` setting immediately on a running host. However, this setting is reset when the host is restarted.

```
echo 1 > /proc/sys/vm/overcommit_memory
```

To change the setting in a persistent way, add the following line to the `/etc/sysctl.conf` file:

```
vm.overcommit_memory=1
```

Then run `sysctl -p`. No reboot is needed.

Resolution: Fixed in CDH 5.14.0 and higher / Impala 2.11.0

DROP TABLE PURGE on S3A table may not delete externally written files

A `DROP TABLE PURGE` statement against an S3 table could leave the data files behind, if the table directory and the data files were created with a combination of `hadoop fs` and `aws s3` commands.

Bug: [IMPALA-3558](#)

Severity: High

Resolution: The underlying issue with the S3A connector depends on the resolution of [HADOOP-13230](#).

Impala catalogd heap issues when upgrading to 5.7

The default heap size for Impala `catalogd` has changed in CDH 5.7 / Impala 2.5 and higher:

- Before 5.7, by default `catalogd` was using the JVM's default heap size, which is the smaller of 1/4th of the physical memory or 32 GB.
- Starting with CDH 5.7.0, the default `catalogd` heap size is 4 GB.

For example, on a host with 128GB physical memory this will result in `catalogd` heap decreasing from 32GB to 4GB. This can result in out-of-memory errors in `catalogd` and leading to query failures.

Severity: High

Workaround: Increase the `catalogd` memory limit as follows.

For schemas with large numbers of tables, partitions, and data files, the `catalogd` daemon might encounter an out-of-memory error. To increase the memory limit for the `catalogd` daemon:

1. Check current memory usage for the `catalogd` daemon by running the following commands on the host where that daemon runs on your cluster:

```

jcmd catalogd_pid VM.flags
jmap -heap catalogd_pid

```

2. Decide on a large enough value for the `catalogd` heap.

- On systems managed by Cloudera Manager, include this value in the configuration field **Java Heap Size of Catalog Server in Bytes** (Cloudera Manager 5.7 and higher), or **Impala Catalog Server Environment Advanced Configuration Snippet (Safety Valve)** (prior to Cloudera Manager 5.7). Then restart the Impala service.
- On systems not managed by Cloudera Manager, put the `JAVA_TOOL_OPTIONS` environment variable setting into the startup script for the `catalogd` daemon, then restart the `catalogd` daemon.

For example, the following environment variable setting specifies the maximum heap size of 8 GB.

```
JAVA_TOOL_OPTIONS="-Xmx8g"
```

3. Use the same `jcmd` and `jmap` commands as earlier to verify that the new settings are in effect.

Breakpad minidumps can be very large when the thread count is high

The size of the breakpad minidump files grows linearly with the number of threads. By default, each thread adds 8 KB to the minidump size. Minidump files could consume significant disk space when the daemons have a high number of threads.

Bug: [IMPALA-3509](#)

Severity: High

Workaround: Add `--minidump_size_limit_hint_kb=size` to set a soft upper limit on the size of each minidump file. If the minidump file would exceed that limit, Impala reduces the amount of information for each thread from 8 KB to 2 KB. (Full thread information is captured for the first 20 threads, then 2 KB per thread after that.) The minidump file can still grow larger than the “hinted” size. For example, if you have 10,000 threads, the minidump file can be more than 20 MB.

Parquet scanner memory increase after IMPALA-2736

The initial release of CDH 5.8 / Impala 2.6 sometimes has a higher peak memory usage than in previous releases while reading Parquet files.

CDH 5.8 / Impala 2.6 addresses the issue IMPALA-2736, which improves the efficiency of Parquet scans by up to 2x. The faster scans may result in a higher peak memory consumption compared to earlier versions of Impala due to the new column-wise row materialization strategy. You are likely to experience higher memory consumption in any of the following scenarios:

- Very wide rows due to projecting many columns in a scan.
- Very large rows due to big column values, for example, long strings or nested collections with many items.
- Producer/consumer speed imbalances, leading to more rows being buffered between a scan (producer) and downstream (consumer) plan nodes.

Bug: [IMPALA-3662](#)

Severity: High

Workaround: The following query options might help to reduce memory consumption in the Parquet scanner:

- Reduce the number of scanner threads, for example: `set num_scanner_threads=30`
- Reduce the batch size, for example: `set batch_size=512`
- Increase the memory limit, for example: `set mem_limit=64g`

Resolution: Fixed in CDH 5.10 / Impala 2.8.

Process mem limit does not account for the JVM's memory usage

Some memory allocated by the JVM used internally by Impala is not counted against the memory limit for the `impalad` daemon.

Bug: [IMPALA-691](#)

Workaround: To monitor overall memory usage, use the `top` command, or add the memory figures in the Impala web UI `/memz` tab to JVM memory usage shown on the `/metrics` tab.

Fix issues with the legacy join and agg nodes using `--enable_partitioned_hash_join=false` and `--enable_partitioned_aggregation=false`

Bug: [IMPALA-2375](#)

Workaround: Transition away from the “old-style” join and aggregation mechanism if practical.

Resolution: Fixed in CDH 5.7.0 / Impala 2.5.0.

Impala Known Issues: Correctness

These issues can cause incorrect or unexpected results from queries. They typically only arise in very specific circumstances.

DECIMAL AVG() can return incorrect results in Impala

When both an `AVG()` over a `DECIMAL` value and a `DISTINCT` aggregate (for example, `COUNT(DISTINCT ...)`) appear in the same `SELECT` statement, the `DECIMAL AVG()` can return incorrect results.

Bug: [IMPALA-5251](#)

Severity: High

Releases affected: CDH 5.11.0 only

Immediate action required:

- If you use Impala and are not yet on CDH 5.11.0, wait for CDH 5.11.1 to upgrade.
- If you use Impala and are in process of upgrading to CDH 5.11.0, or must upgrade before CDH 5.11.1 becomes available, contact Cloudera Support to get a patch to avoid this issue.
- If you are on CDH 5.11.0 and use Impala, contact Cloudera Support to get a patch to avoid this issue.
- If you do not use Impala, you are not affected.

Resolution: Fixed in CDH 5.12.0 and higher / Impala 2.9.0

Parquet scanner memory bug: I/O buffer is attached to output batch while scratch batch rows still reference it

Impala queries may return incorrect results when scanning plain-encoded string columns in uncompressed Parquet files. I/O buffers holding the string data are prematurely freed, leading to invalid memory reads and possibly non-deterministic results. This does not affect Parquet files that use a compression codec such as Snappy. Snappy is both strongly recommended generally and the default choice for Impala-written Parquet files.

How to determine whether a query might be affected:

- The query must reference `STRING` columns from a Parquet table.
- A selective filter on the Parquet table makes this issue more likely.
- Identify any uncompressed Parquet files processed by the query. Examine the `HDFS_SCAN_NODE` portion of a query profile that scans the suspected table. Use a query that performs a full table scan, and materializes the column values. (For example, `SELECT MIN(colname) FROM tablename.`) Look for “File Formats”. A value containing `PARQUET/NONE` means uncompressed Parquet.
- Identify any plain-encoded string columns in the associated table. Pay special attention to tables containing Parquet files generated through Hive, Spark, or other mechanisms outside of Impala, because Impala uses Snappy compression by default for Parquet files. Use `parquet-tools` to dump the file metadata. Note that a column could have several encodings within the same file (the column data is stored in several column chunks). Look for `VLE:PLAIN` in the output of `parquet-tools`, which means the values are plain encoded.

Bug: [IMPALA-4539](#)

Severity: High

Resolution: Fixed in CDH 5.10.0 / Impala 2.8 and higher

Workaround: Use Snappy or another compression codec for Parquet files.

ABS(n) where n is the lowest bound for the int types returns negative values

If the `abs()` function evaluates a number that is right at the lower bound for an integer data type, the positive result cannot be represented in the same type, and the result is returned as a negative number. For example, `abs(-128)` returns `-128` because the argument is interpreted as a `TINYINT` and the return value is also a `TINYINT`.

Bug: [IMPALA-4513](#)

Severity: High

Resolution: Fixed in CDH 5.14.0 and higher / Impala 2.11.0

Workaround: Cast the integer value to a larger type. For example, rewrite `abs(tinyint_col)` as `abs(cast(tinyint_col as smallint))`.

Java udf expression returning string in group by can give incorrect results.

If the `GROUP BY` clause included a call to a Java UDF that returned a string value, the UDF could return an incorrect result.

Bug: [IMPALA-4266](#)

Severity: High

Resolution: Fixed in CDH 5.10 / Impala 2.8 and higher.

Workaround: Rewrite the expression to concatenate the results of the Java UDF with an empty string call. For example, rewrite `my_hive_udf()` as `concat(my_hive_udf(), '')`.

Incorrect assignment of NULL checking predicate through an outer join of a nested collection.

A query could return wrong results (too many or too few NULL values) if it referenced an outer-joined nested collection and also contained a null-checking predicate (`IS NULL`, `IS NOT NULL`, or the `<=>` operator) in the `WHERE` clause.

Bug: [IMPALA-3084](#)

Severity: High

Resolution: Fixed in CDH 5.9.0 / Impala 2.7.0.

Incorrect result due to constant evaluation in query with outer join

An `OUTER JOIN` query could omit some expected result rows due to a constant such as `FALSE` in another join clause. For example:

```
explain SELECT 1 FROM alltypestiny a1
  INNER JOIN alltypesagg a2 ON a1.smallint_col = a2.year AND false
  RIGHT JOIN alltypes a3 ON a1.year = a1.bigint_col;
```

Explain String
Estimated Per-Host Requirements: Memory=1.00KB VCores=1
00:EMPTYSET

Bug: [IMPALA-3094](#)

Severity: High

Workaround: None

Incorrect assignment of an inner join On-clause predicate through an outer join.

Impala might return incorrect results for queries that have the following properties:

- There is an `INNER JOIN` following a series of `OUTER JOINS`.
- The `INNER JOIN` has an `On`-clause with a predicate that references at least two tables that are on the nullable side of the preceding `OUTER JOINS`.

The following query demonstrates the issue:

```
select 1 from functional.alltypes a left outer join
  functional.alltypes b on a.id = b.id left outer join
  functional.alltypes c on b.id = c.id right outer join
  functional.alltypes d on c.id = d.id inner join functional.alltypes e
  on b.int_col = c.int_col;
```

The following listing shows the incorrect `EXPLAIN` plan:

Explain String
Estimated Per-Host Requirements: Memory=480.04MB VCores=4
14:EXCHANGE [UNPARTITIONED]
08:NESTED LOOP JOIN [CROSS JOIN, BROADCAST]

```

--13:EXCHANGE [BROADCAST]
|
| 04:SCAN HDFS [functional.alltypes e]
|   partitions=24/24 files=24 size=478.45KB
07:HASH JOIN [RIGHT OUTER JOIN, PARTITIONED]
|   hash predicates: c.id = d.id
|   runtime filters: RF000 <- d.id

```

Bug: [IMPALA-3126](#)

Severity: High

Resolution: Fixed in CDH 5.10.0 / Impala 2.8.0 and higher

Workaround: High

For some queries, this problem can be worked around by placing the problematic ON clause predicate in the WHERE clause instead, or changing the preceding OUTER JOINS to INNER JOINS (if the ON clause predicate would discard NULLs). For example, to fix the problematic query above:

```

select 1 from functional.alltypes a
  left outer join functional.alltypes b
    on a.id = b.id
  left outer join functional.alltypes c
    on b.id = c.id
  right outer join functional.alltypes d
    on c.id = d.id
  inner join functional.alltypes e
    where b.int_col = c.int_col

```

```

+-----+
| Explain String
+-----+

```

```

| Estimated Per-Host Requirements: Memory=480.04MB VCores=4
+-----+

```

```

```

Impala may use incorrect bit order with BIT_PACKED encoding

Parquet BIT_PACKED encoding as implemented by Impala is LSB first. The parquet standard says it is MSB first.

Bug: [IMPALA-3006](#)

Severity: High, but rare in practice because BIT_PACKED is infrequently used, is not written by Impala, and is deprecated in Parquet 2.0.

BST between 1972 and 1995

The calculation of start and end times for the BST (British Summer Time) time zone could be incorrect between 1972 and 1995. Between 1972 and 1995, BST began and ended at 02:00 GMT on the third Sunday in March (or second Sunday when Easter fell on the third) and fourth Sunday in October. For example, both function calls should return 13, but actually return 12, in a query such as:

```

select
  extract(from_utc_timestamp(cast('1970-01-01 12:00:00' as timestamp), 'Europe/London'),
    "hour") summer70start,
  extract(from_utc_timestamp(cast('1970-12-31 12:00:00' as timestamp), 'Europe/London'),
    "hour") summer70end;

```

Bug: [IMPALA-3082](#)

Severity: High

`parse_url()` returns incorrect result if `@` character in URL

If a URL contains an `@` character, the `parse_url()` function could return an incorrect value for the hostname field.

Bug: <https://issues.cloudera.org/browse/IMPALA-1170>IMPALA-1170

Resolution: Fixed in CDH 5.7.0 / Impala 2.5.0 and CDH 5.5.4 / Impala 2.3.4.

`%` escaping does not work correctly when occurs at the end in a `LIKE` clause

If the final character in the RHS argument of a `LIKE` operator is an escaped `\%` character, it does not match a `%` final character of the LHS argument.

Bug: [IMPALA-2422](#)

`ORDER BY rand()` does not work.

Because the value for `rand()` is computed early in a query, using an `ORDER BY` expression involving a call to `rand()` does not actually randomize the results.

Bug: [IMPALA-397](#)

Resolution: Fixed in CDH 5.12.0 / Impala 2.9.0

Wrong results with correlated `WHERE` clause subquery inside a `NULL`-checking conditional function

Impala may generate an incorrect plan, and therefore incorrect results, for queries that have a correlated scalar subquery as a parameter to a `NULL`-checking conditional function such as `isnull()`.

Bug: [IMPALA-4373](#)

Severity: High

Workaround: None

Cannot execute IR UDF when single node execution is enabled

A UDF compiled into an LLVM IR bitcode module (`.bc`) would have undefined effects when native code generation was turned off, for example when Impala applied the single-node optimization for small queries.

Bug: [IMPALA-4432](#)

Severity: High

Resolution: In CDH 5.10 / Impala 2.8 and higher, Impala returns an error if the UDF cannot run because of this issue.

Workaround: Turn native code generation back on with the query option setting `DISABLE_CODEGEN=0`.

Duplicated column in inline view causes dropping null slots during scan

If the same column is queried twice within a view, `NULL` values for that column are omitted. For example, the result of `COUNT(*)` on the view could be less than expected.

Bug: [IMPALA-2643](#)

Workaround: Avoid selecting the same column twice within an inline view.

Resolution: Fixed in CDH 5.7.0 / Impala 2.5.0, CDH 5.5.2 / Impala 2.3.2, and CDH 5.4.10 / Impala 2.2.10.

Incorrect assignment of predicates through an outer join in an inline view.

A query involving an `OUTER JOIN` clause where one of the table references is an inline view might apply predicates from the `ON` clause incorrectly.

Bug: [IMPALA-1459](#)

Resolution: Fixed in CDH 5.7.0 / Impala 2.5.0, CDH 5.5.2 / Impala 2.3.2, and CDH 5.4.9 / Impala 2.2.9.

Crash: `impala::Coordinator::ValidateCollectionSlots`

A query could encounter a serious error if includes multiple nested levels of `INNER JOIN` clauses involving subqueries.

Bug: [IMPALA-2603](#)

Incorrect assignment of On-clause predicate inside inline view with an outer join.

A query might return incorrect results due to wrong predicate assignment in the following scenario:

1. There is an inline view that contains an outer join
2. That inline view is joined with another table in the enclosing query block
3. That join has an On-clause containing a predicate that only references columns originating from the outer-joined tables inside the inline view

Bug: [IMPALA-2665](#)

Resolution: Fixed in CDH 5.7.0 / Impala 2.5.0, CDH 5.5.2 / Impala 2.3.2, and CDH 5.4.9 / Impala 2.2.9.

Wrong assignment of having clause predicate across outer join

In an `OUTER JOIN` query with a `HAVING` clause, the comparison from the `HAVING` clause might be applied at the wrong stage of query processing, leading to incorrect results.

Bug: [IMPALA-2144](#)

Resolution: Fixed in CDH 5.7.0 / Impala 2.5.0.

Wrong plan of NOT IN aggregate subquery when a constant is used in subquery predicate

A `NOT IN` operator with a subquery that calls an aggregate function, such as `NOT IN (SELECT SUM(...))`, could return incorrect results.

Bug: [IMPALA-2093](#)

Resolution: Fixed in CDH 5.7.0 / Impala 2.5.0 and CDH 5.5.4 / Impala 2.3.4.

Impala Known Issues: Metadata

These issues affect how Impala interacts with metadata. They cover areas such as the metastore database, the `COMPUTE STATS` statement, and the Impala `catalogd` daemon.

Concurrent catalog operations with heavy DDL workloads can cause queries with `SYNC_DDL` to fail fast

When Catalog Server is under a heavy load with concurrent catalog operations of long running DDLs, queries running with the `SYNC_DDL` query option can fail with the following message:

```
ERROR: CatalogException: Couldn't retrieve the catalog topic
version for the SYNC_DDL operation after 3 attempts.The operation has
been successfully executed but its effects may have not been
broadcast to all the coordinators.
```

The catalog operation is actually successful as the change has been committed to HMS and Catalog Server cache, but when Catalog Server notices a longer than expected time for it to broadcast the changes, it fails fast.

The coordinator daemons eventually sync up in the background.

Affected Versions: CDH versions from 5.15 to 6.1

Bug: [IMPALA-7961](#)

Resolution: Fixed in CDH 6.2.0 / Impala 3.2.

Catalogd may crash when loading metadata for tables with many partitions, many columns, and with incremental stats

Incremental stats use up about 400 bytes per partition for each column. For example, for a table with 20K partitions and 100 columns, the memory overhead from incremental statistics is about 800 MB. When serialized for transmission across the network, this metadata exceeds the 2 GB Java array size limit and leads to a `catalogd` crash.

Bugs: [IMPALA-2647](#), [IMPALA-2648](#), [IMPALA-2649](#)

Workaround: If feasible, compute full stats periodically and avoid computing incremental stats for that table. The scalability of incremental stats computation is a continuing work item.

Can't update stats manually via alter table after upgrading to CDH 5.2

Bug: [IMPALA-1420](#)

Workaround: On CDH 5.2, when adjusting table statistics manually by setting the `numRows`, you must also enable the Boolean property `STATS_GENERATED_VIA_STATS_TASK`. For example, use a statement like the following to set both properties with a single `ALTER TABLE` statement:

```
ALTER TABLE table_name SET TBLPROPERTIES('numRows'='new_value',
'STATS_GENERATED_VIA_STATS_TASK' = 'true');
```

Resolution: The underlying cause is the issue [HIVE-8648](#) that affects the metastore in Hive 0.13. The workaround is only needed until the fix for this issue is incorporated into a CDH release.

Impala Known Issues: Interoperability

These issues affect the ability to interchange data between Impala and other systems. They cover areas such as data types and file formats.

Queries Stuck on Failed HDFS Calls and not Timing out

In CDH 6.2 / Impala 3.2 and higher, if the following error appears multiple times in a short duration while running a query, it would mean that the connection between the `impalad` and the HDFS NameNode is in a bad state and hence the `impalad` would have to be restarted:

```
"hdfsOpenFile() for <filename> at backend <hostname:port> failed to finish before the
<hdfs_operation_timeout_sec> second timeout "
```

In CDH 6.1 / Impala 3.1 and lower, the same issue would cause Impala to wait for a long time or hang without showing the above error message.

Bug: [HADOOP-15720](#)

Affected Versions: All versions of Impala

Workaround: Restart the `impalad` in the bad state.

CREATE TABLE AS SELECT (CTAS) fails to write to HDFS

This issue can occur on clusters where HDFS NameNode high availability is enabled. The `CREATE TABLE AS SELECT` statement fails to open the HDFS file for writing. When this condition occurs an error is thrown in the Hue UI and logs that starts with "Failed to open HDFS file for writing:".

Severity: High

Workaround: To write data to HDFS on clusters where HDFS NameNode high availability is enabled, manually create and populate the table using the `CREATE TABLE` statement followed by `INSERT`.

DESCRIBE FORMATTED gives error on Avro table

This issue can occur either on old Avro tables (created prior to Hive 1.1 / CDH 5.4) or when changing the Avro schema file by adding or removing columns. Columns added to the schema file will not show up in the output of the `DESCRIBE FORMATTED` command. Removing columns from the schema file will trigger a `NullPointerException`.

As a workaround, you can use the output of `SHOW CREATE TABLE` to drop and recreate the table. This will populate the Hive metastore database with the correct column definitions.

**Warning:**

Only use this for external tables, or Impala will remove the data files. In case of an internal table, set it to external first:

```
ALTER TABLE table_name SET TBLPROPERTIES('EXTERNAL'='TRUE');
```

(The part in parentheses is case sensitive.) Make sure to pick the right choice between internal and external when recreating the table. See [Overview of Impala Tables](#) for the differences between internal and external tables.

Severity: High

Resolution: Fixed in CDH 5.8.2 and CDH 5.9.0 / Impala 2.6.2 and Impala 2.7.0

Avro Scanner fails to parse some schemas

The default value in Avro schema must match the first union type. For example, if the default value is `null`, then the first type in the `UNION` must be `"null"`.

Bug: [IMPALA-635](#)

Workaround: Swap the order of the fields in the schema specification. For example, use `["null", "string"]` instead of `["string", "null"]`. Note that the files written with the problematic schema must be rewritten with the new schema because Avro files have embedded schemas.

Impala BE cannot parse Avro schema that contains a trailing semi-colon

If an Avro table has a schema definition with a trailing semicolon, Impala encounters an error when the table is queried.

Bug: [IMPALA-1024](#)

Severity: Remove trailing semicolon from the Avro schema.

Fix decompressor to allow parsing gzips with multiple streams

Currently, Impala can only read gzipped files containing a single stream. If a gzipped file contains multiple concatenated streams, the Impala query only processes the data from the first stream.

Bug: [IMPALA-2154](#)

Workaround: Use a different gzip tool to compress file to a single stream file.

Resolution: Fixed in CDH 5.7.0 / Impala 2.5.0.

Impala incorrectly handles text data when the new line character `\n\r` is split between different HDFS block

If a carriage return / newline pair of characters in a text table is split between HDFS data blocks, Impala incorrectly processes the row following the `\n\r` pair twice.

Bug: [IMPALA-1578](#)

Workaround: Use the Parquet format for large volumes of data where practical.

Resolution: Fixed in CDH 5.8.0 / Impala 2.6.0.

Invalid bool value not reported as a scanner error

In some cases, an invalid `BOOLEAN` value read from a table does not produce a warning message about the bad value. The result is still `NULL` as expected. Therefore, this is not a query correctness issue, but it could lead to overlooking the presence of invalid data.

Bug: [IMPALA-1862](#)

Resolution: Fixed in CDH 5.10.0 and higher / Impala 2.8.0

Incorrect results with basic predicate on CHAR typed column.

When comparing a `CHAR` column value to a string literal, the literal value is not blank-padded and so the comparison might fail when it should match.

Bug: [IMPALA-1652](#)

Workaround: Use the `RPAD()` function to blank-pad literals compared with `CHAR` columns to the expected length.

Impala Known Issues: Limitations

These issues are current limitations of Impala that require evaluation as you plan how to integrate Impala into your data management workflow.

Set limits on size of expression trees

Very deeply nested expressions within queries can exceed internal Impala limits, leading to excessive memory usage.

Bug: [IMPALA-4551](#)

Severity: High

Workaround: Avoid queries with extremely large expression trees. Setting the query option `disable_codegen=true` may reduce the impact, at a cost of longer query runtime.

Hue and BDR require separate parameters for Impala Load Balancer

Cloudera Manager supports a single parameter for specifying the Impala Daemon Load Balancer. However, because BDR and Hue need to use different ports when connecting to the load balancer, it is not possible to configure the load balancer value so that BDR and Hue will work correctly in the same cluster.

Workaround: To configure BDR with Impala, use the load balancer configuration either without a port specification or with the Beeswax port.

To configure Hue, use the **Hue Server Advanced Configuration Snippet (Safety Valve) for `impalad_flags`** to specify the load balancer address with the `HiveServer2` port.

Affected Versions: CDH versions from 5.11 to 6.0

Bug: [OPSAPS-46641](#)

Impala Known Issues: Miscellaneous / Older Issues

These issues do not fall into one of the above categories or have not been categorized yet.

A failed CTAS does not drop the table if the insert fails.

If a `CREATE TABLE AS SELECT` operation successfully creates the target table but an error occurs while querying the source table or copying the data, the new table is left behind rather than being dropped.

Bug: [IMPALA-2005](#)

Workaround: Drop the new table manually after a failed `CREATE TABLE AS SELECT`.

Casting scenarios with invalid/inconsistent results

Using a `CAST()` function to convert large literal values to smaller types, or to convert special values such as `NaN` or `Inf`, produces values not consistent with other database systems. This could lead to unexpected results from queries.

Bug: [IMPALA-1821](#)

Support individual memory allocations larger than 1 GB

The largest single block of memory that Impala can allocate during a query is 1 GiB. Therefore, a query could fail or Impala could crash if a compressed text file resulted in more than 1 GiB of data in uncompressed form, or if a string function such as `group_concat()` returned a value greater than 1 GiB.

Bug: [IMPALA-1619](#)

Resolution: Fixed in CDH 5.9.0 / Impala 2.7.0 and CDH 5.8.3 / Impala 2.6.3.

Impala Parser issue when using fully qualified table names that start with a number.

A fully qualified table name starting with a number could cause a parsing error. In a name such as `db.571_market`, the decimal point followed by digits is interpreted as a floating-point number.

Bug: [IMPALA-941](#)

Workaround: Surround each part of the fully qualified name with backticks (```).

Impala should tolerate bad locale settings

If the `LC_*` environment variables specify an unsupported locale, Impala does not start.

Bug: [IMPALA-532](#)

Workaround: Add `LC_ALL="C"` to the environment settings for both the Impala daemon and the Statestore daemon. See [Modifying Impala Startup Options](#) for details about modifying these environment settings.

Resolution: Fixing this issue would require an upgrade to Boost 1.47 in the Impala distribution.

Log Level 3 Not Recommended for Impala

The extensive logging produced by log level 3 can cause serious performance overhead and capacity issues.

Workaround: Reduce the log level to its default value of 1, that is, `GLOG_v=1`. See [Setting Logging Levels](#) for details about the effects of setting different logging levels.

Cloudera Distribution of Apache Kafka Known Issues

Flume Kafka Client Incompatible Changes in CDH 5.8

After an upgrade to CDH 5.8, Flume throws an error on startup and stops processing Kafka messages. This is caused by an incompatible configuration change: upgrade of the Kafka client from 0.8.2 to 0.9.0 in CDH 5.8.

Additionally, Flume may skip some Kafka messages because Kafka offset storage moves from ZooKeeper to Kafka with the client change. Without knowing about the previous offsets stored in ZooKeeper, the Flume Kafka client assumes the most recent offset, skipping over the existing messages that have not yet been read.

Products affected: Flume

Releases affected: CDH 5.8.0, CDH 5.8.1

Users affected: Users who have Flume configured with a Kafka source or channel. Flume Kafka sinks are not affected.

Severity (Low/Medium/High): High

Impact: Potential loss of messages consumed by the Flume agent from Kafka source, or loss of events in the Flume Kafka channel after upgrade

Immediate action required: If you are upgrading from a version lower than CDH 5.7.0, upgrade to CDH 5.7.x first. The Flume Kafka client version in lower versions of CDH does not support the migration properties required in the Flume configuration.

If you are currently running CDH 5.7.x, upgrade to CDH 5.8.2 or CDH 5.9.0 to resolve this issue. If you are upgrading to CDH 5.8.0 or CDH 5.8.1, see the following documentation to perform the steps required for Flume before upgrading: http://www.cloudera.com/documentation/enterprise/latest/topics/cdh_58_upgrade_kafka_flume_note.html

Addressed in release/refresh/patch: CDH 5.8.2 and higher, CDH 5.9.0 and higher

Cloudera Bug: TSB-173

Workaround: See [Upgrading to CDH 5.8 When Using the Flume Kafka Client](#)

Cloudera Manager 5.12.1 Installs the Latest Version of CDK powered By Apache Kafka by Default

Installing Kafka through Cloudera Manager 5.12.1 installs the latest available version of CDK Powered By Apache Kafka by default.

Workaround: In Cloudera Manager, go to **Hosts > Parcels > Configuration** and change the appropriate remote parcel repository to a parcel repository that hosts the required version of CDK Powered by Apache Kafka. Once the parcel repository is set, install the correct version of CDK Powered by Apache Kafka from the parcel. For more information regarding parcel configuration and installation, see [Parcel Configuration Settings](#), and [Installing or Upgrading Kafka from a Parcel](#).

Affected Versions: CDH 5.12.1

Fixed Versions: 5.13.0

Cloudera Issue: OPSAPS-43222

Apache Kudu Known Issues

The following are known bugs and issues in Kudu. Note that this list is not exhaustive, and is meant to communicate only the most important known issues.

Kudu Masters unable to join back after a restart

In a multi master Kudu environment, if a master is restarted or goes offline for a few minutes, it can occasionally have trouble joining the cluster on startup. For example, if this happens in case of three kudu masters, and one of the other two masters is stopped or dies during this time, then the overall Kudu cluster is down because the majority of the masters are not running.

This issue is resolved by the [KUDU-2748](#) upstream JIRA.

Products affected: Apache Kudu

Affected version:

- CDH 5.14.0, 5.14.2, 5.14.4
- CDH 5.15.0, 5.15.1, 5.15.2
- CDH 5.16.1, 5.16.2
- CDH 6.0.0, 6.0.1
- CDH 6.1.0, 6.1.1
- CDH 6.2.0, 6.2.1

Fixed version:

- CDH 6.3.0

For the latest update on this issue see the corresponding Knowledge article: [TSB 2020-442: Kudu Masters unable to join back after a restart](#)

Inconsistent rows returned from queries in Kudu

Due to KUDU-2463, upon restarting Kudu, inconsistent rows may be returned from tables that have not recently been written to, resulting in any of the following:

- multiple rows for the same key being returned
- deleted data being returned
- inconsistent results consistently being returned for the same query

If this happens, you have two options to resolve the conflicts: write to the affected Kudu partitions by:

- re-deleting the known and deleted data
- upserting the most up-to-date version of affected rows.

Products affected: Apache Kudu

Releases affected:

- CDH 5.12.2, 5.13.3, 5.14.4, 5.15.1, 5.16.1
- CDH 6.0.1, 6.1.0, 6.1.1

For the latest update on this issue see the corresponding Knowledge article: [TSB 2019-353: Inconsistent rows returned from queries in Kudu](#)

CFile Checksum Failure Causes Query to Fail

When a CFile checksum fails, for example, due to a underlying disk corruption, queries against the replica will fail with an error message, such as this:

```
Unable to advance iterator: Corruption: checksum error on CFile block
```

Workaround: Remove the corrupted replica from the tablet's Raft configuration. See [Kudu Troubleshooting Guide](#) for the detailed steps.

Affected Versions: CDH 6.0.x and lower

Apache Issue: [KUDU-2469](#)

The Kudu CLI tool crashes before commencing cluster rebalancing

The Kudu CLI crashes when running the 'kudu cluster rebalance' sub-command on the following platforms:

- RHEL/CentOS 7
- Ubuntu14.04 LTS (Trusty)
- SLES12

Affected Versions: CDH 5.16.0, CDH 5.16.1

Workaround: Specify an additional run-time flag `--move_single_replicas=disabled` when running the `kudu cluster rebalance` command. Specifying that flag explicitly disables balancing of non-replicated tables.

NOTE: As a good practice, non-replicated tables should not be used in production Kudu clusters.

Addressed in releases: CDH 5.16.2

Crash due to CHECK failure during compactions: `pv_delete_redo != nullptr`

Due to [KUDU-2233](#), tablet servers might crash on restart with a fatal log message like the following:

```
F1201 14:55:37.052140 10508 compaction.cc:756] Check failed: pv_delete_redo != nullptr
*
**
*** Check failure stack trace: ***

@ 0x3ec36e893d (unknown)
@ 0x0 (unknown)}}
```

After this crash occurs, the affected tablet server requires a patch in order to start again.

This crash is much more likely to occur on workloads involving deleting and re-inserting the same rows repeatedly.

Although data loss has not been observed as a result of this issue, data loss or corruption is possible. The integrity of a Kudu cluster's data can be verified using a `ksck` checksum scan:

```
sudo -u kudu kudu cluster ksck -checksum_scan <master addresses>
```

Products affected: Kudu

Releases affected:

- CDH 5.12.0, 5.12.1, 5.12.2
- CDH 5.13.0, CDH 5.13.1, CDH 5.13.2
- CDH 5.14.0, 5.14.1

Users affected: All users running Kudu, but the risk is much greater for workloads that involve deleting and re-inserting rows repeatedly.

Severity: High

Impact: The affected tablet server will not be able to start until a patch is applied. Data loss or corruption is possible.

Immediate action required: Upgrade to a version containing a fix.

If this is not possible, raising the minimum number of log segments retained to 2 will make the problem very unlikely to occur. To do this, go to the configuration page for Kudu and add `--log_min_segments_to_retain=2` to the Kudu Service Advanced Configuration Snippet (Safety Valve) for `gflagfile` option.

If the issue still occurs, it's necessary to patch the affected tablet server or upgrade to a version containing a fix.

Once upgraded to a version containing a fix, the `--log_min_segments_to_retain` setting should be removed.

Addressed in release: CDH5.13.3, CDH5.14.2

[Partitions may be pruned incorrectly when range-partitioned on a primary key prefix](#)

Without the fix from [KUDU-2173](#), the Kudu C++ client's partition pruner may incorrectly prune a partition when evaluating certain queries containing predicates on both the range partition columns and other columns that are part of the primary key. This may cause queries to fail to return some matching rows.

Specifically, the pruner mistakenly treats a range partition which is a proper prefix of a primary key as an exclusive bound, when in fact it is an inclusive bound if the remaining primary key column constraints are greater than the minimum value.

For example, given a simple schema:

```
CREATE TABLE t (
  a INT NOT NULL,
  b INT NOT NULL,
  PRIMARY KEY (a,b)
) PARTITION BY RANGE(a) PARTITIONS (
  ...
)
```

With the following range partition:

```
RANGE (a) PARTITION VALUES >= 10
```

And the following query:

```
SELECT * FROM t WHERE a < 11 AND b < 11
```

The partition pruner would exclude the above partition, even though it contains rows like (10, 1). Instead, the partition pruner treats `>= 10` as `> 10`. This wouldn't be a problem if the range partition was on column (b) instead, since that is not a prefix of the primary key. The same applies for (a, b), since that is the whole primary key and not a prefix.

Products affected: Kudu

Releases affected:

- CDH 5.10.0, 5.10.1, 5.10.2
- CDH 5.11.0, 5.11.1, 5.11.2
- CDH 5.12.0, 5.12.1
- CDH 5.13.0

Users affected: Direct Kudu users via its C++ or Python client. Indirect users via Impala.

Severity (Low/Medium/High): High

Impact: Certain queries won't return all the available matching rows and no error message will be displayed.

Immediate action required: Assess if any tables are currently affected by this bug.

1. Download the tool at <https://www.cloudera.com/content/dam/www/Support/Downloads/tsb-257.tar.gz>.
2. Extract the tool:

```
tar xzvf tsb-257.tar.gz
```

Run it:

```
java -jar tsb-257-check-0.1.0.jar <master-addresses> [table-name]
```

3. Capture the output. Depending on the output:

- If no tables are affected, ensure no new table is created with range partitioning on a proper prefix of the primary key until a new version is available for upgrade.
- If at least one table is affected, contact Cloudera Support to understand the next steps.

Addressed in release/refresh/patch:

- CDH 5.12.2
- CDH 5.13.1
- CDH 5.14.0
- CDH 5.15.0

C++ Client Fails to Re-acquire Authentication Token in Multi-master Clusters

A security-related issue can cause Impala queries to start failing on busy clusters in the following scenario:

- The cluster runs with the `--rpc_authentication` set as `optional` or `required`. The default is `optional`. Secure clusters use `required`.
- The cluster is using multiple masters.
- Impala queries happen frequently enough that the leader master connection to some `impalad` isn't idle-closed (more than 1 query per 65 seconds).
- The connection stays alive for longer than the authentication token timeout (1 week by default).
- A master leadership change occurs after the authentication token expiration.

Impala queries will start failing with errors in the `impalad` logs like:

```
I0904 13:53:08.748968 95857 client-internal.cc:283] Unable to determine the new leader
Master: Not authorized: Client connection negotiation failed: client connection to
10.164.44.13:7051: FATAL_INVALID_AUTHENTICATION_TOKEN: Not authorized: authentication
token expired
I0904 13:53:10.389009 95861 status.cc:125] Unable to open Kudu table: Timed out:
GetTableSchema timed out after deadline expired
@ 0x95b1e9 impala::Status::Status()
@ 0xff22d4 impala::KuduScanNodeBase::Open()
@ 0xff101e impala::KuduScanNode::Open()
@ 0xb73ced impala::FragmentInstanceState::Open()
```

```
@ 0xb7532b impala::FragmentInstanceState::Exec()
@ 0xb64ae8 impala::QueryState::ExecInstance()
@ 0xd15193 impala::Thread::SuperviseThread()
@ 0xd158d4 boost::detail::thread_data<>::run()
@ 0x129188a (unknown)
@ 0x7f717ceade25 start_thread
@ 0x7f717cbdb34d __clone
```

Impala shell queries will fail with a message like:

```
Unable to open Kudu table: Timed out: GetTableSchema timed out after deadline expired
```

Workaround:

- Restart the affected Impala Daemons. Restarting a daemon ensures the problem will not reoccur for at least the authentication token lifetime, which defaults to one week.
- Increase the authentication token lifetime (`--authn_token_validity_seconds`). Beware that raising this lifetime increases the window of vulnerability of the cluster if a client is compromised. It is recommended that you keep the token lifetime at one month maximum for a secure cluster. For unsecured clusters, a longer token lifetime is acceptable, and a 3 month lifetime is recommended.

Affected Versions: From CDH 5.11 through CDH 6.0

Fixed Versions: CDH 5.15.2, CDH 5.16.1

Apache Issue: [KUDU-2580](#)

Timeout Possible with Log Force Synchronization Option

If the Kudu master is configured with the `-log_force_fsync_all` option, tablet servers and clients will experience frequent timeouts, and the cluster may become unusable.

Longer Startup Times with a Large Number of Tablets

If a tablet server has a very large number of tablets, it may take several minutes to start up. It is recommended to limit the number of tablets per server to 1000 or fewer. The maximum allowed number of tablets is 2000 per server. Consider this limitation when pre-splitting your tables. If you notice slow start-up times, you can monitor the number of tablets per server in the web UI.

Kerberos Authentication Issues

- Kerberos authentication does not function correctly on hosts which contain capital letters in their hostname.
- Kerberos authentication does not function correctly if `rdns = false` is configured in `krb5.conf`.

Memory Issue with Fault Tolerant Scans

Unlike regular scans, fault tolerant scans will allocate all required memory when the scan begins rather than as it progresses. This can be significant for big tablets. Moreover, this memory usage isn't counted towards the tablet server's overall memory limit, raising the likelihood of the tablet server being out-of-memory killed by the kernel.

Affected Versions: CDH 6.2 / Kudu 1.9 and lower

Apache Issue: [KUDU-2466](#)

Confusing Descriptions for Kudu TLS/SSL Settings in Cloudera Manager

Descriptions in the Cloudera Manager Admin Console for TLS/SSL settings are confusing, and will be replaced in a future release. The correct information about the settings is in the Usage Notes column:

Field	Usage Notes
Kerberos Principal	Set to the default principal, <code>kudu</code> .

Field	Usage Notes
Enable Secure Authentication And Encryption	Select this checkbox to enable authentication <i>and</i> RPC encryption between all Kudu clients and servers, as well as between individual servers. Only enable this property after you have configured Kerberos.
Master TLS/SSL Server Private Key File (PEM Format)	Set to the path containing the Kudu master host's private key (PEM-format). This is used to enable TLS/SSL encryption (over HTTPS) for browser-based connections to the Kudu master web UI.
Tablet Server TLS/SSL Server Private Key File (PEM Format)	Set to the path containing the Kudu tablet server host's private key (PEM-format). This is used to enable TLS/SSL encryption (over HTTPS) for browser-based connections to Kudu tablet server web UIs.
Master TLS/SSL Server Certificate File (PEM Format)	Set to the path containing the signed certificate (PEM-format) for the Kudu master host's private key (set in Master TLS/SSL Server Private Key File). The certificate file can be created by concatenating all the appropriate root and intermediate certificates required to verify trust.
Tablet Server TLS/SSL Server Certificate File (PEM Format)	Set to the path containing the signed certificate (PEM-format) for the Kudu tablet server host's private key (set in Tablet Server TLS/SSL Server Private Key File). The certificate file can be created by concatenating all the appropriate root and intermediate certificates required to verify trust.
Master TLS/SSL Server CA Certificate (PEM Format)	Disregard this field.
Tablet Server TLS/SSL Server CA Certificate (PEM Format)	Disregard this field.
Enable TLS/SSL for Master Server	Enables HTTPS encryption on the Kudu master web UI.
Enable TLS/SSL for Tablet Server	Enables HTTPS encryption on the Kudu tablet server web UIs.

Apache Mahout Known Issues

The Scala module with Mahout does not support Java 8

Cloudera Bug: CDH-31784

Workaround: None

Apache Oozie Known Issues

[Apache Oozie Server Vulnerability CVE-2017-15712](#)

A vulnerability in the Oozie Server allows a cluster user to read private files owned by the user running the Oozie Server process.

Products affected: Oozie

Releases affected: All releases prior to CDH 5.12.0, CDH 5.12.0, CDH 5.12.1, CDH 5.12.2, CDH 5.13.0, CDH 5.13.1, CDH 5.14.0

Users affected: Users running the Oozie Server

Date/time of detection: November 13, 2017

Detected by: Daryn Sharp and Jason Lowe of Oath (formerly Yahoo! Inc)

Severity: (Low/Medium/High) High

Impact: The vulnerability allows a cluster user to read private files owned by the user running the Oozie Server process. The malicious user can construct a workflow XML file containing XML directives and configuration that reference sensitive files on the Oozie server host.

CVE: CVE-2017-15712

Immediate action required: Upgrade to release where the issue is fixed.

Addressed in release/refresh/patch: CDH 5.13.2 and higher, CDH 5.14.2 and higher, 5.15.0 and higher

Oozie does not consider timezone parameter when scheduling using cron-like syntax

Oozie workflows can be scheduled using coordinators. Coordinators can have start time, end time, and frequency parameters. All those have an effect on when and how often coordinator actions (occurrences) of the same coordinator job (definition) will schedule to run.

[There are three ways](#) to choose the frequency parameter:

1. Use a constant value (meaning number of minutes) like: `frequency="60"`. Note that because the number of minutes per day will vary in a daylight saving time zone, only values less than 1440 (minutes in a non-daylight-adjusting day) might be useful.
2. [Put an EL expression](#) like: `frequency="${coord:days(1)}"`. This will repeat the workflow once every day, based on the start time.
3. [Use a Cron expression](#) like: `frequency="10 9 * * *"`. This will schedule the coordinator application every day 9:10am.

If you create a scheduled job using either a constant value or an Expression Language expression while using the timezone parameter to supply a timezone with daylight saving time, Oozie schedules the coordinator actions considering daylight saving changes.

This is not the case when you use a Cron expression while using the timezone parameter to supply DST aware timezone. In this case, Oozie schedules the coordinator actions in a way that does not consider the timezone parameter. Only `oozie.processing.timezone` configuration value is considered configured as part of `oozie-site.xml`, and only for calculating the offset to GMT. `oozie-site.xml` affects the overall behavior for each coordinator job.

Affected Versions: CDH5.14.0 and lower.

Fixed in Versions: CDH5.16.1 and higher, CDH6.0.0 and higher

Bug: [OOZIE-2494](#)

Cloudera Bug: CDH-40279

Workaround: The workaround is use case specific. See the following Knowledge Base article and consider the listed caveats: [Oozie Coordinators Timezone and DST change handling caveats](#).

After enabling HA, Oozie may fail to start due to "NoSuchFieldError: EXTERNAL_PROPERTY

This issue happens in rare cases. Due to an incompatibility with the version of Jackson used by Oozie and Hive, and depending on the order that jars are loaded into Oozie's classpath, Oozie may fail to start.

Affected Versions: CDH5.9.3 and below.

Fixed in Versions: CDH 5.10.0 and higher.

Bug: [HIVE-1640](#)

Cloudera Bug: CDH-42408

Workaround: If using parcels:

1. Delete or move `/opt/cloudera/parcels/CDH/lib/oozie/libserver/hive-exec.jar` and `/opt/cloudera/parcels/CDH/lib/oozie/libtools/hive-exec.jar`.
2. Download `hive-exec-<cdh version>-core.jar` from the Cloudera repo and put it in `/opt/cloudera/parcels/CDH/lib/oozie/libserver/` and `/opt/cloudera/parcels/CDH/lib/oozie/libtools/`.
3. Download `kryo-2.22.jar` from the maven repo and put it in `/opt/cloudera/parcels/CDH/lib/oozie/libserver/` and `/opt/cloudera/parcels/CDH/lib/oozie/libtools/`.

Note: If using packages, use `/usr/lib/oozie` instead of `/opt/cloudera/parcels/CDH/lib/oozie/` in the above paths.

Oozie Web Console returns 500 error when Oozie server runs on JDK 8u75 or higher

The Oozie Web Console returns a 500 error when the Oozie server is running on JDK 8u75 and higher. The Oozie server still functions, and you can use the Oozie command line, REST API, Java API, or the Hue Oozie Dashboard to review status of those jobs.

Affected Versions: CDH5.x and higher, except for the releases listed below.

Fixed in Versions: CDH 5.5.5, 5.7.2, 5.8.2, 5.9.0 and above.

Bug: [OOZIE-2533](#)

Cloudera Bug: CDH-40362

Workaround: Use an earlier version of Java 8 or use the Hue Oozie Dashboard.

Oozie jobs fail (gracefully) on secure YARN clusters when JobHistory server is down

If the JobHistory server is down on a YARN (MRv2) cluster, Oozie attempts to submit a job, by default, three times. If the job fails, Oozie automatically puts the workflow in a `SUSPEND` state.

Affected Versions: CDH 5 Beta 1 and higher.

Cloudera Bug: CDH-14623

Workaround: When the JobHistory server is running again, use the `resume` command to tell Oozie to continue the workflow from the point at which it left off.

Oozie does not start when `oozie.email.smtp.auth` is disabled

If you enable SLA integration, and `oozie.email.smtp.auth` is disabled, Oozie throws a `NullPointerException` and fails to start.

Affected Versions: C5.5.1 and lower.

Bug: [OOZIE-2365](#)

Cloudera Bug: CDH-35331

Workaround: In Cloudera Manager, configure **Oozie Server Advanced Configuration Snippet (Safety Valve) for `oozie-site.xml`** as follows:

```
<property>
  <name>oozie.email.smtp.password</name>
  <value>none</value>
</property>
<property>
  <name>oozie.email.smtp.username</name>
  <value>none</value>
</property>
```

Oozie works with MapReduce or YARN, but not both

The Oozie server works with a MapReduce (MRv1) cluster or a YARN (MRv2) cluster, but not both at the same time.

Workaround: Use two different Oozie servers.

Apache Parquet Known Issues

Parquet file writes run out of memory if (number of partitions) times (block size) exceeds available memory

The Parquet output writer allocates one block for each table partition it is processing and writes partitions in parallel. The MapReduce or YARN task will run out of memory if (number of partitions) times (Parquet block size) is greater than the available memory.

Cloudera Bug: CDH-20157, CDH-20253

Workaround: None; if necessary, reduce the number of partitions in the table.

parquet-thrift cannot read Parquet data written by Hive

parquet-thrift cannot read Parquet data written by Hive, and parquet-avro will show an additional record level in lists named array_element.

Bug: [PARQUET-113](#)

Cloudera Bug: CDH-22189, CDH-22220

Workaround: None; arrays written by parquet-avro or parquet-thrift cannot currently be read by parquet-hive.

Apache Pig Known Issues

Missing results in Hive, Spark, Pig, Custom MapReduce jobs, and other Java applications when filtering Parquet data written by Impala

Apache Hive and Apache Spark rely on Apache Parquet's parquet-mr Java library to perform filtering of Parquet data stored in row groups. Those row groups contain statistics that make the filtering efficient without having to examine every value within the row group.

Recent versions of the parquet-mr library contain a bug described in [PARQUET-1217](#). This bug causes filtering to behave incorrectly if only some of the statistics for a row group are written. Starting in CDH 5.13, Apache Impala populates statistics in this way for Parquet files. As a result, Hive and Spark may incorrectly filter Parquet data that is written by Impala.

In CDH 5.13, Impala started writing Parquet's null_count metadata field without writing the min and max fields. This is valid, but it triggers the [PARQUET-1217](#) bug in the predicate push-down code of the Parquet Java library (parquet-mr). If the null_count field is set to a non-zero value, parquet-mr assumes that min and max are also set and reads them without checking whether they are actually there. If those fields are not set, parquet-mr reads their default value instead.

For integer SQL types, the default value is 0, so parquet-mr incorrectly assumes that the min and max values are both 0. This causes the problem when filtering data. Unless the value 0 itself matches the search condition, all row groups are discarded due to the incorrect min/max values, which leads to missing results.

Affected Products: The Parquet Java library (parquet-mr) and by extension, all Java applications reading Parquet files, including, but not limited to:

- Hive
- Spark
- Pig
- Custom MapReduce jobs

Affected Versions:

- CDH 5.13.0, 5.13.1, 5.13.2, and 5.14.0
- CDS 2.2 Release 2 Powered by Apache Spark and earlier releases on CDH 5.13.0 and later

Who Is Affected: Anyone writing Parquet files with Impala and reading them back with Hive, Spark, or other Java-based components that use the parquet-mr libraries for reading Parquet files.

Severity (Low/Medium/High): High

Impact: Parquet files containing null values for integer fields written by Impala produce missing results in Hive, Spark, and other Java applications when filtering by the integer field.

Immediate Action Required:

- **Upgrade**

You should upgrade to one of the fixed maintenance releases mentioned below.

- **Workaround**

This issue can be avoided at the price of performance by disabling predicate push-down optimizations:

- In Hive, use the following `SET` command:

```
SET hive.optimize.ppd = false;
```

- In Spark, disable the following configuration setting:

```
--conf spark.sql.parquet.filterPushdown=false
```

Addressed in the Following Releases:

- CDH 5.13.3 and higher
- CDH 5.14.2 and higher
- CDH 5.15.0 and higher
- CDS 2.3 Release 2 and higher

For the latest update on this issue, see the corresponding Knowledge Base article:

[TSB:2018-300: Missing results in Hive, Spark, Pig, and other Java applications when filtering Parquet data written by Impala](#)

Hive, Pig, and Sqoop 1 fail in MRv1 tarball installation because `/usr/bin/hbase` sets `HADOOP_MAPRED_HOME` to MRv2

This problem affects tarball installations only.

Cloudera Bug: CDH-6640

Resolution: Use workaround.

Workaround: If you are using MRv1, edit the following line in `/etc/default/hadoop` from

```
export HADOOP_MAPRED_HOME=/usr/lib/hadoop-mapreduce
```

to

```
export HADOOP_MAPRED_HOME=/usr/lib/hadoop-0.20-mapreduce
```

In addition, `/usr/lib/hadoop-mapreduce` must not exist in `HADOOP_CLASSPATH`.

Pig fails to read Parquet file (created with Hive) with a complex field if schema not specified explicitly

Affected Versions: CDH 5.1 - 5.12

Fixed in Versions: CDH 5.13 and higher

Cloudera Bug: CDH-15607

Workaround: Provide the schema of the fields in the `LOAD` statement.

Cloudera Search Known Issues

The current release includes the following known limitations:

Default Solr core names cannot be changed (limitation)

Although it is technically possible to give user-defined Solr core names during core creation, it is to be avoided in the context of Cloudera Search. Cloudera Manager expects core names in the default "collection_shardX_replicaY" format. Altering core names results in Cloudera Manager being unable to fetch Solr metrics for the given core and this, eventually, may corrupt data collection for co-located core, or even shard and server level charts.

Affected versions: All.

The `solrconfig.xml.secure` Template Does Not Enforce Apache Sentry Authorization

The `solrconfig.xml.secure` file generated by the `solrctl instancedir --generate` command does not enable Sentry authorization correctly. If you copied this file or renamed it to `solrconfig.xml` and used it for any collections, Sentry authorization is not being enforced on those collections.

Workaround: Modify the `solrconfig.xml` configuration file for each Sentry-protected collection as follows:

1. Download the collection configuration from ZooKeeper:

```
solrctl instancedir --get <config_name> /tmp/<config_name>
```

2. Edit the `/tmp/<config_name>/conf/solrconfig.xml` file as follows:

Change this line:

```
<updateRequestProcessorChain name="updateIndexAuthorization">
```

to this:

```
<updateRequestProcessorChain name="updateIndexAuthorization" default="true">
```

3. Upload the modified configuration to ZooKeeper:

```
solrctl instancedir --update <config_name> /tmp/<config_name>
```

Cloudera Bug: CDH-54101

Affected Versions: All CDH 5 versions except CDH 5.12.1 and higher

Fixed Versions: CDH 5.9.3, CDH 5.10.2, CDH 5.11.2, CDH 5.12.1

Collection Creation No Longer Supports Automatically Selecting A Configuration If Only One Exists

Before CDH 5.5.0, a collection could be created without specifying a configuration. If no `-c` value was specified, then:

- If there was only one configuration, that configuration was chosen.
- If the collection name matched a configuration name, that configuration was chosen.

Search for CDH 5.5.0 includes multiple built-in configurations. As a result, there is no longer a case in which only one configuration can be chosen by default.

To avoid this issue, explicitly specify the collection configuration to use by passing `-c configName` to `solrctl collection --create`.

Cloudera Bug: CDH-34050

Affected Versions: CDH 5.5.0 and higher

Creating an Instance Directory Fails If Matching Name Exists in `/solr/configs` Znode

The `solrctl instancedir --create` command checks for existing configurations under the `/solr/configs` ZooKeeper znode. If there is a znode with a name that matches the name of the config you are trying to create, the command fails.

Workaround: Use a different name for the instance directory, or make sure that the conflicting data in ZooKeeper is not needed and use `solrctl instancedir --update` instead.

Cloudera Bug: CDH-57036

Affected Versions: All CDH 5 versions except CDH 5.13.0 and higher

Fixed Versions: CDH 5.9.4, CDH 5.10.3, CDH 5.11.2, CDH 5.12.1, CDH 5.13.0

Configuration Templates Are Not Automatically Created on Existing SolrCloud Deployments

Configuration templates are only created when Solr is initialized. As a result, templates are not automatically available on existing SolrCloud deployments, even after upgrading to CDH 5.5.0.

If you do not need to retain information in your SolrCloud cluster, you can reinitialize solr using Cloudera Manager or using `solrctl init`. If you need to retain information in your cluster, there is no automated way to create the templates, but you can access the templates on a host with Solr installed at `/usr/lib/solr/templateName` for packages and `/opt/cloudera/parcels/CDH/lib/solr/templateName` for parcels. The templates can be uploaded to ZooKeeper using `instancedir` commands such as `solrctl instancedir --create templateName /path/to/templateName`, although they are not protected by ZooKeeper ACLs.

Cloudera Bug: CDH-34052

Affected Versions: CDH 5.5.0 and higher

Solr ZooKeeper ACLs Are Not Automatically Applied to Existing ZNodes

As of CDH 5.4, in Kerberos-enabled environments, ZooKeeper ACLs restrict access to Solr metadata stored in ZooKeeper to the solr user. This metadata cannot be modified by other users. These ACLs that limit access to the solr user are only applied automatically to new znodes.

This protection is not automatically applied to existing deployments.

To enable Solr ZooKeeper ACLs without retaining the existing cluster's Solr state, remove the solr znodes and reinitialize solr.

To remove solr znodes and reinitialize solr:

1. Using the `zookeeper-client`, enter the command `rmr /solr`.
2. Reinitialize Solr:
 - Select **Initialize Solr** in Cloudera Manager *OR*
 - Use `solrctl init`

To set ACLs using a script (CDH 5.7 and higher):

1. Create a `jaas.conf` file containing the following:

```
Client {
  com.sun.security.auth.module.Krb5LoginModule required
  useKeyTab=false
  useTicketCache=true
  principal="solr@EXAMPLE.COM";
};
```

Replace `EXAMPLE.COM` with your Kerberos realm name.

2. Set the `LOG4J_PROPS` environment variable to a `log4j.properties` file:

```
export LOG4J_PROPS=/etc/zookeeper/conf/log4j.properties
```

3. Set the `ZKCLI_JVM_FLAGS` environment variable:

```
export ZKCLI_JVM_FLAGS="-Djava.security.auth.login.config=/path/to/jaas.conf \  
-DzkACLProvider=org.apache.solr.common.cloud.ConfigAwareSaslZkACLProvider \  
-Droot.logger=INFO,console"
```

4. Authenticate as the `solr` user:

```
kinit solr@EXAMPLE.COM
```

Replace `EXAMPLE.COM` with your Kerberos realm name.

5. Run the `zkcli.sh` script as follows:

- **Cloudera Manager:**

```
/opt/cloudera/parcels/CDH/lib/solr/bin/zkcli.sh -zkhost zk01.example.com:2181 -cmd  
updateacls /solr
```

- **Unmanaged:**

```
/usr/lib/solr/bin/zkcli.sh -zkhost zk01.example.com:2181 -cmd updateacls /solr
```

Replace `zk01.example.com` with the hostname of a ZooKeeper server.

To enable Solr ZooKeeper ACLs while retaining the existing cluster's Solr state in versions lower than CDH 5.7, manually modify the existing `znode`'s ACL information. For example, using `zookeeper-client`, run the command `setAcl [path] sasl:solr:cdrwa,world:anyone:r`. This grants the `solr` user ownership of the specified path. Run this command for `/solr` and every `znode` under `/solr` except for the configuration `znodes` under and including `/solr/configs`.

Cloudera Bug: CDH-26416

Affected Versions: CDH 5.4.0 and higher

HBase Indexer ACLs Are Not Automatically Applied to Existing ZNodes

As of CDH 5.4, in Kerberos-enabled environments, ZooKeeper ACLs restrict access to Lily HBase Indexer metadata stored in ZooKeeper to `hbase` user. This metadata cannot be modified by other users. These ACLs that limit access to the `hbase` user are only applied automatically to new `znodes`.

This protection is not automatically applied to existing deployments.

To enable Lily HBase Indexer ACLs without retaining the existing cluster's Lily HBase Indexer state, turn off the Lily HBase Indexer, remove the `hbase-indexer` `znodes`, and then restart the Lily HBase Indexer.

To remove `hbase-indexer` `znodes` and reinitialize Lily HBase Indexer:

1. In Cloudera Manager, click

to the right of the Lily HBase Indexer service and select **Stop**.

2. Using the `zookeeper-client`, enter the command `rmr /ngdata`.

3. In Cloudera Manager, click

to the right of the Lily HBase Indexer service and select **Start**.

The Lily HBase Indexer automatically creates all required `znodes` when it is started.

To enable Lily HBase Indexer while retaining the existing HBase-Indexer state, manually modify the existing `znode`'s ACL information. For example, using `zookeeper-client`, run the command `setAcl`

[path]sas1:hbase:cdrwa,world:anyone:r. This grants the hbase user ownership of every znode under /ngdata (inclusive of /ngdata).

Note: This operation is not recursive, so creating a simple script may be helpful.

Cloudera Bug: CDH-26417

Affected Versions: CDH 5.4.0 and higher

[CrunchIndexerTool which includes Spark indexer requires specific input file format specifications](#)

If the `--input-file-format` option is specified with `CrunchIndexerTool`, then its argument must be `text`, `avro`, or `avroParquet`, rather than a fully qualified class name.

Cloudera Bug: CDH-22190

[Previously deleted empty shards may reappear after restarting the leader host](#)

It is possible to be in the process of deleting a collection when hosts are shut down. In such a case, when hosts are restarted, some shards from the deleted collection may still exist, but be empty.

Workaround: To delete these empty shards, manually delete the folder matching the shard. On the hosts on which the shards exist, remove folders under `/var/lib/solr/` that match the collection and shard. For example, if you had an empty shard 1 and empty shard 2 in a collection called `MyCollection`, you might delete all folders matching `/var/lib/solr/MyCollection{1,2}_replica*/`.

Cloudera Bug: CDH-20256

[The `quickstart.sh` file does not validate ZooKeeper and the NameNode on some operating systems](#)

The `quickstart.sh` file uses the `timeout` function to determine if ZooKeeper and the NameNode are available. To ensure this check can be complete as intended, the `quickstart.sh` determines if the operating system on which the script is running supports `timeout`. If the script detects that the operating system does not support `timeout`, the script continues without checking if the NameNode and ZooKeeper are available. If your environment is configured properly or you are using an operating system that supports `timeout`, this issue does not apply.

Workaround: This issue only occurs in some operating systems. If `timeout` is not available, a warning is displayed, but the `quickstart` continues and final validation is always done by the MapReduce jobs and Solr commands that are run by the `quickstart`.

Cloudera Bug: CDH-19923

[Field value class guessing and Automatic schema field addition are not supported with the `MapReduceIndexerTool` nor the `HBaseMapReduceIndexerTool`](#)

The `MapReduceIndexerTool` and the `HBaseMapReduceIndexerTool` can be used with a Managed Schema created via NRT indexing of documents or via the Solr Schema API. However, neither tool supports adding fields automatically to the schema during ingest.

Workaround: Define the schema before running the `MapReduceIndexerTool` or `HBaseMapReduceIndexerTool`. In non-schemaless mode, define in the schema using the `schema.xml` file. In schemaless mode, either define the schema using the Solr Schema API or index sample documents using NRT indexing before invoking the tools. In either case, Cloudera recommends that you verify that the schema is what you expect using the List Fields API command.

Cloudera Bug: CDH-26856

[The “Browse” and “Spell” Request Handlers are not enabled in schemaless mode](#)

The “Browse” and “Spell” Request Handlers require certain fields be present in the schema. Since those fields cannot be guaranteed to exist in a Schemaless setup, the “Browse” and “Spell” Request Handlers are not enabled by default.

Workaround: If you require the “Browse” and “Spell” Request Handlers, add them to the `solrconfig.xml` configuration file. Generate a non-schemaless configuration to see the usual settings and modify the required fields to fit your schema.

Cloudera Bug: CDH-19407

Enabling blockcache writing may result in unusable indexes

It is possible to create indexes with `solr.hdfs.blockcache.write.enabled` set to `true`. Such indexes may appear corrupt to readers, and reading these indexes may irreversibly corrupt indexes. Blockcache writing is disabled by default.

Workaround: Do not enable blockcache writing.

Cloudera Bug: CDH-17978

Solr fails to start when Trusted Realms are added for Solr into Cloudera Manager

Cloudera Manager generates name rules with spaces as a result of entries in the Trusted Realms, which do not work with Solr. This causes Solr to not start.

Workaround: Do not use the Trusted Realm field for Solr in Cloudera Manager. To write your own name rule mapping, add an environment variable `SOLR_AUTHENTICATION_KERBEROS_NAME_RULES` with the mapping. See [Cloudera Security](#) for more information.

Cloudera Bug: CDH-17289

Lily HBase batch indexer jobs fail to launch

A symptom of this issue is an exception similar to the following:

```
Exception in thread "main" java.lang.IllegalAccessError: class
com.google.protobuf.ZeroCopyLiteralByteString cannot access its superclass

at java.lang.reflect.Method.invoke(Method.java:606)
at org.apache.hadoop.util.RunJar.main(RunJar.java:212)

```

This is because of an optimization introduced in [HBASE-9867](#) that inadvertently introduced a classloader dependency. In order to satisfy the new classloader requirements, `hbase-protocol.jar` must be included in Hadoop's classpath. This can be resolved on a per-job launch basis by including it in the `HADOOP_CLASSPATH` environment variable when you submit the job.

Workaround: Run the following command before issuing Lily HBase MapReduce jobs. Replace the `.jar` file names and filepaths as appropriate.

```

$ export HADOOP_CLASSPATH=</path/to/hbase-protocol>.jar; hadoop jar <MyJob>.jar
<MyJobMainClass>

```

Cloudera Bug: CDH-16539

[Users with insufficient Solr permissions may receive a "Page Loading" message from the Solr Web Admin UI](#)

Users who are not authorized to use the Solr Admin UI are not given page explaining that access is denied, and instead receive a web page that never finishes loading.

Workaround: None

Cloudera Bug: CDH-58276

[Using MapReduceIndexerTool or HBaseMapReduceIndexerTool multiple times may produce duplicate entries in a collection.](#)

Repeatedly running the `MapReduceIndexerTool` on the same set of input files can result in duplicate entries in the Solr collection. This occurs because the tool can only insert documents and cannot update or delete existing Solr documents. This issue does not apply to the `HBaseMapReduceIndexerTool` unless it is run with more than zero reducers.

Workaround: To avoid this issue, use `HBaseMapReduceIndexerTool` with zero reducers. This must be done without Kerberos.

Cloudera Bug: CDH-15441

[Deleting collections may fail if hosts are unavailable.](#)

It is possible to delete a collection when hosts that host some of the collection are unavailable. After such a deletion, if the previously unavailable hosts are brought back online, the deleted collection may be restored.

Workaround: Ensure all hosts are online before deleting collections.

Cloudera Bug: CDH-58694

[Saving search results is not supported.](#)

Cloudera Search does not support the ability to save search results.

Workaround: None

Cloudera Bug: CDH-21162

[HDFS Federation is not supported.](#)

Cloudera Search does not support HDFS Federation.

Workaround: None

Cloudera Bug: CDH-11357

Apache Sentry Known Issues

Sentry doesn't support Kafka topic name with more than 64 characters

A Kafka topic name can have 249 characters, but Sentry only supports topic names up to 64 characters.

Workaround: Keep Kafka topic names to 64 characters or less.

Affected Versions: All CDH 5.x and 6.x versions

Cloudera Issue: CDH-64317

When granting privileges, a single transaction per grant causes long delays

Sentry takes a long time to grant or revoke a large number of column-level privileges that are requested in a single statement. For example if you execute the following command:

```
GRANT SELECT(col1, col2, ...) ON TABLE table1;
```

Sentry applies the grants to each column separately and the refresh process causes long delays.

Workaround: Split the grant statement up into smaller chunks. This prevents the refresh process from causing delays.

Affected Versions:

- CDH: 5.14.4
- CDH: 5.15.1
- CDH: 5.16.0
- CDH: 6.1.0

Fixed Versions:

- CDH 5.16.1 and above
- CDH 6.2.0 and above

Cloudera Issue: CDH-74982

Snapshot doesn't complete with null SDS entries

If you have a partition with null SDS entries, a full snapshot will never complete.

Workaround: Delete the null SDS entries from HMS and restart Sentry.

Affected Versions: CDH 5.16.1

Fixed Versions: CDH 5.16.1 and above

Cloudera Issue: CDH-75158

SHOW ROLE GRANT GROUP raises exception for a group that was never granted a role

If you run the command SHOW ROLE GRANT GROUP for a group that has never been granted a role, beeline raises an exception. However, if you run the same command for a group that does not have any roles, but has at one time been granted a role, you do not get an exception, but instead get an empty list of roles granted to the group.

Workaround: Adding a role will prevent the exception.

Affected Versions: CDH 5.16.1

Cloudera Issue: CDH-71694

Sentry allows the `ALTER TABLE EXCHANGE PARTITION` operation on a restricted database

If a user has ALL permissions on a database, the `ALTER TABLE EXCHANGE PARTITION` command allows the user to move partitions from a table that the user does not have access to. For example, if a user has ALL permissions on database A, but no permissions on database B, the user can create a table with a schema in database A that is identical to a table in database B. The user can then move partitions from database B into database A, which allows the user to view restricted data and remove that data from the source database.

After you upgrade to a version of CDH listed in the "Addressed in release" section below, a user that tries to use the `EXCHANGE PARTITION` command to move a partition from a restricted database will receive a "No valid privileges" error.

Products affected: Hive services running Sentry

Affected Versions:

- CDH 5.13.x and below
- CDH 5.14.0, 5.14.2, 5.14.3
- CDH 5.15.0

Users affected: Hive users running Sentry

Date/time of detection: May 10, 2018

Severity (Low/Medium/High): 8.1 High ([CVSS:3.0/AV:N/AC:L/PR:L/UI:N/S:U/C:H/I:H/A:N](#))

Impact: Sensitive data exposure

CVE: CVE-2018-8028

Immediate action required: Upgrade to a version of CDH with the fix.

Addressed in release/refresh/patch:

- CDH 5.14.4
- CDH 5.15.1
- CDH 5.16.1
- CDH 6.0.0

For the latest update on this issue see the corresponding Knowledge article:

[TSB 2018-312: Sentry allows the "ALTER TABLE EXCHANGE PARTITION" operation on a restricted database](#)

Performance Issue: `MPath` is queried for each `MAuthzPathsMapping` in full snapshot

`MAuthzPathsMapping` contains list of `MPath` instances. From log message, when getting path full snapshot at `SentryStore.retrieveFullPathsImageCore()`, `DataNucleus` issues a query for all `MPath` instances associated with each `MAuthzPathsMapping`. Therefore, getting full path image may take a very long time.

Workaround: The solution is to get `MPath` in a batch when getting full path image.

Affected Versions: CDH 5.13 and below

Apache Issue: [SENTRY-2184](#)

Cloudera Issue: None

The `REVOKE GRANT OPTION` also revokes privileges with no grant option

When you use the `REVOKE GRANT OPTION` command to revoke the `GRANT` privilege from a role, Hive revokes the privilege that has the `GRANT OPTION` and if the role also has the privilege without the grant option, that is revoked as well.

For example, if a role has `SELECT` and `SELECT WITH GRANT OPTION` privileges, and you run the `REVOKE GRANT OPTION` command, the role will have no `SELECT` privileges on that object. Both the `SELECT` and `SELECT WITH GRANT OPTION` privileges will be revoked.

Workaround: Revoke the GRANT OPTION and the privilege, and then grant the privilege.

Affected Versions: All CDH 5.x versions

Apache Issue: [SENTRY-2402](#)

Cloudera Issue: CDH-72979

After upgrade, HDFS ACLs are not synched due to Sentry taking too many snapshots

The schema change that was introduced in CDH 5.13.0 requires Sentry to take an HMS snapshot when you upgrade. Sentry might take too many snapshots, resulting in a period of time in which ACLs are not synched with HDFS. This can cause job failures.

Note that this issue is similar to [CDH-67922](#), but has a different root cause.

Who is Affected: Users that currently have any CDH version below 5.13.0 and are upgrading to any of the affected versions. For example, users upgrading from CDH 5.12.2 to CDH 5.13.0 are affected, but users upgrading from 5.12.2 to 5.13.3 are not affected.

Action Required: Cloudera recommends that if you have Sentry installed, you do not upgrade to any of the affected versions. Instead, upgrade to one of the fixed versions.

Affected Versions:

- CDH 5.13.0, 5.13.1, 5.13.2
- CDH 5.14.0, 5.14.1

Fixed Versions:

- CDH 5.13.3
- CDH 5.14.2, 5.14.3
- CDH 5.15.0 and above

Apache Issue: [SENTRY-2210](#)

Cloudera Issue: CDH-70480

After upgrade, HDFS ACLs are not synched due to Sentry taking too long to retrieve the snapshot from the database

The schema change that was introduced in 5.13.0 requires Sentry to take an HMS snapshot and save it to the Sentry database when you upgrade. When the NameNode service starts after the upgrade and asks for a path update, Sentry must retrieve a full snapshot from the Sentry database and send it to the NameNode. In the Sentry database, AUTHZ_PATH does not have an index on the foreign key AUTHZ_OBJ_ID. This can cause the snapshot retrieval from the Sentry database to take a long time, resulting in ACLs not being synched with HDFS until the snapshot is complete. After Sentry retrieves the full snapshot and sends it to the NameNode, Sentry only needs to retrieve and send delta changes.

Note that this issue is similar to [CDH-70480](#), but has a different root cause.

Who is Affected: Users that currently have any CDH version below 5.13.0 and are upgrading to any of the affected versions. For example, users upgrading from CDH 5.12.2 to CDH 5.13.3 are affected. MySQL users are not affected because MySQL automatically creates the index for the foreign key.

Action Required: After you upgrade, manually add the index to your schema with the appropriate command for the database:

- Oracle:

```
CREATE INDEX "AUTHZ_PATH_FK_IDX" ON "AUTHZ_PATH" ("AUTHZ_OBJ_ID");
```

- PostgreSQL:

```
CREATE INDEX "AUTHZ_PATH_FK_IDX" ON "AUTHZ_PATH" USING btree ("AUTHZ_OBJ_ID");
```

- Apache Derby:

```
CREATE INDEX AUTHZ_PATH_FK_IDX ON AUTHZ_PATH (AUTHZ_OBJ_ID);
```

- IBM Db2:

```
CREATE INDEX AUTHZ_PATH_FK_IDX ON AUTHZ_PATH (AUTHZ_OBJ_ID);
```

Affected Versions:

- CDH 5.13.0, 5.13.1, 5.13.2, 5.13.3
- CDH 5.14.0, 5.14.1, 5.14.2, 5.14.3
- CDH 5.15.0

Fixed Versions: CDH 5.16.1

Cloudera Issue: CDH-67922

You must use a relational database with Sentry HA

A flat-file cannot scale in a meaningful way with regards to search, replace, add, and delete operations - but a relational database can.

Workaround: Use a relational database.

Affected Versions: CDH 5.13.0 and above

Cloudera Issue: None

GRANT/REVOKE operations could fail if there are too many concurrent requests

Under a significant workload, Grant/Revoke operations can have issues.

Workaround: Given that grant and revoke actions are largely an administrative concern, plan en masse privilege changes accordingly.

Affected Versions: 5.13.0 and above

Apache Issue: [SENTRY-1855](#)

Cloudera Issue: CDH-56553

Creating large set of Sentry roles results in performance problems

Using more than a thousand roles/permissions may cause significant performance problems.

Workaround: In general it is better for users to have only a few roles associated as possible; then allowing for administrator roles to have very broad privileges.

Affected Versions: All CDH 5.x versions

Cloudera Issue: CDH-59010

Sentry takes a long time to finish HMS sync on larger object count (>2M)

When there are many Hive objects (tables and partitions) and many is in millions, it may take Sentry a few minutes (or a few tens of minutes) to fully synchronize table information between HMS and Sentry and during this time HDFS sync would not be functional. This delay is usually a one-time cost during the upgrade to 5.13 and should not be a problem during Sentry server restart.

Workaround: Be cognizant of the expected time to processes many objects. Scheduling the installation/upgrade during a low-usage time and when the system can simply process all of the objects would be best.

Affected Versions: 5.13.0 and above

Cloudera Issue: CDH-59310

Sentry process crashes with OOM upon reaching array length limit

To prevent Sentry from crashing with OOM upon reaching array length limit, use a Java version that has that has [JDK-8055949](#) fixed. This also affects HMS when Sentry is enabled and there are a lot of partitions.

Workaround: Use a Java version that has that has [JDK-8055949](#) fixed.

Affected Versions: All CDH 5 versions

Cloudera Issue: None

YARN Dynamic Resource Pools Do Not Work with Hive When Sentry Is Enabled

Hive jobs are not submitted into the correct YARN queue when Hive is using Sentry because Hive does not use the YARN API to resolve the user or group of the job's original submitter. This causes the job to be placed in a queue using the placement rules based on the Hive user. The HiveServer2 fair scheduler queue mapping used for "non-impersonation" mode does not handle the primary-secondary queue mappings correctly.

Products Affected: Hive, YARN, Sentry

Affected Versions:

This issue is fixed by [HIVE-8634](#), which is available in CDH 5.3 and higher. However, in CDH 5.3, 5.4, 5.5, 5.6, and 5.7, you must configure Hive to load the scheduler configuration into HiveServer2. In CDH 5.8 or higher managed clusters, Cloudera Manager automatically deploys the fair scheduler configuration to HiveServer2, but you must make sure that your configuration complies with the [Placement Rule](#) and [Submission Access](#) requirements described below.

Important: If you are using CDH 5.0.x, 5.1.0 to 5.1.4, or 5.2.0, you must upgrade to a later release that includes the fix ([HIVE-8634](#)).

Apache Issue: [HIVE-8634](#)

Resolution: Use the workaround for your version of CDH.

Workaround for CDH 5.3, 5.4, 5.5, 5.6, 5.7:

Also see [Placement Rule Requirement](#) and [Job Submission Access Requirement](#) for additional configuration information.

- **Managed clusters:**

1. In the Cloudera Manager Admin Console, click **Cluster *n***, select the **YARN** service, and click the **Instances** tab.
2. In the YARN Instances page, click the **ResourceManager(Active)** role, and then click the **Processes** tab.
3. In the ResourceManager Processes page, click **fair-scheduler.xml**, which opens in a new browser tab. Copy the contents of the **fair-scheduler.xml** page.
4. Create a new file named `fair-scheduler.xml` and paste the contents of the **fair-scheduler.xml** browser page into it. Save the file.
5. In a terminal window, create a new directory on the HiveServer2 host where you can store the `fair-scheduler.xml` file you created in the previous step. For example, `/etc/hive/fsxml`.

Important: Do not place the `fair_scheduler.xml` file into the standard Hive configuration directory. That directory is managed by Cloudera Manager and the file might be removed when you change other configuration settings.

6. Upload the `fair-scheduler.xml` file to the directory you created in the previous step.
7. In the Cloudera Manager Admin Console, click **Cloudera Manager** to return to the home page, and click **Hive > Configuration**.
8. On the Hive service Configuration page, select **Service-Wide** scope and **Advanced** category.
9. In the panel on the right, scroll down until you find the **Hive Service Advanced Configuration Snipped (Safety Valve) for hive-site.xml**, and add the `yarn.scheduler.fair.allocation.file` property with the path

to the `fair-scheduler.xml` file you created in the previous steps. For example, if you put the `fair-scheduler.xml` file in the `/etc/hive/fsxml` directory, add the following:

```
<property>
  <name>yarn.scheduler.fair.allocation.file</name>
  <value>/etc/hive/fsxml/fair-scheduler.xml</value>
</property>
```

10 Click **Save Changes**.

11 Restart the Hive service.

Note: An updated configuration file must be deployed each time a change is made in the fair scheduler configuration. The new file is read automatically by HiveServer2.

- **Unmanaged clusters:**

1. Log in to a node that runs the ResourceManager.
2. Navigate to the `$HADOOP_HOME/conf/` directory and locate the `fair-scheduler.xml` file.
3. Copy the `fair-scheduler.xml` file to the HiveServer2 node in the `/etc/hive/conf` directory.
4. Open the `/etc/hive/conf/hive-site.xml` file and add the following property:

```
<property>
  <name>yarn.scheduler.fair.allocation.file</name>
  <value>/etc/hive/conf/fair-scheduler.xml</value>
</property>
```

5. Save the `hive-site.xml` file.

6. Restart the Hive service:

```
$ sudo service hive-server2 stop
$ sudo service hive-server2 start
```

Note: An updated configuration file must be deployed each time a change is made in the fair scheduler configuration. The new file is read automatically by HiveServer2.

Placement Rule Requirement

After HiveServer2 determines into which queue the job can be placed, it submits the job with a queue specified in the submission request. This placement request is only honored if the placement rules in the `fair-scheduler.xml` file has the following rule defined as the first rule in the fair-scheduler policy:

```
<rule name="specified" />
```

Make sure that this is the first rule defined in the `fair-scheduler.xml` file. If another rule is defined as the first rule, placement behavior cannot be determined.

Job Submission Access Requirement

The `hive` user must be in the list of users allowed to submit jobs to the pool. The submitting user is used to determine pool placement, but the `hive` user is still the user that is expected to run the job in the pool.

Sentry does not manage permissions of Hive directories after certain commands

Sentry stops managing HDFS permissions of Hive directories that were the targets of certain DDL/DML commands.

Examples:

Alter tables, which are not rename or set location. For example "alter table set property"

Insert on a unpartitioned table.

Products affected: Sentry, HDFS, Hive

Affected Versions: All versions of CDH 5, except for those indicated in the 'Addressed in release/refresh/patch' section below.

Users affected: Users running Sentry with Hive or Impala using the HDFS ACL synchronization feature.

Impact:

The table/partition directory ACLs and permissions will be reverted to the underlying HDFS values after either of these workflows

Insert on unpartitioned tables

Alter table property on any table

Immediate action required: Upgrade to fixed version as soon as possible. If affected prior to an upgrade restart the HMS to act as a reset until the DDL/DML commands are rerun.

Addressed in release/refresh/patch: CDH 5.5.5 and higher, CDH 5.7.2 and higher, CDH 5.8.0 and higher

`CREATE FUNCTION ... USING JAR` [does not work on Sentry-secured clusters](#)

In a cluster without Sentry, a user is able to create a UDF using the `CREATE FUNCTION ... USING <hdfs location>` command in Hive, with a JAR located on HDFS. However, once Sentry is enabled, this command does not work even if the user is granted the `ALL` privilege to the URI on HDFS.

Affected Versions: CDH 5.7, 5.6, 5.5, 5.4

Fixed Versions: CDH 5.9.0 and above

Cloudera Issue: CDH-33816

With Sentry enabled, only Hive admin users have access to YARN job logs

As a prerequisite of enabling Sentry, Hive impersonation is turned off, which means all YARN jobs are submitted to the Hive job queue, and are run as the `hive` user. This is an issue because the YARN History Server now has to block users from accessing logs for their own jobs, since their own usernames are not associated with the jobs. As a result, end users cannot access any job logs unless they can get `sudo` access to the cluster as the `hdfs`, `hive` or other admin users.

In CDH 5.8 (and higher), Hive overrides the default configuration, `mapred.job.queue.name`, and places incoming jobs into the connected user's job queue, even though the submitting user remains `hive`. Hive obtains the relevant queue/username information for each job by using YARN's `fair-scheduler.xml` file.

Affected Versions: All CDH 5.x versions

Cloudera Issue: CDH-22890

Moving a partitioned table to a new location on the filesystem does not affect ACLs set on the previous location

With HDFS/Sentry sync enabled, if you move a partitioned table to a new location on the filesystem using the `ALTER TABLE .. SET LOCATION` command, ACLs set on the previous location remain unchanged. This occurs irrespective of whether the table is managed by Sentry.

Affected Versions: All CDH 5.x versions

Apache Issue: [SENTRY-1373](#)

Cloudera Issue: CDH-41784

Column-level privileges are not supported on Hive Metastore views

GRANT and REVOKE for column level privileges is not supported on Hive Metastore views.

Apache Issue: [SENTRY-754](#)

SELECT privilege on all columns does not equate to SELECT privilege on table

Users who have been explicitly granted the SELECT privilege on all columns of a table, will *not* have the permission to perform table-level operations. For example, operations such as `SELECT COUNT (1)` or `SELECT COUNT (*)` will not work even if you have the SELECT privilege on all columns.

There is one exception to this. The `SELECT * FROM TABLE` command will work even if you do not have explicit table-level access.

Apache Issue: [SENTRY-838](#)

The EXPLAIN SELECT operation works without table or column-level privileges

Users are able to run the EXPLAIN SELECT operation, exposing metadata for all columns, even for tables/columns to which they weren't explicitly granted access.

Apache Issue: [SENTRY-849](#)

With HDFS sync enabled, unexpected directory permissions are set when the NameNode plugin cannot communicate with the Sentry Server

With HDFS-Sentry sync enabled, if the NameNode plugin is unable to communicate with the Sentry Service, affected HDFS files will continue to use a cached copy of the synchronized ACLs for a configurable period of time, after which they will fall back to the Hive System User and the Hive System Group (for example, `hive:hive`). The timeout value can be modified by adding the `sentry.authorization-provider.cache-stale-threshold.ms` parameter to the `hdfs-site.xml` Safety Valve in Cloudera Manager. The default timeout value is 60 seconds, but you can increase this value from several minutes to a few hours, as needed to accommodate large clusters.

Affected Versions: CDH 5.14.7, 5.5.2

Fixed Versions: CDH 5.5.0 and above

Cloudera Issue: CDH-33623

Hive authorization (Grant/Revoke/Show) statements do not support fully qualified table names (`default.tab1`)

Workaround: Switch to the database before granting privileges on the table.

Affected Versions: CDH 5.12.x and below

Fixed Versions: CDH 5.13.0 and above

Cloudera Issue: CDH-19530

Object types Server and URI are not supported in `SHOW GRANT ROLE roleName on OBJECT objectName`

Workaround: Use `SHOW GRANT ROLE roleName` to list all privileges granted to the role.

Affected Versions: All CDH 5.x versions

Cloudera Issue: CDH-19430

Relative URI paths not supported by Sentry

Sentry supports only absolute (not relative) URI paths in permission grants. Although some early releases (for example, CDH 5.7.0) may not have raised explicit errors when relative paths were set, upgrading a system that uses relative paths causes the system to lose Sentry permissions.

Affected Versions: All versions. Relative paths are not supported in Sentry for permission grants.

Resolution: Revoke privileges that have been set using relative paths, and grant permissions using absolute paths before upgrading.

Absolute (Use this form)	Relative (Do not use this form)
hdfs://absolute/path/	hdfs://relative/path
s3a://bucketname/	s3a://bucketname

Apache Spark Known Issues

CVE-2019-10099: Apache Spark local files left unencrypted

Certain operations in Spark leave local files unencrypted on disk, even when local file encryption is enabled with “spark.io.encryption.enabled”.

This includes cached blocks that are fetched to disk (controlled by `spark.maxRemoteBlockSizeFetchToMem`) in the following cases:

- In SparkR when `parallelize` is used
- In Pyspark when `broadcast` and `parallelize` are used
- In Pyspark when `python udfs` is used

Products affected:

- CDH
- CDS Powered by Apache Spark

Affected versions:

- CDH 5.15.1 and earlier
- CDH 6.0.0
- CDS 2.1.0 release 1 and release 2
- CDS 2.2.0 release 1 and release 2
- CDS 2.3.0 release 3

Users affected: All users who run Spark on CDH and CDS in a multi-user environment.

Date/time of detection: July 2018

Severity (Low/Medium/High): 6.3 Medium ([CVSS AV:L/AC:H/PR:N/UI:R/S:U/C:H/I:H/A:N](#))

Impact: Unencrypted data accessible.

CVE: CVE-2019-10099

Immediate action required: Upgrade to a version of CDH containing the fix.

Workaround: Do not use of pyspark and the fetch-to-disk options.

Fixed versions:

- CDH 5.15.2
- CDH 5.16.0
- CDH 6.0.1
- CDS 2.1.0 release 3
- CDS 2.2.0 release 3
- CDS 2.3.0 release 4

For the latest update on this issue see the corresponding Knowledge article: [TSB 20210-336: Apache Spark local files left unencrypted](#)

Partitioned tables in the Avro format with upper case column names return NULL values from Spark SQL

When you use Spark SQL to query external partitioned Hive tables created in the Avro format and which contain upper case column names, Spark SQL returns NULL values for the upper case column names.

Workaround: In Spark 1.6, create aliases that do not contain upper case characters for each column name.

Affected Versions: CDH 5.8.2 - CDH 5.14.3

Fixed Versions: CDH 5.14.4 and later

Apache Bug: [SPARK-15848](#)

Cloudera Bug: CDH-72396, CDH-45978

Missing results in Hive, Spark, Pig, Custom MapReduce jobs, and other Java applications when filtering Parquet data written by Impala

Apache Hive and Apache Spark rely on Apache Parquet's `parquet-mr` Java library to perform filtering of Parquet data stored in row groups. Those row groups contain statistics that make the filtering efficient without having to examine every value within the row group.

Recent versions of the `parquet-mr` library contain a bug described in [PARQUET-1217](#). This bug causes filtering to behave incorrectly if only some of the statistics for a row group are written. Starting in CDH 5.13, Apache Impala populates statistics in this way for Parquet files. As a result, Hive and Spark may incorrectly filter Parquet data that is written by Impala.

In CDH 5.13, Impala started writing Parquet's `null_count` metadata field without writing the `min` and `max` fields. This is valid, but it triggers the [PARQUET-1217](#) bug in the predicate push-down code of the Parquet Java library (`parquet-mr`). If the `null_count` field is set to a non-zero value, `parquet-mr` assumes that `min` and `max` are also set and reads them without checking whether they are actually there. If those fields are not set, `parquet-mr` reads their default value instead.

For integer SQL types, the default value is 0, so `parquet-mr` incorrectly assumes that the `min` and `max` values are both 0. This causes the problem when filtering data. Unless the value 0 itself matches the search condition, all row groups are discarded due to the incorrect `min/max` values, which leads to missing results.

Affected Products: The Parquet Java library (`parquet-mr`) and by extension, all Java applications reading Parquet files, including, but not limited to:

- Hive
- Spark
- Pig
- Custom MapReduce jobs

Affected Versions:

- CDH 5.13.0, 5.13.1, 5.13.2, and 5.14.0
- CDS 2.2 Release 2 Powered by Apache Spark and earlier releases on CDH 5.13.0 and later

Who Is Affected: Anyone writing Parquet files with Impala and reading them back with Hive, Spark, or other Java-based components that use the `parquet-mr` libraries for reading Parquet files.

Severity (Low/Medium/High): High

Impact: Parquet files containing null values for integer fields written by Impala produce missing results in Hive, Spark, and other Java applications when filtering by the integer field.

Immediate Action Required:

- **Upgrade**

You should upgrade to one of the fixed maintenance releases mentioned below.

- **Workaround**

This issue can be avoided at the price of performance by disabling predicate push-down optimizations:

- In Hive, use the following `SET` command:

```
SET hive.optimize.ppd = false;
```
- In Spark, disable the following configuration setting:

```
--conf spark.sql.parquet.filterPushdown=false
```

Addressed in the Following Releases:

- CDH 5.13.3 and higher
- CDH 5.14.2 and higher
- CDH 5.15.0 and higher
- CDS 2.3 Release 2 and higher

For the latest update on this issue, see the corresponding Knowledge Base article:

[TSB:2018-300: Missing results in Hive, Spark, Pig, and other Java applications when filtering Parquet data written by Impala](#)

Apache Spark experimental features are not supported unless specifically identified as supported

If an Apache Spark feature or API is identified as experimental, in general Cloudera does not provide support for it.

Spark 2.x not supported on unmanaged clusters

Launching Spark 2.x jobs from machines not managed by Cloudera Manager is not supported.

ADLS not Supported for All Spark Components

Microsoft Azure Data Lake Store (ADLS) is a cloud-based filesystem that you can access through Spark applications. Spark with Kudu is not currently supported for ADLS data. (Hive-on-Spark is available for ADLS in CDH 5.12 and higher.)

IPython / Jupyter notebooks not supported

- The IPython notebook system (renamed to Jupyter as of IPython 4.0) is not supported.

Certain Spark Streaming features not supported

- The `mapWithState` method is unsupported because it is a nascent unstable API.
- **Affected Versions:** All CDH 5 versions
- **Bug:** [SPARK-2629](#).

Certain Spark SQL features not supported

The following Spark SQL features are not supported:

- Thrift JDBC/ODBC server
- Spark SQL CLI

Spark Dataset API not supported

Cloudera distribution of Spark 1.6 does not support the Spark Dataset API. However, Spark 2.0 and higher supports the Spark Dataset API.

JDBC Datasource API not supported

Using the JDBC Datasource API to access Hive or Impala is not supported

GraphX not supported

Cloudera does not support GraphX.

Affected Versions: All CDH 5 versions.

SparkR not supported

Cloudera does not support SparkR.

Affected Versions: All CDH 5 versions.

Scala 2.11 not supported

Spark in CDH 5.x does not support Scala 2.11 because it is binary incompatible, and also not yet full-featured. However, Spark 2.0 and higher supports Scala 2.11.

Affected Versions: All CDH 5 versions.

Spark Streaming cannot consume from secure Kafka till it starts using Kafka 0.9 Consumer API

Bug: [SPARK-12177](#).

Workaround: Use Spark 2.

Tables saved with the Spark SQL `DataFrame.saveAsTable` method are not compatible with Hive

Writing a `DataFrame` directly to a Hive table creates a table that is not compatible with Hive; the metadata stored in the metastore can only be correctly interpreted by Spark. For example:

```
val hsc = new HiveContext(sc)
import hsc.implicits._
val df = sc.parallelize(data).toDF()
df.write.format("parquet").saveAsTable(tableName)
```

creates a table with this metadata:

```
inputFormat:org.apache.hadoop.mapred.SequenceFileInputFormat
outputFormat:org.apache.hadoop.hive ql.io.HiveSequenceFileOutputFormat
```

This is also occurs when using explicit schema, such as:

```
val schema = StructType(Seq(...))
val data = sc.parallelize(Seq(Row(...), ...))
val df = hsc.createDataFrame(data, schema)
df.write.format("parquet").saveAsTable(tableName)
```

Affected Versions: CDH 5.5 and higher

Workaround: Explicitly create a Hive table to store the data. For example:

```
df.registerTempTable(tempName)
hsc.sql(s"""
CREATE TABLE $tableName (
// field definitions )
STORED AS $format """)
hsc.sql(s"INSERT INTO TABLE $tableName SELECT * FROM $tempName")
```

Cloudera Bug: CDH-33639

Cannot create Parquet tables containing date fields in Spark SQL

If you create a Parquet table containing date field in Spark SQL, you see the following exception:

```
Exception in thread "main" org.apache.spark.sql.execution.QueryExecutionException:
FAILED: Execution Error, return code 1 from
org.apache.hadoop.hive.ql.exec.DDLTask.java.lang.UnsupportedOperationException: Parquet
does not support date.
at
org.apache.spark.sql.hive.client.ClientWrapper$$anonfun$runHive$1.apply(ClientWrapper.scala:433)
```

This is due to a limitation ([HIVE-6384](#)) in the version of Hive (1.1) included in CDH 5.5.0.

Cloudera Bug: CDH-33640

Spark SQL does not support the union type

Tables containing union fields cannot be read or created using Spark SQL.

Affected Versions: CDH 5.5.0 and higher

Cloudera Bug: CDH-33641

Spark SQL does not respect size limit for the varchar type

Spark SQL treats `varchar` as string (that is, there no size limit). The observed behavior is that Spark reads and writes these columns as regular strings; if inserted values exceed the size limit, no error will occur. The data will be truncated when read from Hive, but not when read from Spark.

Affected Versions: CDH 5.5.0 and higher

Bug: [SPARK-5918](#)

Cloudera Bug: CDH-33642

Spark SQL does not support the char type

Spark SQL does not support the `char` type (fixed-length strings). Like unions, tables with such fields cannot be created from or read by Spark.

Affected Versions: CDH 5.5.0 to CDH 5.6.1

Fixed in Versions: CDH 5.7.0 and higher

Cloudera Bug: CDH-33643

Spark SQL does not support transactional tables

Spark SQL does not support Hive transactions ("ACID").

Affected Versions: CDH 5.5.0 and higher

Cloudera Bug: CDH-33644

Spark SQL does not prevent you from writing key types not supported by Avro tables

Spark allows you to declare DataFrames with any key type. Avro supports only string keys and trying to write any other key type to an Avro table will fail.

Affected Versions: CDH 5.5.0 and higher

Cloudera Bug: CDH-33648

Spark SQL does not support timestamp in Avro tables

Affected Versions: CDH 5.5.0 and higher

Cloudera Bug: CDH-33649

Spark SQL does not support all 'ANALYZE TABLE COMPUTE STATISTICS' syntax

`ANALYZE TABLE <table name> COMPUTE STATISTICS NOSCAN` works. `ANALYZE TABLE <table name> COMPUTE STATISTICS (without noscan)` and `ANALYZE TABLE <table name> COMPUTE STATISTICS FOR COLUMNS` both return errors.

Affected Versions: CDH 5.5.0 and higher

Cloudera Bug: CDH-33650

Spark SQL statements that can result in table partition metadata changes may fail

Because Spark does not have access to Sentry data, it may not know that a user has permissions to execute an operation and instead fail it. SQL statements that can result in table partition metadata changes, for example, "ALTER TABLE" or "INSERT", may fail.

Affected Versions: CDH 5.5.0 to CDH 5.6.1

Fixed in Versions: 5.7.0 and higher

Cloudera Bug: CDH-33446

Spark SQL does not respect Sentry ACLs when communicating with Hive metastore

Even if user is configured via Sentry to not have read permission to a Hive table, a Spark SQL job running as that user can still read the table's metadata directly from the Hive metastore.

Cloudera Bug: CDH-33658

Dynamic allocation and Spark Streaming

If you are using Spark Streaming, Cloudera recommends that you disable dynamic allocation by setting `spark.dynamicAllocation.enabled` to `false` when running streaming applications.

Spark uses Akka version 2.2.3

The CDH 5.5 version of Spark 1.5 differs from the Apache Spark 1.5 release in using Akka version 2.2.3, the version used by Spark 1.1 and CDH 5.2. Apache Spark 1.5 uses Akka version 2.3.11.

Spark standalone mode does not work on secure clusters

Cloudera Bug: CDH-16998, "fixed" by workaround.

Workaround: On secure clusters, run Spark applications on YARN.

Limitation with Region Pruning for HBase Tables

When SparkSQL accesses an HBase table through the HiveContext, region pruning is not performed. This limitation can result in slower performance for some SparkSQL queries against tables that use the HBase SerDes than when the same table is accessed through Impala or Hive.

Input Format Change on `spark.yarn.am.waitTime`

The `spark.yarn.am.waitTime` property does not accept valid input formats, such as "250s".

Affected Versions: CDH 5.10.0 to CDH 5.10.2

Fixed in Versions: CDH 5.10.3, CDH 5.11.3, CDH 5.12.2, CDH 5.13.0 and higher

Workaround: Specify the value in milliseconds without "s" at the end.

History link in ResourceManager web UI broken for killed Spark applications

When a Spark application is killed, the history link in the ResourceManager web UI does not work.

Workaround: To view the history for a killed Spark application, see the Spark HistoryServer web UI instead.

Affected Versions: All CDH versions

Apache Issue: None

Cloudera Issue: CDH-49165

Spark application using dynamic allocation fails with `java.lang.AssertionError`

When dynamic allocation is enabled, Spark applications can fail with a `java.lang.AssertionError: assertion failed` error when the number of running executors exceeds the target number of executors. For example, this can

occur if an application has many small tasks, and Spark requests a large amount of executors before reducing the target, triggering a race condition resulting in an error message similar to the following

```
ERROR yarn.YarnAllocator: Failed to launch executor 16 on container
container_e11_1513498336069_33453_01_000022
java.lang.AssertionError: assertion failed
```

Workaround: Disable dynamic allocation by specifying `spark.dynamicAllocation.enabled=false` for the problematic job.

Affected Versions:

- CDH versions lower than 5.12
- CDH 5.12.0, 5.12.1
- CDH 5.13.0

Fixed Versions:

- CDH 5.12.2
- CDH 5.13.1
- CDH 5.14 and higher

Apache Issue: [SPARK-17511](#)

Cloudera Issue: CDH-56799

Apache Sqoop Known Issues

MySQL JDBC driver shipped with CentOS 6 systems does not work with Sqoop

CentOS 6 systems currently ship with version 5.1.17 of the MySQL JDBC driver. This version does not work correctly with Sqoop.

Bug: None

Affected Versions: MySQL JDBC 5.1.17, 5.1.4, 5.3.0

Cloudera Bug: CDH-23180

Workaround: Install version 5.1.31 of the JDBC driver as detailed in (Sqoop 1) or (Sqoop 2).

MS SQL Server "integratedSecurity" option unavailable in Sqoop

The `integratedSecurity` option is not available in the Sqoop CLI.

Bug: None

Workaround: None

Sqoop 1

Sqoop does not support Hive metastore HA for Parquet format

If the Hive metastore (HMS) is configured for high availability (HA), the value of the `hive.metastore.uris` property in `/etc/hive/conf.cloudera.HIVE-1/hive-site.xml` contains a list of URIs instead of one URI. For example:

```
<value>thrift://hive-1.example.com:9083,thrift://hive-2.example.com:9083,thrift://hive-3.example.com:9083</value>
```

Sqoop uses Kite for Parquet file handling and Kite does not support HMS HA. Using Kite, Sqoop takes the first URI from the `hive.metastore.uris` list and uses that to connect to the HMS. If that address is not available, the Sqoop command fails.

This issue occurs when you use the following Sqoop arguments with the `sqoop-import` command: `--hive-import` and `--as-parquetfile`.

Bug: CDH-57895

Affected Versions: CDH 5.12.x and below.

Fixed in Versions: CDH 5.13 and higher.

Cloudera Bug: CDH-57895

Workaround: None.

Sqoop1 Metastore job tool ignores overrides

Sqoop job command option overrides are being ignored due to SQOOP-2896. The `exec` action should let you override arguments in a saved job by passing `options` after `--`, as in:

```
sqoop job --exec job -- options_to_override>
```

However, the values in `options_to_override` are not being passed to the saved job. Sqoop jobs that use overrides can break or execute incorrectly, as shown in the example below.

```
sqoop job --create my_eval_query -- eval --connect jdbc:mysql://fqdn.example.com:3306/db
--username user --password password --query "select * from t1"
```

This command executes the job defined in `my_eval_query` and returns the rows in the table:

```
sqoop job --exec my_eval_query
c1  c2          c3
1   2017-02-17  row data 1
2   2017-02-17  row data 2
3   2017-02-17  row data 3
```

In this next run below, the override query is ignored. The job uses the original parameters stored for the job and returns the same rows as before rather than the single row where column `c1 = 2`:

```
sqoop job --exec my_eval_query -- --query "select * from t1 where c1 = 2"
c1  c2          c3
1   2017-02-17  row data 1
2   2017-02-17  row data 2 <--- Only this row should be returned
3   2017-02-17  row data 3
```

Affected releases: CDH 5.8.0, 5.8.1, 5.8.3, 5.8.4; CDH 5.9.0, 5.9.1; CDH 5.10.0

Bug: SQOOP-2896

Cloudera Bug: CDH-51101

Fixed in Versions: CDH 5.8.5, CDH 5.9.2, CDH 5.9.3, CDH 5.10.1, CDH 5.10.2, CDH 5.11.0 (and higher) releases.

Sqoop1 (doc import + --as-parquetfile) limitation with KMS/KTS Encryption at Rest

Due to a limitation with Kite SDK, it is not possible to use (sqoop import --as-parquetfile) with KMS/KTS Encryption zones. See the following example.

```
sqoop import --connect jdbc:db2://djaxludb1001:61035/DBAT003 --username=dh810202 --P
--target-dir /data/hive_scratch/ASDISBURSEMENT --delete-target-dir -m1 --query "select
disbursementnumber,disbursementdate,xmldata FROM DB2dba.ASDISBURSEMENT where
DISBURSEMENTNUMBER = 2011113210000115311 AND \${CONDITIONS}" -hive-import --hive-database
adminserver -hive-table asdisbursement_dave --map-column-java XMLDATA=String
--as-parquetfile

16/12/05 12:23:46 INFO mapreduce.Job: map 100% reduce 0%

can't be moved into an encryption zone.
```

Cloudera Bug: CDH-40826 and SQOOP-2943

Workaround: Use an alternate data file type, for example text or avro.

[Doc import as Parquet files may result in out-of-memory errors](#)

Out-of-memory (OOM) errors can be caused in the following two cases:

- With many very large rows (multiple megabytes per row) before initial-page-run check (ColumnWriter)
- When rows vary significantly by size so that the next-page-size check is based on small rows and is set very high followed by many large rows

Bug: PARQUET-99

Cloudera Bug: CDH-50896

Workaround: None, other than restructuring the data.

[Hive, Pig, and Sqoop 1 fail in MRv1 tarball due to incorrect HADOOP_MAPRED_HOME setting](#)

This issue affects tarball installations only.

Bug: None

Cloudera Bug: CDH-6640. Fixed for packages only: CDH-6648.

Workaround: For MRv1 only, manually edit as follows:

- Change the path for the Hadoop MapReduce home setting in `/etc/default/hadoop` from:

```
export HADOOP_MAPRED_HOME=/usr/lib/hadoop-mapreduce
```

to:

```
export HADOOP_MAPRED_HOME=/usr/lib/hadoop-0.20-mapreduce
```

- Remove `/usr/lib/hadoop-mapreduce` from the `HADOOP_CLASSPATH`.

[Sqoop 2](#)

[Sqoop 2 client cannot be used with a different version of the Sqoop 2 server](#)

The Sqoop 2 client and server must be running the same CDH version.

Cloudera Bug: CDH-11901

Workaround: Make sure all Sqoop 2 components are running the same version of CDH.

[Sqoop 2 upgrade may fail if any job's source and destination links point to the same connector](#)

For example, the links for the job shown in the following output both point to `generic-jdbc-connector`:

```

Cloudera Bug: CDH-27779

Workaround: Before upgrading, make sure no jobs have source and destination links that point to the same connector.

Apache Phoenix Known Issues

Potential deadlock on region opening with secondary index recovery

Distributed deadlock happens in clusters with a moderate number of regions for the data tables, secondary index tables.

Products affected: Phoenix

Releases affected: Phoenix 4.14.1 parcel

User affected: Users of Phoenix with secondary indexes

Severity (Low/Medium/High): Medium

Impact: Deadlock on region opening

Immediate action required/workaround:

Make the following configuration changes in HBase:

- 1) Set `hbase.master.startup.retainassign` to `false`
- 2) Increase the value of `hbase.regionserver.executor.openregion.threads` and restart cluster should bring up cluster.

If you continue to encounter issues, tune the following assignment manager parameters to match the count of regions for faster assignments:

- `hbase.assignment.threads.max`
- `hbase.master.namespace.init.timeout`

- `hbase.master.wait.on.regionserver.mintostart`
- `hbase.bulk.assignment.threshold.regions`
- `hbase.bulk.assignment.threshold.servers`

Apache ZooKeeper Known Issues

ZooKeeper JMX did not support TLS when managed by Cloudera Manager

The ZooKeeper service optionally exposes a JMX port used for reporting and metrics. By default, Cloudera Manager enables this port, but prior to Cloudera Manager 6.1.0, it did not support mutual TLS authentication on this connection. While JMX has a password-based authentication mechanism that Cloudera Manager enables by default, weaknesses have been found in the authentication mechanism, and Oracle now advises JMX connections to enable mutual TLS authentication in addition to password-based authentication. A successful attack may leak data, cause denial of service, or even allow arbitrary code execution on the Java process that exposes a JMX port. Beginning in Cloudera Manager 6.1.0, it is possible to configure mutual TLS authentication on ZooKeeper's JMX port.

Products affected: ZooKeeper

Releases affected: Cloudera Manager 6.1.0 and lower, Cloudera Manager 5.16 and lower

Users affected: All

Date/time of detection: June 7, 2018

Severity (Low/Medium/High): 9.8 High ([CVSS:3.0/AV:N/AC:L/PR:N/UI:N/S:U/C:H/I:H/A:H](#))

Impact: Remote code execution

CVE: CVE-2018-11744

Immediate action required: Upgrade to Cloudera Manager 6.1.0 and enable TLS for the ZooKeeper JMX port by turning on the configuration settings "Enable TLS/SSL for ZooKeeper JMX" and "Enable TLS client authentication for JMX port" on the ZooKeeper service and configuring the appropriate TLS settings. Alternatively, disable the ZooKeeper JMX port via the configuration setting "Enable JMX Agent" on the ZooKeeper service.

Note: Disabling the ZooKeeper JMX port prevents Cloudera Manager from performing health checks on the ZooKeeper service.

Addressed in release/refresh/patch: Cloudera Manager 6.1.0

Adding New ZooKeeper Servers Can Lead to Data Loss

When the number of new ZooKeeper servers exceeds the number that already exist in the ZooKeeper service (for example, if you increase the number of servers from 1 to 3), and a Start command is immediately issued to the ZooKeeper service, the new servers can form a quorum, which causes data loss in existing servers.

Users of the following versions of Cloudera Manager are affected:

5.0.0–5.0.5, 5.1.0–5.1.4, 5.2.0–5.2.4, and 5.3.0–5.3.2

Workaround: If you use a version of Cloudera Manager listed above, upgrade to the next available maintenance release with the bug fix (within the minor version), or to Cloudera Manager 5.4.

The ZooKeeper server cannot be migrated from version 3.4 to 3.3, then back to 3.4, without user intervention.

Upgrading from 3.3 to 3.4 is supported, as is downgrading from 3.4 to 3.3. However, moving from 3.4 to 3.3 and back to 3.4 will fail. 3.4 is checking the `datadir` for `acceptedEpoch` and `currentEpoch` files and comparing these against the snapshot and log files contained in the same directory. These epoch files are new in 3.4.

As a result: 1) Upgrading from 3.3 to 3.4 is fine - the `*Epoch` files do not exist, and the server creates them. 2) Downgrading from 3.4 to 3.3 is also fine as version 3.3 ignores the `*Epoch` files. 3) Going from 3.4 to 3.3 then back to 3.4 fails because 3.4 sees invalid `*Epoch` files in the `datadir`; 3.3 will have ignored them, applying changes to the snapshot and log files without updating the `*Epoch` files.

Bug: [ZOOKEEPER-1149](#)

Cloudera Bug: CDH-5272

Anticipated Resolution: See workaround

Workaround: Delete the *Epoch files if this situation occurs — the version 3.4 server will recreate them as in case 1) above.

Issues Fixed in CDH 5

Note: For links to the detailed change lists that describe the bug fixes and improvements to all of the CDH 5 projects, including bug-fix reports for the corresponding upstream Apache projects, see the packaging section of [CDH Version and Packaging Information](#).

Issues Fixed in CDH 5.16.x

The following topics describe issues fixed in CDH 5.16.x, from newest to oldest release. You can also review [What's New in Cloudera Documentation](#) or [Known issues in CDH 5](#) for more information. Note that there was no CDH release numbered 5.16.0.

Issues Fixed in CDH 5.16.2

CDH 5.16.2 fixes the following issues:

XSS Cloudera Manager

Malicious Impala queries can result in Cross Site Scripting (XSS) when viewed in Cloudera Manager.

Products affected: Apache Impala

Releases affected:

- Cloudera Manager 5.13.x, 5.14.x, 5.15.1, 5.15.2, 5.16.1
- Cloudera Manager 6.0.0, 6.0.1, 6.1.0

Users affected: All Cloudera Manager Users

Date/time of detection: November 2018

Severity (Low/Medium/High): High

Impact: When a malicious user generates a piece of JavaScript in the impala-shell and then goes to the Queries tab of the Impala service in Cloudera Manager, that piece of JavaScript code gets evaluated, resulting in an XSS.

CVE: CVE-2019-14449

Immediate action required: There is no workaround, upgrade to the latest available maintenance release.

Addressed in release/refresh/patch:

- Cloudera Manager 5.16.2
- Cloudera Manager 6.0.2, 6.1.1, 6.2.0, 6.3.0

Timestamp type-casted to varchar in a binary predicate can produce incorrect result

In an Impala query the timestamp can be type-casted to a varchar of smaller length to convert a timestamp value to a date string. However, if such Impala query is used in a binary comparison against a string literal, it can produce incorrect results, because of a bug in the expression rewriting code. The following is an example of this:

```
> select * from (select cast('2018-12-11 09:59:37' as timestamp) as ts) tbl where cast(ts as varchar(10)) = '2018-12-11';
```

The output will have 0 rows.

Products affected: Apache Impala

Releases affected:

- CDH 5.15.0, 5.15.1, 5.15.2, 5.16.0, 5.16.1
- CDH 6.0.0, 6.0.1, 6.1.0, 6.1.1

For the latest update on this issue see the corresponding Knowledge article: [TSB 2019-358: Timestamp type-casted to varchar in a binary predicate can produce incorrect result](#)

Inconsistent rows returned from queries in Kudu

Due to KUDU-2463, upon restarting Kudu, inconsistent rows may be returned from tables that have not recently been written to, resulting in any of the following:

- multiple rows for the same key being returned
- deleted data being returned
- inconsistent results consistently being returned for the same query

If this happens, you have two options to resolve the conflicts: write to the affected Kudu partitions by:

- re-deleting the known and deleted data
- upserting the most up-to-date version of affected rows.

Products affected: Apache Kudu

Releases affected:

- CDH 5.12.2, 5.13.3, 5.14.4, 5.15.1, 5.16.1
- CDH 6.0.1, 6.1.0, 6.1.1

For the latest update on this issue see the corresponding Knowledge article: [TSB 2019-353: Inconsistent rows returned from queries in Kudu](#)

Upstream Issues Fixed

The following upstream issues are fixed in CDH 5.16.2:

Apache Flume

- [FLUME-2973](#) - Deadlock in hdfs sink.
- [FLUME-3223](#) - Flume HDFS Sink should retry close prior recover lease.

Apache Hadoop

- [HADOOP-15442](#) - ITestS3AMetrics.testMetricsRegister should not know the name of the metrics source.
- [HDFS-11751](#) - DFSZKFailoverController daemon exits with the wrong status code.
- [HDFS-12683](#) - DFSZKFailOverController re-order logic for logging exception.
- [HDFS-14111](#) - hdfsOpenFile on HDFS causes unnecessary IO from file offset 0
- [MAPREDUCE-6382](#) - HTML links in the Diagnostics in JHS job overview must not be escaped.
- [MAPREDUCE-7125](#) - JobResourceUploader creates LocalFileSystem when it's not necessary.
- [MAPREDUCE-7131](#) - Job History Server has race condition where it moves files from intermediate to finished but thinks file is in intermediate.
- [YARN-4227](#) - Ignore expired containers from the removed nodes in FairScheduler.
- [YARN-4677](#) - RMNodeResourceUpdateEvent update from scheduler can lead to race condition.

Apache HBase

- [HBASE-16810](#) - HBase Balancer throws ArrayIndexOutOfBoundsException when regionservers are in /hbase/draining znode and unloaded
- [HBASE-17510](#) - DefaultMemStore gets the wrong heap size after rollback
- [HBASE-19730](#) - Backport HBASE-14497 Reverse Scan threw StackOverflow caused by readPt checking
- [HBASE-20604](#) - ProtobufLogReader#readNext can incorrectly loop to the same position in the stream until the the WAL is rolled

- [HBASE-21275](#) - Disable TRACE HTTP method for thrift http server
- [HBASE-21546](#) - ConnectException in TestThriftHttpServer

Apache Hive

- [HIVE-12476](#) - Metastore NPE on Oracle with Direct SQL
- [HIVE-13278](#) - Avoid FileNotFoundException when map/reduce.xml is not available
- [HIVE-13394](#) - Analyze table fails in Tez on empty partitions
- [HIVE-13592](#) - metastore calls map is not thread safe
- [HIVE-14557](#) - Nullpointer When both SkewJoin and Mapjoin Enabled
- [HIVE-14560](#) - Support exchange partition between S3 and HDFS tables
- [HIVE-14690](#) - Query fail when hive.exec.parallel=true, with conflicting session dir
- [HIVE-16839](#) - Unbalanced calls to openTransaction/commitTransaction when altering the same partition concurrently
- [HIVE-18778](#) - Needs to capture input/output entities in explain
- [HIVE-20331](#) - Query with union all, lateral view and Join fails with "cannot find parent in the child operator"
- [HIVE-20678](#) - HiveHBaseTableOutputFormat should implement HiveOutputFormat to ensure compatibility
- [HIVE-20695](#) - HoS Query fails with hive.exec.parallel=true
- [HIVE-21028](#) - get_table_meta should use a fetch plan to avoid race conditions ending up in NucleusObjectNotFoundException
- [HIVE-21044](#) - Improvements to HMS metrics
- [HIVE-21045](#) - Add connection pool info and rolling performance info to the metrics system

Hue

- [HUE-8388](#) - [oozie] Make Hue create a new workspace when importing an Oozie workflow instead of using the "deployment_dir" field
- [HUE-8450](#) - [editor] Embedded mode improvements for previous Hue version
- [HUE-8458](#) - [frontend] Improve application loading performance
- [HUE-8468](#) - [frontend] Dynamically adding styles in embedded mode fails in Internet Explorer (throws a Java script exception)
- [HUE-8584](#) - [useradmin] Errors returned for Add Sync Ldap Group
- [HUE-8585](#) - [useradmin] Errors returned for Add Sync Ldap Users
- [HUE-8631](#) - HBase is not accessible by way of the Hue server; instead returns "API Error."
- [HUE-8660](#) - [core] File browser cannot view files containing a hash (#) in the name
- [HUE-8691](#) - [useradmin] Attempting to add/sync group will not add users if the objectClass posixGroup exists in the LDAP entry
- [HUE-8692](#) - [useradmin] Group sync fails if all group members are not found with error "No such object"
- [HUE-8693](#) - [useradmin] Security application only displays 100 users in the impersonation list
- [HUE-8705](#) - [oozie] Hidden popup window is blocking the Query drop-down menu and the search box
- [HUE-8709](#) - [useradmin] Black transparent screen remains after confirmation modal is hidden
- [HUE-8746](#) - [pig] Add hcat support to the Pig Editor in Hue

Hue allows unsigned SAML assertions

If Hue receives an unsigned assertion, it continues to process it as valid. This means it is possible for an end-user to forge or remove the signature and manipulate a SAML assertion to gain access without a successful authentication.

Products affected: Hue, CDH

Releases affected:

- CDH 5.15.x and earlier
- CDH 5.16.0, 5.16.1
- CDH 6.0.x
- CDH 6.1.x

User affected: All users who are using SAML with Hue.

CVE: CVE-2019-14775

Date/time of detection: January 2019

Detected by: Joel Snape

Severity (Low/Medium/High): High

Impact:

This is a significant security risk as it allows anyone to fake their access validity and therefore access Hue, even if they should not have access. In more detail: if Hue receives an unsigned assertion, it continues to process it as valid. This means it is possible for an end-user to forge or remove the signature and manipulate a SAML assertion to gain access without a successful authentication.

CVE: CVE-2019-14775

Immediate action required:

- **Upgrade (recommended):** Upgrade to a version of CDH containing the fix.
- **Workaround:** None

Addressed in release/refresh/patch:

- CDH 5.16.2
- CDH 6.2.0

Apache Impala

- [IMPALA-6323](#) - Impala now supports a constant in the window specifications.
- [IMPALA-7960](#) - Impala now returns a correct result when comparing `TIMESTAMP` to a string literal in a binary predicate where the `TIMESTAMP` is casted to `VARCHAR` of smaller length.
- [IMPALA-7961](#) - Fixed an issue where queries running with the `SYNC_DDL` query option can fail when the Catalog Server is under a heavy load with concurrent catalog operations of long-running DDLs.
- [IMPALA-8058](#) - Fixed cardinality estimates for HBase queries, which could sometimes yield hugely high numbers.
- [IMPALA-8109](#) - Impala can now read the gzip files bigger than 2 GB.
- [IMPALA-8212](#) - Fixed a race condition in the Kerberos authentication code.

Kite

- [KITE-1185](#) - Make root temp directory path configurable in `HiveAbstractDatasetRepository`

Apache Kudu

- [KUDU-1678](#) - Fixed a crash caused by a race condition between altering tablet schemas and deleting tablet replicas.
- [KUDU-2195](#) - Now you can use the `--cmeta_force_fsync` flag to `fsync` Kudu's consensus metadata more aggressively. Setting this to `true` may decrease Kudu's performance, but will improve its durability in the face of power failures and forced shutdowns. The issue was much more likely to happen when Kudu was running on XFS.
- [KUDU-2463](#) - Fixed an issue in which incorrect results would be occasionally returned in scans following a server restart.
- [CDH-76920](#) - Fixed the issue where the Kudu CLI crashes when running the `'kudu cluster rebalance'` sub-command on some platforms.

Apache Oozie

- [OOZIE-3382](#) - Implement and backport `Optimize SshActionExecutor's drainBuffers` method

Apache Pig

- [PIG-5373](#) - `InterRecordReader` might skip records if certain sync markers are used
- [PIG-5374](#) - Use `CircularFifoBuffer` in `InterRecordReader`

Apache Sentry

- [SENTRY-2205](#) - Improve Sentry NN Logging.
- [SENTRY-2301](#) - Log where sentry stands in the snapshot fetching process, periodically

- [SENTRY-2372](#) - SentryStore should not implement grantOptionCheck
- [SENTRY-2419](#) - Log where sentry stands in the process of persisting the snapshot
- [SENTRY-2427](#) - PortUse Hadoop KerberosName class to derive shortName
- [SENTRY-2428](#) - Skip null partitions or partitions with null sds entries
- [SENTRY-2437](#) - PortWhen granting privileges a single transaction per grant causes long delays
- [SENTRY-2490](#) - PortWhen building a full perm update for each object we only build 1 privilege per role
- [SENTRY-2498](#) - Exception while deleting paths that does't exist
- [SENTRY-2502](#) - Modified BackportSentry NN plug-in stops fetching updates from sentry server.
- [SENTRY-2511](#) - Debug level logging on HMSPaths significantly affects performance

Apache Spark

- [SPARK-4224](#) - [CORE][YARN] Support group acls
- [SPARK-19019](#) - [PYTHON][BRANCH-1.6] Fix hijacked `collections.namedtuple` and port cloudpickle changes for PySpark to work with Python 3.6.0

Apache Zookeeper

- [ZOOKEEPER-1392](#) - Request READ or ADMIN permission for getAcl()
- [ZOOKEEPER-2141](#) - ACL cache in DataTree never removes entries

Issues Fixed in CDH 5.16.1

CDH 5.16.1 fixes the following issues:

CVE-2019-10099: Apache Spark local files left unencrypted

Certain operations in Spark leave local files unencrypted on disk, even when local file encryption is enabled with “spark.io.encryption.enabled”.

This includes cached blocks that are fetched to disk (controlled by `spark.maxRemoteBlockSizeFetchToMem`) in the following cases:

- In SparkR when parallelize is used
- In Pyspark when broadcast and parallelize are used
- In Pyspark when python udfs is used

Products affected:

- CDH
- CDS Powered by Apache Spark

Affected versions:

- CDH 5.15.1 and earlier
- CDH 6.0.0
- CDS 2.1.0 release 1 and release 2
- CDS 2.2.0 release 1 and release 2
- CDS 2.3.0 release 3

Users affected: All users who run Spark on CDH and CDS in a multi-user environment.

Date/time of detection: July 2018

Severity (Low/Medium/High): 6.3 Medium ([CVSS AV:L/AC:H/PR:N/UI:R/S:U/C:H/I:H/A:N](#))

Impact: Unencrypted data accessible.

CVE: CVE-2019-10099

Immediate action required: Upgrade to a version of CDH containing the fix.

Workaround: Do not use of pyspark and the fetch-to-disk options.

Fixed versions:

- CDH 5.15.2
- CDH 5.16.0
- CDH 6.0.1
- CDS 2.1.0 release 3
- CDS 2.2.0 release 3
- CDS 2.3.0 release 4

For the latest update on this issue see the corresponding Knowledge article: [TSB 20210-336: Apache Spark local files left unencrypted](#)

[CVE-2018-1296 Permissive Apache Hadoop HDFS listXAttr Authorization Exposes Extended Attribute Key/Value Pairs](#)

AHDFS exposes extended attribute key/value pairs during listXAttrs, verifying only path-level search access to the directory rather than path-level read permission to the referent.

Products affected: Apache HDFS

Releases affected:

- CDH 5.4.0 - 5.15.1, 5.16.0
- CDH 6.0.0, 6.0.1, 6.1.0

Users affected: Users who store sensitive data in extended attributes, such as users of HDFS encryption.

Date/time of detection: December 12, 2017

Detected by: Rushabh Shah, Yahoo! Inc., Hadoop committer

Severity (Low/Medium/High): Medium

Impact: HDFS exposes extended attribute key/value pairs during listXAttrs, verifying only path-level search access to the directory rather than path-level read permission to the referent. This affects features that store sensitive data in extended attributes.

CVE: CVE-2018-1296

Immediate action required:

- Upgrade: Update to a version of CDH containing the fix.
- Workaround: If a file contains sensitive data in extended attributes, users and admins need to change the permission to prevent others from listing the directory that contains the file.

Addressed in release/refresh/patch:

- CDH 5.15.2, 5.16.1
- CDH 6.1.1, 6.2.0

[Apache Tomcat Vulnerability CVE-2018-11784](#)

Fixed a vulnerability in Apache Tomcat where specially-crafted URLs could be used to redirect to any given URI. CVE-2018-11784.

Cloudera Issue: CDH-73885

[Cloudera Search restore operation puts shard replicas on same host](#)

Restoring an Apache Solr collection sometimes places all shard replicas on the same host.

Cloudera Issue: CDH-68828

[Missing authorization in Apache Impala may allow data injection](#)

A malicious user who is authenticated with Kerberos may have unauthorized access to internal services used by Impala to transfer intermediate data during query execution. If details of a running query (e.g. query ID, query plan) are available, a user can craft some RPC requests with custom software to inject data into a running query or end query execution prematurely, leading to wrong results of the query.

Cloudera Issue: CDH-72373 / TSB-338

CVE: CVE-2018-11785

Upstream Issues Fixed

The following upstream issues are fixed in CDH 5.16.1:

Apache Hadoop

- [HADOOP-13426](#) - Improved IPC performance.
- [HADOOP-13483](#) - Fixed an issue where file-create overwrote directories instead of throwing error messages
- [HADOOP-15473](#) - Configured the serialFilter in KeyProvider to avoid UnrecoverableKeyException caused by JDK-8189997
- [HADOOP-15655](#) - Enhanced KMS client retry behavior. Previously, the KMS did not retry upon SocketTimeoutException.
- [HDFS-8229](#) - Fixed an issue where the LAZY_PERSIST file gets deleted after NameNode restart.
- [HDFS-10240](#) - Fixed a race between close/recoverLease leads to missing block
- [HDFS-12299](#) - Fixed a race between update pipeline and DN Re-Registration
- [HDFS-13051](#) - Fixed a dead lock during async editlog rolling if the edit queue is full.
- [HDFS-13322](#) - Fixed an issue where the UID persists when switching between ticket caches.
- [HDFS-13486](#) - Fixed an issue where a faulty node can cause a lease leak and NPE on accessing data.
- [HDFS-13601](#) - Optimized ByteString conversions in PBHelper.
- [HDFS-13611](#) - Fixed an issue where text was used as a ConcurrentHashMap key in PBHelperClient.
- [HDFS-13813](#) - Added a check to see if a child inode exists in the global FSDirectory directory when saving (serializing) INodeDirectorySection.
- [MAPREDUCE-7053](#) - Fixed an issue where Timed out tasks can fail to produce thread dump
- [YARN-6966](#) - Fixed an issue where NodeManager metrics may return wrong negative values when NM restart.
- [YARN-6967](#) - Fixed an issue where the limit for diagnostic message size was not honored
- [YARN-8436](#) - Fixed an issue where the ResourceManager can fail while sorting queues if an update comes in

Apache HBase

- [HBASE-15232](#) - Handle region location cache mgmt in AsyncProcess for multi()'s
- [HBASE-15390](#) - Unnecessary MetaCache evictions cause elevated number of requests to meta
- [HBASE-18891](#) - Upgrade to netty-all 4.0.50.Final
- [HBASE-19924](#) - hbase rpc throttling does not work for multi() with request count rater.
- [HBASE-20493](#) - Port HBASE-19994 (Create a new class for RPC throttling exception, make it retryable) to branch-1
- [HBASE-20651](#) - Master, prevents hbck or shell command to reassign the split parent region
- [HBASE-20723](#) - Custom hbase.wal.dir results in data loss because we write recovered edits into a different place than where the recovering region server looks for them
- [HBASE-20997](#) - rebuildUserRegions() does not build ReplicaMapping during master switchover

Apache Hive

Code Changes Should Not Be Required

The following fixes should not require code changes, but they contain improvements that might enhance your deployment:

- [HIVE-6980](#) - Drop table by using direct sql
- [HIVE-10296](#) - Cast exception observed when hive runs a multi join query on metastore (postgres), since postgres pushes the filter into the join, and ignores the condition before applying cast
- [HIVE-12981](#) - ThriftCLIService uses incompatible getShortName() implementation
- [HIVE-15237](#) - Propagate Spark job failure to Hive
- [HIVE-15860](#) - RemoteSparkJobMonitor may hang when RemoteDriver exits abnormally
- [HIVE-16483](#) - HoS should populate split related configurations to HiveConf
- [HIVE-17213](#) - HoS file merging doesn't work for union all
- [HIVE-18031](#) - Support replication for Alter Database operation
- [HIVE-18283](#) - Better error message and error code for HoS exceptions

- [HIVE-18765](#) - SparkClientImpl swallows exception messages from the RemoteDriver
- [HIVE-18916](#) - SparkClientImpl doesn't error out if spark-submit fails
- [HIVE-19259](#) - Create view on tables having union all fail with 'Table not found'
- [HIVE-19310](#) - Metastore: MetaStoreDirectSql.ensureDbInit has some slow DN calls which might need to be run only in test env
- [HIVE-19371](#) - Add table ownerType to HMS thrift API
- [HIVE-19372](#) - Add table ownerType to JDO/SQL and ObjectStore
- [HIVE-19374](#) - Parse and process ALTER TABLE SET OWNER command syntax
- [HIVE-19605](#) - TAB_COL_STATS table has no index on db/table name
- [HIVE-19668](#) - Over 30% of the heap wasted by duplicate org.antlr.runtime.CommonToken's and duplicate strings
- [HIVE-19783](#) - Retrieve only locations in HiveMetaStore.dropPartitionsAndGetLocations
- [HIVE-20183](#) - Inserting from bucketed table can cause data loss, if the source table contains empty bucket
- [HIVE-20345](#) - Drop database may hang if the tables get deleted from a different call

Hue

- [HUE-8118](#) - [core] Fine grain tracking of the memory usage
- [HUE-8118](#) - [core] The duration of the request is always shown even when instrumentation flag is off
- [HUE-8128](#) - [backend] Force debug logging in server logs does not get all debug
- [HUE-8162](#) - [core] Add delete operation to the right document assist
- [HUE-8177](#) - [oozie] Add a config check for /user/hue/oozie/workspaces
- [HUE-8377](#) - [security] Support new Sentry finer grain privileges
- [HUE-8377](#) - [security] Correctly apply the new permissions to the database scope
- [HUE-8451](#) - [notebook] Many "codec can't decode byte" errors on pig execution if browser language=jp
- [HUE-8464](#) - [core] Fix SAML encryption missing key file passphrase
- [HUE-8467](#) - [jobbrowser] Support impala digest auth for queries
- [HUE-8475](#) - [report] Protect against pivot conflicting with nested facets
- [HUE-8476](#) - [frontend] Fix jQuery Hive autocomplete column mapping
- [HUE-8487](#) - [useradmin] Fix Add Sync LDAP user fails when using DN with special character
- [HUE-8505](#) - [core] Close impala session on logout
- [HUE-8519](#) - [jb] Impala API can now directly return json
- [HUE-8558](#) - [jb] Add tracking URL to Spark Jobs and remove url and killUrl
- [HUE-8564](#) - [useradmin] Fix last activity update for jobbrowser/api/jobs requests
- [HUE-8564](#) - [useradmin] Fix last activity update for notebook/api/check_status
- [HUE-8571](#) - [sentry] navigator_api ERROR for PRIVILEGE_HIERARCHY[hierarchy[server][SENTRY_PRIVILEGE_KEY]['action']]
- [HUE-8602](#) - [sentry] Remove ALTER and DROP in the Hive section

Apache Impala

- [IMPALA-6086](#) - Require the SELECT privilege on the database for built-in function calls.
- [IMPALA-6451](#) - Fixed the AuthorizationException in CTAS for Kudu tables.
- [IMPALA-6479](#) - DESCRIBE now respects column level privileges and only shows the columns that the user has the privilege to view.
- [IMPALA-6571](#) - Fixed the NullPointerException in SHOW CREATE TABLE for HBase tables.
- [IMPALA-7225](#) - REFRESH..PARTITION no longer reset the number of rows in a partition.
- [IMPALA-7272](#) - Fixed the crash in StringMinMaxFilter.
- [IMPALA-7360](#) - Fixed an issue where Avro scanner sometimes skipped blocks when skip marker was on HDFS block boundary.
- [IMPALA-7419](#) - Fixed the NullPointerException in SimplifyConditionalsRule.
- [IMPALA-7483](#) - impalad/catalogd on JVM deadlock now get aborted.
- [IMPALA-7520](#) - Fixed the NullPointerException in SentryProxy.

Apache Kudu

- [KUDU-2260](#) - Fixed a rare issue where system failure could leave unexpected null bytes at the end of metadata files, causing Kudu to be unable to restart.
- [KUDU-2364](#) - Fixed an issue when a tablet server was wiped and recreated with the same RPC address, ksck listed it twice, both as healthy, even though only one of them was there.
- [KUDU-2412](#) - The kudu-python client can now compile in environments where `__int128` is not supported. This was most commonly el6 environments.
- [KUDU-2509](#) - Fixed an issue that might result in a crash of a tablet server in case of a WAL replay error while bootstrapping a tablet.
- [KUDU-2580](#) - Fixed authentication token reacquisition in the C++ client.
- Fixed an issue that caused the kudu CLI tool to unexpectedly exit when the connection to the master or tserver was abruptly closed.

Apache Oozie

- [OOZIE-2457](#) - Oozie log parsing regex consume more than 90% cpu
- [OOZIE-3193](#) - Applications are not killed when submitted via subworkflow
- [OOZIE-3354](#) - [core] [SSH action] SSH action gets hung
- [OOZIE-3370](#) - Property filtering is not consistent across job submission

Apache Pig

The following issues are fixed in CDH 6.1.1:

- [PIG-5373](#) - InterRecordReader might skip records if certain sync markers are used
- [PIG-5374](#) - Use CircularFifoBuffer in InterRecordReader

Apache Sentry

- [SENTRY-1272](#) - Enable ALTERVIEW_RENAME and ALTERVIEW_AS operation in hive binding
- [SENTRY-2194](#) - Upgrade Sentry hadoop-version dependency to 2.7.5
- [SENTRY-2210](#) - AUTHZ_PATH should have index on the foreign key AUTHZ_OBJ_ID
- [SENTRY-2214](#) - Sentry should not allow URI grants to EMPTY or NULL locations
- [SENTRY-2219](#) - Create index AUTHZ_PATH_FK_IDX at table AUTHZ_PATH only when it does not exist for Oracle
- [SENTRY-2238](#) - Explicitly set Database on SentryHivePrivilegeObjectDesc
- [SENTRY-2299](#) - NPE In Sentry HDFS Sync Plugin
- [SENTRY-2310](#) - Sentry is not be able to fetch full update subsequently, when there is HMS restart in the snapshot process.
- [SENTRY-2332](#) - Load hadoop default configuration when starting sentry service
- [SENTRY-2333](#) - Create index AUTHZ_PATH_FK_IDX at table AUTHZ_PATH for Postgres only when it does not exist
- [SENTRY-2403](#) - Incorrect naming in RollingFileWithoutDeleteAppender
- [SENTRY-2406](#) - Make sure inputHierarchy and outputHierarchy have unique values

Apache Solr

- [SOLR-12290](#) - Do not close any servlet streams and improve our servlet stream closing prevention code for users and devs.
- [SOLR-12293](#) - Updates need to use their own connection pool to maintain connection reuse and prevent spurious recoveries.

Apache Spark

- [SPARK-22864](#) - [CORE] Disable allocation schedule in ExecutorAllocationManagerSuite.
- [SPARK-25253](#) - [PYSPARK] Refactor local connection & auth code
- [SPARK-25318](#) - Add exception handling when wrapping the input stream during the the fetch or stage retry in response to a corrupted block

Apache Zookeeper

- [ZOOKEEPER-706](#) - Large numbers of watches can cause session re-establishment to fail
- [ZOOKEEPER-1382](#) - Zookeeper server holds onto dead/expired session ids in the watch data structures

Issues Fixed in CDH 5.15.x

The following topics describe issues fixed in CDH 5.15.x, from newest to oldest release. You can also review [What's New in CDH 5.15.x](#) on page 1814 or [Known Issues in CDH 5](#) on page 1944.

Issues Fixed in CDH 5.15.2

CVE-2019-10099: Apache Spark local files left unencrypted

Certain operations in Spark leave local files unencrypted on disk, even when local file encryption is enabled with “spark.io.encryption.enabled”.

This includes cached blocks that are fetched to disk (controlled by `spark.maxRemoteBlockSizeFetchToMem`) in the following cases:

- In SparkR when parallelize is used
- In Pyspark when broadcast and parallelize are used
- In Pyspark when python udfs is used

Products affected:

- CDH
- CDS Powered by Apache Spark

Affected versions:

- CDH 5.15.1 and earlier
- CDH 6.0.0
- CDS 2.1.0 release 1 and release 2
- CDS 2.2.0 release 1 and release 2
- CDS 2.3.0 release 3

Users affected: All users who run Spark on CDH and CDS in a multi-user environment.

Date/time of detection: July 2018

Severity (Low/Medium/High): 6.3 Medium ([CVSS AV:L/AC:H/PR:N/UI:R/S:U/C:H/I:H/A:N](#))

Impact: Unencrypted data accessible.

CVE: CVE-2019-10099

Immediate action required: Upgrade to a version of CDH containing the fix.

Workaround: Do not use of pyspark and the fetch-to-disk options.

Fixed versions:

- CDH 5.15.2
- CDH 5.16.0
- CDH 6.0.1
- CDS 2.1.0 release 3
- CDS 2.2.0 release 3
- CDS 2.3.0 release 4

For the latest update on this issue see the corresponding Knowledge article: [TSB 20210-336: Apache Spark local files left unencrypted](#)

[CVE-2018-1296 Permissive Apache Hadoop HDFS listXAttr Authorization Exposes Extended Attribute Key/Value Pairs](#)

AHDFS exposes extended attribute key/value pairs during listXAttrs, verifying only path-level search access to the directory rather than path-level read permission to the referent.

Products affected: Apache HDFS

Releases affected:

- CDH 5.4.0 - 5.15.1, 5.16.0
- CDH 6.0.0, 6.0.1, 6.1.0

Users affected: Users who store sensitive data in extended attributes, such as users of HDFS encryption.

Date/time of detection: December 12, 2017

Detected by: Rushabh Shah, Yahoo! Inc., Hadoop committer

Severity (Low/Medium/High): Medium

Impact: HDFS exposes extended attribute key/value pairs during listXAttrs, verifying only path-level search access to the directory rather than path-level read permission to the referent. This affects features that store sensitive data in extended attributes.

CVE: CVE-2018-1296

Immediate action required:

- Upgrade: Update to a version of CDH containing the fix.
- Workaround: If a file contains sensitive data in extended attributes, users and admins need to change the permission to prevent others from listing the directory that contains the file.

Addressed in release/refresh/patch:

- CDH 5.15.2, 5.16.1
- CDH 6.1.1, 6.2.0

[Missing authorization in Apache Impala may allow data injection](#)

A malicious user who is authenticated with Kerberos may have unauthorized access to internal services used by Impala to transfer intermediate data during query execution. If details of a running query (e.g. query ID, query plan) are available, a user can craft some RPC requests with custom software to inject data into a running query or end query execution prematurely, leading to wrong results of the query.

Cloudera Issue: CDH-72373 / TSB-338

CVE: CVE-2018-11785

[Upstream Issues Fixed](#)

The following upstream issues are fixed in CDH 5.15.2:

Apache Hadoop

- [HADOOP-15473](#) - Enhanced serialFilter in KeyProvider to avoid UnrecoverableKeyException caused by JDK-8189997.
- [HADOOP-15655](#) - Enhanced KMS client retry behavior.
- [HDFS-10240](#) - Fixed an issue where a race between close/recoverLease leads to missing blocks.
- [HDFS-12299](#) - Fixed a race between update pipeline and DataNode Re-Registration.
- [HDFS-13322](#) - Fixed an issue with fuse dfs that caused the UID to persist when switching between ticket caches.
- [HDFS-13486](#) - Backport HDFS-11817 to fix an issue where a faulty node can cause a lease leak and NPE on accessing data.
- [HDFS-13813](#) - Enhanced NameNode behavior to exit if dangling child inode is detected when saving FsImage.
- [MAPREDUCE-7053](#) - Fixed an issue where timed out tasks can fail to produce thread dump.
- [YARN-6966](#) - Fixed an issue where NodeManager metrics may return wrong negative values when NM restart.
- [YARN-6967](#) - Fixed an issue where an application attempt's diagnostic message size was not properly limited.

- [YARN-8436](#) - Fixed an issue with FSParentQueue where the comparison method violates its general contract.

Apache HBase

- [HBASE-19730](#) - HBASE-14497 Reverse Scan threw StackOverflow caused by readPt checking
- [HBASE-19924](#) - hbase rpc throttling does not work for multi() with request count rater.
- [HBASE-20493](#) - Port HBASE-19994 (Create a new class for RPC throttling exception, make it retryable) to branch-1
- [HBASE-20723](#) - Custom hbase.wal.dir results in data loss because we write recovered edits into a different place than where the recovering region server looks for them.
- [HBASE-20997](#) - rebuildUserRegions() does not build ReplicaMapping during master switchover
- [HBASE-21275](#) - Disable TRACE HTTP method for thrift http server

Apache Hive

- [HIVE-12981](#) - ThriftCLIService uses incompatible getShortName() implementation
- [HIVE-13394](#) - Analyze table fails in tez on empty partitions
- [HIVE-14236](#) - Partial backport of to fix union-stats related errors
- [HIVE-14560](#) - Support exchange partition between s3 and hdfs tables
- [HIVE-14690](#) - Query fail when hive.exec.parallel=true, with conflicting session dir
- [HIVE-16483](#) - HoS should populate split related configurations to HiveConf
- [HIVE-17213](#) - HoS: file merging doesn't work for union all
- [HIVE-19259](#) - Create view on tables having union all fail with 'Table not found'
- [HIVE-20183](#) - Inserting from bucketed table can cause data loss, if the source table contains empty bucket
- [HIVE-20345](#) - Drop database may hang if the tables get deleted from a different call
- [HIVE-20678](#) - HiveHBaseTableOutputFormat should implement HiveOutputFormat to ensure compatibility
- [HIVE-20695](#) - HoS Query fails with hive.exec.parallel=true

Hue

- [HUE-8128](#) - [backend] Force debug logging in server logs does not get all debug
- [HUE-8398](#) - [editor] Fix broken result table after multiple queries in embedded mode
- [HUE-8399](#) - [editor] Various improvements for embedded mode
- [HUE-8399](#) - [editor] Fix various embedded mode issues in old version
- [HUE-8399](#) - [editor] Limit functions assist to Impala in embedded mode
- [HUE-8399](#) - [editor] Hide the right assistant in embedded mode
- [HUE-8451](#) - [notebook] Many "codec can't decode byte" errors on pig execution if browser language=jp
- [HUE-8458](#) - [frontend] Fix issue with async loading of js resources in the dashboard
- [HUE-8458](#) - [frontend] Evaluate the js resources while others are being fetched
- [HUE-8458](#) - [frontend] Load new scripts using \$.get and eval instead of appending <script> tags
- [HUE-8464](#) - [core] Fix SAML encryption missing key file passphrase
- [HUE-8467](#) - [jobbrowser] Support impala digest auth for queries
- [HUE-8468](#) - [frontend] Append a style tag to head instead of modifying stylesheets for dynamic styles in embedded mode
- [HUE-8475](#) - [report] Protect against pivot conflicting with nested facets
- [HUE-8487](#) - [useradmin] Fix Add Sync LDAP user fails when using DN with special character
- [HUE-8505](#) - [core] Close impala session on logout
- [HUE-8558](#) - [jb] Add tracking URL to Spark Jobs and remove url and killUrl
- [HUE-8564](#) - [useradmin] Fix last activity update for notebook/api/check_status
- [HUE-8564](#) - [useradmin] Fix last activity update for jobbrowser/api/jobs requests

Apache Impala

- [IMPALA-6907](#) - Now Impala correctly closes all stale connections to removed impala cluster members.
- [IMPALA-7225](#) - Fixed an issue where the REFRESH...PARTITION statement caused statistics for the refreshed partition to be automatically reset to -1 (unknown) . With the fix, statistics will be changed only if an explicit COMPUTE STATS statement is issued for an object.

- [IMPALA-7272](#) - Fixed a crash caused by a memory management problem when the query execution requires finding strings inside a range defined by the lesser-than and greater-than comparisons.
- [IMPALA-7360](#) - Fixed an issue where Impala could incorrectly skip data if a record separator in a sequence-based file (Avro, RC or sequence file) straddled an HDFS block boundary.
- [IMPALA-7537](#) - Fixed a security issue where REVOKE ALL ON SERVER did not have a permanent effect if the ALL permission was granted using the WITH GRANT option. Running INVALIDATE METADATA no longer causes the permission to reappear.
- [IMPALA-7585](#) - Fixed an issue in KRPC, which can cause slow or hung queries on non-secured clusters.

Apache Kudu

- [KUDU-2463](#) - Fixed an issue in which incorrect results would be returned in scans following a server restart.
- [KUDU-2509](#) - Fixed an issue that might result in a crash of a tablet server in case of a WAL replay error while bootstrapping a tablet.
- [KUDU-2580](#) - Fixed authentication token reacquisition in the C++ client.

Apache Oozie

- [OOZIE-2457](#) - Oozie log parsing regex consume more than 90% cpu
- [OOZIE-3354](#) - [core] [SSH action] SSH action gets hung
- [OOZIE-3370](#) - Property filtering is not consistent across job submission

Apache Sentry

- [SENTRY-1944](#) - Optimize DelegateSentryStore.getGroupsByRoles() and update SentryGenericPolicyProcessor to retrieve roles to group mapping in a single transaction
- [SENTRY-2194](#) - Upgrade Sentry hadoop-version dependency to 2.7.5
- [SENTRY-2214](#) - Sentry should not allow URI grants to EMPTY or NULL locations
- [SENTRY-2309](#) - ModifiedCatch NPE thrown when fetching Partitions with no corresponding SDS entry
- [SENTRY-2332](#) - Load hadoop default configuration when starting sentry service
- [SENTRY-2403](#) - Incorrect naming in RollingFileWithoutDeleteAppender
- [SENTRY-2406](#) - Make sure inputHierarchy and outputHierarchy have unique values
- [SENTRY-2428](#) - Skip null partitions or partitions with null sds entries

Apache Spark

- [SPARK-25253](#) - [PYSPARK] Refactor local connection & auth code
- [SPARK-25318](#) - Add exception handling when wrapping the input stream during the the fetch or stage retry in response to a corrupted block

Apache Zookeeper

- [ZOOKEEPER-706](#) - Large numbers of watches can cause session re-establishment to fail
- [ZOOKEEPER-1382](#) - Zookeeper server holds onto dead/expired session ids in the watch data structures

Issues Fixed in CDH 5.15.1

CDH 5.15.1 fixes the following issues.

Hadoop YARN Privilege Escalation CVE-2016-6811

Fixed a vulnerability in Hadoop YARN that allows a user who can escalate to the yarn user the ability to possibly run arbitrary commands as the root user. CVE-2016-6811

Apache HBase potential privilege escalation for user of HBase "Thrift 1" API Server over HTTP CVE-2018-8025

CVE-2018-8025 describes an issue in Apache HBase that affects the optional "Thrift 1" API server when running over HTTP. There is a race-condition that could lead to authenticated sessions being incorrectly applied to users, e.g. one authenticated user would be considered a different user or an unauthenticated user would be treated as an authenticated user.

Products affected: HBase Thrift Server

Releases affected:

- CDH 5.4.x - 5.12.x
- CDH 5.13.0, 5.13.1, 5.13.2, 5.13.3
- CDH 5.14.0, 5.14.2, 5.14.3
- CDH 5.15.0

Fixed versions: CDH 5.14.4, 5.15.1

Users affected: Users with the HBase Thrift 1 service role installed and configured to work in “thrift over HTTP” mode. For example, those using Hue with HBase impersonation enabled.

Severity: High

Potential privilege escalation.

CVE: CVE-2018-8025

Immediate action required: Upgrade to a CDH version with the fix, or, disable the HBase Thrift-over-HTTP service. Disabling the HBase Thrift-over-HTTP service will render Hue impersonation inoperable and all HBase access via Hue will be performed using the “hue” user instead of the authenticated user.

Knowledge article: For the latest update on this issue see the corresponding Knowledge article - TSB: 2018-315: Potential privilege escalation for user of HBase “Thrift 1” API Server over HTTP

[Apache Hive CREATE TABLE EXTERNAL commands run very slowly on Amazon S3](#)

When you run a `CREATE EXTERNAL TABLE` command on Amazon S3 storage, the command runs extremely slowly and might not complete. This usually occurs for tables that have pre-existing, nested data. There is no known workaround.

Affected Versions: CDH 5.15.0

Cloudera Bug: CDH-68833

Workaround: None

Fixed versions: CDH 5.15.1 and later

[Cloudera Search restore operation puts shard replicas on same host](#)

Restoring an Apache Solr collection sometimes places all shard replicas on the same host.

Cloudera Issue: CDH-68828

[Zip Slip Vulnerability CVE-2018-8009](#)

“Zip Slip” is a widespread arbitrary file overwrite critical vulnerability, which typically results in remote command execution. It was discovered and responsibly disclosed by the Snyk Security team ahead of a public disclosure on June 5, 2018, and affects thousands of projects.

Cloudera has analyzed our use of zip-related software, and has determined that only Apache Hadoop is vulnerable to this class of vulnerability in CDH 5. This has been fixed in upstream Hadoop as CVE-2018-8009.

[hdfs snapshotDiff /.reserved/raw/... fails on snapshottable directories](#)

Fixed an issue where the `hdfs snapshotDiff` command fails when the command is supplied with the raw path.

Cloudera Issue: CDH-66029

[Upstream Issues Fixed](#)

The following upstream issues are fixed in CDH 5.15.1:

Apache Flume

- [FLUME-2786](#), [FLUME-3056](#), [FLUME-3117](#) - Application enters a deadlock when stopped while `handleConfigurationEvent`
- [FLUME-2894](#) - Flume components should stop in the correct order
- [FLUME-2976](#) - Exception when JMS source tries to connect to a Weblogic server without authentication

- [FLUME-3222](#) - Fix for NoSuchFileException thrown when files are being deleted

Apache Hadoop

- [HADOOP-13024](#) - Distcp with -delete feature on raw data not implemented
- [HADOOP-13972](#) - ADLS to support per-store configuration
- [HADOOP-15186](#) - Allow Azure Data Lake SDK dependency version to be set on the command line
- [HADOOP-15317](#) - Improve NetworkTopology chooseRandom's loop
- [HADOOP-15342](#) - Updating ADLS connector to use SDK version 2.2.7
- [HADOOP-15356](#) - Make the HTTP timeout configurable in ADLS connector
- [HADOOP-15434](#) - Upgrade to ADLS SDK that exposes current timeout
- [HADOOP-15466](#) - Correct units in `adl.http.timeout` property
- [HDFS-9229](#) - Expose size of NameNode directory as a metric
- [HDFS-11751](#) - DFSZKFailoverController daemon exits with wrong status code
- [HDFS-11993](#) - Add log info when connect to datanode socket address failed
- [HDFS-12683](#) - DFSZKFailOverController re-order logic for logging Exception
- [HDFS-12710](#) - HTTPFS HTTP max header size env variable is not respected in branch-2
- [HDFS-12981](#) - Running `renameSnapshot` on a non-existent snapshot to itself should throw error
- [HDFS-13281](#) - `Namenode#createFile` should be `/.reserved/raw/` aware
- [HDFS-13314](#) - NameNode should optionally exit if it detects Fslmage corruption
- [MAPREDUCE-7094](#) - LocalDistributedCacheManager leaves classloaders open, which leaks File Descriptors
- [YARN-4227](#) - Ignore expired containers from removed nodes in FairScheduler
- [YARN-4325](#) - NodeManager log handlers fail to send finished/failed events in some cases
- [YARN-4677](#) - `RMNodeResourceUpdateEvent` update from scheduler can lead to a race condition
- [YARN-5121](#) - Fix container-executor portability issues

Apache HBase

Code Changes Should Not Be Required

The following fixes should not require code changes, but they contain improvements that might enhance your deployment:

- [HBASE-20229](#) - `ConnectionImplementation.locateRegions()` returns duplicated entries when region replication is on
- [HBASE-20293](#) - `get_splits` returns duplicate split points when region replication is on
- [HBASE-20664](#) - Reduce the broad scope of `outToken` in `ThriftHttpServlet`

Apache Hive

Code Changes Should Not Be Required

The following fixes should not require code changes, but they contain improvements that might enhance your deployment:

- [HIVE-9915](#) - Allow specifying file format for managed tables
- [HIVE-15580](#) - Eliminate unbounded memory usage for `orderBy` and `groupBy` in Hive on Spark
- [HIVE-15682](#) - Eliminate per-row based dummy iterator creation
- [HIVE-15683](#) - Make configurable how Hive on Spark shuffles data for `GROUP BY`
- [HIVE-16080](#) - Add `parquet` to possible values for `hive.default.fileformat` and `hive.default.fileformat.managed`
- [HIVE-16659](#) - Query plan should reflect `hive.spark.use.groupby.shuffle`
- [HIVE-19041](#) - Thrift deserialization of `Partition` objects should intern fields
- [HIVE-19231](#) - Beeline generates garbled output when using `UnsupportedTerminal`
- [HIVE-19424](#) - NPE In `MetaDataFormatters`
- [HIVE-19668](#) - Over 30% of the heap is wasted by duplicate `org.antlr.runtime.CommonTokens` and duplicate strings
- [HIVE-19700](#) - Workaround for `JLine` issue with `UnsupportedTerminal`
- [HIVE-19870](#) - `HCatalog` dynamic partition query can fail if the table path is managed by Sentry

Hue

- [HUE-6697](#) - [job] Prevent reset of job page tabs when job is running
- [HUE-7946](#) - [job] Link to subworkflow on workflow dashboard page 404s in Hue 4
- [HUE-7989](#) - [useradmin] Provide better UI message and message in logs when ldap server down
- [HUE-8053](#) - Fix unit test
- [HUE-8053](#) - [useradmin] LDAP authentication with sync_groups_on_login=true fails with KeyError exception
- [HUE-8055](#) - [desktop] Support multiple LDAP servers in LDAP Test command
- [HUE-8063](#) - [fb] Better error message when HTTPFS is not working
- [HUE-8137](#) - [core] Refresh translations files for 4.2
- [HUE-8159](#) - [oozie] Unable to create Workflow/Schedule using Java document Action
- [HUE-8170](#) - [useradmin] Fix LDAP sync (ldap_access.py) certificate validation logic
- [HUE-8173](#) - [core] Add a warning log when a users switched to the old Hue 3 UI
- [HUE-8173](#) - [core] Add a log line when a user loads a page not via the load balancer even if we have one
- [HUE-8191](#) - [job] UnicodeEncodeError occurs in Job Browser when browser language is not English
- [HUE-8202](#) - [job] Fix mutual authentication failed with Isilon
- [HUE-8207](#) - [indexer] Issue previewing input file with unicode data
- [HUE-8217](#) - [dashboard] Fix HTML resultset widget templating
- [HUE-8232](#) - [oozie] Fix 500 error if coordinator associated workflow has been deleted
- [HUE-8236](#) - [core] Correct Hue config value use integer instead of math expression
- [HUE-8253](#) - [editor] Support downloading Query results with query names(file names) other than ISO-8859-1 charset
- [HUE-8253](#) - [editor] Fix the broken unit test in 5.15 due to conflict after backporting
- [HUE-8274](#) - [s3] Moving a folder using drag and drop deletes the folder itself
- [HUE-8280](#) - [fb] Move action button does not prevent move to itself
- [HUE-8280](#) - [fb] Fix the missed conflict issue after backporting
- [HUE-8282](#) - [fb] Check if EC2 instance before check IAM metadata
- [HUE-8305](#) - [useradmin] Optimize performance on checking Hue permissions if user is in many groups
- [HUE-8310](#) - Broken template for multiple custom apps
- [HUE-8313](#) - [core] Remove hardcoding to ImpersonationBackend when using embedded mode
- [HUE-8314](#) - [core] Fix SAML encryption missing config
- [HUE-8320](#) - [core] After copying a workflow using Hue 4 button, saving the copied workflow fails
- [HUE-8344](#) - [hbase] Hbase old version of data can not display in Hue
- [HUE-8350](#) - [solr] indexer app permission is not being acknowledged in HUE
- [HUE-8350](#) - [solr] indexer app permission is not being acknowledged in HUE
- [HUE-8370](#) - [pig] Imported old version Pig script missing properties fields
- [HUE-8392](#) - [oozie] Cannot add more actions using drag & drop from actions bar in the Oozie editor after adding around 3 actions
- [HUE-8404](#) - [useradmin] Fix multibackend invalid password removes drop down to select Local
- [HUE-8409](#) - [core] When idle session timeout is enabled it causes issues with Spnego
- [HUE-8440](#) - [job] Link for Spark logs in Properties tab of Job Browser is incorrect
- [HUE-8455](#) - [pig] Oozie editor fails with 'hadoopProperties' for pig script saved in Hue 3

Apache Impala

- [IMPALA-6687](#) - Fixed INSERT with mixed case in partition column names.
- [IMPALA-6822](#) - Added a query option to control shuffling by distinct expressions.
- [IMPALA-6847](#) - Added a work around high memory estimates for admission control.
- [IMPALA-6908](#) - IsConnResetTException() should include ECONNRESET.
- [IMPALA-6934](#) - Corrected the wrong results with EXISTS subqueries that contain ORDER BY, LIMIT, and OFFSET.
- [IMPALA-7014](#) - Disabled the stacktrace symbolisation by default.
- [IMPALA-7078](#) - Reduced the queue size based on num_scanner_threads.

- [IMPALA-7078](#) - Improved memory consumption of wide Avro scans.
- [IMPALA-7288](#) - Fixed the Codegen crash in FinalizeModule.
- [IMPALA-7298](#) - Impala no longer passes IP address as hostname in Kerberos principal.

Apache Kudu

- [KUDU-2367](#) - Fixed an issue where a permanently failed tablet replica was not properly identified, which could cause the tablet not to re-replicate in very small clusters.
- [KUDU-2377](#) - Fixed an issue that caused Kudu servers to fail to start when RLIMIT_NPROC=-1.
- [KUDU-2378](#) - Fixed unaligned loads of int128 from rows.
- [KUDU-2379](#) - Fixed an issue that caused secure Spark jobs to fail.
- [KUDU-2416](#) - Fixed PartialRow.setMin.
- [KUDU-2443](#) - Fixed replica movement and replacement for RF=1.
- [KUDU-2447](#) - Fixed the tablet server crash with the error, "NONE predicate can not be pushed into key".
- [KUDU-2478](#) - Restored Python 2.6 compatibility.
- Added the ability to adjust scan timeouts in Spark.
- Increased the timeout to begin tablet copies, which improves Kudu's re-replication time when the cluster is busy.
- Fixed a NullPointerException thrown when calling ColumnSchema#toString on non-decimal types.
- Greatly improved the performance of many types of queries on tables from which many rows have been deleted.
- Fixed an issue that caused partition pruning to be too conservative for queries from the Java client that use Decimal predicates.

Apache Oozie

- [OOZIE-2491](#) - oozie acl cannot specify group, it does not work
- [OOZIE-3134](#) - Potential inconsistency between the in-memory SLA map and the Oozie database
- [OOZIE-3260](#) - [sla] Remove stale item above max retries on JPA related errors from in-memory SLA map

Apache Parquet

- [PARQUET-1246](#) - Ignore float/double statistics in case of NaN

Apache Sentry

Code Changes Should Not Be Required

The following fixes should not require code changes, but they contain improvements that might enhance your deployment:

- [SENTRY-1209](#) - Sentry does not block Hive's cross-schema table renames
- [SENTRY-2020](#) - Fix testConsumeCycleWithInsufficientPrivileges test failure in kafka e2e tests
- [SENTRY-2144](#) - Table Rename Cross Database should update permission correctly
- [SENTRY-2165](#) - NotificationProcessor process notification methods have logs wrongly flagged as ERROR
- [SENTRY-2183](#) - Increase default sentry-hdfs rpc timeout to 20 mins
- [SENTRY-2184](#) - Performance Issue: MPath is queried for each MAuthzPathsMapping in full snapshot
- [SENTRY-2226](#) - Support Hive operation ALTER TABLE EXCHANGE.
- [SENTRY-2269](#) - Make SentryStore pluggable
- [SENTRY-2299](#) - NPE In Sentry HDFS Sync Plugin
- [SENTRY-2310](#) - Sentry is not be able to fetch full update subsequently, when there is HMS restart in the snapshot process

Apache Solr

- [SOLR-12290](#) - Do not close any servlet streams and improve our servlet stream closing prevention code for users and devs.
- [SOLR-12293](#) - Updates need to use their own connection pool to maintain connection reuse and prevent spurious recoveries.

Apache Spark

- [SPARK-12504](#) - [SQL] Masking credentials in the sql plan explain output for JDBC data sources
- [SPARK-12652](#) - [PYSPARK] Upgrade Py4J to 0.9.1
- [SPARK-13709](#) - [SQL] Initialize deserializer with both table and partition properties when reading partitioned tables
- [SPARK-13807](#) - De-duplicate `Python*Helper` instantiation code in PySpark streaming
- [SPARK-13848](#) - [SPARK-5185] Update to Py4J 0.9.2 in order to fix classloading issue
- [SPARK-15061](#) - [PYSPARK] Upgrade to Py4J 0.10.1
- [SPARK-16781](#) - [PYSPARK] java launched by PySpark as gateway may not be the same java used in the spark environment
- [SPARK-17960](#) - [PYSPARK][UPGRADE TO PY4J 0.10.4]
- [SPARK-19822](#) - [TEST] CheckpointSuite.testCheckpointedOperation: should not filter checkpointFilesOfLatestTime with the PATH string
- [SPARK-20862](#) - [MLLIB][PYTHON] Avoid passing float to ndarray.reshape in LogisticRegressionModel
- [SPARK-21278](#) - [PYSPARK] Upgrade to Py4J 0.10.6
- [SPARK-22429](#) - [STREAMING] Streaming checkpointing code does not retry after failure
- [SPARK-23852](#) - [SQL] Add test that fails if PARQUET-1217 is not fixed

Apache Sqoop

- [SQOOP-2567](#) - SQOOP import for Oracle fails with invalid precision/scale for decimal
- [SQOOP-3082](#) - Sqoop import fails after TCP connection reset if split by datetime column

Apache Zookeeper

- [ZOOKEEPER-2375](#) - Prevent multiple initialization of login object in each ZooKeeperSaslClient instance

Issues Fixed in CDH 5.15.0

CDH 5.15.0 fixes the following issues.

Impala/Sentry security roles mismatch after Catalog Server restart

This issue occurs when Impala's Catalog Server is restarted without also restarting all the Impala Daemons.

Impala uses generated numeric identifiers for roles. These identifiers are regenerated during catalogd restarts, and the same role can get a different identifier, possibly used by a different role before restart. An impalad's metadata cache can contain old id + role pairs, and when it is updated with privileges with new role ids from the catalog, the privilege will be added to the wrong role; the one that previously had the same role id.

Products affected: Apache Impala

Releases affected:

- CDH 5.14.4 and all prior releases

Users affected: Impala users with authorization enabled.

Date/time of detection: 5th October, 2018

Severity (Low/Medium/High): 3.8 "Low"; [CVSS](#):3.0/AV:N/AC:H/PR:H/UI:R/S:U/C:L/I:L/A:L

Impact: Users may get privileges of unrelated users.

CVE: CVE-2019-16381

Immediate action required: Update to a version of CDH containing the fix.

Addressed in release/refresh/patch: CDH 5.15.0

Apache Hive vulnerabilities CVE-2018-1282 and CVE-2018-1284

This security bulletin, [TSB 2018-299](#), covers two vulnerabilities that have been addressed in CDH 5.15.0 and later:

- **CVE-2018-1282:** JDBC driver is susceptible to SQL injection attack if the input parameters are not properly cleaned

- **CVE-2018-1284:** Hive UDF series `UDFXPathXXXX` allows users to pass carefully crafted XML to access arbitrary files

For further details, see the original [Known Issue for Hive](#).

Apache Oozie Server vulnerability CVE-2017-15712

A vulnerability in the Oozie Server allows a cluster user to read private files owned by the user running the Oozie Server process.

Products affected: Oozie

Releases affected: All releases prior to CDH 5.12.0, CDH 5.12.0, CDH 5.12.1, CDH 5.12.2, CDH 5.13.0, CDH 5.13.1, CDH 5.14.0

Users affected: Users running the Oozie Server

Date/time of detection: November 13, 2017

Detected by: Daryn Sharp and Jason Lowe of Oath (formerly Yahoo! Inc)

Severity: (Low/Medium/High) High

Impact: The vulnerability allows a cluster user to read private files owned by the user running the Oozie Server process. The malicious user can construct a workflow XML file containing XML directives and configuration that reference sensitive files on the Oozie server host.

CVE: CVE-2017-15712

Immediate action required: Upgrade to release where the issue is fixed.

Addressed in release/refresh/patch: CDH 5.13.2 and higher, 5.14.2 and higher, 5.15.0 and higher

Apache Hadoop MapReduce Job History Server (JHS) vulnerability CVE-2017-15713

A vulnerability in Hadoop's Job History Server allows a cluster user to expose private files owned by the user running the MapReduce Job History Server (JHS) process. See <http://seclists.org/oss-sec/2018/q1/79> for reference.

Products affected: Apache Hadoop MapReduce

Releases affected: All releases prior to CDH 5.12.0. CDH 5.12.0, CDH 5.12.1, CDH 5.12.2, CDH 5.13.0, CDH 5.13.1, CDH 5.14.0

Users affected: Users running the MapReduce Job History Server (JHS) daemon

Date/time of detection: November 8, 2017

Detected by: Man Yue Mo of lgtm.com

Severity (Low/Medium/High): High

Impact: The vulnerability allows a cluster user to expose private files owned by the user running the MapReduce Job History Server (JHS) process. The malicious user can construct a configuration file containing XML directives that reference sensitive files on the MapReduce Job History Server (JHS) host.

CVE: CVE-2017-15713

Immediate action required: Upgrade to a release where the issue is fixed.

Addressed in release/refresh/patch: CDH 5.13.2 and higher, 5.14.2 and higher, 5.15.0 and higher

Upstream Issues Fixed

The following upstream issues are fixed in CDH 5.15.0:

Apache Avro

- [AVRO-2109](#) - Reset buffers in case of IOException

Apache Flume

- [FLUME-2442](#) - Need an alternative to providing clear text passwords in flume config

- [FLUME-2917](#) - Provide netcat UDP source as alternative to TCP

Apache Hadoop

- [HADOOP-12886](#) - Exclude weak ciphers in SSLFactory through ssl-server.xml
- [HADOOP-14966](#) - Handle JDK-8071638 for hadoop-common
- [HADOOP-15085](#) - Output streams closed with IOUtils suppressing write errors
- [HADOOP-15113](#) - NPE in S3A getFileStatus: null instrumentation on using closed instance.
- [HADOOP-15149](#) - CryptoOutputStream should implement StreamCapabilities.
- [HADOOP-15161](#) - Streaming and common statistics missing from S3A metrics
- [HADOOP-15185](#) - Update ADLS connector to use the current version of ADLS SDK.
- [HADOOP-15206](#) - BZip2 drops and duplicates records when input split size is small
- [HDFS-1172](#) - Blocks in newly completed files are considered under-replicated too quickly
- [HDFS-7764](#) - DirectoryScanner shouldn't abort the scan if one directory had an error
- [HDFS-8693](#) - refreshNamenodes does not support adding a new standby to a running DN
- [HDFS-9023](#) - When NN is not able to identify DN for replication, reason behind it can be logged.
- [HDFS-10453](#) - ReplicationMonitor thread could stuck for long time due to the race between replication and delete of same file in a large cluster.
- [HDFS-10690](#) - Optimize insertion/removal of replica in ShortCircuitCache
- [HDFS-11187](#) - Optimize disk access for last partial chunk checksum of Finalized replica
- [HDFS-11494](#) - Log message when DN is not selected for block replication
- [HDFS-11576](#) - Block recovery will fail indefinitely if recovery time > heartbeat interval
- [HDFS-11847](#) - Enhance dfsadmin listOpenFiles command to list files blocking datanode decommissioning.
- [HDFS-11848](#) - Enhance dfsadmin listOpenFiles command to list files under a given path
- [HDFS-12318](#) - Fix IOException condition for openInfo in DFSInputStream
- [HDFS-12323](#) - NameNode terminates after full GC thinking QJM unresponsive if full GC is much longer than timeout
- [HDFS-12832](#) - INode.getFullPathName may throw ArrayIndexOutOfBoundsException lead to NameNode exit.
- [HDFS-12881](#) - Output streams closed with IOUtils suppressing write errors
- [HDFS-12910](#) - Secure Datanode Starter should log the port when it fails to bind
- [HDFS-13112](#) - Token expiration edits may cause log corruption or deadlock
- [HDFS-13170](#) - Port webhdfs unmaskedpermission parameter to HTTPFS
- [MAPREDUCE-6711](#) - JobImpl fails to handle preemption events on state COMMITTING

Apache HBase

Code Changes Might Be Required

The following fixed issues might require changes to your HBase code or your configuration:

- [HBASE-15128](#) - Disable region splits and merges switch in master.
This might require code changes if `org.apache.hadoop.hbase.client.Admin` was subclassed.
- [HBASE-15866](#) - Split `hbase.rpc.timeout` into `*.read.timeout` and `*.write.timeout`
This might require code changes if you want to specify different values for RPC read and write timeouts.
- [HBASE-16008](#) - A robust way deal with early termination of HBCK.
This might require code changes if `org.apache.hadoop.hbase.client.Admin` was subclassed.

Code Changes Should Not Be Required

The following fixes should not require code changes, but they contain improvements that might enhance your deployment:

- [HBASE-14252](#) - RegionServers fail to start when setting `hbase.ipc.server.callqueue.scan.ratio` to 0
- [HBASE-19163](#) - "Maximum lock count exceeded" from region server's batch processing
- [HBASE-19440](#) - Not able to enable balancer with RSGroups once disabled

- [HBASE-19886](#) - Display maintenance mode in shell, web UI

Apache Hive

Code Changes Might Be Required

The following fixed issues might require changes to your HiveQL code or your configuration:

- [HIVE-16324](#) - Truncate table should not work when EXTERNAL property of table is set to `true` (lower case). This fix changes how the EXTERNAL table property is interpreted by Hive. After this fix, if your current deployment sets the EXTERNAL table property to `true` (lower case), the external table will no longer be truncated. Read the Jira for further details.
- [HIVE-18879](#) - Disallow embedded elements in the UDFXPathUtil class. This fix might change how your XML parser works if you use embedded elements with the `xpath` UDFs. For example, if you use embedded elements with the following UDFs in your queries: `xpath`, `xpath_short`, `xpath_int`, `xpath_long`, `xpath_float`, `xpath_double`, `xpath_number`, or `xpath_string`.

Code Changes Should Not Be Required

The following fixes should not require code changes, but they contain improvements that might enhance your deployment:

- [HIVE-8472](#) - Add SET LOCATION option to the ALTER DATABASE command
- [HIVE-10495](#) - Hive index creation code throws a NullPointerException if index table is null
- [HIVE-14786](#) - Option added to Beeline to display binary column data as a string or a byte array (`--convertBinaryArrayToString=[true | false]`)
- [HIVE-14792](#) - Optimization added to minimize AvroSerde reads of the remote schema-file
- [HIVE-15329](#) - Fix for when a NullPointerException occurs during table creation
- [HIVE-15543](#) - Fix to prevent Hive fetching Spark memory/cores to decide parallelism when Spark dynamic allocation is enabled
- [HIVE-16601](#) - Display Session Id and Query Name / Id in Spark UI
- [HIVE-16663](#) - Added string caching for rows to Beeline
- [HIVE-16890](#) - Remove the superfluous wrapper from HiveVarcharWritable
- [HIVE-18228](#) - Azure credential properties added to the HiveConf hidden list
- [HIVE-18788](#) - Cleans up inputs in JDBC PreparedStatement (`HivePreparedStatement`) to fix SQL injection vulnerabilities

Hue

- [HUE-7860](#) - [core] Integrate non IO blocking Python Webserver
- [HUE-7913](#) - [autocomplete] Add variable locations to the autocomplete parser
- [HUE-7913](#) - [autocomplete] Report quoted variable locations with possible column references
- [HUE-7915](#) - [assist] Increase the frontend cache TTL to 10 days
- [HUE-7942](#) - [editor] FIX variables with incorrect placeholder.
- [HUE-7943](#) - [editor] Variable list are not being refreshed
- [HUE-8043](#) - [editor] Cancel a query using ctrl-enter shortcut

Apache Impala

- [IMPALA-4315](#) - Allow `USE` and `SHOW TABLES` if there is at least one table in a database where the user has table or column privileges.
- [IMPALA-4323](#) - The `SET ROW FORMAT` clause was added to the `ALTER TABLE` statement for the `TEXT` or `SEQUENCE` file formats.
- [IMPALA-4886](#) - Table metrics are available in the catalog web UI.
- [IMPALA-5654](#) - Disallows explicitly setting the Kudu table name property for managed Kudu tables in a `CREATE TABLE` and `ALTER TABLE` statements, e.g. `CREATE TABLE t (i INT) STORED AS KUDU TBLPROPERTIES('kudu.table_name' = 'some_name')`.
- [IMPALA-6549](#) - The file handle cache, controlled by the `max_cached_file_handles` flag, is enabled by default.

Apache Kudu

- [KUDU-1613](#) - Fixed a scenario where the on-disk data of a tablet server was completely erased and a new tablet server was started on the same host. This issue could prevent tablet replicas previously hosted on the server from being evicted and re-replicated. Tablets now immediately evict replicas that respond with a different server UUID than expected.
- [KUDU-1927](#) - Fixed a rare race condition when connecting to masters during their startup which might cause a client to get a response without a CA certificate and/or authentication token. This would cause the client to fail to authenticate with other servers in the cluster. The leader master now always sends a CA certificate and an authentication token (when applicable) to a Kudu client with a successful ConnectToMaster response.
- [KUDU-2262](#) - The Kudu Java client now will retry a connection if no master is discovered as a leader, and the user has a valid authentication token. This avoids failure in recoverable cases when masters are in the process of the very first leader election after starting up.
- [KUDU-2264](#) - The Java client will now automatically attempt to re-acquire Kerberos credentials from the ticket cache when the prior credentials are about to expire. This allows client instances to persist longer than the expiration time of a single Kerberos ticket so long as some other process renews the credentials in the ticket cache. Documentation on interacting with Kerberos authentication has been added to the Javadoc for the `AsyncKuduClient` class.
- [KUDU-2265](#) - Follower masters are now able to verify authentication tokens even if they have never been a leader. Prior to this fix, if a follower master had never been a leader, clients would be unable to authenticate to that master, resulting in spurious error messages being logged.
- [KUDU-2295](#) - Fixed a tablet server crash when a tablet replica is deleted during a scan.
- [KUDU-2312](#) - The evaluation order of predicates in scans with multiple predicates has been made deterministic. Due to a bug, this was not necessarily the case previously. Predicates are applied in most to least selective order, with ties broken by column index. The evaluation order may change in the future, particularly when better column statistics are made available internally.
- [KUDU-2331](#) - Previously, the `kudu tablet change_config move_replica` tool required all tablet servers in the cluster to be available when performing a move. This restriction has been relaxed: only the tablet server that will receive a replica of the tablet being moved and the hosts of the tablet's existing replicas need to be available for the move to occur.
- [KUDU-2343](#) - Fixed a bug in the Java client which prevented the client from locating the new leader master after a leader failover in the case that the previous leader either remained online or restarted quickly. This bug resulted in the client timing out operations with errors indicating that there was no leader master.
- [KUDU-2259](#) - The Unix process username of the client is now included inside the exported security credentials, so that the effective username of clients who import credentials and subsequently use unauthenticated (SASL PLAIN) connections matches the client who exported the security credentials. For example, this is useful to let the Spark executors know which username to use if the Spark driver has no authentication token. This change only affects clusters with encryption disabled using `--rpc-encryption=disabled`.

Apache Oozie

- [OOZIE-3173](#) - Coordinator job with frequency using cron syntax creates only one action in catchup mode
- [OOZIE-3183](#) - Better logging for SshActionExecutor and extended HA capability when calling to remote host

Apache Spark

- [SPARK-12297](#) - Convert Impala-written timestamps from UTC to local TZ ()
- [SPARK-22188](#) - [CORE] Adding security headers for preventing XSS, MitM and MIME sniffing
- [SPARK-23660](#) - Fix exception in yarn cluster mode when application ended fast

Apache Sqoop

- [SQOOP-3153](#) - Sqoop export with `--as-<spec_file_format>` will now display a verbose error message as these options are only valid for imports

Issues Fixed in CDH 5.14.x

The following topics describe issues fixed in CDH 5.14.x, from newest to oldest release. You can also review [What's New in CDH 5.14.x](#) on page 1816 or [Known Issues in CDH 5](#) on page 1944.

Issues Fixed in CDH 5.14.4

CDH 5.14.4 fixes the following issues.

Hadoop YARN Privilege Escalation CVE-2016-6811

Fixed a vulnerability in Hadoop YARN that allows a user who can escalate to the yarn user the ability to possibly run arbitrary commands as the root user. CVE-2016-6811

Apache HBase potential privilege escalation for user of HBase “Thrift 1” API Server over HTTP CVE-2018-8025

CVE-2018-8025 describes an issue in Apache HBase that affects the optional "Thrift 1" API server when running over HTTP. There is a race-condition that could lead to authenticated sessions being incorrectly applied to users, e.g. one authenticated user would be considered a different user or an unauthenticated user would be treated as an authenticated user.

Products affected: HBase Thrift Server

Releases affected:

- CDH 5.4.x - 5.12.x
- CDH 5.13.0, 5.13.1, 5.13.2, 5.13.3
- CDH 5.14.0, 5.14.2, 5.14.3
- CDH 5.15.0

Fixed versions: CDH 5.14.4

Users affected: Users with the HBase Thrift 1 service role installed and configured to work in “thrift over HTTP” mode. For example, those using Hue with HBase impersonation enabled.

Severity: High

Potential privilege escalation.

CVE: CVE-2018-8025

Immediate action required: Upgrade to a CDH version with the fix, or, disable the HBase Thrift-over-HTTP service. Disabling the HBase Thrift-over-HTTP service will render Hue impersonation inoperable and all HBase access via Hue will be performed using the “hue” user instead of the authenticated user.

Knowledge article: For the latest update on this issue see the corresponding Knowledge article - TSB: 2018-315: Potential privilege escalation for user of HBase “Thrift 1” API Server over HTTP

Zip Slip Vulnerability CVE-2018-8009

“Zip Slip” is a widespread arbitrary file overwrite critical vulnerability, which typically results in remote command execution. It was discovered and responsibly disclosed by the Snyk Security team ahead of a public disclosure on June 5, 2018, and affects thousands of projects.

Cloudera has analyzed our use of zip-related software, and has determined that only Apache Hadoop is vulnerable to this class of vulnerability in CDH 5. This has been fixed in upstream Hadoop as CVE-2018-8009.

Apache HiveQL SELECT STRUCT fails with RuntimeException

The HiveQL query `SELECT STRUCT("x" , null) ;` fails in CDH 5.10.0 onward and returns the following compilation error:

```
Error while compiling statement: FAILED: RuntimeException
java.lang.RuntimeException: Hive internal error: conversion of void to void not
supported yet.
```

This has been fixed in CDH 5.14.4 (CDH-67208) and later and now HiveQL queries like `SELECT STRUCT("x" ,null) ;` run successfully.

Apache Hive vulnerabilities [CVE-2018-1282](#) and [CVE-2018-1284](#)

This security bulletin, [TSB 2018-299](#), covers two vulnerabilities that have been addressed in CDH 5.14.4 and later:

- **CVE-2018-1282:** JDBC driver is susceptible to SQL injection attack if the input parameters are not properly cleaned
- **CVE-2018-1284:** Hive UDF series `UDFXPathXXXX` allows users to pass carefully crafted XML to access arbitrary files

For further details, see the original [Known Issue for Hive](#).

Upstream Issues Fixed

The following upstream issues are fixed in CDH 5.14.4:

Apache Flume

- [FLUME-2786](#) - FLUME-3056 FLUME-3117 Application enters a deadlock when stopped while `handleConfigurationEvent`
- [FLUME-2894](#) - Flume components should stop in the correct order

Apache Hadoop

- [HADOOP-12886](#) - Exclude weak ciphers in SSLFactory through `ssl-server.xml`
- [HADOOP-13024](#) - Distcp with `-delete` feature on raw data not implemented
- [HADOOP-13972](#) - ADLS to support per-store configuration.
- [HADOOP-15186](#) - Allow Azure Data Lake SDK dependency version to be set on the command line.
- [HADOOP-15317](#) - Improve `NetworkTopology.chooseRandom`'s loop.
- [HADOOP-15342](#) - Update ADLS connector to use the current SDK version (2.2.7)
- [HADOOP-15356](#) - Make HTTP timeout configurable in ADLS connector
- [HADOOP-15466](#) - Correct units in `adl.http.timeout`.
- [HDFS-9229](#) - Expose size of NameNode directory as a metric
- [HDFS-10903](#) - Replace config key literal strings with config key names II: `hadoop hdfs`
- [HDFS-11993](#) - Add log info when connect to datanode socket address failed
- [HDFS-12832](#) - `INode.getFullPathName` may throw `ArrayIndexOutOfBoundsException` lead to NameNode exit.
- [HDFS-13170](#) - Port `webhdfs.unmaskedpermission` parameter to HTTPFS
- [HDFS-13314](#) - NameNode should optionally exit if it detects `FsImage` corruption
- [MAPREDUCE-7094](#) - `LocalDistributedCacheManager` leaves classloaders open, which leaks FDs
- [YARN-5121](#) - Fix some container-executor portability issues

Apache HBase

- [HBASE-15866](#) - Split `hbase.rpc.timeout` into `*.read.timeout` and `*.write.timeout`
- [HBASE-16201](#) - fix a NPE issue in `RpcServer`
- [HBASE-17944](#) - Removed unused JDK version parsing from `ClassSize`.
- [HBASE-20229](#) - `ConnectionImplementation.locateRegions()` returns duplicated entries when region replication is on
- [HBASE-20293](#) - `get_splits` returns duplicate split points when region replication is on
- [HBASE-20664](#) - Reduce the broad scope of `outToken` in `ThriftHttpServlet`

Apache Hive

Code Changes Might Be Required

No upstream fixed issues might require code changes for the CDH 5.14.4 release of Apache Hive.

Code Changes Should Not Be Required

The following fixes should not require code changes, but they contain improvements that might enhance your deployment:

- [HIVE-14792](#) - AvroSerde reads the remote schema-file at least once per mapper, per table reference.
- [HIVE-18788](#) - Clean up inputs in JDBC PreparedStatement
- [HIVE-18879](#) - Disallow embedded element in UDFXPathUtil needs to work if xercesImpl.jar in classpath
- [HIVE-19041](#) - Thrift deserialization of Partition objects should intern fields
- [HIVE-19424](#) - NPE In MetaDataFormatters
- [HIVE-19700](#) - Workaround for JLine issue with UnsupportedTerminal

Hue

- [HUE-7826](#) - [security] Uncaught TypeError: privilege.privilegeScope is not a function error when deleting a Solr privilege
- [HUE-7946](#) - [jib] Link to subworkflow on workflow dashboard page 404s in Hue 4
- [HUE-7946](#) - [jib] Link to subworkflow on workflow dashboard page 404s in Hue 4
- [HUE-7989](#) - [useradmin] Provide better UI message and message in logs when ldap server down
- [HUE-8063](#) - [fb] Better error message when HTTPFS is not working
- [HUE-8069](#) - [core] Pyformance reporter thread stops on exceptions in gauge callbacks
- [HUE-8159](#) - [oozie] Unable to create Workflow/Schedule using Java document Action
- [HUE-8170](#) - [useradmin] Fix LDAP sync (ldap_access.py) certificate validation logic
- [HUE-8173](#) - [core] Add a warning log when a users switched to the old Hue 3 UI
- [HUE-8173](#) - [core] Add a log line when a user loads a page not via the load balancer even if we have one
- [HUE-8191](#) - [jib] UnicodeEncodeError occurs in Job Browser when browser language is not English
- [HUE-8202](#) - [jib] Fix mutual authentication failed with Isilon
- [HUE-8207](#) - [indexer] Issue previewing input file with unicode data
- [HUE-8217](#) - [dashboard] Fix HTML resultset widget templating
- [HUE-8232](#) - [oozie] Fix 500 error if coordinator associated workflow has been deleted
- [HUE-8236](#) - [core] Correct Hue config value use integer instead of math expression
- [HUE-8274](#) - [s3] Moving a folder using drag and drop deletes the folder itself
- [HUE-8280](#) - [fb] Move action button does not prevent move to itself
- [HUE-8282](#) - [fb] Check if EC2 instance before check IAM metadata
- [HUE-8314](#) - [core] Fix SAML encryption missing config
- [HUE-8320](#) - [core] After copying a workflow using Hue 4 button, saving the copied workflow fails

Apache Impala

- [IMPALA-4315](#) - Users with the column-level privileges can run the USE and SHOW TABLES statements.
- [IMPALA-5270](#) - Impala now passes fully resolved sort expressions to prevent crashes with inline view and analytic functions.
- [IMPALA-6500](#) - Fixed an issue where Impala crashed under certain hypervisors that returned out-of-range CPU IDs.
- [IMPALA-6687](#) - The INSERT statements with mixed case partition column name no longer fails.
- [IMPALA-6822](#) - A new query option, SHUFFLE_DISTINCT_EXPRS, is available for disabling shuffling by distinct expressions.
- [IMPALA-6908](#) - The ECONNRESET error code handling was added to the IsConnReset function that checks if a given exception is due to a stale connection.
- [IMPALA-6934](#) - Correct results returns from the EXISTS subquery containing ORDER BY, LIMIT, and OFFSET
- [IMPALA-6954](#) - Fixed a problem with expression rewrites that caused losses of partitions with CTAS into Kudu.
- [IMPALA-7032](#) - Codegen for CHAR type null literals are disabled to prevent a crash.

Apache Kudu

- [KUDU-2331](#) - The `kudu tablet change_config move_replica` tool no longer fails for an unavailable tablet server if the tablet server is not the source or destination of the move.
- Improved the speed of scans in cases where a large number of rows have previously been deleted from the table.

Apache Oozie

- [OOZIE-2491](#) - oozie acl cannot specify group,it does not work

Apache Sentry

- [SENTRY-1209](#) - Sentry does not block Hive's cross-schema table renames
- [SENTRY-2144](#) - Table Rename Cross Database should update permission correctly.
- [SENTRY-2165](#) - NotificationProcessor process notification methods have logs wrongly flagged as ERROR
- [SENTRY-2183](#) - Increase default sentry-hdfs rpc timeout to 20 mins
- [SENTRY-2184](#) - Performance Issue: MPath is queried for each MAuthzPathsMapping in full snapshot
- [SENTRY-2194](#) - Upgrade Sentry hadoop-version dependency to 2.7.5
- [SENTRY-2226](#) - CDH5Support Hive operation ALTER TABLE EXCHANGE.

Apache Solr

- [SOLR-12293](#) - Updates need to use their own connection pool to maintain connection reuse and prevent spurious recoveries.

Apache Spark

- [SPARK-12504](#) - [SQL] Masking credentials in the sql plan explain output for JDBC data sources.
- [SPARK-12652](#) - [PYSPARK] Upgrade Py4J to 0.9.1
- [SPARK-13709](#) - [SQL] Initialize deserializer with both table and partition properties when reading partitioned tables
- [SPARK-13807](#) - De-duplicate `Python*Helper` instantiation code in PySpark streaming
- [SPARK-13848](#) - [SPARK-5185] Update to Py4J 0.9.2 in order to fix classloading issue
- [SPARK-15061](#) - [PYSPARK] Upgrade to Py4J 0.10.1
- [SPARK-16781](#) - [PYSPARK] java launched by PySpark as gateway may not be the same java used in the spark environment
- [SPARK-17960](#) - [PYSPARK][UPGRADE TO PY4J 0.10.4]
- [SPARK-20862](#) - [MLLIB][PYTHON] Avoid passing float to ndarray.reshape in LogisticRegressionModel
- [SPARK-21278](#) - [PYSPARK] Upgrade to Py4J 0.10.6
- [SPARK-23660](#) - Fix exception in yarn cluster mode when application ended fast

Apache Sqoop

- [SQOOP-2567](#) - SQOOP import for Oracle fails with invalid precision/scale for decimal
- [SQOOP-3082](#) - Sqoop import fails after TCP connection reset if split by datetime column

Issues Fixed in CDH 5.14.3

There are no fixed issues in CDH 5.14.3. This release only contained fixed issues for Cloudera Manager. For more information, see [Issues Fixed in Cloudera Manager 5.14.3](#) on page 2561.

Issues Fixed in CDH 5.14.2

CDH 5.14.2 fixes the following issues.

Missing results in Hive, Spark, Pig, Custom MapReduce jobs, and other Java applications when filtering Parquet data written by Impala

This issue, which was also reported in [TSB-2018-300](#), is fixed in CDH 5.14.2 and higher. For further details, see the original [Known Issue for Hive](#), [Known Issue for Spark](#), [Known Issue for Pig](#), or the [Known Issue for MapReduce](#).

Apache Oozie Server Vulnerability CVE-2017-15712

A vulnerability in the Oozie Server allows a cluster user to read private files owned by the user running the Oozie Server process.

Products affected: Oozie

Releases affected: All releases prior to CDH 5.12.0, CDH 5.12.0, CDH 5.12.1, CDH 5.12.2, CDH 5.13.0, CDH 5.13.1, CDH 5.14.0

Users affected: Users running the Oozie Server

Date/time of detection: November 13, 2017

Detected by: Daryn Sharp and Jason Lowe of Oath (formerly Yahoo! Inc)

Severity: (Low/Medium/High) High

Impact: The vulnerability allows a cluster user to read private files owned by the user running the Oozie Server process. The malicious user can construct a workflow XML file containing XML directives and configuration that reference sensitive files on the Oozie server host.

CVE: CVE-2017-15712

Immediate action required: Upgrade to release where the issue is fixed.

Addressed in release/refresh/patch: CDH 5.13.2, 5.14.2

[Apache Hadoop MapReduce Job History Server \(JHS\) vulnerability CVE-2017-15713](#)

A vulnerability in Hadoop's Job History Server allows a cluster user to expose private files owned by the user running the MapReduce Job History Server (JHS) process. See <http://seclists.org/oss-sec/2018/q1/79> for reference.

Products affected: Apache Hadoop MapReduce

Releases affected: All releases prior to CDH 5.12.0. CDH 5.12.0, CDH 5.12.1, CDH 5.12.2, CDH 5.13.0, CDH 5.13.1, CDH 5.14.0

Users affected: Users running the MapReduce Job History Server (JHS) daemon

Date/time of detection: November 8, 2017

Detected by: Man Yue Mo of lgtm.com

Severity (Low/Medium/High): High

Impact: The vulnerability allows a cluster user to expose private files owned by the user running the MapReduce Job History Server (JHS) process. The malicious user can construct a configuration file containing XML directives that reference sensitive files on the MapReduce Job History Server (JHS) host.

CVE: CVE-2017-15713

Immediate action required: Upgrade to a release where the issue is fixed.

Addressed in release/refresh/patch: CDH 5.13.2, 5.14.2, 5.15.0

[Slow or stalled queries under highly concurrent write workloads when Sentry + Hive are used, caused by a Hive metastore deadlock](#)

This issue, which was also reported in [TSB-2018-294](#), is fixed in CDH 5.14.2. For further details, see the original [Known Issue](#).

[Crash due to CHECK failure during compactions: pv_delete_redo != nullptr](#)

This issue, which was also reported in [TSB-2018-298](#), is fixed in CDH 5.13.3 and 5.14.2. For further details, see the original [Known Issue](#).

[Secure Impala-Kudu clusters need to be restarted frequently](#)

Due to Kudu-2264, secure, long-running Impala clusters on CDH 5.13.x and later will be unable to interact with Kudu tables after some time because the Kudu client used by Impala will no longer be able to authenticate with Kudu. The problem starts after the client's ticket can no longer be renewed, which is typically after 7 days. Restarting the Impala service will allow Impala to work with Kudu again.

Impala will begin failing to read or write Kudu tables with errors in the Impala daemon logs resembling:

```
W1121 22:47:47.231425 50416 ConnectToCluster.java:302] Error receiving response from
cdh-master-4db933ef.cdh-cluster.internal:7051
Java exception follows:
org.apache.kudu.client.NonRecoverableException: Server requires Kerberos, but this client
```

```

Products Affected: Impala

Releases Affected: CDH 5.13.0, CDH 5.13.1, and CDH 5.14.0

Users Affected: Users running a secure cluster with Impala and Kudu.

Severity: Medium

Impact: Impala will not be able to query or write to Kudu tables until the service is restarted. The Impala service will need to be restarted periodically in order to continue being able to work with Kudu tables.

Immediate action required: To work around the issue, users can restart the Impala service at least once per ticket renewal period. This period is typically 7 days.

Addressed in release: CDH 5.13.2, CDH 5.13.3, and CDH 5.14.2

Upstream Issues Fixed

The following upstream issues are fixed in CDH 5.14.2:

- [HADOOP-6852](#) - apparent bug in concatenated-bzip2 support (decoding)
- [HADOOP-14872](#) - CryptoInputStream should implement unbuffer
- [HADOOP-15012](#) - Add readahead, dropbehind, and unbuffer to StreamCapabilities
- [HADOOP-15143](#) - NPE due to Invalid KerberosTicket in UGI
- [HDFS-4185](#) - Add a metric for number of active leases
- [HDFS-6054](#) - MiniQJMHACluster should not use static port to avoid binding failure in unit test.
- [HDFS-11644](#) - Support for querying outputstream capabilities
- [HDFS-12251](#) - Add document for StreamCapabilities.
- [HDFS-12386](#) - Add fsserver defaults call to WebhdfsFileSystem.
- [HDFS-12528](#) - Added a configuration dfs.domain.socket.disable.interval.seconds to change the interval that disables short-circuit reads on failures.
- [HDFS-12985](#) - NameNode crashes during restart after an OpenForWrite file present in the Snapshot got deleted.
- [HDFS-13040](#) - Kerberized inotify client fails despite kinit properly
- [HDFS-13115](#) - In getNumUnderConstructionBlocks(), ignore the inodelds for which the inodes have been deleted
- [HDFS-13164](#) - File not closed if streamer fail with DSQuotaExceededException.
- [MAPREDUCE-7015](#) - Possible race condition in JHS if the job is not loaded
- [MAPREDUCE-7020](#) - Task timeout in uber mode can crash AM
- [MAPREDUCE-7048](#) - Uber AM can crash due to unknown task in statusUpdate
- [MAPREDUCE-7053](#) - Timed out tasks can fail to produce thread dump
- [YARN-2416](#) - InvalidStateTransitionException in ResourceManager if AMLauncher does not receive response for startContainers() call in time
- [YARN-3760](#) - FSDataOutputStream leak in AggregatedLogFormat.LogWriter.close()
- [YARN-4813](#) - TestRMWebServicesDelegationTokenAuthentication.testDoAs fails intermittently
- [YARN-6288](#) - Exceptions during aggregated log writes are mishandled
- [YARN-7083](#) - Log aggregation deletes/renames while file is open
- [YARN-7363](#) - ContainerLocalizer don't have a valid log4j config in case of Linux container executor.
- [YARN-7590](#) - Improve container-executor validation check
- [YARN-7622](#) - Allow fair-scheduler configuration on HDFS
- [YARN-7705](#) - Create the container log directory with correct sticky bit in C code
- [YARN-7758](#) - Add an additional check to the validity of container and application ids passed to container-executor
- [HBASE-14252](#) - RegionServers fail to start when setting hbase.ipc.server.callqueue.scan.ratio to 0

- [HBASE-16980](#) - TestRowProcessorEndpoint failing consistently
- [HBASE-17924](#) - Consider sorting the row order when processing multi() ops before taking rowlocks
- [HBASE-18625](#) - Splitting of region with replica, doesn't update region list in serverHolding. A server crash leads to overlap.
- [HBASE-19163](#) - "Maximum lock count exceeded" from region server's batch processing
- [HBASE-19364](#) - Truncate_preserve fails with table when replica region > 1
- [HBASE-19391](#) - Calling HRegion#initializeRegionInternals from a region replica can still re-create a region directory
- [HBASE-19553](#) - Old replica regions should be cleared from AM memory after primary region split or merge
- [HBASE-19728](#) - Add lock to filesCompacting in all place.
- [HBASE-19934](#) - HBaseSnapshotException when read replicas is enabled and online snapshot is taken after region splitting
- [HBASE-20061](#) - HStore synchronized member variable filesCompacting should be private
- [HIVE-11569](#) - Use PreOrderOnceWalker where feasible
- [HIVE-11609](#) - Capability to add a filter to hbase scan via composite key doesn't work
- [HIVE-14792](#) - AvroSerde reads the remote schema-file at least once per mapper, per table reference.
- [HIVE-15859](#) - HoS: Write RPC messages in event loop
- [HIVE-17624](#) - MapredLocalTask running in separate JVM could throw ClassNotFoundException
- [HIVE-18127](#) - Do not strip '--' comments from shell commands issued from CliDriver
- [HIVE-16886](#) - Hive metastore (HMS) log notifications may have duplicated event IDs if multiple HMSs are running concurrently
- [HIVE-18671](#) - Lock not released after Hive on Spark query was cancelled
- [HIVE-18917](#) - Add spark.home to hive.conf.restricted.list
- [HUE-7646](#) - [sentry] Changing role privileges removes HDFS ACLs
- [HUE-7755](#) - [oozie] Adding Distcp arguments and properties
- [HUE-7779](#) - [jb] Add job type in the API calls
- [HUE-7783](#) - [editor] Add log toggling functionality to the presentation mode
- [HUE-7784](#) - [dashboard] Fix JS error on right assist filtering
- [HUE-7790](#) - [assist] Silence all API errors in the right assistant
- [HUE-7794](#) - [fb] Modify/upload file failed if S3 bucket encryption is SSE-KMS
- [HUE-7802](#) - [dashboard] Protect against missing function in old dashboards
- [HUE-7806](#) - [core] Show all the users "Switch to Hue 4" option
- [HUE-7812](#) - [core] Metrics and Threads page don't get refreshed Step#1
- [HUE-7813](#) - [useradmin] Add login dropdown when there is only one item
- [HUE-7822](#) - [core] Unable to clone oozie workflow in Hue 4.0
- [HUE-7830](#) - [core] Non supported feature use_default_configuration doesn't work in Hue 4
- [HUE-7837](#) - [presentation] Toggle hiding/showing the code snippets should also hide the log panels
- [HUE-7842](#) - [dashboard] Avoid extra search call when dropping a new facet in a new row
- [HUE-7844](#) - [editor] Fix rendering of barcharts when the first value is missing
- [HUE-7850](#) - [editor] Presentation mode will fail if past queries are expired
- [HUE-7854](#) - [core] Update translations files for 4.2
- [HUE-7855](#) - [editor] Fixed JS error on subscription removal
- [HUE-7855](#) - [editor] Disable the editor auto-resize when running a saved query
- [HUE-7861](#) - [jb] Handle Impala query timeout
- [HUE-7874](#) - [oozie] SSH action missing configuration for retry-max and retry-interval
- [HUE-7898](#) - [editor] Impala query expiration shows update max_row_size help
- [HUE-7909](#) - [editor] Hide options in session settings
- [HUE-7916](#) - [frontend] Avoid breaking of scatterplot chart for some grouping values
- [HUE-7920](#) - [frontend] The stacked graph shouldn't have empty areas in the stacks
- [HUE-7927](#) - [metastore] Sample view on the main table page should have an horizontal scrollbar
- [HUE-7929](#) - [indexes] Field list table on the index page should have an horizontal scrollbar

- [HUE-7932](#) - [oozie] Clicking on workflow with several decision nodes hangs Hue
- [HUE-7934](#) - [importer] Unselecting has Header checkbox has no effect
- [HUE-7974](#) - [metastore] Open Database location opens in Hue 3
- [HUE-7992](#) - [oozie] Big workflows show horizontally scroll in Hue 4
- [HUE-7997](#) - [backend] Python LDAP library exposes password
- [HUE-8009](#) - [useradmin] Fix login page error for invalid local user when LDAP also enabled
- [HUE-8024](#) - [indexer] Use old collection API to avoid grant Update privilege
- [HUE-8025](#) - [metadata] Do not show the deleted databasess/tables in the search
- [HUE-8032](#) - [core] XSS in Hue Admin Interface
- [HUE-8036](#) - [presentation] Protect from storm of API calls when loading back a query with presentation
- [HUE-8053](#) - [useradmin] LDAP authentication with sync_groups_on_login=true fails with KeyError exception
- [HUE-8055](#) - [desktop] Support multiple LDAP servers in LDAP Test command
- [IMPALA-3942](#) - Fixed incorrectly escaped string literal in front-end.
- [IMPALA-4664](#) - Fixed an unexpected string conversion in Shell.
- [IMPALA-5139](#) - Updated mvn-quiet.sh to print execution content to log file.
- [IMPALA-5269](#) - Fix the issue with final line of query followed by a comment.
- [IMPALA-5936](#) - The '%' operator no longer overflows on large decimals.
- [IMPALA-5940](#) - Impala no longer shows stack tracing with Status::Expected().
- [IMPALA-6008](#) - Creating a UDF from a shared library with a .ll extension does not crash Impala.
- [IMPALA-6114](#) - Require type equality for NumericLiteral::localEquals().
- [IMPALA-6284](#) - Mark the intermediate decimal avg struct as packed.
- [IMPALA-6295](#) - Fix mix/max handling of 'nan' and 'inf'.
- [IMPALA-6307](#) - CTAS statement fails with duplicate column exception.
- [IMPALA-6348](#) - Redact only sensitive fields in runtime profiles.
- [IMPALA-6353](#) - Impala no longer crashes in snappy decompressor.
- [IMPALA-6384](#) - RequestPoolService should honor custom group mapping config.
- [IMPALA-6388](#) - Fix the Union node number of hosts estimation
- [IMPALA-6418](#) - Find a reliable way to detect supported TLS versions.
- [IMPALA-6435](#) - Disabled codegen for CHAR literals.
- [IMPALA-6454](#) - CTAS into Kudu fails with mixed-case partition or primary key column names.
- [IMPALA-6473](#) - An analytic sorts with the same expression in PARTITION BY and ORDER BY does not return an error.
- [IMPALA-6489](#) - Impala now uses the correct template tuple size.
- [IMPALA-6530](#) - Impala now tracks time spent opening HDFS file handles.
- [IMPALA-6538](#) - Fixed read path when Parquet min/max statistics contain NaN.
- [IMPALA-6542](#) - Fixed inconsistent write path of Parquet min/max statistics.
- [IMPALA-6570](#) - Support KUDU on SLES12.
- [IMPALA-6577](#) - Avoid slow Status constructor on expiration thread.
- [KUDU-1613](#) - Fixed an issue where a reformatted server could prevent re-replication of the replicas it previously hosted.
- [KUDU-2238](#) - Fixed an issue where large updates were not flushed to disk under memory pressure.
- [KUDU-2251](#) - Fixed a crash due to an overflow bug that could occur when a tablet was updated very frequently.
- [KUDU-2274](#) - Fixed an issue where copying over a tombstoned replica could produce a replica in an inconsistent state.
- [KUDU-2343](#) - Fixed an issue where the Java client would fail to connect to the leader master after a leadership change.
- [OOZIE-1401](#) - amend PurgeCommand should purge the workflow jobs w/o end_time
- [OOZIE-2045](#) - Oozie can detect symlink changes and reload the sharelib
- [OOZIE-2536](#) - Hadoop's cleanup of local directory in uber mode causing failures

- [PARQUET-1133](#) - Add int96 support by returning bytearray, Skip originalType comparison for map types when originalType is null
- [PARQUET-1217](#) - Incorrect handling of missing values in Statistics
- [PIG-5325](#) - Schema disambiguation can't be turned off for nested schemas
- [SENTRY-1459](#) - Alter view with HMS Client fails with "java.lang.IllegalArgumentException: Can not create a Path from a null string"
- [SENTRY-1951](#) - Old SentryStore.retrieveFullPathsImage() should be removed
- [SENTRY-2019](#) - Improve logging in SentryPlugin
- [SENTRY-2040](#) - When getting Snapshots from HMS we need more logging around cases when a snapshot is not being received
- [SENTRY-2066](#) - DB name is not set for AlterTable
- [SENTRY-2068](#) - Disable HTTP TRACE method from the Sentry Web Server
- [SENTRY-2078](#) - Have sentry server print an obvious INFO level log message when it becomes the writer
- [SENTRY-2120](#) - cross-site scripting vulnerability in LogLevelServlet
- [SENTRY-2124](#) - LeaderStatusMonitor.toString() throws IllegalFormatException with AtomicLong
- [SOLR-11873](#) - HA cases fixed when NameNode fails over. Solr will remain green in CM and will remain fast due to remembering the last known good NameNode.
- [SPARK-16845](#) - [SQL][BRANCH-1.6] GeneratedClass\$SpecificOrdering` grows beyond 64 KB
- [SPARK-21551](#) - [PYTHON] Increase timeout for PythonRDD.serveIterator
- [SPARK-23438](#) - [DSTREAMS] Fix DStreams data loss with WAL when driver crashes
- [SQOOP-2976](#) - Introduce a flag to expand decimal values to fit AVRO schema
- [SQOOP-3233](#) - Fixed error in HCatalog imports that occurred when the target column type was either CHAR or VARCHAR and the source column was a number (decimal or int)
- [SQOOP-3241](#) - From now on, the ImportAllTables tool will use a clone SqoopOptions object for every import instead of using the same. This fix also includes tests to ensure that cloning works correctly
- [ZOOKEEPER-1872](#) - QuorumPeer is not shutdown in few cases
- [ZOOKEEPER-2249](#) - CRC check failed when preAllocSize smaller than node data

Issues Fixed in CDH 5.14.1

CDH 5.14.1 fixes the following issue:

Hive Replications Can Fail Intermittently

This issue, which was also reported in [TSB-2018-276](#), is fixed in CDH 5.14.1. For further details, see the original [Known Issue](#).

Issues Fixed in CDH 5.14.0

CDH 5.14.0 fixes the following issues.

Hue

Hue operations randomly fail and display a 502 error

Hue operations randomly fail.

Affected versions: CDH 5.12.x, 5.13.0

Workaround: Make configuration changes to the Hue Load Balancer:

1. Find the Hue Load Balancer host by selecting Host > All Host and search for "Hue Load Balancer"
2. Navigate to the following directory on the Hue Load Balancer host: `/usr/share/cmf/hue/httpd/`.
3. Edit the `httpd.conf` file and add the following property after the `ProxyPass` property: `SetEnv proxy-intial-not-pooled 1`.

4. Inside the `<IfDefine Cloudera_HTTPD_USE_SSL>` block under the `SSLProtocol` property line, add the following properties:

```
SSLProxyProtocol all -SSLv2 -SSLv3
SSLCipherSuite
```

Cloudera Bug: CDH-57588

Upstream Issues Fixed

The following upstream issues are fixed in CDH 5.14.0:

- [FLUME-2579](#) - Support durable subscription in JMSSource
- [FLUME-3046](#) - Kafka Sink and Source Configuration Improvements
- [FLUME-3100](#) - Support arbitrary header substitution for topic of Kafka Sink
- [FLUME-3158](#) - Upgrade surefire version and config
- [FLUME-3195](#) - Split the KafkaChannelTest to avoid timeouts
- [FLUME-3201](#) - Fix SyslogUtil to handle RFC3164 format in December correctly
- [HADOOP-10829](#) - Iteration on CredentialProviderFactory.serviceLoader is thread-unsafe
- [HADOOP-12717](#) - NPE when trying to rename a directory in Windows Azure Storage FileSystem
- [HADOOP-12903](#) - IPC Server should allow suppressing exception logging by type, not log 'server too busy' messages.
- [HADOOP-14475](#) - Metrics of S3A don't print out when enabled
- [HADOOP-14687](#) - AuthenticatedURL will reuse bad/expired session cookies
- [HADOOP-14814](#) - Fix incompatible API change on FsServerDefaults to HADOOP-14104
- [HADOOP-14864](#) - FSDataInputStream#unbuffer UOE should include stream class name
- [HADOOP-14880](#) - [KMS] Document&test missing KMS client side configs
- [HADOOP-14891](#) - Remove references to Guava Objects.toStringHelper
- [HADOOP-14892](#) - MetricsSystemImpl should use Time.monotonicNow for measuring durations
- [HADOOP-14919](#) - BZip2 drops records when reading data in splits
- [HADOOP-14944](#) - Add JvmMetrics to KMS.
- [HADOOP-14948](#) - Document missing config key hadoop.treat.subject.external
- [HADOOP-14960](#) - Add GC time percentage monitor/alerter
- [HADOOP-15023](#) - ValueQueue should also validate (int) (lowWatermark * numValues) > 0 on construction.
- [HADOOP-15067](#) - GC time percentage reported in JvmMetrics should be a gauge, not counter
- [HDFS-9941](#) - Do not log StandbyException on NN, other minor logging fixes
- [HDFS-10326](#) - Disable setting tcp socket send/receive buffers for write pipelines
- [HDFS-10984](#) - Expose nntop output as metrics
- [HDFS-11659](#) - TestDataNodeHotSwapVolumes.testRemoveVolumeBeingWritten fail due to no DataNode available for pipeline recovery
- [HDFS-11799](#) - Introduce a config to allow setting up write pipeline with fewer nodes than replication factor
- [HDFS-11896](#) - Non-dfsUsed will be doubled on dead node re-registration
- [HDFS-12052](#) - Set SWEBHDFS delegation token kind when ssl is enabled in HttpFS
- [HDFS-12143](#) - Improve performance of getting and removing inode features
- [HDFS-12171](#) - Reduce IIP object allocations for inode lookup
- [HDFS-12177](#) - NameNode exits due to setting BlockPlacementPolicy loglevel to Debug
- [HDFS-12319](#) - DirectoryScanner will throw IllegalStateException when Multiple BP's are present
- [HDFS-12371](#) - BlockVerificationFailures and BlocksVerified show up as 0 in Datanode JMX
- [HDFS-12485](#) - expunge may fail to remove trash from encryption zone
- [HDFS-12495](#) - TestPendingInvalidateBlock#testPendingDeleteUnknownBlocks fails intermittently
- [HDFS-12544](#) - SnapshotDiff - support diff generation on any snapshot root descendant directory.
- [HDFS-12578](#) - TestDeadDatanode#testNonDFSUsedONDeadNodeReReg failing in branch-2.7
- [HDFS-12603](#) - Enable async edit logging by default

- [HDFS-12754](#) - Lease renewal can hit a deadlock
- [MAPREDUCE-5124](#) - AM lacks flow control for task events
- [MAPREDUCE-6797](#) - Job history server scans can become blocked on a single, slow entry
- [MAPREDUCE-7028](#) - Concurrent task progress updates causing NPE in Application Master
- [YARN-2162](#) - Add ability in Fair Scheduler to optionally configure maxResources in terms of percentage.
- [YARN-7049](#) - FSAppAttempt preemption related fields have confusing names.
- [YARN-7057](#) - FSAppAttempt#getResourceUsage doesn't need to consider resources queued for preemption.
- [YARN-7363](#) - Revert "ContainerLocalizer don't have a valid log4j config in case of Linux container executor. (Contributed by Yufei Gu)"
- [YARN-7363](#) - ContainerLocalizer don't have a valid log4j config in case of Linux container executor.
- [HBASE-5291](#) - Add Kerberos HTTP SPNEGO authentication support to HBase web consoles
- [HBASE-15354](#) - Use same criteria for clearing meta cache for all operations
- [HBASE-15714](#) - We are calling checkRow() twice in doMiniBatchMutation()
- [HBASE-17424](#) - Disable external entity parsing in RemoteAdmin
- [HBASE-17590](#) - Drop cache hint should work on store file write path
- [HBASE-17658](#) - Fix bookkeeping error with max regions for a table
- [HBASE-18125](#) - shell disregards spaces at the end of a split key in a split file
- [HBASE-18141](#) - Regionserver fails to shutdown when abort triggered during RPC call
- [HBASE-18142](#) - Deletion of a cell deletes the previous versions too
- [HBASE-18233](#) - 'We shouldn't wait for readlock in doMiniBatchMutation in case of deadlock'
- [HBASE-18471](#) - The DeleteFamily cell is skipped when StoreScanner seeks to next column
- [HBASE-18480](#) - The cost of BaseLoadBalancer.cluster is changed even if the rollback is done
- [HBASE-18572](#) - Delete can't remove the cells which have no visibility label
- [HBASE-18665](#) - ReversedScannerCallable invokes getRegionLocations incorrectly
- [HBASE-18675](#) - Making {max,min}SessionTimeout configurable for MiniZooKeeperCluster
- [HBASE-18743](#) - HFiles in use by a table which has the same name and namespace with a default table cloned from snapshot may be deleted when that snapshot and default table are deleted
- [HBASE-18757](#) - Fix improper bitwise & in bucketcache offset calculation
- [HBASE-18847](#) - Remove unneeded synchronized block from HFileWriterV2 warning in branch-1.2
- [HBASE-18890](#) - Backport HBASE-14499 (Master coprocessors shutdown will not happen on master abort) to branch-1
- [HBASE-18907](#) - Methods missing rpc timeout parameter in HTable
- [HBASE-18924](#) - Backport HBASE-18568 (Correct metric of numRegions) to branch-1.2 and branch-1.3
- [HBASE-18998](#) - processor.getRowsToLock() always assumes there is some row being locked
- [HBASE-19215](#) - Incorrect exception handling on the client causes incorrect call timeouts and byte buffer allocations on the server

- [IMPALA-4669](#) - [KRPC] Add kudu_rpc library to build
- [IMPALA-4670](#) - Introduces RpcMgr class
- [IMPALA-4704](#) - Turns on client connections when local catalog initialized.
- [IMPALA-4736](#) - Add SIGUSR1 behavior to help string for 'minidump_path' flag
- [IMPALA-4786](#) - Clean up how ImpalaServers are created

- [IMPALA-4847](#) - Simplify HdfsTable block metadata loading code
- [IMPALA-4856](#) - Port data stream service to KRPC
- [IMPALA-4856](#) - IMPALA-4872: Include KRPC services in plan fragment's destinations
- [IMPALA-4856](#) - Rename thrift-deps to gen-deps
- [IMPALA-4863](#) - IMPALA-5311: Correctly account the file type and compression codec
- [IMPALA-4918](#) - Support getting column comments via HS2
- [IMPALA-4927](#) - Impala should handle invalid input from Sentry
- [IMPALA-4939](#) - IMPALA-4940: Decimal V2 multiplication
- [IMPALA-4964](#) - Fix Decimal modulo overflow
- [IMPALA-4985](#) - use parquet stats of nested types for dynamic pruning
- [IMPALA-5018](#) - Error on decimal modulo or divide by zero
- [IMPALA-5019](#) - Decimal V2 addition
- [IMPALA-5129](#) - Use Kudu's Kinit code to avoid expensive fork
- [IMPALA-5142](#) - EventSequence displays negative elapsed time.
- [IMPALA-5174](#) - Suppress kudu flags that aren't relevant to Impala
- [IMPALA-5199](#) - prevent hang on empty row batch exchange
- [IMPALA-5210](#) - Count rows and collection items in parquet scanner separately
- [IMPALA-5211](#) - Simplifying nullif conditional.
- [IMPALA-5211](#) - Simplifying ifnull/isnull/nvl where conditional is a literal.
- [IMPALA-5243](#) - Speed up code gen for wide Avro tables.
- [IMPALA-5250](#) - Unify decompressor output_length semantics
- [IMPALA-5307](#) - Part 4: copy out uncompressed text and seq
- [IMPALA-5307](#) - Part 2: copy out strings in uncompressed Avro
- [IMPALA-5307](#) - part 1: don't transfer disk I/O buffers out of parquet
- [IMPALA-5307](#) - Part 3: remove TODO from RCFile
- [IMPALA-5317](#) - add DATE_TRUNC() function
- [IMPALA-5341](#) - Avoid unintended filter out in fe test
- [IMPALA-5376](#) - Implement all TPCDS test cases or alternates for Impala.
- [IMPALA-5383](#) - [DOCS] Document unpartitioned Kudu tables
- [IMPALA-5394](#) - Change ThriftServer() to always use TAcceptQueueServer
- [IMPALA-5416](#) - Fix an impala-shell command recursion bug
- [IMPALA-5417](#) - make I/O buffer queue fixed-size
- [IMPALA-5425](#) - Add test for validating input when setting query options
- [IMPALA-5429](#) - Multi threaded block metadata loading
- [IMPALA-5448](#) - fix invalid number of splits reported in Parquet scan node
- [IMPALA-5501](#) - [DOCS] Clarify 'binaries' w.r.t. installation procedure
- [IMPALA-5525](#) - Extend TestScannersFuzzing to test uncompressed parquet
- [IMPALA-5529](#) - [DOCS] New trunc() signatures
- [IMPALA-5538](#) - Revert "Use explicit catalog versions for deleted objects"
- [IMPALA-5538](#) - Use explicit catalog versions for deleted objects
- [IMPALA-5541](#) - Reject BATCH_SIZE greater than 65536
- [IMPALA-5589](#) - Re-apply:change "set" in impala-shell to show empty string for unset query options
- [IMPALA-5589](#) - Revert "change "set" in impala-shell to show empty string for unset query options"
- [IMPALA-5589](#) - change "set" in impala-shell to show empty string for unset query options
- [IMPALA-5599](#) - Clean up references to TimestampValue in be/src.
- [IMPALA-5599](#) - Fix for mis-use of TimestampValue
- [IMPALA-5624](#) - Replace "ls -l" with opendir() in ProcessStateInfo
- [IMPALA-5638](#) - [DOCS] Add known issue for Impala-Kudu-Sentry issue
- [IMPALA-5653](#) - Remove "unlimited" process mem_limit option
- [IMPALA-5664](#) - Unix time to timestamp conversions may crash Impala

- [IMPALA-5668](#) - Fix cast(X as timestamp) for negative subsecond Decimals
- [IMPALA-5736](#) - Add impala-shell argument to set default query options
- [IMPALA-5789](#) - Add always_false flag in bloom filter
- [IMPALA-5836](#) - Improvements to Eclipse frontend configuration.
- [IMPALA-5844](#) - use a MemPool for expr result allocations
- [IMPALA-5846](#) - Fix output path for kudu libraries
- [IMPALA-5854](#) - Revert "Update external hadoop versions"
- [IMPALA-5854](#) - Update external hadoop versions
- [IMPALA-5860](#) - upgrade to LLVM 3.9.1
- [IMPALA-5870](#) - Improve runtime profile for partial sort
- [IMPALA-5873](#) - Check for existence of sync_file_range()
- [IMPALA-5894](#) - [DOCS] Clarify placement of STRAIGHT_JOIN hint
- [IMPALA-5895](#) - clean up runtime profile lifecycle
- [IMPALA-5902](#) - add ThreadSanitizer build
- [IMPALA-5905](#) - build-all-flag-combinations addendum
- [IMPALA-5905](#) - add script for all-build-options job
- [IMPALA-5908](#) - Allow SET to unset modified query options.
- [IMPALA-5912](#) - fix crash in trunc(..., "WW") in release build
- [IMPALA-5920](#) - addendum - add missing RAT check
- [IMPALA-5920](#) - Remove admission control dependency on YARN RM jar
- [IMPALA-5926](#) - Avoid printing expensive stack when closing a session
- [IMPALA-5927](#) - Fix enable_distcc for zsh
- [IMPALA-5932](#) - Improve transitive closure computation performance in FE
- [IMPALA-5940](#) - Avoid log spew by using Status::Expected()
- [IMPALA-5940](#) - Avoid log spew by using Status::Expected.
- [IMPALA-5941](#) - Fix Metastore schema creation in create-test-configuration.sh
- [IMPALA-5957](#) - print memory address, not memory
- [IMPALA-5965](#) - avoid per-value switch on NeedsConversionInline() in parquet
- [IMPALA-5966](#) - Fix the result file location of PlannerTest
- [IMPALA-5975](#) - Work around broken beeline clients
- [IMPALA-5976](#) - Remove equivalence class computation in FE
- [IMPALA-5986](#) - Correct set-option logic to recognize digits in names.
- [IMPALA-5987](#) - LZ4 Codec silently produces bogus compressed data for large inputs
- [IMPALA-5988](#) - optimise MemPool::TryAllocate()
- [IMPALA-5999](#) - Fix LLVM linkage errors due LibCache sync issues
- [IMPALA-6001](#) - Part 1: Increase log level during catalog update processing
- [IMPALA-6002](#) - Add a LLVM diagnostic handler for LLVM linker errors
- [IMPALA-6004](#) - Fix test_row_filters failure on ASAN
- [IMPALA-6009](#) - Upgrade Guava to 14.0.1
- [IMPALA-6012](#) - workaround - downgrade hive temporarily
- [IMPALA-6016](#) - Fix logging in TableLoadingMgr class
- [IMPALA-6019](#) - Remove dead code parallel-executor*
- [IMPALA-6021](#) - Revert "IMPALA-6009: Upgrade Guava to 14.0.1"
- [IMPALA-6027](#) - Retry downloading toolchain components.
- [IMPALA-6030](#) - Don't start coordinator specific thread pools if a node isn't a coordinator node
- [IMPALA-6040](#) - skip test_multi_compression_types where Hive isn't supported
- [IMPALA-6053](#) - Fix exception when storadelds don't match hosts
- [IMPALA-6054](#) - Parquet dictionary pages should be freed on dictionary construction
- [IMPALA-6055](#) - Fix hdfs encryption test far Hadoop 2.8+
- [IMPALA-6060](#) - Check the return value of JNI exception handling functions

- [IMPALA-6067](#) - Enable S3 access via IAM roles for EC2 VMs
- [IMPALA-6068](#) - Revert "Fix dataload for complextypes_fileformat"
- [IMPALA-6068](#) - Fix dataload for complextypes_fileformat
- [IMPALA-6069](#) - Fix CodegenAnyVal's handling of 'nan'
- [IMPALA-6076](#) - Parquet BIT_PACKED deprecation warning
- [IMPALA-6080](#) - clean up table descriptor handling
- [IMPALA-6081](#) - Fix test_basic_filters runtime profile failure
- [IMPALA-6084](#) - Avoid using of global namespace for llvm
- [IMPALA-6099](#) - Fix crash in CheckForAlwaysFalse()
- [IMPALA-6100](#) - increase test_exchange_delays timeout on slow builds
- [IMPALA-6105](#) - Clarify argument order in single_node_perf_run
- [IMPALA-6106](#) - handle comments before set in test parser
- [IMPALA-6108](#) - IMPALA-6070: Parallel data load (re-instated).
- [IMPALA-6108](#) - Revert "IMPALA-6070: Parallel data load."
- [IMPALA-6109](#) - xfail TestHdfsUnknownErrors::test_hdfs_safe_mode_error_255
- [IMPALA-6118](#) - Fix assertion failure in coordinator bloom filter updating
- [IMPALA-6121](#) - remove I/O mgr request context cache
- [IMPALA-6123](#) - Fix column order of a query test in test_inline_view_limit
- [IMPALA-6124](#) - Fix alter table ddl updates and test
- [IMPALA-6126](#) - ASAN detects heap-use-after-free in thrift-server-test
- [IMPALA-6127](#) - Fix timeout in TestRuntimeFilter.test_wait_time
- [IMPALA-6128](#) - Spill-to-disk Encryption(AES-CFB + SHA256) is slow
- [IMPALA-6134](#) - Update code base to use impala::ConditionVariable
- [IMPALA-6136](#) - Part 1: Query duration should not be normally negative.
- [IMPALA-6137](#) - fix text scanner split delim mem mgmt
- [IMPALA-6144](#) - PublishFilter() continues to run after query failure/cancellation
- [IMPALA-6148](#) - Specifying thirdparty deps as URLs
- [IMPALA-6151](#) - add query-level fragment/backend counters
- [IMPALA-6155](#) - Allow tests to pass when ORDER BY does not cover the query.
- [IMPALA-6164](#) - Fix stale query profile in TestAlwaysFalseFilter
- [IMPALA-6171](#) - Revert "IMPALA-1575: part 2: yield admission control resources"
- [IMPALA-6173](#) - Fix SHOW CREATE TABLE for unpartitioned Kudu tables
- [IMPALA-6183](#) - Fix Decimal to Double conversion
- [IMPALA-6184](#) - Clean up after ScalarExprEvaluator::Clone() fails
- [IMPALA-6187](#) - Fix missing conjuncts evaluation with empty projection
- [IMPALA-6188](#) - make test_top_n_reclaim less flaky
- [IMPALA-6198](#) - marks a test as debug-only
- [IMPALA-6201](#) - Fix test_basic_filters on ASAN
- [IMPALA-6206](#) - Fix data load failure with -notests
- [IMPALA-6217](#) - fix DCHECK in Parquet fuzz test
- [IMPALA-6220](#) - Revert "IMPALA-6128: Spill-to-disk Encryption(AES-CFB + SHA256) is slow"
- [IMPALA-6225](#) - Part 1: Query profile date-time strings should have ns precision.
- [IMPALA-6232](#) - Disable file handle cache by default
- [IMPALA-6241](#) - timeout in admission control test under ASAN
- [IMPALA-6256](#) - Incorrect principal will be used for internal connections if FLAGS_be_principal is set
- [IMPALA-6262](#) - Always initialize runtime profile for DataSink
- [IMPALA-6280](#) - Materialize TupleIsNullPredicate for insert sorts
- [IMPALA-6281](#) - Fix use-after-free in InitAuth()
- [IMPALA-6285](#) - Don't print stack trace on RPC errors.
- [IMPALA-6286](#) - Remove invalid runtime filter targets.

- [IMPALA-6291](#) - disable AVX512 codegen in LLVM
- [IMPALA-6292](#) - addendum: Fix failing test
- [IMPALA-6292](#) - Fix incorrect DCHECK in decimal subtraction
- [IMPALA-6298](#) - Skip test_profile_fragment_instances on local filesystem
- [IMPALA-6308](#) - Fix bad Status() usage in data-stream-sender.cc
- [IMPALA-5307](#) - ScannerContext API change
- [IMPALA-5493](#) - Add Protobuf to CMakeLists.txt
- [KUDU-1078](#) - Fixed an error message commonly found in tablet server logs indicating that operations were being read "from the future".
- [KUDU-1411](#) - HybridTime timestamp propagation now works in the Java client when using scan tokens.
- [KUDU-2044](#) - Tombstoned tablets no longer report metrics.
- [KUDU-2173](#) - Fixed a bug in the C++ client which could cause tablets to be erroneously pruned, or skipped, during certain scans, resulting in fewer results than expected being returned from queries. The bug only affected tables whose range partition columns are a proper prefix of the primary key.
- [KUDU-2188](#) - Published Kudu Java artifacts are now fully compatible with JRE 7 and JRE 8. There was previously a bug in the release process which made them compatible only with JRE 8.
- Fixed a typo in the list of default TLS ciphers used by Kudu servers. As a result, two additional cipher suites are now available:
 - ECDHE-RSA-AES128-SHA256 TLSv1.2 Kx=ECDH Au=RSA Enc=AES(128) Mac=SHA256
 - AES256-GCM-SHA384 TLSv1.2 Kx=RSA Au=RSA Enc=AESGCM(256) Mac=AEAD
- [KUDU-2231](#) - Sparse column predicates no longer cause excessive data-block reads.
- [OOZIE-1401](#) - PurgeCommand should purge the workflow jobs w/o end_time
- [OOZIE-3072](#) - oozie.service.HadoopAccessorService.action.configurations should overwrite default values set in Hadoop's configuration files
- [OOZIE-3078](#) - PasswordMasker throws NPE with null arguments
- [OOZIE-3103](#) - Improve log message regarding max concurrency for coordinators
- [OOZIE-3112](#) - SparkConfigurationService overwrites properties provided via --properties-file option in SparkAction
- [OOZIE-3132](#) - Instrument SLACalculatorMemory
- [PIG-3299](#) - Provide support for LazyOutputFormat to avoid creating empty files
- [SENTRY-1272](#) - Enable ALTERVIEW_RENAME and ALTERVIEW_AS operation in hive binding
- [SENTRY-1712](#) - Add trigger mechanism for Sentry to push full path snapshot to Name Node.
- [SENTRY-1906](#) - Sentry clients to retry connections to server with delay to avoid failing fast
- [SENTRY-1963](#) - Sentry JSON reporter should use regular implementation for local file system
- [SENTRY-1992](#) - Improve parameter handling for SentryGenericProviderBackend
- [SENTRY-2014](#) - incorrect handling of HDFS paths with multiple forward slashes
- [SENTRY-2031](#) - Add trigger mechanism for Sentry to pull full path snapshot from HMS
- [SENTRY-2032](#) - Leading Slashes need to be removed when creating HMS path entries
- [SENTRY-2035](#) - Metrics should move to destination atomically
- [SENTRY-2036](#) - sentry_sync_notifications() should set ID when it returns errors
- [SENTRY-2046](#) - Create a full snapshot if AUTHZ_PATHS_SNAPSHOT_ID is empty, even if HMS and Sentry Notifications are in sync
- [SENTRY-2047](#) - isEmptyCore method in SentryStore has references to MAuthzPathsMapping when it should be generic
- [SPARK-15273](#) - YarnSparkHadoopUtil#getOutOfMemoryErrorArgument should respect OnOutOfMemoryError parameter given by user
- [SQOOP-3196](#) - Modify MySQLAuthTest to use configurable test database parameters
- [SQOOP-3197](#) - Database credentials cannot be configured in PostgreSQL third party tests
- [SQOOP-3229](#) - Document how to run third party tests manually with databases running in docker
- [SQOOP-3243](#) - Importing BLOB data causes "Stream closed" error on encrypted HDFS
- [SQOOP-3257](#) - Sqoop does not log and print metastore password

- [ZOOKEEPER-1583](#) - Document maxClientCnxns in conf/zoo_sample.cfg
- [ZOOKEEPER-1584](#) - Adding mvn-install target for deploying the zookeeper artifacts to .m2 repository
- [ZOOKEEPER-2887](#) - define dependency versions in build.xml to be easily overridden in build.properties

Issues Fixed in CDH 5.13.x

The following topics describe issues fixed in CDH 5.13.x, from newest to oldest release. You can also review [What's New in CDH 5.13.x](#) on page 1817 or [Known Issues in CDH 5](#) on page 1944.

Issues Fixed in CDH 5.13.3

Missing results in Hive, Spark, Pig, Custom MapReduce jobs, and other Java applications when filtering Parquet data written by Impala

This issue, which was also reported in [TSB-2018-300](#), is fixed in CDH 5.13.3 and higher. For further details, see the original [Known Issue for Hive](#), [Known Issue for Spark](#), [Known Issue for Pig](#), or the [Known Issue for MapReduce](#).

Slow or stalled queries under highly concurrent write workloads when Sentry + Hive are used, caused by a Hive metastore deadlock

This issue, which was also reported in [TSB-2018-294](#), is fixed in CDH 5.13.3. For further details, see the original [Known Issue](#).

Crash due to CHECK failure during compactions: `pv_delete_redo != nullptr`

This issue, which was also reported in [TSB-2018-298](#), is fixed in CDH 5.13.3 and 5.14.2. For further details, see the original [Known Issue](#).

Upstream Issues Fixed

The following upstream issues are fixed in CDH 5.13.3:

- [HADOOP-6852](#) - apparent bug in concatenated-bzip2 support (decoding)
- [HADOOP-12886](#) - Exclude weak ciphers in SSLFactory through ssl-server.xml
- [HDFS-6054](#) - MiniQJMHACluster should not use static port to avoid binding failure in unit test.
- [HDFS-10903](#) - Replace config key literal strings with config key names II: hadoop hdfs
- [HDFS-12386](#) - Add fserver defaults call to WebhdfsFileSystem.
- [HDFS-13040](#) - Kerberized inotify client fails despite kinit properly
- [HDFS-13115](#) - In getNumUnderConstructionBlocks(), ignore the inodelds for which the inodes have been deleted
- [HDFS-13170](#) - Port webhdfs unmaskedpermission parameter to HTTPFS
- [MAPREDUCE-7048](#) - Uber AM can crash due to unknown task in statusUpdate
- [MAPREDUCE-7053](#) - Timed out tasks can fail to produce thread dump
- [YARN-2416](#) - InvalidStateTransitionException in ResourceManager if AMLauncher does not receive response for startContainers() call in time
- [HBASE-15714](#) - We are calling checkRow() twice in doMiniBatchMutation()
- [HBASE-15866](#) - Split hbase.rpc.timeout into *.read.timeout and *.write.timeout
- [HBASE-17319](#) - Truncate table with preserve after split may cause truncation to fail
- [HBASE-17924](#) - Consider sorting the row order when processing multi() ops before taking rowlocks
- [HBASE-18233](#) - We shouldn't wait for readlock in
- [HBASE-19163](#) - "Maximum lock count exceeded" from region server's batch processing
- [HBASE-19188](#) - Build fails on branch-1 using maven-3.5.2
- [HBASE-19364](#) - Truncate_preserve fails with table when replica region > 1
- [HBASE-19391](#) - Calling HRegion#initializeRegionInternals from a region replica can still re-create a region directory
- [HBASE-19553](#) - Old replica regions should be cleared from AM memory after primary region split or merge
- [HBASE-19728](#) - Add lock to filesCompacting in all place.
- [HBASE-19934](#) - HBaseSnapshotException when read replicas is enabled and online snapshot is taken after region splitting
- [HBASE-20052](#) - TestRegionOpen#testNonExistentRegionReplica fails due to NPE

- [HBASE-20061](#) - HStore synchronized member variable filesCompacting should be private
- [HIVE-14792](#) - AvroSerde reads the remote schema-file at least once per mapper, per table reference.
- [HIVE-16886](#) - HMS log notifications may have duplicated event IDs if multiple HMSs are running concurrently
- [HIVE-18671](#) - Lock not released after Hive on Spark query was cancelled
- [HIVE-18917](#) - Add spark.home to hive.conf.restricted.list
- [HUE-7431](#) - [core] When idle session timeout is enabled it causes issues with IDP initiated SAML
- [HUE-7920](#) - [frontend] The stacked graph shouldn't have empty areas in the stacks
- [HUE-7932](#) - [oozie] Clicking on workflow with several decision nodes hangs Hue
- [HUE-7992](#) - [oozie] Big workflows show horizontally scroll in Hue 4
- [HUE-7997](#) - [backend] Python LDAP library exposes password
- [HUE-8009](#) - [useradmin] Fix login page error for invalid local user when LDAP also enabled
- [HUE-8024](#) - [indexer] Use old collection API to avoid grant Update privilege
- [HUE-8032](#) - [core] XSS in Hue Admin Interface
- [HUE-8053](#) - [useradmin] LDAP authentication with sync_groups_on_login=true fails with KeyError exception
- [HUE-8055](#) - [desktop] Support multiple LDAP servers in LDAP Test command
- [HUE-8063](#) - [fb] Better error message when HTTPFS is not working
- [HUE-8069](#) - [core] Pyformance reporter thread stops on exceptions in guage callbacks
- [HUE-8069](#) - [core] Fix code format and exception logging
- [IMPALA-6353](#) - Fixed the crash in snappy decompressor.
- [IMPALA-6473](#) - Error in analytic sort with same expr in 'partition by' and 'order by'.
- [IMPALA-6500](#) - Impala crashes randomly on different queries with GROUP BY.
- [KUDU-2238](#) - Fixed a bug where large updates were not flushed to disk, even when the server is under memory pressure..
- [KUDU-2274](#) - Fixed a very rare bug where a tombstone being copied over could produce a tablet replica in an inconsistent state.
- [KUDU-2343](#) - Java client doesn't properly reconnect to leader master when old leader is online.
- [OOZIE-3132](#) - Instrument SLACalculatorMemory
- [PARQUET-1133](#) - Add int96 support by returning bytearray, Skip originalType comparison for map types when originalType is null
- [PARQUET-1217](#) - Incorrect handling of missing values in Statistics
- [SENTRY-1459](#) - Alter view with HMS Client fails with "java.lang.IllegalArgumentException: Can not create a Path from a null string"
- [SENTRY-2124](#) - LeaderStatusMonitor.toString() throws IllegalFormatConversionException with AtomicLong
- [SOLR-11873](#) - ofand SOLR-7391: Use time based expiration cache in all necessary places in HdfsDirectoryFactory.
- [SPARK-19982](#) - Disable flaky java bean encoder tests ().
- [SPARK-23438](#) - [DSTREAMS] Fix DStreams data loss with WAL when driver crashes
- [SQOOP-2976](#) - avro padding

Issues Fixed in CDH 5.13.2

CDH 5.13.2 fixes the following issues.

Hive Replications Can Fail Intermittently

This issue, which was also reported in [TSB-2018-276](#), is fixed in CDH 5.13.2. For further details, see the original [Known Issue](#).

Secure Impala-Kudu clusters need to be restarted frequently

Due to Kudu-2264, secure, long-running Impala clusters on CDH 5.13.x and later will be unable to interact with Kudu tables after some time because the Kudu client used by Impala will no longer be able to authenticate with Kudu. The problem starts after the client's ticket can no longer be renewed, which is typically after 7 days. Restarting the Impala service will allow Impala to work with Kudu again.

Impala will begin failing to read or write Kudu tables with errors in the Impala daemon logs resembling:

```

W1121 22:47:47.231425 50416 ConnectToCluster.java:302] Error receiving response from

```

Products Affected: Impala

Releases Affected: CDH 5.13.0, CDH 5.13.1, and CDH 5.14.0

Users Affected: Users running a secure cluster with Impala and Kudu.

Severity: Medium

Impact: Impala will not be able to query or write to Kudu tables until the service is restarted. The Impala service will need to be restarted periodically in order to continue being able to work with Kudu tables.

Immediate action required: To work around the issue, users can restart the Impala service at least once per ticket renewal period. This period is typically 7 days.

Addressed in release: CDH 5.13.2, CDH 5.13.3, and CDH 5.14.2

Apache Hadoop MapReduce Job History Server (JHS) vulnerability

A vulnerability in Hadoop's Job History Server allows a cluster user to expose private files owned by the user running the MapReduce Job History Server (JHS) process. See <http://seclists.org/oss-sec/2018/q1/79> for reference.

Products affected: Apache Hadoop MapReduce

Releases affected: All releases prior to CDH 5.12.0. CDH 5.12.0, CDH 5.12.1, CDH 5.12.2, CDH 5.13.0, CDH 5.13.1, CDH 5.14.0

Users affected: Users running the MapReduce Job History Server (JHS) daemon

Date/time of detection: November 8, 2017

Detected by: Man Yue Mo of lgtm.com

Severity (Low/Medium/High): High

Impact: The vulnerability allows a cluster user to expose private files owned by the user running the MapReduce Job History Server (JHS) process. The malicious user can construct a configuration file containing XML directives that reference sensitive files on the MapReduce Job History Server (JHS) host.

CVE: CVE-2017-15713

Immediate action required: Upgrade to a release where the issue is fixed.

Addressed in release/refresh/patch: CDH 5.13.2, 5.14.2, 5.15.0

HUE

Group sync fails when a non-standard (not uid) user_name_attr is used

Group sync fails when a non-standard (not uid) user_name_attr is used. For example, if a customer user "LDAP User Attribute" is used sync fails for users where the users uid value does not match the user_name_attr defined in the configuration. There is also a "... is not JSON serializable" error when running "Sync LDAP Users/Groups"

Bug: CDH-61984

Apache Oozie Server Vulnerability

A vulnerability in the Oozie Server allows a cluster user to read private files owned by the user running the Oozie Server process.

Products affected: Oozie

Releases affected: All releases prior to CDH 5.12.0, CDH 5.12.0, CDH 5.12.1, CDH 5.12.2, CDH 5.13.0, CDH 5.13.1, CDH 5.14.0

Users affected: Users running the Oozie Server

Date/time of detection: November 13, 2017

Detected by: Daryn Sharp and Jason Lowe of Oath (formerly Yahoo! Inc)

Severity: (Low/Medium/High) High

Impact: The vulnerability allows a cluster user to read private files owned by the user running the Oozie Server process. The malicious user can construct a workflow XML file containing XML directives and configuration that reference sensitive files on the Oozie server host.

CVE: CVE-2017-15712

Immediate action required: Upgrade to release where the issue is fixed.

Addressed in release/refresh/patch: CDH 5.13.2, 5.14.2

Upstream Issues Fixed

The following upstream issues are fixed in CDH 5.13.2:

- [FLUME-3046](#) - Kafka Sink and Source Configuration Improvements
- [FLUME-3100](#) - Support arbitrary header substitution for topic of Kafka Sink
- [FLUME-3158](#) - Upgrade surefire version and config
- [FLUME-3195](#) - Split the KafkaChannelTest to avoid timeouts
- [FLUME-3201](#) - Fix SyslogUtil to handle RFC3164 format in December correctly
- [HADOOP-14687](#) - AuthenticatedURL will reuse bad/expired session cookies
- [HADOOP-14814](#) - Fix incompatible API change on FsServerDefaults to HADOOP-14104
- [HADOOP-15143](#) - NPE due to Invalid KerberosTicket in UGI
- [HDFS-11799](#) - Introduce a config to allow setting up write pipeline with fewer nodes than replication factor
- [HDFS-12052](#) - Set SWEBHDFS delegation token kind when ssl is enabled in HttpFS
- [HDFS-12485](#) - expunge may fail to remove trash from encryption zone
- [HDFS-12985](#) - NameNode crashes during restart after an OpenForWrite file present in the Snapshot got deleted.
- [MAPREDUCE-5124](#) - AM lacks flow control for task events
- [MAPREDUCE-7015](#) - Possible race condition in JHS if the job is not loaded
- [MAPREDUCE-7020](#) - Task timeout in uber mode can crash AM
- [MAPREDUCE-7028](#) - Concurrent task progress updates causing NPE in Application Master
- [YARN-4813](#) - TestRMWebServicesDelegationTokenAuthentication.testDoAs fails intermittently
- [YARN-7363](#) - ContainerLocalizer don't have a valid log4j config in case of Linux container executor.
- [YARN-7590](#) - Improve container-executor validation check
- [YARN-7622](#) - Allow fair-scheduler configuration on HDFS
- [YARN-7705](#) - Create the container log directory with correct sticky bit in C code
- [YARN-7758](#) - Add an additional check to the validity of container and application ids passed to container-executor
- [HBASE-14252](#) - RegionServers fail to start when setting hbase.ipc.server.callqueue.scan.ratio to 0
- [HBASE-15354](#) - Use same criteria for clearing meta cache for all operations
- [HBASE-16980](#) - TestRowProcessorEndpoint failing consistently
- [HBASE-18625](#) - Splitting of region with replica, doesn't update region list in serverHolding. A server crash leads to overlap.
- [HBASE-19215](#) - Incorrect exception handling on the client causes incorrect call timeouts and byte buffer allocations on the server
- [HIVE-9447](#) - Metastore: inefficient Oracle query for removing unused column descriptors when adding or dropping a table or partition
- [HIVE-11569](#) - Use PreOrderOnceWalker where feasible

- [HIVE-11609](#) - Capability to add a filter to hbase scan via composite key doesn't work
- [HIVE-14303](#) - CommonJoinOperator.checkAndGenObject should return directly to avoid NPE if ExecReducer.close is called twice
- [HIVE-15519](#) - BitSet not computed properly for ColumnBuffer subset
- [HIVE-15859](#) - HoS: Write RPC messages in event loop
- [HIVE-16708](#) - Exception while renewing a Delegation Token
- [HIVE-17022](#) - Add mode in lock debug statements
- [HIVE-17624](#) - MapredLocalTask running in separate JVM could throw ClassNotFoundException
- [HIVE-17969](#) - Metastore to alter table in batches of partitions when renaming table
- [HIVE-18009](#) - Multiple lateral view query is slow on Hive on Spark
- [HIVE-18127](#) - Do not strip '--' comments from shell commands issued from CliDriver
- [HUE-7353](#) - [search] Timeline chart shouldn't degrade the page performance
- [HUE-7564](#) - Remove one of the get_connection(ldap_config) function in ldap_access.py.
- [HUE-7567](#) - [all] Fix test desktop.lib.rest.test_clear_cookies
- [HUE-7583](#) - [editor] Export result to table throws already exists error
- [HUE-7592](#) - [jib] Hide older browser if the new ones is enabled
- [HUE-7622](#) - [jib] Reruning a wokflow redirects to a json result
- [HUE-7624](#) - [core] Support multi-authentication with AllowFirstUserDjangoBackend and LdapBackend
- [HUE-7646](#) - [sentry] Changing role privileges removes HDFS ACLs
- [HUE-7647](#) - [core] Group sync fails when a non-standard (not uid) user_name_attr is used
- [HUE-7666](#) - [editor] Presentation mode with variables shouldn't break the editor
- [HUE-7667](#) - [core] Fix http client pool by correctly mounting Transport Adapter to a prefix.
- [HUE-7676](#) - [core] skip_trash for hue_config_validation
- [HUE-7692](#) - [editor] Upgrade failure from from CDH <= 5.4
- [HUE-7697](#) - [core] Allow Kerberos Renewer to retry kinit multiple times
- [HUE-7739](#) - [metastore] Fix column context popover in the table browser
- [HUE-7755](#) - [oozie] Adding Distcp arguments and properties
- [HUE-7790](#) - [assist] Silence all API errors in the right assistant
- [HUE-7794](#) - [fb] Modify/upload file failed if S3 bucket encryption is SSE-KMS
- [HUE-7802](#) - [dashboard] Protect against missing function in old dashboards
- [HUE-7806](#) - [core] Show all the users "Switch to Hue 4" option
- [HUE-7822](#) - [core] Unable to clone oozie workflow in Hue 4.0
- [HUE-7830](#) - [core] Non supported feature use_default_configuration doesn't work in Hue 4
- [HUE-7874](#) - [oozie] SSH action missing configuration for retry-max and retry-interval
- [HUE-7909](#) - [editor] Hide options in session settings
- [HUE-7916](#) - [frontend] Avoid breaking of scatterplot chart for some grouping values
- [IMPALA-2810](#) - Remove column stats restoration when altering table.
- [IMPALA-4664](#) - Unexpected string conversion in Shell.
- [IMPALA-5167](#) - Revert "Reduce the number of Kudu clients created (FE)".
- [IMPALA-5664](#) - Unix time to timestamp conversions may crash Impala
- [IMPALA-5926](#) - Avoid printing expensive stack when closing a session.
- [IMPALA-5936](#) - Operator '%' overflows on large decimals.
- [IMPALA-5940](#) - Avoid log spew by using Status::Expected.
- [IMPALA-5951](#) - Remove flaky test_catalogd_timeout.
- [IMPALA-5987](#) - LZ4 Codec silently produces bogus compressed data for large inputs.
- [IMPALA-6004](#) - Fix the test_row_filters failure on ASAN.
- [IMPALA-6053](#) - Fix the exception when storadelds don't match hosts.
- [IMPALA-6060](#) - Check the return value of JNI exception handling functions.
- [IMPALA-6067](#) - Enable S3 access via IAM roles for EC2 VMs.
- [IMPALA-6069](#) - Fix CodegenAnyVal's handling of 'nan'.

- [IMPALA-6100](#) - Increase test_exchange_delays timeout on slow builds.
- [IMPALA-6106](#) - Handle comments before set in test parser.
- [IMPALA-6114](#) - Require type equality for NumericLiteral::localEquals().
- [IMPALA-6137](#) - Fix text scanner split delim mem mgmt.
- [IMPALA-6183](#) - Fix Decimal to Double conversion.
- [IMPALA-6184](#) - Clean up after ScalarExprEvaluator::Clone() fails.
- [IMPALA-6280](#) - Materialize TupleIsNullPredicate for insert sorts.
- [IMPALA-6284](#) - Mark the intermediate decimal avg struct as packed.
- [IMPALA-6286](#) - Remove invalid runtime filter targets.
- [IMPALA-6291](#) - Disable AVX512 codegen in LLVM.
- [IMPALA-6295](#) - Fix mix/max handling of 'nan' and 'inf'.
- [IMPALA-6307](#) - CTAS statement fails with duplicate column exception.
- [IMPALA-6308](#) - Fix bad Status() usage in data-stream-sender.cc.
- [IMPALA-6348](#) - Redact only sensitive fields in runtime profiles.
- [IMPALA-6364](#) - Bypass file handle cache for ineligible files.
- [IMPALA-6381](#) - Increase test_exchange_delays timeout for isilon.
- [IMPALA-6384](#) - RequestPoolService should honor custom group mapping config.
- [IMPALA-6388](#) - Fix the Union node number of hosts estimation.
- [IMPALA-6418](#) - Find a reliable way to detect supported TLS versions.
- [IMPALA-6435](#) - Disable codegen for CHAR literals.
- [KUDU-2147](#) - Consensus: Unknown leader should not be treated as valid UUID
- [KUDU-2231](#) - Sparse column predicate can cause excessive data-block reads.
- [KUDU-2251](#) - rowset size can overflow int in RowSetInfo.
- `rpc`: Allow setting `--rpc_tls_min_protocol` on older RHEL versions.
- [OOZIE-1401](#) - amend PurgeCommand should purge the workflow jobs w/o end_time
- [OOZIE-2045](#) - Symlink support for sharelib
- [OOZIE-3078](#) - PasswordMasker throws NPE with null arguments
- [OOZIE-3103](#) - Improve log message regarding max concurrency for coordinators
- [OOZIE-3112](#) - SparkConfigurationService overwrites properties provided via `--properties-file` option in SparkAction
- [PIG-5325](#) - Schema disambiguation can't be turned off for nested schemas
- [SENTRY-1712](#) - Add trigger mechanism for Sentry to push full path snapshot to Name Node.
- [SENTRY-1951](#) - Old SentryStore.retrieveFullPathsImage() should be removed
- [SENTRY-2019](#) - Improve logging in SentryPlugin
- [SENTRY-2031](#) - Add trigger mechanism for Sentry to pull full path snapshot from HMS
- [SENTRY-2032](#) - Leading Slashes need to removed when creating HMS path entries
- [SENTRY-2040](#) - When getting Snapshots from HMS we need more logging around cases when a snapshot is not being received
- [SENTRY-2046](#) - Create a full snapshot if AUTHZ_PATHS_SNAPSHOT_ID is empty, even if HMS and Sentry Notifications are in sync
- [SENTRY-2047](#) - isEmptyCore method in SentryStore has references to MAuthzPathsMapping when it should be generic
- [SENTRY-2066](#) - DB name is not set for AlterTable
- [SENTRY-2078](#) - Have sentry server print an obvious INFO level log message when it becomes the writer

- [ZOOKEEPER-2249](#) - CRC check failed when preAllocSize smaller than node data

Issues Fixed in CDH 5.13.1

CDH 5.13.1 fixes the following issues.

HDFS

Cannot re-encrypt an encryption zone if a previous re-encryption on it was canceled

When canceling a re-encryption on an encryption zone, the status of the re-encryption would continue to show "Processing". When this occurred, future re-encrypt commands for this encryption zone failed inside the NameNode, and the re-encryption never completed.

Bug: HDFS-12518, CDH-59073

Upstream Issues Fixed in 5.13.1

The following upstream issues are fixed in CDH 5.13.1:

- [FLUME-3186](#) - Make asyncHbaseClient config parameters available from Flume config
- [HADOOP-13017](#) - Implementations of InputStream.read(buffer, offset, bytes) to exit 0 if bytes==0
- [HDFS-6763](#) - Initialize file system-wide quota once on transitioning to active
- [HDFS-7582](#) - Enforce maximum number of ACL entries separately per access and default.
- [HDFS-8540](#) - Mover should exit with NO_MOVE_BLOCK if no block can be moved
- [HDFS-8541](#) - Mover should exit with NO_MOVE_PROGRESS if there is no move progress
- [HDFS-8865](#) - Improve quota initialization performance
- [HDFS-9003](#) - ForkJoin thread pool leaks
- [HDFS-9396](#) - Total files and directories on jmx and web UI on standby is uninitialized
- [HDFS-11384](#) - Balancer disperses getBlocks calls to avoid NameNode's rpc queue saturation
- [HDFS-11742](#) - Improve balancer usability after HDFS-8818
- [HDFS-11755](#) - Underconstruction blocks can be considered missing
- [HDFS-12424](#) - Datatable sorting on the Datanode Information page in the Namenode UI is broken
- [HDFS-12494](#) - libhdfs SIGSEGV in setTLSEceptionStrings
- [HDFS-12518](#) - Re-encryption should handle task cancellation and progress better.
- [HDFS-12642](#) - Log block and datanode details in BlockRecoveryWorker.
- [YARN-6757](#) - Refactor the usage of yarn.nodemanager.linux-container-executor.cgroups.mount-path.

Issues Fixed in CDH 5.13.0

CDH 5.13.0 fixes the following issues.

Sqoop 1

Sqoop does not support Hive metastore HA for Parquet format

If the Hive metastore (HMS) is configured for high availability (HA), the value of the `hive.metastore.uris` property in `/etc/hive/conf.cloudera.HIVE-1/hive-site.xml` contains a list of URIs instead of one URI. For example:

```
<value>thrift://hive-1.example.com:9083,thrift://hive-2.example.com:9083,thrift://hive-3.example.com:9083</value>
```

Sqoop uses Kite for Parquet file handling and Kite does not support HMS HA. Using Kite, Sqoop takes the first URI from the `hive.metastore.uris` list and uses that to connect to the HMS. If that address is not available, the Sqoop command fails.

This issue occurs when you use the following Sqoop arguments with the `sqoop-import` command: `--hive-import` and `--as-parquetfile`.

Bug: CDH-57895

Upstream Issues Fixed in 5.13.0

The following upstream issues are fixed in CDH 5.13.0:

- [AVRO-1985](#) - DataFileWriter.appendTo(SeekableInput, OutputStream) does not close the input anymore
- [FLUME-2752](#) - Fix AvroSource startup resource leaks
- [FLUME-2905](#) - Fix NetcatSource file descriptor leak if startup fails
- [FLUME-3093](#) - Groundwork for version changes in root pom
- [FLUME-3144](#) - Improve Log4jAppender's performance by allowing logging collection of messages
- [FLUME-3152](#) - Add Flume Metric for Backup Checkpoint Errors
- [HADOOP-9137](#) - Support connection limiting in IPC server
- [HADOOP-11572](#) - s3a delete() operation fails during a concurrent delete of child entries
- [HADOOP-13414](#) - Hide Jetty Server version header in HTTP responses
- [HADOOP-13588](#) - ConfServlet should respect Accept request header
- [HADOOP-13628](#) - Support to retrieve specific property from configuration via REST API
- [HADOOP-13700](#) - Remove unthrown IOException from TrashPolicy#initialize and #getInstance signatures.
- [HADOOP-13827](#) - Add reencryptEncryptedKey interface to KMS.
- [HADOOP-13867](#) - FilterFileSystem should override rename(.., options) to take effect of Rename options called via FilterFileSystem implementations
- [HADOOP-14024](#) - KMS JMX endpoint throws ClassNotFoundException
- [HADOOP-14038](#) - Rename ADLS credential properties
- [HADOOP-14174](#) - Set default ADLS access token provider type to ClientCredential
- [HADOOP-14251](#) - Credential provider should handle property key deprecation
- [HADOOP-14260](#) - Configuration.dumpConfiguration should redact sensitive information
- [HADOOP-14324](#) - Refine S3 server-side-encryption key as encryption secret; improve error reporting and diagnostics
- [HADOOP-14349](#) - Rename ADLS CONTRACT_ENABLE_KEY
- [HADOOP-14376](#) - Memory leak when reading a compressed file using the native library
- [HADOOP-14401](#) - maven-project-info-reports-plugin can be removed
- [HADOOP-14407](#) - DistCp - Introduce a configurable copy buffer size.
- [HADOOP-14440](#) - Add metrics for connections dropped
- [HADOOP-14464](#) - hadoop-aws doc header warning #5 line wrapped
- [HADOOP-14504](#) - ProvidedFileStatusIterator#next() may throw IndexOutOfBoundsException
- [HADOOP-14511](#) - WritableRpcEngine.Invocation#toString NPE on null parameters
- [HADOOP-14515](#) - Addendum. Specifically configure zookeeper-related log levels in KMS log4j.
- [HADOOP-14515](#) - Specifically configure zookeeper-related log levels in KMS log4j.
- [HADOOP-14521](#) - Revert "KMS client needs retry logic"
- [HADOOP-14521](#) - KMS client needs retry logic
- [HADOOP-14523](#) - OpensslAesCtrCryptoCodec.finalize() holds excessive amounts of memory
- [HADOOP-14524](#) - Make CryptoCodec Closeable so it can be cleaned up proactively.
- [HADOOP-14533](#) - Size of args cannot be less than zero in TraceAdmin#run as its linkedlist
- [HADOOP-14540](#) - Replace MRV1 specific terms in HostsFileReader
- [HADOOP-14542](#) - Add IOUtils.cleanupWithLogger that accepts slf4j logger API
- [HADOOP-14563](#) - LoadBalancingKMSClientProvider#warmUpEncryptedKeys swallows IOException
- [HADOOP-14586](#) - StringIndexOutOfBoundsException breaks org.apache.hadoop.util.Shell on 2.7.x with Java 9
- [HADOOP-14627](#) - Support MSI and DeviceCode token provider in ADLS
- [HADOOP-14678](#) - AdlFileSystem#initialize swallows exception when getting user name
- [HADOOP-14688](#) - Intern strings in KeyVersion and EncryptedKeyVersion
- [HADOOP-14705](#) - Add batched interface reencryptEncryptedKeys to KMS.

- [HADOOP-14760](#) - Add missing override to LoadBalancingKMSSClientProvider.
- [HADOOP-14824](#) - Update ADLS SDK to 2.2.2 for MSI fix
- [HADOOP-14844](#) - Remove requirement to specify TenantGuid for MSI Token Provider
- [HDFS-7847](#) - Modify NNThroughputBenchmark to be able to operate on a remote NameNode
- [HDFS-8312](#) - Added permission check for moving file to Trash.
- [HDFS-8586](#) - Dead Datanode is allocated for write when client is from deadnode
- [HDFS-8674](#) - Improve performance of postponed block scans
- [HDFS-8818](#) - Changes the global moveExecutor to per datanode executors and changes MAX_SIZE_TO_MOVE to be configurable.
- [HDFS-8856](#) - Make LeaseManager#countPath O(1).
- [HDFS-8870](#) - Lease is leaked on write failure
- [HDFS-9503](#) - Use generic option -fs for NNThroughputBenchmark instead of -namenode
- [HDFS-10468](#) - HDFS read ends up ignoring an interrupt
- [HDFS-10480](#) - Add an admin command to list currently open files
- [HDFS-10506](#) - OIV's ReverseXML processor cannot reconstruct some snapshot details
- [HDFS-10899](#) - Add functionality to re-encrypt EDEKs.
- [HDFS-11210](#) - Enhance key rolling to guarantee new KeyVersion is returned from generateEncryptedKeys after a key is rolled.
- [HDFS-11303](#) - Hedged read might hang infinitely if read data from all DN failed
- [HDFS-11345](#) - Document the configuration key for FSNamesystem lock fairness
- [HDFS-11352](#) - Potential deadlock in NN when failing over
- [HDFS-11377](#) - Balancer hung due to no available mover threads
- [HDFS-11472](#) - Fix inconsistent replica size after a data pipeline failure
- [HDFS-11674](#) - reserveSpaceForReplicas is not released if append request failed due to mirror down and replica recovered
- [HDFS-11708](#) - Positional read will fail if replicas moved to different DNs after stream is opened
- [HDFS-11711](#) - DN should not delete the block On "Too many open files" Exception
- [HDFS-11738](#) - Hedged pread takes more time when block moved from initial locations
- [HDFS-11741](#) - Long running balancer may fail due to expired DataEncryptionKey
- [HDFS-11833](#) - HDFS architecture documentation describes outdated placement policy
- [HDFS-11849](#) - JournalNode startup failure exception should be logged in log file
- [HDFS-11851](#) - getGlobalJNIEnv() may deadlock if exception is thrown
- [HDFS-11861](#) - ipc.Client.Connection#sendRpcRequest should log request name
- [HDFS-11881](#) - NameNode consumes a lot of memory for snapshot diff report generation
- [HDFS-11891](#) - DU#refresh should print the path of the directory when an exception is caught
- [HDFS-11932](#) - BPSERVICEACTOR thread name is not correctly set
- [HDFS-11945](#) - Internal lease recovery may not be retried for a long time
- [HDFS-11960](#) - Successfully closed files can stay under-replicated
- [HDFS-12042](#) - Lazy initialize AbstractINodeDiffList#diffs for snapshots to reduce memory consumption
- [HDFS-12078](#) - Add time unit to the description of property dfs.namenode.stale.datanode.interval in hdfs-default.xml
- [HDFS-12089](#) - Fix ambiguous NN retry log message in WebHDFS
- [HDFS-12117](#) - HttpFS does not seem to support SNAPSHOT related methods for WebHDFS REST Interface
- [HDFS-12139](#) - HTTPFS liststatus returns incorrect pathSuffix for path of file
- [HDFS-12140](#) - Remove BPOfferService lock contention to get block pool id
- [HDFS-12157](#) - Do fsyncDirectory(..) outside of FSDataset lock
- [HDFS-12191](#) - Provide option to not capture the accessTime change of a file to snapshot if no other modification has been done to this file
- [HDFS-12217](#) - HDFS snapshots doesn't capture all open files when one of the open files is deleted.
- [HDFS-12278](#) - LeaseManager operations are inefficient in 2.8
- [HDFS-12336](#) - Listing encryption zones still fails when deleted EZ is not a direct child of snapshottable directory

- [HDFS-12357](#) - Let NameNode to bypass external attribute provider for configured users
- [HDFS-12359](#) - Re-encryption should operate with minimum KMS ACL requirements.
- [HDFS-12363](#) - Possible NPE in BlockManager\$StorageInfoDefragmenter#scanAndCompactStorages
- [HDFS-12369](#) - Edit log corruption due to hard lease recovery of not-closed file which has snapshots.
- [HDFS-12383](#) - Re-encryption updater should handle canceled tasks better.
- [HDFS-12400](#) - Provide a way for NN to drain the local key cache before re-encryption.
- [YARN-2780](#) - Log aggregated resource allocation in rm-appsummary.log
- [YARN-3006](#) - Improve the error message when attempting manual failover with auto-failover enabled.
- [YARN-4995](#) - FairScheduler: Display per-queue demand on the scheduler page.
- [YARN-6432](#) - Revert "FairScheduler: Reserve preempted resources for corresponding applications.
- [YARN-6751](#) - Display reserved resources in web UI per queue
- [YARN-6752](#) - Display reserved resources in web UI per application
- [YARN-6802](#) - Add max AM resource and AM resource usage to leaf queue view in FairScheduler WebUI.
- [YARN-7099](#) - ResourceHandlerModule.parseConfiguredCGroupPath only works for privileged yarn users.
- [HBASE-9393](#) - Hbase does not close a dead connection with the datanode.
- [HBASE-12770](#) - Don't transfer all the queued hlogs of a dead server to the same alive server
- [HBASE-15548](#) - SyncTable: sourceHashDir is supposed to be optional but doesn't work without it
- [HBASE-15691](#) - ConcurrentModificationException in BucketAllocator
- [HBASE-15720](#) - Print row locks at the debug dump page
- [HBASE-16033](#) - Add more details in logging of responseTooSlow/TooLarge
- [HBASE-16045](#) - endtime argument for VerifyReplication was incorrectly specified in usage
- [HBASE-16090](#) - ResultScanner is not closed in SyncTable#finishRemainingHashRanges()
- [HBASE-16351](#) - Improve error reporting for license failures
- [HBASE-16409](#) - Row key for bad row should be properly delimited in VerifyReplication
- [HBASE-16423](#) - Add re-compare option to VerifyReplication to avoid occasional inconsistent rows
- [HBASE-16638](#) - Reduce the number of Connection's created in classes of hbase-spark module
- [HBASE-16772](#) - Add verbose option to VerifyReplication for logging good rows
- [HBASE-17047](#) - Add an API to get HBase connection cache statistics
- [HBASE-17131](#) - Avoid livelock caused by HRegion#processRowsWithLocks
- [HBASE-17287](#) - Master becomes a zombie if filesystem object closes
- [HBASE-17341](#) - Add a timeout during replication endpoint termination
- [HBASE-17352](#) - Fix hbase-assembly build with bash 4
- [HBASE-17534](#) - Avoid re-wrapping IOExceptions as IOExceptions
- [HBASE-17587](#) - Do not Rethrow DoNotRetryIOException as UnknownScannerException
- [HBASE-17648](#) - HBase Table-level synchronization fails between two secured(kerberized) cluster
- [HBASE-17698](#) - ReplicationEndpoint choosing sinks
- [HBASE-17773](#) - VerifyReplication tool wrongly emits Invalid arguments error
- [HBASE-17904](#) - GET runs into NoSuchElementException when using Read Replica, with hbase.
ipc.client.specificThreadForWriting to be true and hbase.rpc.client.impl to be
org.apache.hadoop.hbase.ipc.RpcClientImpl
- [HBASE-18005](#) - read replica: handle the case that region server hosting both primary replica and meta region is
down
- [HBASE-18021](#) - Add more info in timed out RetriesExhaustedException for read replica client get processing
- [HBASE-18024](#) - HRegion#initializeRegionInternals should not re-create .hregioninfo file when the region directory
no longer exists
- [HBASE-18025](#) - CatalogJanitor should collect outdated RegionStates from the AM
- [HBASE-18030](#) - Per Cell TTL tags may get duplicated with increments/Append causing tags length overflow.
- [HBASE-18035](#) - Meta replica does not give any primaryOperationTimeout to primary meta region
- [HBASE-18036](#) - Data locality is not maintained after cluster restart or SSH
- [HBASE-18066](#) - Get with closest_row_before on hbase:meta can return empty Cell during region merge/split

- [HBASE-18077](#) - Update JUnit licensing to use EPL
- [HBASE-18081](#) - The way we process connection preamble in SimpleRpcServer is broken
- [HBASE-18122](#) - Scanner id should include ServerName of region server
- [HBASE-18137](#) - Replication gets stuck for empty WALs
- [HBASE-18192](#) - Replication drops recovered queues on region server shutdown
- [HBASE-18212](#) - reduce log level for unbuffer warning.
- [HBASE-18230](#) - Remove Velocity vars from LICENSE
- [HBASE-18247](#) - Hbck to fix the case that replica region shows as key in the meta table
- [HBASE-18255](#) - Set JVM code cache size in provided configuration
- [HBASE-18358](#) - Backport HBASE-18099 'FlushSnapshotSubprocedure should wait for concurrent Region#flush() to finish'
- [HBASE-18362](#) - hbck should not report split replica parent region from meta as errors
- [HBASE-18390](#) - Sleep too long when finding region location failed
- [HBASE-18479](#) - should apply HBASE-18255 to HBASE_MASTER_OPTS too
- [HBASE-18487](#) - Minor fixes in row lock implementation
- [HIVE-6727](#) - Table level stats for external tables are set incorrectly
- [HIVE-8838](#) - Support Parquet through HCatalog
- [HIVE-9152](#) - Dynamic Partition Pruning support added
- [HIVE-9567](#) - JSON SerDe not escaping special chars when writing char/varchar data
- [HIVE-10209](#) - FetchTask with VC may fail because ExecMapper.done is true
- [HIVE-10616](#) - TypeInfoUtils doesn't handle DECIMAL with just precision specified
- [HIVE-11193](#) - ConstantPropagateProcCtx should use a Set instead of a List to hold operators to be deleted
- [HIVE-11240](#) - Change value type from int to long for HiveConf.ConfVars.METASTORESERVERMAXMESSAGEIZE
- [HIVE-11462](#) - GenericUDFStruct should constant fold at compile time
- [HIVE-11592](#) - ORC metadata section can sometimes exceed protobuf message size limit
- [HIVE-12270](#) - Add DBTokenStore support to HS2 delegation token
- [HIVE-12274](#) - Increase width of columns used for general configuration in the metastore
- [HIVE-12551](#) - Fix several kryo exceptions in branch-1
- [HIVE-12667](#) - DPP: UDFs on the partition column side does not evaluate correctly
- [HIVE-12762](#) - Common join on parquet tables returns incorrect result when hive.optimize.index.filter set to true
- [HIVE-13330](#) - ORC vectorized string dictionary reader does not differentiate null vs empty string dictionary
- [HIVE-13588](#) - NPE is thrown from MapredLocalTask.executeInChildVM.
- [HIVE-13947](#) - HoS prints wrong number for hash table size in map join scenario
- [HIVE-14178](#) - Hive::needsToCopy should reuse FileUtils::equalsFileSystem
- [HIVE-15068](#) - Run ClearDanglingScratchDir periodically inside HS2
- [HIVE-15122](#) - Hive: Upcasting types should not obscure stats
- [HIVE-15208](#) - Query string should be HTML encoded for Web UI
- [HIVE-15233](#) - UDF UUID() should be non-deterministic
- [HIVE-15428](#) - HoS DPP doesn't remove cyclic dependency
- [HIVE-15792](#) - Hive should raise SemanticException when LPAD/RPAD pad character's length is 0
- [HIVE-16183](#) - Fix potential thread safety issues with static variables
- [HIVE-16291](#) - Hive fails when unions a parquet table with itself
- [HIVE-16450](#) - Some metastore operations are not retried even with desired underlining exceptions
- [HIVE-16559](#) - Parquet schema evolution for partitioned tables may break if table and partition serdes differ
- [HIVE-16613](#) - SaslClientHandler.sendHello fails with SASL timeout instead of real cause
- [HIVE-16675](#) - Fix ConcurrentModificationException in SparkClientImpl#startDriver
- [HIVE-16729](#) - Improve location validator to check for blank paths
- [HIVE-16845](#) - INSERT OVERWRITE a table with dynamic partitions on S3 fails with NPE
- [HIVE-16869](#) - Hive returns wrong result when predicates on non-existing columns are pushed down to Parquet reader

- [HIVE-16875](#) - Query against view with partitioned child on HoS fails with privilege exception.
- [HIVE-16930](#) - HoS should verify the value of Kerberos principal and keytab file before adding them to spark-submit command parameters
- [HIVE-16935](#) - Hive should strip comments from input before choosing which CommandProcessor to run.
- [HIVE-16949](#) - Leak of threads from Get-Input-Paths and Get-Input-Summary thread pool
- [HIVE-16960](#) - Hive throws an ugly error exception when HDFS sticky bit is set
- [HIVE-16961](#) - Hive on Spark leaks spark application in case user cancels query and closes session
- [HIVE-16974](#) - Change the sort key for the schema tool validator to be ID column
- [HIVE-16978](#) - HoS: add current thread ID to the log redirector for the RemoteDriver
- [HIVE-16982](#) - WebUI "Show Query" tab prints "UNKNOWN" instead of explaining configuration option

- [IMPALA-992](#) - Rerun past queries from history in shell
- [IMPALA-1470](#) - Fix error message with catalog down
- [IMPALA-1478](#) - Improve error message when subquery is used in the ON clause
- [IMPALA-1882](#) - Remove ORDER BY restriction from first_value()/last_value()
- [IMPALA-1891](#) - Statestore won't send deletions in initial non-delta topic
- [IMPALA-2373](#) - Extrapolate row counts for HDFS tables.
- [IMPALA-2525](#) - Treat parquet ENUMs as STRINGs when creating impala tables.
- [IMPALA-2615](#) - support [[nodiscard]] on Status
- [IMPALA-3040](#) - addendum: use specific_build_type_timeout for slow builds
- [IMPALA-3208](#) - max_row_size option
- [IMPALA-3504](#) - UDF for current timestamp in UTC
- [IMPALA-3894](#) - Change the behavior parsing date "YY"
- [IMPALA-3905](#) - HdfsScanner::GetNext() for Avro, RC, and Seq scans.
- [IMPALA-3931](#) - arbitrary fixed-size uda intermediate types
- [IMPALA-3937](#) - Deprecate --be_service_threads

- [IMPALA-4039](#) - Increase width of Operator column in runtime profile
- [IMPALA-4086](#) - Add benchmark for simple scheduler
- [IMPALA-4164](#) - Avoid overly aggressive inlining in LLVM IR
- [IMPALA-4192](#) - Disentangle Expr and ExprContext
- [IMPALA-4276](#) - Profile displays non-default query options set by planner
- [IMPALA-4418](#) - Fixes extra blank lines in query result
- [IMPALA-4622](#) - Add ALTER COLUMN statement.
- [IMPALA-4623](#) - Enable file handle cache
- [IMPALA-4669](#) - Add Kudu's RPC, util, and security libraries
- [IMPALA-4674](#) - Port spilling ExecNodes to new buffer pool
- [IMPALA-4687](#) - Get Impala working against HBase 2.0
- [IMPALA-4703](#) - reservation denial debug action
- [IMPALA-4737](#) - Prevent SIGUSR1 from killing daemons when minidumps are disabled
- [IMPALA-4794](#) - Grouping distinct agg plan robust to data skew
- [IMPALA-4795](#) - Allow fetching function obj from catalog using signature
- [IMPALA-4826](#) - Fix error during a scan on repeated root schema in Parquet.
- [IMPALA-4833](#) - Use scheduling information to make per-node memory reservation tight
- [IMPALA-4861](#) - READ_WRITE warning on CREATE TABLE LIKE PARQUET.
- [IMPALA-4862](#) - make resource profile consistent with backend behaviour
- [IMPALA-4866](#) - Hash join node does not apply limits correctly
- [IMPALA-4905](#) - Don't send empty insert status to coordinator
- [IMPALA-4925](#) - Cancel finstance if query has finished
- [IMPALA-5016](#) - Simplify COALESCE() in SimplifyConditionalsRule.
- [IMPALA-5031](#) - UBSAN clean and method for testing UBSAN cleanliness
- [IMPALA-5036](#) - Parquet count star optimization
- [IMPALA-5061](#) - Populate null_count in parquet::statistics
- [IMPALA-5085](#) - large rows in BufferedTupleStreamV2
- [IMPALA-5104](#) - Admit queries with mem equal to proc mem_limit
- [IMPALA-5108](#) - idle_session_timeout kicks in later than expected
- [IMPALA-5109](#) - Increase range of backend latency histogram
- [IMPALA-5116](#) - Remove deprecated hash_* types in gutil
- [IMPALA-5158](#) - Account for difference between process memory consumption and memory used by queries
- [IMPALA-5160](#) - adjust spill buffer size based on planner estimates
- [IMPALA-5167](#) - Reduce the number of Kudu clients created
- [IMPALA-5240](#) - Allow config of number of disk I/O threads per disk type
- [IMPALA-5275](#) - Avoid printing status stack trace on hot paths
- [IMPALA-5280](#) - Coalesce chains of OR conditions to an IN predicate
- [IMPALA-5286](#) - Query with Kudu col name w/ different casing from 'order by' fails
- [IMPALA-5316](#) - Adds last_day() function
- [IMPALA-5327](#) - Handle return of JNI GetStringUTFChar
- [IMPALA-5336](#) - Fix partition pruning when column is cast
- [IMPALA-5347](#) - reduce codegen overhead of timestamp trunc()
- [IMPALA-5350](#) - Tidy up thread groups for first exec threads
- [IMPALA-5352](#) - Age out unused file handles from the cache
- [IMPALA-5354](#) - INSERT hints for Kudu tables
- [IMPALA-5376](#) - Loads all TPC-DS tables
- [IMPALA-5386](#) - Fix ReopenCachedHdfsFileHandle failure case
- [IMPALA-5389](#) - simplify BufferDescriptor lifetime
- [IMPALA-5407](#) - Fix crash in HdfsSequenceTableWriter
- [IMPALA-5412](#) - Fix scan result with partitions on same file

- [IMPALA-5420](#) - Skip ACL fetch if the acl bit is not set.
- [IMPALA-5427](#) - Fix race between CRS::UpdateQueryStatus() and beeswax RPCs
- [IMPALA-5431](#) - Remove redundant path exists checks during table load
- [IMPALA-5433](#) - Mark single-argument Status c'tors as explicit
- [IMPALA-5446](#) - dropped Sorter::Reset() status
- [IMPALA-5477](#) - Fix minidump-2-core tool
- [IMPALA-5479](#) - Propagate the argument type in RawValue::Compare()
- [IMPALA-5480](#) - Improve missing filters message
- [IMPALA-5481](#) - Clarify RowDescriptor ownership
- [IMPALA-5482](#) - fix git checkout when workloads are modified
- [IMPALA-5483](#) - Automatically disable codegen for small queries
- [IMPALA-5484](#) - Fix LICENSE issues discovered by IPMC in 2.9 vote
- [IMPALA-5488](#) - Fix handling of exclusive HDFS file handles
- [IMPALA-5489](#) - Improve Sentry authorization for Kudu tables
- [IMPALA-5492](#) - Fix incorrect newline character in the LDAP message
- [IMPALA-5494](#) - Fixes the selectivity of NOT IN predicates
- [IMPALA-5495](#) - Improve error message if no impalad role is configured
- [IMPALA-5497](#) - spilling hash joins that output build rows hit OOM
- [IMPALA-5498](#) - Support for partial sorts in Kudu INSERTs
- [IMPALA-5499](#) - avoid ephemeral port conflicts
- [IMPALA-5500](#) - Reduce catalog update topic size
- [IMPALA-5504](#) - Fix TupleIsNullPredicate evaluation.
- [IMPALA-5506](#) - Add stdin description to help information of query_file option
- [IMPALA-5507](#) - Add clear description to help information of KEYVAL option
- [IMPALA-5511](#) - Add process start time to debug web page
- [IMPALA-5513](#) - Fix display message exception when using invalid KEYVAL
- [IMPALA-5514](#) - Throw an error when --ldap_password_cmd is used without LDAP auth
- [IMPALA-5517](#) - Allow IMPALA_LOGS_DIR to be overridden
- [IMPALA-5520](#) - TopN node periodically reclaims old allocations
- [IMPALA-5524](#) - Fixes NPE during planning with DISABLE_UNSAFE_SPILLS=1
- [IMPALA-5529](#) - Add additional function signatures for TRUNC()
- [IMPALA-5531](#) - Fix correctness issue in correlated aggregate subqueries
- [IMPALA-5532](#) - Stack-allocate compressors in RowBatch (de)serialization
- [IMPALA-5536](#) - Fix TCLIService thrift compilation on Hive 2
- [IMPALA-5539](#) - Fix Kudu timestamp with -use_local_tz_for_unix_ts
- [IMPALA-5540](#) - Revert Sentry version back to 5.13
- [IMPALA-5546](#) - Allow creating unpartitioned Kudu tables
- [IMPALA-5547](#) - Rework FK/PK join detection.
- [IMPALA-5548](#) - Fix some minor nits with HDFS parquet column readers
- [IMPALA-5549](#) - Remove deprecated fields from CatalogService API
- [IMPALA-5551](#) - Fix AggregationNode::Close() when Prepare() fails
- [IMPALA-5554](#) - sorter DCHECK on null column
- [IMPALA-5560](#) - always store CHAR(N) inline in tuple
- [IMPALA-5567](#) - race in fragment instance teardown
- [IMPALA-5570](#) - fix spilling null-aware anti join
- [IMPALA-5572](#) - Timestamp codegen for text scanner
- [IMPALA-5573](#) - Add decimal codegen in text scanner
- [IMPALA-5579](#) - Fix IndexOutOfBoundsException in GetTables metadata request
- [IMPALA-5580](#) - fix Java UDFs that return NULL strings
- [IMPALA-5582](#) - Store sentry privileges in lower case

- [IMPALA-5586](#) - Null-aware anti-join can take a long time to cancel
- [IMPALA-5588](#) - Reduce the frequency of fault injection
- [IMPALA-5591](#) - set should handle negative values
- [IMPALA-5594](#) - don't import shaded classes
- [IMPALA-5595](#) - Only set KuduScanner timestamp feature flag if necessary
- [IMPALA-5598](#) - Fix excessive dumping in MemLimitExceeded
- [IMPALA-5602](#) - Fix query optimization for kudu and datasource tables
- [IMPALA-5611](#) - KuduPartitionExpr holds onto memory unnecessarily
- [IMPALA-5612](#) - join inversion should factor in parallelism
- [IMPALA-5615](#) - Fix compute incremental stats for general partition exprs
- [IMPALA-5616](#) - Add --enable_minidumps startup flag
- [IMPALA-5617](#) - Include full workload name in tpch_nested query filenames
- [IMPALA-5618](#) - buffered-tuple-stream-v2 fixes
- [IMPALA-5623](#) - Fix lag() on STRING cols to release UDF mem
- [IMPALA-5627](#) - fix dropped statuses in HDFS writers
- [IMPALA-5629](#) - avoid expensive list::size() call
- [IMPALA-5630](#) - Add Kudu client version as a common metric
- [IMPALA-5636](#) - Change the metadata in parquet
- [IMPALA-5638](#) - Fix Kudu table set tblproperties inconsistencies
- [IMPALA-5641](#) - mem-estimate should never be less than mem-reservation
- [IMPALA-5643](#) - Add total number of threads created per group to /threadz
- [IMPALA-5644](#) - Fail queries early when their minimum reservation is too high to execute within the given mem_limit
- [IMPALA-5648](#) - fix count(*) mem estimate regression
- [IMPALA-5650](#) - Make sum_init_zero a SUM function
- [IMPALA-5652](#) - deprecate unlimited process mem_limit
- [IMPALA-5657](#) - FunctionCallExpr.toSql() and clone() ignore 'IGNORE NULLS' case
- [IMPALA-5658](#) - addtl. process/system-wide memory metrics
- [IMPALA-5659](#) - Begin standardizing treatment of thirdparty libraries
- [IMPALA-5659](#) - glog/gflags should be dynamically linked
- [IMPALA-5661](#) - buffer pool limit
- [IMPALA-5666](#) - ASAN poisoning for MemPool and BufferPool
- [IMPALA-5670](#) - Misc. tidying of ExecEnv
- [IMPALA-5676](#) - avoid expensive consistency checks in BTSv2
- [IMPALA-5677](#) - limit clean page memory consumption
- [IMPALA-5679](#) - Fix Parquet count(*) with group by string
- [IMPALA-5681](#) - release reservation from blocking operators
- [IMPALA-5686](#) - Update a mini cluster Sentry property
- [IMPALA-5689](#) - Avoid inverting non-equi left joins
- [IMPALA-5691](#) - recalibrate mem limit for Q18
- [IMPALA-5696](#) - Enable cipher configuration when using TLS / Thrift
- [IMPALA-5709](#) - Remove mini-impala-cluster
- [IMPALA-5713](#) - always reserve memory for preaggs
- [IMPALA-5714](#) - Add OpenSSL to bootstrap_toolchain.py
- [IMPALA-5715](#) - (mitigation only) defer destruction of MemTrackers
- [IMPALA-5716](#) - Don't delete cmake_modules/* when enabling distcc
- [IMPALA-5722](#) - Fix string to decimal cast
- [IMPALA-5725](#) - coalesce() with outer join incorrectly rewritten
- [IMPALA-5739](#) - Correctly handle sles12 SP2
- [IMPALA-5742](#) - De-allocate buffer in parquet-reader on exit
- [IMPALA-5743](#) - Support TLS version configuration for Thrift servers

- [IMPALA-5744](#) - Add 'use_krpc' flag and create DataStream interface
- [IMPALA-5745](#) - Bump Breakpad version
- [IMPALA-5749](#) - coordinator race hits DCHECK 'num_remaining_backends_ > 0'
- [IMPALA-5750](#) - Catch exceptions from boost thread creation
- [IMPALA-5756](#) - start memory maintenance thread after metric creation
- [IMPALA-5757](#) - Make tbl property toSql deterministic
- [IMPALA-5769](#) - Add periodic minidump cleanup
- [IMPALA-5773](#) - Correctly account for memory used in data stream receiver queue
- [IMPALA-5774](#) - Prevent FindInSet() from reading off end of string
- [IMPALA-5775](#) - Allow shell to support TLSv1, v1.1 and v1.2
- [IMPALA-5776](#) - HdfsTextScanner::WritePartialTuple() writes the varlen data to an incorrect memory pool
- [IMPALA-5778](#) - Clarify logging around and usage of read_size startup option
- [IMPALA-5784](#) - Separate planner and user set query options in profile
- [IMPALA-5787](#) - Dropped status in KuduTableSink::Send()
- [IMPALA-5788](#) - Fix agg node crash when grouping by nondeterministic exprs
- [IMPALA-5791](#) - Make bootstrap_development.sh survive apt-get failure
- [IMPALA-5796](#) - CTAS for Kudu fails with expr rewrite
- [IMPALA-5798](#) - ASAN use-after-poison in Parquet decoder
- [IMPALA-5799](#) - Kudu DML can crash if schema has changed
- [IMPALA-5800](#) - Configure Squeasel's cipher suite and TLS version
- [IMPALA-5811](#) - Add 'backends' tab to query details pages
- [IMPALA-5812](#) - Fix NPE when joining on empty const select
- [IMPALA-5815](#) - right outer join returns invalid memory
- [IMPALA-5819](#) - DCHECK in HdfsTextScanner::Close()
- [IMPALA-5823](#) - fix SET_DENY_RESERVATION_PROBABILITY
- [IMPALA-5825](#) - Catch exceptions thrown by TSSLocketFactory c'tor
- [IMPALA-5838](#) - Improve errors on AC buffer mem rejection
- [IMPALA-5840](#) - Don't write page-level statistics in Parquet files.
- [IMPALA-5849](#) - Remove compile-time checks for OpenSSL > 1.0.0
- [IMPALA-5850](#) - Cast sender partition exprs under unions.
- [IMPALA-5852](#) - improve MINIMUM_RESERVATION_UNAVAILABLE error
- [IMPALA-5853](#) - fix GetResultSetMetadata() error message for invalid query id
- [IMPALA-5855](#) - Preaggregation crashes - unable to initialize hash table
- [IMPALA-5857](#) - avoid invalid free of hedged read metrics
- [IMPALA-5867](#) - Fix bugs parsing 2-digit year
- [IMPALA-5871](#) - KuduPartitionExpr incorrectly handles its child types
- [IMPALA-5885](#) - free runtime filter allocations in Parquet
- [IMPALA-5888](#) - free other local allocations in Parquet
- [IMPALA-5890](#) - Abort queries if scanner hits IO errors
- [IMPALA-5891](#) - fix PeriodicCounterUpdater initialization
- [IMPALA-5892](#) - Allow reporting status independent of fragment instance
- [IMPALA-2615](#) - annotate Status with [[nodiscard]]
- [IMPALA-5412](#) - Fix scan result with partitions on same file
- [KITE-762](#) - HiveAbstractDatasetRepository now uses the first URI from hive.metastore.uris property
- [KITE-1155](#) - Deleting an already deleted empty path should not fail the job
- [KUDU-871](#) - Allow tombstoned tablets to vote
- [KUDU-1125](#) - (part 1) catalog_manager: try to avoid unnecessarily rewriting tablet info
- [KUDU-1407](#) - reassign failed tablets
- [KUDU-1442](#) - log number of open log block containers
- [KUDU-1544](#) - Race in Java client's AsyncKuduSession.apply()

- [KUDU-1726](#) - Avoid fsync-per-block in tablet copy
- [KUDU-1755](#) - Part 1: Improve tablet on disk size metric
- [KUDU-1811](#) - C++ client: use larger batches when fetching scan tokens
- [KUDU-1863](#) - improve overall safety of graceful server shutdown
- [KUDU-1865](#) - Avoid heap allocation for payload slices
- [KUDU-1894](#) - fixed deadlock in client.Connection
- [KUDU-1911](#) - improve missing required arg message
- [KUDU-1929](#) - [rpc] Allow using encrypted private keys for TLS
- [KUDU-1942](#) - Kerberos fails to log in on hostnames with capital letters
- [KUDU-1943](#) - Add BlockTransaction to Block Manager
- [KUDU-1952](#) - Remove round-robin for block placement
- [KUDU-1955](#) - refuse to use world-readable keytabs
- [KUDU-2004](#) - Undefined behavior in TlsSocket::Writev()
- [KUDU-2013](#) - Support for long lived auth tokens in Java client
- [KUDU-2032](#) - Kerberos authentication fails with rdns disabled in krb5.conf
- [KUDU-2039](#) - Fix the table count in the /tables page of master webUI
- [KUDU-2041](#) - Fix negotiation deadlock
- [KUDU-2049](#) - Fix too-strict CHECK in RleIntBlockDecoder::SeekToPositionInBlock
- [KUDU-2053](#) - Fix race in Java RequestTracker
- [KUDU-2058](#) - Fix LocatedTablet string comparisons
- [KUDU-2060](#) - Show primary keys in the master's table web UI page
- [KUDU-2066](#) - Add experimental Gradle build support
- [KUDU-2067](#) - Enable cfile checksumming by default
- [KUDU-2072](#) - upgrade to cmake 3.9.0 breaks sles12sp0 cmake patch
- [KUDU-2078](#) - Sink failure if batch size > session's flush buffer size
- [KUDU-2083](#) - Decrement running maintenance ops on failed prepare
- [KUDU-2085](#) - Fix crash when seeking past end of prefix-encoded blocks
- [KUDU-2087](#) - Fix failure to map Kerberos principal to username with FreeIPA
- [KUDU-2088](#) - Synchronizer may not go out of scope with outstanding references
- [KUDU-2091](#) - Certificates with intermediate CA's do not work with Kudu
- [KUDU-2101](#) - Include a table summary at the bottom
- [KUDU-2102](#) - fix PosixRWFile::Sync to guarantee durability when used concurrently
- [KUDU-2103](#) - [java]Canonicalize hostnames in client
- [KUDU-2104](#) - Upgrade to Spark 2.2.0
- [KUDU-2114](#) - Don't re-delete tombstoned replicas
- [KUDU-2118](#) - Fully shut down TabletReplica on delete
- [KUDU-2123](#) - Auto-vivify cmeta on tombstoned replicas if doesn't exist at startup
- [KUDU-2131](#) - switch to LIFO log container retrieval
- [KUDU-2138](#) - delete failed replicas in tablet report
- [KUDU-2141](#) - master: Remove DCHECK when tablet report has no opid_index
- [OOZIE-2488](#) - Upgrade to latest OpenJPA version
- [OOZIE-2796](#) - oozie.action.keep.action.dir not getting notice
- [OOZIE-2816](#) - Strip out the first command word from Sqoop action if its "sqoop"
- [OOZIE-2854](#) - Oozie should handle transient database problems
- [OOZIE-2984](#) - Parse spark-defaults.conf values with spaces without needing the quotes
- [PARQUET-825](#) - Static analyzer findings (NPEs, resource leaks)
- [PIG-3567](#) - LogicalPlanPrinter throws OOM for large scripts
- [PIG-3655](#) - BinStorage and InterStorage approach to record markers is broken
- [SENTRY-1546](#) - Generic Policy provides bad error messages for Sentry exceptions
- [SENTRY-1580](#) - Provide pooled client connection model with HA

- [SENTRY-1646](#) - Unable to truncate table <database>.<tablename>; from "default" databases
- [SENTRY-1665](#) - cross-site scripting vulnerability in ConfServlet
- [SENTRY-1696](#) - Expose time spent creating the initial snapshot as a metric
- [SENTRY-1724](#) - Remove old PoolClientInvocationHandler
- [SENTRY-1744](#) - Simplify creation of DelegateSentryStore
- [SENTRY-1801](#) - Sentry Namenode Plugin should handle unknown permissions
- [SENTRY-1820](#) - Add JSON file reporter for Sentry metrics
- [SENTRY-1822](#) - Allow multiple Sentry reporters
- [SENTRY-1827](#) - Minimize TPathsDump thrift message used in HDFS sync
- [SENTRY-1853](#) - Add the log level access mechanism
- [SENTRY-1881](#) - PrivilegeOperatePersistence throws wrong type of exceptions
- [SENTRY-1892](#) - Reduce memory consumption of HMSPath\$Entry and TPathEntry
- [SENTRY-1903](#) - TransactionManager shows retried transactions starting from 0
- [SENTRY-1932](#) - Improve logging for HMSPath
- [SENTRY-1937](#) - Optimize performance for listing sentry roles by group name
- [SENTRY-1938](#) - Sentry logs to provide more relevant information
- [SOLR-10889](#) - Stale zookeeper information is used during failover check
- [SPARK-13278](#) - Launcher fails to start with JDK 9 EA
- [SPARK-13669](#) - Job always fails in the external shuffle service unavailable situation
- [SPARK-15067](#) - YARN executors are launched with fixed perm gen size
- [SPARK-19688](#) - Spark on YARN credentials file set to different application directory
- [SPARK-20393](#) - Strengthen Spark to prevent XSS vulnerabilities
- [SPARK-20904](#) - Task failures during shutdown cause problems with pre-empted executors
- [SQOOP-3139](#) - sqoop tries to re execute select query during import in case of a connection reset error and this is causing lots of duplicate records from source
- [ZOOKEEPER-1653](#) - zookeeper fails to start because of inconsistent epoch
- [ZOOKEEPER-2678](#) - Large databases take a long time to regain a quorum

Issues Fixed in CDH 5.12.x

The following topics describe issues fixed in CDH 5.12.x, from newest to oldest release. You can also review [What's New in CDH 5.12.x](#) on page 1819 or [Known Issues in CDH 5](#) on page 1944.

Issues Fixed in CDH 5.12.2

Upstream Issues Fixed

The following upstream issues are fixed in CDH 5.12.2:

- [FLUME-3046](#) - Kafka Sink and Source Configuration Improvements
- [FLUME-3100](#) - Support arbitrary header substitution for topic of Kafka Sink
- [FLUME-3144](#) - Improve Log4jAppender's performance by allowing logging collection of messages
- [FLUME-3186](#) - Make asyncHbaseClient configuration parameters available from Flume configuration
- [HADOOP-13017](#) - Implementations of InputStream.read(buffer, offset, bytes) to exit 0 if bytes==0
- [HADOOP-14687](#) - AuthenticatedURL will reuse bad/expired session cookies
- [HDFS-6763](#) - Initialize file system-wide quota once on transitioning to active
- [HDFS-7582](#) - Enforce maximum number of ACL entries separately per access and default.
- [HDFS-8540](#) - Mover should exit with NO_MOVE_BLOCK if no block can be moved
- [HDFS-8541](#) - Mover should exit with NO_MOVE_PROGRESS if there is no move progress
- [HDFS-8818](#) - Allow Balancer to run faster.
- [HDFS-8865](#) - Improve quota initialization performance
- [HDFS-9003](#) - ForkJoin thread pool leaks
- [HDFS-9396](#) - Total files and directories on jmx and web UI on standby is uninitialized
- [HDFS-11384](#) - Balancer disperses getBlocks calls to avoid NameNode's rpc queue saturation

- [HDFS-11738](#) - Hedged pread takes more time when block moved from initial locations
- [HDFS-11742](#) - Improve balancer usability after HDFS-8818
- [HDFS-11755](#) - Underconstruction blocks can be considered missing
- [HDFS-11851](#) - getGlobalJNIEnv() may deadlock if exception is thrown
- [HDFS-12052](#) - Set SWEBHDFS delegation token kind when ssl is enabled in HttpFS
- [HDFS-12117](#) - HttpFS does not seem to support SNAPSHOT related methods for WebHDFS REST Interface
- [HDFS-12191](#) - Provide option to not capture the accessTime change of a file to snapshot if no other modification has been done to this file
- [HDFS-12357](#) - Let NameNode to bypass external attribute provider for configured users
- [HDFS-12363](#) - Possible NPE in BlockManager\$StorageInfoDefragmenter#scanAndCompactStorages
- [HDFS-12369](#) - Edit log corruption due to hard lease recovery of not-closed file which has snapshots.
- [HDFS-12424](#) - Datatable sorting on the Datanode Information page in the Namenode UI is broken
- [HDFS-12494](#) - libhdfs SIGSEGV in setTLSEnvironmentStrings
- [HDFS-12642](#) - Log block and datanode details in BlockRecoveryWorker.
- [YARN-6757](#) - Refactor the usage of yarn.nodemanager.linux-container-executor.cgroups.mount-path
- [YARN-7099](#) - ResourceHandlerModule.parseConfiguredCGroupPath only works for privileged yarn users.
- [YARN-7261](#) - Add debug message for better download latency monitoring.
- [HBASE-15548](#) - SyncTable: sourceHashDir is supposed to be optional but won't work without
- [HBASE-15691](#) - ConcurrentModificationException in BucketAllocator
- [HBASE-16351](#) - Improve error reporting for license failures
- [HBASE-17287](#) - Master becomes a zombie if filesystem object closes
- [HBASE-17352](#) - Fix hbase-assembly build with bash 4
- [HBASE-17534](#) - Avoid re-wrapping IOExceptions as IOExceptions
- [HBASE-17648](#) - HBase Table-level synchronization fails between two secured(kerberized) cluster
- [HBASE-17698](#) - ReplicationEndpoint choosing sinks
- [HBASE-18025](#) - CatalogJanitor should collect outdated RegionStates from the AM
- [HBASE-18030](#) - Per Cell TTL tags may get duplicated with increments/Append causing tags length overflow.
- [HBASE-18036](#) - Data locality is not maintained after cluster restart or SSH
- [HBASE-18066](#) - Get with closest_row_before on hbase:meta can return empty Cell during region merge/split
- [HBASE-18077](#) - Update JUnit licensing to use EPL
- [HBASE-18081](#) - The way we process connection preamble in SimpleRpcServer is broken
- [HBASE-18122](#) - Scanner id should include ServerName of region server
- [HBASE-18390](#) - Sleep too long when finding region location failed
- [HBASE-18487](#) - Minor fixes in row lock implementation
- [HBASE-18577](#) - Shaded client includes several non-relocated third party dependencies
- [HBASE-18665](#) - ReversedScannerCallable invokes getRegionLocations incorrectly
- [HBASE-18675](#) - Making {max,min}SessionTimeout configurable for MiniZooKeeperCluster
- [HBASE-18924](#) - Backport HBASE-18568 (Correct metric of numRegions) to branch-1.2 and branch-1.3
- [HBASE-19215](#) - Incorrect exception handling on the client causes incorrect call timeouts and byte buffer allocations on the server
- [HIVE-6727](#) - Table level stats for external tables are set incorrectly
- [HIVE-9447](#) - Metastore: inefficient Oracle query for removing unused column descriptors when add/drop table/partition
- [HIVE-15233](#) - UDF UUID() should be non-deterministic
- [HIVE-15519](#) - BitSet not computed properly for ColumnBuffer subset
- [HIVE-16758](#) - Better Select Number of Replications
- [HIVE-16784](#) - Missing lineage information when hive.blobstore.optimizations.enabled is true
- [HIVE-16949](#) - Leak of threads from Get-Input-Paths and Get-Input-Summary thread pool
- [HIVE-17022](#) - Add mode in lock debug statements
- [HIVE-17218](#) - Canonical-ize hostnames for Hive metastore, and HS2 servers.

- [HIVE-17274](#) - RowContainer spills for timestamp column throws exception
- [HIVE-17640](#) - Comparison of date return null if time part is provided in string.
- [HIVE-17805](#) - SchemaTool validate locations should not return exit 1
- [HIVE-17969](#) - Metastore to alter table in batches of partitions when renaming table
- [HIVE-18009](#) - Multiple lateral view query is slow on hive on spark
- [HUE-6045](#) - [Pig] Update LOG_END_PATTERN to identify completed jobs
- [HUE-6851](#) - [metastore] Don't show the database while loading a table
- [HUE-6901](#) - [oozie] Editor is missing regular ssh action
- [HUE-7106](#) - [oozie] New oozie doc url doesn't update after saving the page
- [HUE-7127](#) - [backend] Fix for Python requests Kerberos/GSSAPI authentication library fails to authenticate kerberos requests to the same destination host.
- [HUE-7141](#) - [dashboard] Menu shows an incomplete dropdown
- [HUE-7155](#) - [backend] Hue needs to support TLSv1_1 and TLSv1_2 via Thrift connections
- [HUE-7179](#) - [core] Avoid issue with searching documents on assist or global search box
- [HUE-7182](#) - [editor] Accented characters not inserted correctly
- [HUE-7192](#) - [desktop] Hue Search is failing with DatabaseError field_cast_sql deprecated after Django 1.8
- [HUE-7223](#) - [autocomplete] Fix issue where the old autocompleter inserts extra characters on exception
- [HUE-7225](#) - [autocomplete] Prevent new line on enter when a suggestion equals the typed text
- [HUE-7264](#) - [core] Fix cx_Oracle removed numbersAsStrings in 6.0
- [HUE-7283](#) - [editor] Fix issue where analytic functions aren't found in the context popover
- [HUE-7335](#) - [editor] Make it possible to close the editor sessions panel form within the panel
- [HUE-7390](#) - [autocomplete] Fall back to only autocomplete the active statement in case there are surrounding errors
- [HUE-7402](#) - [core] Truncate SEARCH Column in Document2 for Oracle database
- [HUE-7412](#) - [editor] Fix indexes for chart limit array slice
- [HUE-7446](#) - [core] RM HA gets called by mistake on each navopt call
- [HUE-7456](#) - [core] Do not retry Thrift call on read operation timed out from ssl.SSLError
- [HUE-7470](#) - [editor] Only check for risks when a snippet has focus
- [HUE-7476](#) - [core] Add Hue shell command to set CM environment
- [HUE-7489](#) - [editor] CloseOperation when GetOperationStatus is in an ERROR_STATE
- [HUE-7519](#) - [assist] Fix JS error when the sample tab can't load samples
- [HUE-7521](#) - [security] Prevent JS error on printAcl not defined
- [HUE-7525](#) - [home] Prevent js error when dragging to select documents
- [HUE-7526](#) - [frontend] Avoid XSS in the wysiwyg5 editor and fix the binding in Hue 4
- [HUE-7530](#) - [editor] Avoid red error popup on close of expired query
- [HUE-7533](#) - [fb] Wrong error message in UI with 500 error when user tries to edit read_only file in File browser
- [HUE-7536](#) - [frontend] Avoid XSS in the table row display modal, HueDatatable and TableExtender2
- [HUE-7538](#) - [frontend] Override default knockout html binding to prevent XSS
- [HUE-7552](#) - [fb] Copy Folder Into Itself Causes Endless Loop
- [HUE-7564](#) - Remove one of the get_connection(ldap_config) function in ldap_access.py.
- [HUE-7567](#) - [all] Add default timeout to REST calls
- [HUE-7592](#) - [jib] Hide older browser if the new ones is enabled
- [HUE-7622](#) - [jib] Reruning a wokflow redirects to a json result
- [IMPALA-4682](#) - Remove Preconditions check from analyzeAggregation().
- [IMPALA-4737](#) - Prevent SIGUSR1 from killing daemons when minidumps are disabled
- [IMPALA-4826](#) - Fix error during a scan on repeated root schema in Parquet.
- [IMPALA-4951](#) - Fix database visibility for user with only column privilege
- [IMPALA-5327](#) - Handle return of JNI GetStringUTFChar
- [IMPALA-5336](#) - Fix partition pruning when column is cast
- [IMPALA-5446](#) - dropped Sorter::Reset() status

- [IMPALA-5495](#) - Improve error message if no impalad role is configured
- [IMPALA-5504](#) - Fix TupleIsNullPredicate evaluation.
- [IMPALA-5531](#) - Fix correctness issue in correlated aggregate subqueries
- [IMPALA-5595](#) - Only set KuduScanner timestamp feature flag if necessary
- [IMPALA-5597](#) - Try casting targetExpr when building runtime filter plan
- [IMPALA-5598](#) - Fix excessive dumping in MemLimitExceeded
- [IMPALA-5689](#) - Avoid inverting non-equi left joins
- [IMPALA-5750](#) - Catch exceptions from boost thread creation
- [IMPALA-5776](#) - Write partial tuple to the correct mempool
- [IMPALA-5784](#) - Separate planner and user set query options in profile
- [IMPALA-5796](#) - CTAS for Kudu fails with expr rewrite
- [IMPALA-5815](#) - right outer join returns invalid memory
- [IMPALA-5819](#) - DCHECK in HdfsTextScanner::Close()
- [IMPALA-5820](#) - Fix string format() syntax in test_scanners_fuzz.py
- [IMPALA-5840](#) - Don't write page-level statistics in Parquet files.
- [IMPALA-5850](#) - Cast sender partition exprs under unions.
- [IMPALA-5856](#) - Fix outer join predicate assignment.
- [IMPALA-5871](#) - KuduPartitionExpr incorrectly handles its child types
- [IMPALA-5885](#) - free runtime filter allocations in Parquet
- [IMPALA-5892](#) - Allow reporting status independent of fragment instance
- [IMPALA-5923](#) - Print binary ID as hex in ChildQuery::Cancel()
- [IMPALA-5954](#) - Set DO_NOT_UPDATE_STATS in alterTable() RPCs to HMS.
- [IMPALA-5983](#) - Fix crash in to/from_utc_timestamp
- [IMPALA-5994](#) - Lower case struct-field names
- [IMPALA-6060](#) - Check the return value of JNI exception handling functions
- [KITE-762](#) - Multiple URIs in hive.metastore.uris configuration may be problematic for Crunch+Kite
- [OOZIE-1401](#) - PurgeCommand should purge the workflow jobs w/o end_time
- [OOZIE-3103](#) - Improve log message regarding max concurrency for coordinators
- [SENTRY-1768](#) - Avoid detaching object on transaction exit when it isn't needed
- [SENTRY-1770](#) - Avoid more detaches on commit
- [SENTRY-1892](#) - Reduce memory consumption of HMSPath\$Entry and TPathEntry
- [SENTRY-1966](#) - Improve logging of HMS sync data (paths and permissions) flowing from Sentry to NameNode
- [SENTRY-1993](#) - StringIndexOutOfBoundsException in HMSPathsDumper.java
- [SENTRY-2027](#) - backportCreate mechanism of delivering commands via WebUI
- [SENTRY-2066](#) - DB name is not set for AlterTable
- [SPARK-17460](#) - [SQL] Make sure sizeInBytes in Statistics will not overflow
- [SPARK-17511](#) - Yarn Dynamic Allocation: Avoid marking released container as Failed
- [SPARK-17531](#) - Fix the "hive.metastore.uris" value that was changed by the backport of to 1.6 branches.
- [SQOOP-3014](#) - Sqoop with HCatalog import loose precision for large numbers that does not fit into double
- [SQOOP-3139](#) - sqoop tries to re execute select query during import in case of a connection reset error and this is causing lots of duplicate records from source
- [SQOOP-3243](#) - Importing BLOB data causes 'Stream closed' error on encrypted HDFS
- [ZOOKEEPER-2347](#) - Deadlock shutting down zookeeper
- [ZOOKEEPER-2678](#) - Discovery and Sync can take a very long time on large DB
- [ZOOKEEPER-2726](#) - backportPatch for ZOOKEEPER-2693 introduces potential race condition

Issues Fixed in CDH 5.12.1

Upstream Issues Fixed

The following upstream issues are fixed in CDH 5.12.1:

- [FLUME-2752](#) - Fix AvroSource startup resource leaks

- [FLUME-2905](#) - Fix NetcatSource file descriptor leak if startup fails
- [HADOOP-13588](#) - ConfServlet should respect Accept request header
- [HADOOP-13628](#) - Support to retrieve specific property from configuration via REST API
- [HADOOP-14260](#) - Configuration. dumpConfiguration should redact sensitive information
- [HADOOP-14511](#) - WritableRpcEngine.Invocation#toString NPE on null parameters
- [HADOOP-14542](#) - Add IOUtils. cleanupWithLogger that accepts slf4j logger API
- [HDFS-8856](#) - Make LeaseManager#countPath O(1).
- [HDFS-10468](#) - HDFS read ends up ignoring an interrupt
- [HDFS-10506](#) - OIV's ReverseXML processor cannot reconstruct some snapshot details
- [HDFS-11303](#) - Hedged read might hang infinitely if read data from all DN failed
- [HDFS-11708](#) - Positional read will fail if replicas moved to different DNs after stream is opened
- [HDFS-11741](#) - Long running balancer may fail due to expired DataEncryptionKey
- [HDFS-11861](#) - ipc.Client. Connection#sendRpcRequest should log request name
- [HDFS-11881](#) - NameNode consumes a lot of memory for snapshot diff report generation
- [HDFS-11960](#) - Successfully closed files can stay under-replicated
- [HDFS-12042](#) - Lazy initialize AbstractINodeDiffList#diffs for snapshots to reduce memory consumption
- [HDFS-12139](#) - HTTPFS liststatus returns incorrect pathSuffix for path of file
- [HDFS-12278](#) - LeaseManager operations are inefficient in 2.8
- [MAPREDUCE-6870](#) - Add configuration for MR job to finish when all reducers are complete.
- [YARN-2780](#) - Log aggregated resource allocation in rm-appsummary.log
- [HBASE-15720](#) - Print row locks at the debug dump page
- [HBASE-16033](#) - Add more details in logging of responseTooSlow/TooLarge
- [HBASE-17131](#) - Avoid livelock caused by HRegion#processRowsWithLocks
- [HBASE-17587](#) - Do not Rethrow DoNotRetryIOException as UnknownScannerException
- [HBASE-18247](#) - Hbck to fix the case that replica region shows as key in the meta table
- [HBASE-18362](#) - hbck should not report split replica parent region from meta as errors
- [HIVE-9567](#) - JSON SerDe not escaping special chars when writing char/varchar data
- [HIVE-10209](#) - FetchTask with VC may fail because ExecMapper.done is true
- [HIVE-11240](#) - Change value type from int to long for HiveConf.ConfVars.METASTORESERVERMAXMESSAGEIZE
- [HIVE-11462](#) - GenericUDFStruct should constant fold at compile time.
- [HIVE-11592](#) - ORC metadata section can sometimes exceed protobuf message size limit
- [HIVE-12274](#) - Increase width of columns used for general configuration in the metastore.
- [HIVE-12551](#) - Fix several kryo exceptions in branch-1
- [HIVE-12762](#) - Common join on parquet tables returns incorrect result when hive.optimize.index. filter set to true
- [HIVE-13330](#) - ORC vectorized string dictionary reader does not differentiate null vs empty string dictionary
- [HIVE-13588](#) - NPE is thrown from MapredLocalTask.executeInChildVM
- [HIVE-13947](#) - HoS prints wrong number for hash table size in map join scenario
- [HIVE-14178](#) - Hive::needsToCopy should reuse FileUtils::equalsFileSystem
- [HIVE-15122](#) - Hive: Upcasting types should not obscure stats (min/max/ndv)
- [HIVE-15792](#) - Hive should raise SemanticException when LPAD/RPAD pad character's length is 0
- [HIVE-16183](#) - Fix potential thread safety issues with static variables
- [HIVE-16291](#) - Hive fails when unions a parquet table with itself
- [HIVE-16559](#) - Parquet schema evolution for partitioned tables may break if table and partition serdes differ
- [HIVE-16729](#) - Improve location validator to check for blank paths
- [HIVE-16845](#) - INSERT OVERWRITE a table with dynamic partitions on S3 fails with NPE
- [HIVE-16869](#) - Hive returns wrong result when predicates on non-existing columns are pushed down to Parquet reader
- [HIVE-16875](#) - Query against view with partitioned child on HoS fails with privilege exception.
- [HIVE-16930](#) - HoS should verify the value of Kerberos principal and keytab file before adding them to spark-submit command parameters

- [HIVE-16935](#) - Hive should strip comments from input before choosing which CommandProcessor to run.
- [HIVE-16974](#) - Change the sort key for the schema tool validator to be <ID>
- [HIVE-17050](#) - Multiline queries that have comment in middle fail when executed via "beeline -e"
- [HIVE-17052](#) - Remove logging of predicate filters
- [HIVE-17149](#) - Hdfs directory is not cleared if partition creation failed on HMS
- [HUE-5217](#) - [backend] Resolve LGPL copyleft issue - Paramiko in boto 2.46.1
- [HUE-5504](#) - [oozie] Only use JDBC URL from hive2 action when hardcoded
- [HUE-6684](#) - [editor] The horizontal scrollbar of the ace editor isn't updated when the right assist is resized.
- [HUE-6701](#) - [editor] The right panel resize bar gets hidden in Hue 3 on window resize.

- [IMPALA-5554](#) - sorter DCHECK on null column
- [IMPALA-5567](#) - race in fragment instance teardown
- [IMPALA-5579](#) - Fix IndexOutOfBoundsException in GetTables metadata request
- [IMPALA-5580](#) - fix Java UDFs that return NULL strings
- [IMPALA-5582](#) - Store sentry privileges in lower case
- [IMPALA-5586](#) - Null-aware anti-join can take a long time to cancel
- [IMPALA-5588](#) - Reduce the frequency of fault injection
- [IMPALA-5611](#) - KuduPartitionExpr holds onto memory unnecessarily
- [IMPALA-5615](#) - Fix compute incremental stats for general partition exprs
- [IMPALA-5616](#) - Add --enable_minidumps startup flag
- [IMPALA-5623](#) - Fix lag() on STRING cols to release UDF mem
- [IMPALA-5627](#) - fix dropped statuses in HDFS writers
- [IMPALA-5638](#) - Fix Kudu table set tblproperties inconsistencies
- [IMPALA-5657](#) - Fix a couple of bugs with FunctionCallExpr and IGNORE NULLS
- [IMPALA-5686](#) - Update a mini cluster Sentry property
- [IMPALA-5691](#) - recalibrate mem limit for Q18
- [KITE-1155](#) - Deleting an already deleted empty path should not fail the job
- [OOZIE-2816](#) - Strip out the first command word from Sqoop action if its "sqoop"
- [OOZIE-2984](#) - Parse spark-defaults.conf values with spaces without needing the quotes
- [PIG-3567](#) - LogicalPlanPrinter throws OOM for large scripts
- [PIG-3655](#) - BinStorage and InterStorage approach to record markers is broken
- [SENTRY-1646](#) - Unable to truncate table <database>.<tablename>; from "default" databases
- [SENTRY-1811](#) - Optimize data structures used in HDFS sync
- [SENTRY-1827](#) - Minimize TPathsDump thrift message used in HDFS sync
- [SOLR-6673](#) - MDC based logging of collection, shard, etc.
- [SOLR-10889](#) - Stale zookeeper information is used during failover check.
- [SPARK-13278](#) - [CORE] Launcher fails to start with JDK 9 EA
- [SPARK-13669](#) - [SPARK-20898] [CORE] Improve the blacklist mechanism to handle external shuffle service unavailable situation
- [SPARK-15067](#) - [YARN] YARN executors are launched with fixed perm gen size
- [SPARK-16845](#) - [SQL][BRANCH-1.6] GeneratedClass\$SpecificOrdering` grows beyond 64 KB
- [SPARK-19019](#) - [PYTHON] Fix hijacked `collections.namedtuple` and port cloudpickle changes for PySpark to work with Python 3.6.0
- [SPARK-19688](#) - [STREAMING] Not to read `spark.yarn.credentials.file` from checkpoint.
- [SPARK-20393](#) - [WEBUI] Strengthen Spark to prevent XSS vulnerabilities
- [SPARK-20904](#) - [CORE] Don't report task failures to driver during shutdown.
- [ZOOKEEPER-1653](#) - zookeeper fails to start because of inconsistent epoch
- [ZOOKEEPER-2040](#) - Server to log underlying cause of SASL connection problems.

Issues Fixed in CDH 5.12.0

Upstream Issues Fixed

The following upstream issues are fixed in CDH 5.12.0:

- [CRUNCH-636](#) - Make replication factor for temporary files configurable
- [FLUME-3092](#) - Extend the FileChannel's monitoring metrics
- [HADOOP-11379](#) - Fix new findbugs warnings in hadoop-auth*

- [HADOOP-11385](#) - Prevent cross site scripting attack on JMXJSONServlet
- [HADOOP-11628](#) - SPNEGO auth does not work with CNAMES in JDK8.
- [HADOOP-11709](#) - Time.NANOSECONDS_PER_MILLISECOND - use class-level final constant instead of method variable
- [HADOOP-11794](#) - Enable distcp to copy blocks in parallel
- [HADOOP-11812](#) - Implement listLocatedStatus for ViewFileSystem to speed up split calculation
- [HADOOP-11962](#) - Sasl message with MD5 challenge text shouldn't be LOG out even in debug level
- [HADOOP-12054](#) - RPC client should not retry for InvalidToken exceptions.
- [HADOOP-12469](#) - distcp should not ignore the ignoreFailures option
- [HADOOP-12622](#) - Improve the loggings in RetryPolicies and RetryInvocationHandler
- [HADOOP-12751](#) - While using kerberos Hadoop incorrectly assumes names with '@' to be non-simple.
- [HADOOP-12906](#) - AuthenticatedURL should convert a 404/Not Found into an FileNotFoundException.
- [HADOOP-13138](#) - Unable to append to a SequenceFile with Compression.NONE
- [HADOOP-13163](#) - Reuse pre-computed filestatus in Distcp-CopyMapper
- [HADOOP-13169](#) - Randomize file list in SimpleCopyListing
- [HADOOP-13174](#) - Add more debug logs for delegation tokens and authentication.
- [HADOOP-13441](#) - Document LdapGroupsMapping keystore password properties
- [HADOOP-13453](#) - S3Guard: Instrument new functionality with Hadoop metrics
- [HADOOP-13552](#) - RetryInvocationHandler logs all remote exceptions
- [HADOOP-13626](#) - Remove distcp dependency on FileStatus serialization
- [HADOOP-13720](#) - Add more info to the msgs printed in AbstractDelegationTokenSecretManager
- [HADOOP-13760](#) - S3Guard: add delete tracking
- [HADOOP-13854](#) - KMS should log error details in KMSExceptionsProvider.
- [HADOOP-14036](#) - S3Guard: intermittent duplicate item keys failure
- [HADOOP-14081](#) - S3A: Consider avoiding array copy in S3ABlockOutputStream (ByteArrayBlock)
- [HADOOP-14100](#) - Upgrade Jsch jar to latest version to fix vulnerability in old versions
- [HADOOP-14120](#) - needless S3AFileSystem.setOptionalPutRequestParameters in S3ABlockOutputStream putObject()
- [HADOOP-14123](#) - Remove misplaced ADL service provider config file for FileSystem
- [HADOOP-14135](#) - Remove URI parameter in AWSCredentialProvider constructors
- [HADOOP-14138](#) - Remove S3A ref from META-INF service discovery, rely on existing core-default entry
- [HADOOP-14141](#) - Store KMS SSL keystore password in catalina.properties
- [HADOOP-14153](#) - ADL module has messed doc structure
- [HADOOP-14173](#) - Remove unused AdlConfKeys#ADL_EVENTS_TRACKING_SOURCE
- [HADOOP-14196](#) - Azure Data Lake doc is missing required config entry
- [HADOOP-14197](#) - Fix ADLS doc for credential provider
- [HADOOP-14214](#) - DomainSocketWatcher::add()/delete() should not self interrupt while looping await()
- [HADOOP-14241](#) - Add ADLS sensitive config keys to default list
- [HADOOP-14242](#) - Make KMS Tomcat SSL property sslEnabledProtocols and clientAuth configurable
- [HADOOP-14246](#) - Authentication Tokens should use SecureRandom instead of Random and 256 bit secrets
- [HADOOP-14266](#) - S3Guard: S3AFileSystem::listFiles() to employ MetadataStore
- [HADOOP-14369](#) - NetworkTopology calls expensive toString() when logging
- [HDFS-2219](#) - Change fsck to support fully qualified paths so that a particular namenode in a federated cluster with multiple namenodes can be specified in the path parameter.
- [HDFS-6757](#) - Simplify lease manager with INodeID
- [HDFS-7433](#) - Optimize performance of DatanodeManager's node map
- [HDFS-7939](#) - Two fsimage_rollback_* files are created which are not deleted after rollback.
- [HDFS-7959](#) - WebHdfs logging is missing on Datanode
- [HDFS-8498](#) - Blocks can be committed with wrong size
- [HDFS-9670](#) - DistCp throws NPE when source is root.
- [HDFS-10220](#) - A large number of expired leases can make namenode unresponsive and cause failover

- [HDFS-10301](#) - Remove FBR tracking state to fix false zombie storage detection for interleaving block reports
- [HDFS-10987](#) - Make Decommission less expensive when lot of blocks present
- [HDFS-11198](#) - NN UI should link DN web address using hostnames
- [HDFS-11340](#) - DataNode reconfigure for disks doesn't remove the failed volumes.
- [HDFS-11373](#) - Backport HDFS-11258 and HDFS-11272(File mtime change could not save to editlog).
- [HDFS-11383](#) - Intern strings in BlockLocation and ExtendedBlock
- [HDFS-11391](#) - Numeric usernames do no work with WebHDFS FS write access.
- [HDFS-11402](#) - HDFS Snapshots should capture point-in-time copies of OPEN files.
- [HDFS-11421](#) - Make WebHDFS' ACLs RegEx configurable
- [HDFS-11529](#) - Add libHDFS API to return last exception
- [HDFS-11531](#) - Expose hedged read metrics via libHDFS API
- [HDFS-11579](#) - Make HttpFS Tomcat SSL property sslEnabledProtocols and clientAuth configurable
- [HDFS-11609](#) - Some blocks can be permanently lost if nodes are decommissioned while dead
- [HDFS-11687](#) - Add new public encryption APIs required by Hive.
- [HDFS-11702](#) - Remove indefinite caching of key provider uri in DFSClient
- [HDFS-11709](#) - StandbyCheckpoint should handle a non-existing legacyOivlImageDir gracefully
- [HDFS-11710](#) - hadoop-hdfs-native-client build fails in trunk in Windows after HDFS-11529
- [HDFS-11714](#) - Newly added NN storage directory won't get initialized and cause space exhaustion
- [HDFS-11724](#) - libhdfs compilation is broken on OS X
- [HDFS-11914](#) - Add more diagnosis info for fsimage transfer failure
- [MAPREDUCE-5485](#) - Allow repeating job commit by extending OutputCommitter API
- [MAPREDUCE-5653](#) - DistCp does not honour config-overrides for mapreduce.[map,reduce].memory.mb
- [MAPREDUCE-6478](#) - Add an option to skip cleanupJob stage or ignore cleanup failure during commitJob.
- [MAPREDUCE-6595](#) - Fix findbugs warnings in OutputCommitter and FileOutputCommitter
- [MAPREDUCE-6762](#) - ControlledJob#toString failed with NPE when job status is not successfully updated
- [MAPREDUCE-6825](#) - YARNRunner#createApplicationSubmissionContext method is longer than 150 lines
- [MAPREDUCE-6850](#) - Shuffle Handler keep-alive connections are closed from the server side
- [MAPREDUCE-6852](#) - Job#updateStatus() failed with NPE due to race condition
- [MAPREDUCE-6871](#) - Allow users to specify racks and nodes for strict locality for AMs
- [YARN-3078](#) - LogCLIHelpers lacks of a blank space before string 'does not exist'
- [YARN-3742](#) - YARN RM will shut down if ZKClient creation times out.
- [YARN-4593](#) - Deadlock in AbstractService.getConfig()
- [YARN-6050](#) - AMs can't be scheduled on racks or nodes
- [YARN-6368](#) - Decommissioning an NM results in a -1 exit code
- [YARN-6380](#) - FSAppAttempt keeps redundant copy of the queue
- [YARN-6381](#) - FSAppAttempt has several variables that should be final
- [YARN-6510](#) - Fix profs stat file warning caused by process names that includes parenthesis.
- [YARN-6615](#) - AmlpFilter drops query parameters on redirect
- [HBASE-14983](#) - Create metrics for per block type hit/miss ratios
- [HBASE-15353](#) - Add metric for number of CallQueueTooBigException's
- [HBASE-15376](#) - ScanNext metric is size-based while every other per-operation metric is time based
- [HBASE-15377](#) - Per-RS Get metric is time based, per-region metric is size-based
- [HBASE-15464](#) - Flush / Compaction metrics revisited
- [HBASE-15780](#) - Make AuthUtil public and rely on it for talking to secure HBase.
- [HBASE-15837](#) - Memstore size accounting is wrong if postBatchMutate() throws exception
- [HBASE-15941](#) - HBase repair should not unsplit healthy splitted region
- [HBASE-16052](#) - Improve HBaseFsck Scalability
- [HBASE-16350](#) - Undo server abort from HBASE-14968
- [HBASE-16561](#) - Add metrics about read/write/scan queue length and active read/write/scan handler count
- [HBASE-16630](#) - Fragmentation in long running Bucket Cache

- [HBASE-16739](#) - Timed out exception message should include encoded region name
- [HBASE-16977](#) - VerifyReplication should log a printable representation of the row keys
- [HBASE-17460](#) - enable_table_replication can not perform cyclic replication of a table
- [HBASE-17501](#) - guard against NPE while reading FileTrailer and HFileBlock
- [HBASE-17673](#) - Monitored RPC Handler not shown in the WebUI
- [HBASE-17682](#) - Region stuck in merging_new state indefinitely
- [HBASE-17688](#) - MultiRowRangeFilter not working correctly if given same start and stop RowKey
- [HBASE-17710](#) - HBase in standalone mode creates directories with 777 permission
- [HBASE-17712](#) - Remove/Simplify the logic of RegionScannerImpl.handleFileNotFound
- [HBASE-17717](#) - Incorrect ZK ACL set for HBase superuser
- [HBASE-17722](#) - Metrics subsystem stop/start messages add a lot of useless bulk to operational logging
- [HBASE-17729](#) - Missing shortcuts for some useful HCD options
- [HBASE-17731](#) - Fractional latency reporting in MultiThreadedAction
- [HBASE-17736](#) - Some options can't be configured by the shell
- [HBASE-17779](#) - disable_table_replication returns misleading message and does not turn off replication
- [HBASE-17780](#) - BoundedByteBufferPool "At capacity" messages are not actionable
- [HBASE-17798](#) - RpcServer.Listener.Reader can abort due to CancelledKeyException
- [HBASE-17803](#) - PE always re-creates table when we specify the split policy
- [HBASE-17877](#) - Improve HBase's byte[] comparator.
- [HBASE-17970](#) - Set yarn.app.mapreduce.am.staging-dir when starting MiniMRCluster
- [HBASE-18096](#) - Limit HFileUtil visibility and add missing annotations
- [HIVE-1575](#) - get_json_object does not support JSON array at the root level
- [HIVE-9679](#) - Remove redundant null-checks from DbNotificationListener
- [HIVE-9954](#) - UDFJson uses the == operator to compare Strings
- [HIVE-11418](#) - Dropping a database in an encryption zone with CASCADE and trash enabled fails
- [HIVE-11487](#) - Add getNumPartitionsByFilter api in metastore api
- [HIVE-11878](#) - ClassNotFoundException can possibly occur if multiple jars are registered one at a time in Hive
- [HIVE-12065](#) - FS stats collection may generate incorrect stats for multi-insert query
- [HIVE-13183](#) - Adds MapredLocalTasks logs in operation log
- [HIVE-13780](#) - Allow user to update AVRO table schema via command even if table's definition was defined through schema file
- [HIVE-13782](#) - Compile async query asynchronously
- [HIVE-14080](#) - hive.metastore.schema.verification should check for schema compatibility
- [HIVE-14340](#) - Add a new hook triggers before query compilation and after query execution
- [HIVE-14559](#) - Remove setting hive.execution.engine in qfiles
- [HIVE-14564](#) - Column Pruning generates out of order columns in SelectOperator which cause ArrayIndexOutOfBoundsException.
- [HIVE-14774](#) - Canceling query using Ctrl-C in beeline might lead to stale locks
- [HIVE-14943](#) - Partial Backport of HIVE-14943 - Base Implementation (of HIVE-10924)
- [HIVE-15483](#) - Database and table name is case sensitive when used in show grant
- [HIVE-15761](#) - ObjectStore.getNextNotification could return an empty NotificationEventResponse causing TProtocolException
- [HIVE-15879](#) - Fix HiveMetaStoreChecker.checkPartitionDirs method
- [HIVE-15882](#) - HS2 generating high memory pressure with many partitions and concurrent queries.
- [HIVE-16004](#) - OutOfMemory in SparkReduceRecordHandler with vectorization mode
- [HIVE-16057](#) - SchemaTool ignores --passWord argument if hadoop.security.credential.provider.path is configured
- [HIVE-16060](#) - GenericUDTFJSONTuple's json cache could overgrow beyond its limit
- [HIVE-16079](#) - HS2: high memory pressure due to duplicate Properties objects
- [HIVE-16119](#) - HiveMetaStoreChecker: remove singleThread logic duplication

- [HIVE-16164](#) - Provide mechanism for passing HMS notification ID between transactional and non-transactional listeners.
- [HIVE-16166](#) - HS2 may still waste up to 15% of memory on duplicate strings.
- [HIVE-16196](#) - UDFJson having thread-safety issues
- [HIVE-16286](#) - Log canceled query id
- [HIVE-16308](#) - PreExecutePrinter and PostExecutePrinter should log to INFO level instead of ERROR
- [HIVE-16315](#) - Describe table doesn't show num of partitions
- [HIVE-16334](#) - Query lock contains the query string, which can cause OOM on ZooKeeper
- [HIVE-16363](#) - QueryLifeTimeHooks should catch parse exceptions
- [HIVE-16389](#) - Allow HookContext to access SQLOperationDisplay
- [HIVE-16413](#) - Create table as select does not check ownership of the location
- [HIVE-16422](#) - Should kill running Spark Jobs when a query is cancelled
- [HIVE-16426](#) - Query cancel: improve the way to handle files.
- [HIVE-16430](#) - Add log to show the cancelled query id when cancelOperation is called
- [HIVE-16449](#) - BeeLineDriver should handle query result sorting
- [HIVE-16451](#) - Race condition between HiveStatement.getQueryLog and HiveStatement.runAsyncOnServer
- [HIVE-16487](#) - Serious Zookeeper exception is logged when a race condition happens
- [HIVE-16555](#) - Add a new thrift API call for get_metastore_uuid
- [HIVE-16556](#) - Hive Metastore schema changes to add METASTORE_DB_PROPERTIES table
- [HIVE-16584](#) - Warning messages should use LogHelper.println instead of printing to the infoStream directly
- [HIVE-16593](#) - SparkClientFactory.stop may prevent JVM from exiting
- [HIVE-16647](#) - Improve the validation output to make the output to stderr and stdout more consistent
- [HIVE-16660](#) - Not able to add partition for views in hive when sentry is enabled
- [HIVE-16665](#) - Race condition in Utilities.GetInputPathsCallable --> createDummyFileForEmptyPartition
- [HIVE-16693](#) - beeline "source" command freezes if you have a comment in it?
- [HIVE-16697](#) - Schema table validator should return a sorted list of missing tables
- [HIVE-16700](#) - Log ZK discovery info (hostname & port) for HTTP mode when connection is established
- [HIVE-16711](#) - Remove property_id column from metastore_db_properties table
- [HIVE-16723](#) - Enable configurable MetaStoreSchemaInfo
- [HIVE-16745](#) - Syntax error in 041-HIVE-16556.mysql.sql script
- [HIVE-16771](#) - Schematool should use MetastoreSchemaInfo to get the metastore schema version from database
- [HUE-7](#) - [metastore] Redesign create table wizard

- [IMPALA-278](#) - Mention DIV arithmetic operator.
- [IMPALA-1427](#) - Improvements to "Unknown disk-ID" warning
- [IMPALA-1670](#), [IMPALA-4141](#) - Support multiple partitions in ALTER TABLE ADD PARTITION
- [IMPALA-1861](#) - Simplify conditionals with constant conditions
- [IMPALA-1972](#), [IMPALA-3882](#) - Fix client_request_state_map_lock_contention
- [IMPALA-2020](#) - Inline big number strings
- [IMPALA-2079](#) - Don't fail when write to scratch dir results in error.
- [IMPALA-2328](#) - Read support for min/max Parquet statistics
- [IMPALA-2518](#) - DROP DATABASE CASCADE removes cache directives of tables
- [IMPALA-2522](#) - Improve the reliability and effectiveness of ETL.
- [IMPALA-2550](#) - Switch to per-query exec rpc
- [IMPALA-2615](#) - warn if Status is ignored
- [IMPALA-3079](#) - Fix sequence file writer
- [IMPALA-3200](#) - Implement suballocator for splitting buffers
- [IMPALA-3202](#) - implement spill-to-disk in new buffer pool
- [IMPALA-3203](#) - Implement scalable buffer recycling in buffer pool.
- [IMPALA-3524](#) - Don't process spilled partitions with 0 probe rows
- [IMPALA-3586](#) - Implement union passthrough
- [IMPALA-3654](#) - Parquet stats filtering for IN predicate
- [IMPALA-3671](#) - Add SCRATCH_LIMIT query option.
- [IMPALA-3742](#) - Partitions and sort INSERTs for Kudu tables
- [IMPALA-3748](#) - minimum buffer requirements in planner
- [IMPALA-3748](#) - add query-wide resource acquisition step
- [IMPALA-3785](#) - Record query handle for invalid handle
- [IMPALA-3794](#) - Workaround for Breakpad ID conflicts
- [IMPALA-3905](#) - Implements HdfsScanner::GetNext() for text scans.
- [IMPALA-3909](#) - Populate min/max statistics in Parquet writer
- [IMPALA-3989](#) - Display skew warning for poorly formatted Parquet files
- [IMPALA-4008](#) - Don't bake fields into generated IR functions of OldHashTable
- [IMPALA-4014](#) - Introduce query-wide execution state.
- [IMPALA-4029](#) - Reduce memory requirements for storing file metadata
- [IMPALA-4036](#) - invalid SQL generated for partitioned table with comment
- [IMPALA-4041](#) - Limit catalog and admission control updates to coordinators
- [IMPALA-4163](#) - Add sortby() query hint
- [IMPALA-4166](#) - Add SORT BY sql clause
- [IMPALA-4341](#) - Add metadata load to planner timeline

- [IMPALA-4351](#), [IMPALA-4353](#) - query generator random profile options for INSERT.
- [IMPALA-4355](#) - random query generator: modify statement execution flow to support DML
- [IMPALA-4359](#) - qgen: add UPSERT support
- [IMPALA-4390](#) - Separate ADD and DROP PARTITION syntax
- [IMPALA-4431](#) - Add audit event log control mechanism to prevent disk overflow
- [IMPALA-4477](#) - Update Kudu to latest commit on master
- [IMPALA-4499](#) - Table name missing from exec summary
- [IMPALA-4546](#) - Fix Moscow timezone conversion after 2014
- [IMPALA-4548](#) - BlockingJoinNode should wait for async build thread
- [IMPALA-4549](#) - consistently treat 9999 as upper bound for timestamp year
- [IMPALA-4588](#) - Enable starting the minicluster when offline
- [IMPALA-4611](#) - Checking perms on S3 files is a very expensive no-op
- [IMPALA-4616](#) - Add missing Kudu column options
- [IMPALA-4617](#) - remove IsConstant() analysis from backend
- [IMPALA-4624](#) - Implement Parquet dictionary filtering
- [IMPALA-4631](#) - avoid DCHECK in PlanFragementExecutor::Close().
- [IMPALA-4640](#) - Fix number of rows displayed by parquet-reader tool
- [IMPALA-4647](#) - fix full data load with ninja
- [IMPALA-4648](#) - remove build_thirdparty.sh
- [IMPALA-4649](#) - add a mechanism to pass flags into make
- [IMPALA-4650](#) - Add Protobuf 2.6.1 to toolchain and as a build dependency
- [IMPALA-4651](#) - Add LibEv to build
- [IMPALA-4652](#) - Add crcutil to build
- [IMPALA-4653](#) - fix sticky config variable problem
- [IMPALA-4662](#) - Fix NULL literal handling in Kudu IN list predicates
- [IMPALA-4673](#) - Use --local_library_dir for tzdb startup scratch space
- [IMPALA-4674](#) - port BufferedTupleStream to BufferPool
- [IMPALA-4676](#) - remove vestigial references to getBlockStorageLocations() API
- [IMPALA-4678](#) - move query MemTracker into QueryState
- [IMPALA-4684](#) - check-hbase-nodes.py: Build failing on RHEL7 when trying to start HBase.
- [IMPALA-4686](#) - Fix schema output for INT96 columns in parquet-reader tool
- [IMPALA-4689](#) - Fix computation of last active time
- [IMPALA-4701](#) - make distcc work reliably with clang
- [IMPALA-4707](#) - fix use-after-free in QueryExecMgr
- [IMPALA-4710](#) - There is an error in control audit log file size number
- [IMPALA-4711](#) - clarify is_null semantics in udf.h
- [IMPALA-4716](#) - Expr rewrite causes IllegalStateException
- [IMPALA-4731](#), [IMPALA-397](#), [IMPALA-4728](#) - Sorter crash Impalad instance.
- [IMPALA-4734](#) - Set parquet::RowGroup::sorting_columns
- [IMPALA-4738](#) - STDDEV_SAMP should return NULL for single record input
- [IMPALA-4740](#) - Add option to use hdfsPread() for HDFS hedged reads
- [IMPALA-4747](#) - macros should only evaluate their arguments once
- [IMPALA-4748](#) - crash in TmpFileMgr when hitting process mem limit
- [IMPALA-4752](#) - make ObjectPool more efficient
- [IMPALA-4757](#) - addendum: avoid double underscore in name
- [IMPALA-4758](#) - Upgrade gutil to recent Kudu version.
- [IMPALA-4762](#) - RECOVER PARTITIONS should batch partition updates
- [IMPALA-4764](#) - Add Hedged read metrics
- [IMPALA-4788](#) - Use HashSet in RECOVER PARTITIONS duplicate checks
- [IMPALA-4789](#) - Fix slow metadata loading due to inconsistent paths.

- [IMPALA-4792](#) - Fix number of distinct values for a CASE with constant outputs
- [IMPALA-4801](#) - fix heap use after free for MemTracker
- [IMPALA-4815](#) - , [IMPALA-4817](#), [IMPALA-4819](#): Write and Read Parquet Statistics for remaining types
- [IMPALA-4820](#) - avoid writing unencrypted data during write cancellation
- [IMPALA-4828](#) - Add "Known Issues" item for
- [IMPALA-4831](#) - enforce BufferPool reservation invariants
- [IMPALA-4839](#) - Remove implicit 'localhost' for KUDU_MASTER_HOSTS
- [IMPALA-4840](#) - Fix REFRESH performance regression.
- [IMPALA-4846](#) - Upgrade Snappy to 1.1.4
- [IMPALA-4849](#) - IllegalStateException from rewritten CASE expr
- [IMPALA-4858](#) - add more info to MemLimitExceeded errors
- [IMPALA-4859](#) - Push down IS NULL / IS NOT NULL to Kudu
- [IMPALA-4877](#) - fix precedence of unary -/+
- [IMPALA-4880](#) - Clarify synchronization policy for 'done_' in KuduScanNode
- [IMPALA-4883](#) - Union Codegen
- [IMPALA-4884](#) - Add JVM heap and non-heap usage in metrics and UI
- [IMPALA-4885](#) - Expose Jvm thread info in web UI
- [IMPALA-4890](#) - /5143: Coordinator race involving TearDown()
- [IMPALA-4892](#) - Session ID included in error message
- [IMPALA-4893](#) - Efficiently update the rows read counter for sequence file
- [IMPALA-4897](#) - AnalysisException: specified cache pool does not exist
- [IMPALA-4923](#) - reduce memory transfer for selective scans
- [IMPALA-4926](#) - Upgrade LZ4 to 1.7.5
- [IMPALA-4937](#) - Remove unused kudu scanner keep alive variable
- [IMPALA-4943](#) - Speed up block md loading for add/recover partition calls.
- [IMPALA-4946](#) - fix hang in BufferPool
- [IMPALA-4955](#) - Fix integer overflow in hdfs table size accounting
- [IMPALA-4959](#) - Avoid picking up the system's boost cmake module
- [IMPALA-4962](#) - Fix SHOW COLUMN STATS for HS2
- [IMPALA-4965](#) - Authorize access to runtime profile and exec summary
- [IMPALA-4966](#) - Add flatbuffers to build
- [IMPALA-4983](#) - Set toolchain version to include LZ4 build flags
- [IMPALA-4988](#) - Add query option read_parquet_statistics
- [IMPALA-4996](#) - Single-threaded KuduScanNode
- [IMPALA-5003](#) - Constant propagation in scan conjuncts
- [IMPALA-5008](#) - Fix reading stats for TINYINT and SMALLINT
- [IMPALA-5021](#) - Fix count(*) remaining rows overflow in Parquet.
- [IMPALA-5027](#) - addendum - remove unneeded #define
- [IMPALA-5030](#) - Adds support for NVL2() function
- [IMPALA-5034](#) - Update Breakpad to newer version
- [IMPALA-5038](#) - Fix file size regex to include bytes
- [IMPALA-5041](#) - Allow AuthManager::Init() to be called more than once
- [IMPALA-5042](#) - Use a HashSet instead of ArrayList for O(1) look ups
- [IMPALA-5056](#) - Ensure analysis uses 'fresh' catalog after metadata loading
- [IMPALA-5057](#) - Upgrade glog (0.3.4-p2) and gflags
- [IMPALA-5073](#) - Part 1: add option to use mmap() for buffer pool
- [IMPALA-5077](#) - add NUMA and current cpu to CpuInfo
- [IMPALA-5080](#) - OutOfMemory PermGen space
- [IMPALA-5110](#) - Add deb support to dump_breakpad_symbols.py
- [IMPALA-5111](#) - Fix check when creating NOT NULL PK col in Kudu

- [IMPALA-5113](#) - fix dirty unpinned invariant
- [IMPALA-5120](#) - Default to partitioned join when stats are missing
- [IMPALA-5123](#) - Fix ASAN use after free in timezone_db
- [IMPALA-5125](#) - SimplifyConditionalsRule incorrectly handles aggregates
- [IMPALA-5127](#) - Add history_max option
- [IMPALA-5130](#) - fix race in MemTracker::EnableReservationReporting()
- [IMPALA-5137](#) - Support Kudu UNIXTIME_MICROS as Impala TIMESTAMP.
- [IMPALA-5140](#) - improve docs building guidelines
- [IMPALA-5144](#) - Remove sortby() hint
- [IMPALA-5147](#) - Add the ability to exclude hosts from query execution
- [IMPALA-5154](#) - Handle 'unpartitioned' Kudu tables
- [IMPALA-5158](#) - Part 1: include untracked memory in MemTracker dumps
- [IMPALA-5166](#) - clean up BufferPool counters
- [IMPALA-5167](#) - Reduce the number of Kudu clients created
- [IMPALA-5169](#) - Add support for async pins in buffer pool
- [IMPALA-5171](#) - update RAT excluded files list
- [IMPALA-5172](#) - crash in tcmmalloc::CentralFreeList::FetchFromOneSpans
- [IMPALA-5173](#) - crash with hash join feeding directly into nlj
- [IMPALA-5174](#) - Bump gflags to 2.2.0-p1
- [IMPALA-5180](#) - Don't use non-deterministic exprs in partition pruning
- [IMPALA-5181](#) - Extract PYPI metadata from a webpage
- [IMPALA-5182](#) - Explicitly close connection to impalad on error from shell
- [IMPALA-5184](#) - build fe against both Hive 1 & 2 APIs
- [IMPALA-5187](#) - , IMPALA-5208: Bump Breakpad Version, undo IMPALA-3794
- [IMPALA-5188](#) - Add slot sorting in TupleDescriptor::LayoutEquals()
- [IMPALA-5189](#) - Pin version of setuptools-scm
- [IMPALA-5192](#) - Don't bake MemPool* into IR
- [IMPALA-5197](#) - Erroneous corrupted Parquet file message
- [IMPALA-5198](#) - Error messages are sometimes dropped before reaching client
- [IMPALA-5207](#) - ,IMPALA-5214: distcc fixes
- [IMPALA-5217](#) - KuduTableSink checks null constraints incorrectly
- [IMPALA-5220](#) - memory maintenance cleanup
- [IMPALA-5221](#) - Avoid re-use of stale SASL contexts.
- [IMPALA-5222](#) - don't call Bits::Log2*() functions
- [IMPALA-5223](#) - Add waiting for HBase Zookeeper nodes to retry loop
- [IMPALA-5224](#) - remove defunct codehaus repository
- [IMPALA-5229](#) - huge page-backed buffers with TCMalloc
- [IMPALA-5230](#) - fix non-functional impalad under ASAN
- [IMPALA-5232](#) - Parquet reader error message prints memory address instead of value
- [IMPALA-5235](#) - Initialize resourceProfile_ with a dummy value
- [IMPALA-5238](#) - transfer reservations between trackers
- [IMPALA-5258](#) - Pass CMAKE_BUILD_TYPE to Impala-Izo
- [IMPALA-5259](#) - Add REFRESH FUNCTIONS <db> statement
- [IMPALA-5261](#) - Heap use-after-free in HdfsSequenceTableWriter
- [IMPALA-5273](#) - Replace StringCompare with glibc memcmp
- [IMPALA-5282](#) - Handle overflows in computeResourceProfile().
- [IMPALA-5294](#) - Kudu INSERT partitioning fails with constants
- [IMPALA-5301](#) - Set Kudu minicluster memory limit
- [IMPALA-5304](#) - reduce transfer of Parquet decompression buffers
- [IMPALA-5309](#) - Adds TABLESAMPLE clause for HDFS table refs.

- [IMPALA-5318](#) - Generate access events with fully qualified table names
- [IMPALA-5324](#) - Fix version check in EvalDictionaryFilters
- [IMPALA-5325](#) - Do not update totalHdfsBytes_/numHdfsFiles_ on Catalogd
- [IMPALA-5331](#) - Use new libHDFS API to address "Unknown Error 255"
- [IMPALA-5333](#) - Add support for Impala to work with ADLS
- [IMPALA-5338](#) - Fix Kudu timestamp column default values
- [IMPALA-5339](#) - Fix analysis with sort.columns and expr rewrites
- [IMPALA-5340](#) - Query profile displays stale query state
- [IMPALA-5342](#) - Add comments of loaded tables in the response of GetTables
- [IMPALA-5347](#) - Parquet scanner microoptimizations
- [IMPALA-5355](#) - Fix the order of Sentry roles and privileges
- [IMPALA-5357](#) - Fix unixtime to UTC TimestampValue perf
- [IMPALA-5358](#) - Fix repeatable table sample.
- [IMPALA-5363](#) - Reset probe_batch_ after reaching limit
- [IMPALA-5364](#) - Correct title of query locations table
- [IMPALA-5375](#) - Builds on CentOS 6.4 failing with broken python dependencies
- [IMPALA-5377](#) - Impala may crash if given a fragment instance while restarting
- [IMPALA-5378](#) - Disk IO manager needs to understand ADLS
- [IMPALA-5381](#) - Adds DEFAULT_JOIN_DISTRIBUTION_MODE query option.
- [IMPALA-5383](#) - Fix PARQUET_FILE_SIZE option for ADLS
- [IMPALA-5388](#) - Only retry RPC on lost connection in send call
- [IMPALA-5391](#) - remove C++11 from UDF header
- [IMPALA-5411](#) - Avoid log spew from GetRuntimeProfileStr
- [IMPALA-5419](#) - Check for cancellation when building hash tables
- [IMPALA-5424](#) - Ignore errors when removing minidumps folder
- [IMPALA-5426](#) - Update Hive schema script to 1.1.0
- [IMPALA-5432](#) - Remove invalid DCHECK from SetMemLimitExceeded
- [IMPALA-5438](#) - Always eval union const exprs in subplan.
- [IMPALA-5454](#) - Work around template rendering bug in /memz
- [IMPALA-5469](#) - Fix exception when processing catalog update
- [IMPALA-5487](#) - Fix race in RuntimeProfile::toThrift()
- [IMPALA-5537](#) - Retry RPC on some exceptions with SSL connection
- [IMPALA-5558](#) - /IMPALA-5576: Reopen stale client connection
- [IMPALA-5562](#) - Only recomputeMemLayout() if tuple has a layout.
- [IMPALA-3905](#) - Implements HdfsScanner::GetNext() for LZO text scans.
- [IMPALA-5172](#) - fix incorrect cast in call to LZO decompress
- [OOZIE-2387](#) - Oozie is Unable to handle Spaces in file/archive tag.
- [OOZIE-2844](#) - Increase stability of Oozie actions when log4j.properties is missing or not readable
- [OOZIE-2872](#) - Address backward compatibility issue introduced by OOOZIE-2748
- [OOZIE-2874](#) - Make the Launcher Mapper map-only job's InputFormat class pluggable.
- [OOZIE-2908](#) - Fix typo in oozie.actions.null.args.allowed property in oozie-default.xml
- [OOZIE-2923](#) - Improve Spark options parsing
- [PARQUET-389](#) - Support predicate push down on missing columns.
- [PIG-5110](#) - Removing schema alias and :: coming from parent relation
- [SENTRY-1556](#) - Simplify privilege cleaning.
- [SENTRY-1644](#) - Partition ACLs disappear after renaming Hive table with partitions
- [SENTRY-1646](#) - Unable to truncate table <database>.<tablename>; from "default" databases
- [SENTRY-1683](#) - MetastoreCacheInitializer has a race condition in handling results list
- [SENTRY-1730](#) - Optimized FileInputStream /FileOutputStream
- [SENTRY-1759](#) - UpdatableCache leaks connections

- [SENTRY-1788](#) - Sentry Store may use JDO object after the associated data is removed in DB
- [SOLR-6673](#) - MDC based logging of collection, shard etc.
- [SOLR-8836](#) - Return 400, and a SolrException when an invalid json is provided to the update handler instead of 500.
- [SOLR-9153](#) - Update Apache commons beanutils version to 1.9.2
- [SOLR-9527](#) - Improve distribution of replicas when restoring a collection
- [SOLR-10076](#) - ofHide keystore and truststore passwords from /admin/info/* outputs. - Updated JMXJsonServlet to use new API - Set redaction default true
- [SPARK-16138](#) - Try to cancel executor requests only if we have at least 1
- [SPARK-20922](#) - Unsafe deserialization in Spark LauncherConnection.
- [ZOOKEEPER-2693](#) - for CVE-2017-5637.

Issues Fixed in CDH 5.11.x

The following topics describe issues fixed in CDH 5.11.x, from newest to oldest release. You can also review [What's New in CDH 5.11.x](#) on page 1822 or [Known Issues in CDH 5](#) on page 1944.

Issues Fixed in CDH 5.11.2

CDH 5.11.2 fixes the following issues:

Upstream Issues Fixed

The following upstream issues are fixed in CDH 5.11.2:

- [FLUME-2752](#) - Fix AvroSource startup resource leaks
- [FLUME-2905](#) - Fix NetcatSource file descriptor leak if startup fails
- [HADOOP-12751](#) - While using kerberos Hadoop incorrectly assumes names with '@' to be non-simple .
- [HADOOP-14141](#) - Store KMS SSL keystore password in catalina.properties
- [HADOOP-14242](#) - Make KMS Tomcat SSL property sslEnabledProtocols and clientAuth configurable
- [HADOOP-14511](#) - WritableRpcEngine.Invocation#toString NPE on null parameters
- [HDFS-6757](#) - Simplify lease manager with INodeID
- [HDFS-8856](#) - Make LeaseManager#countPath O(1).
- [HDFS-10220](#) - A large number of expired leases can make namenode unresponsive and cause failover
- [HDFS-10506](#) - OIV's ReverseXML processor cannot reconstruct some snapshot details
- [HDFS-11579](#) - Make HttpFS Tomcat SSL property sslEnabledProtocols and clientAuth configurable
- [HDFS-11708](#) - Positional read will fail if replicas moved to different DNs after stream is opened
- [HDFS-11741](#) - Long running balancer may fail due to expired DataEncryptionKey
- [HDFS-11861](#) - ipc.Client.Connection#sendRpcRequest should log request name
- [HDFS-11881](#) - NameNode consumes a lot of memory for snapshot diff report generation
- [HDFS-11960](#) - Successfully closed files can stay under-replicated
- [HDFS-12042](#) - Lazy initialize AbstractINodeDiffList#diffs for snapshots to reduce memory consumption
- [HDFS-12139](#) - HTTPFS liststatus returns incorrect pathSuffix for path of file
- [YARN-2780](#) - Log aggregated resource allocation in rm-appsummary.log

- [IMPALA-4276](#) - Profile displays non-default query options set by planner
- [IMPALA-4546](#) - Fix Moscow timezone conversion after 2014
- [IMPALA-4631](#) - don't use floating point operations for time unit conversions
- [IMPALA-4716](#) - Expr rewrite causes IllegalStateException
- [IMPALA-4738](#) - STDDEV_SAMP should return NULL for single record input
- [IMPALA-4962](#) - Fix SHOW COLUMN STATS for HS2
- [IMPALA-5021](#) - Fix count(*) remaining rows overflow in Parquet.
- [IMPALA-5056](#) - Ensure analysis uses 'fresh' catalog after metadata loading
- [IMPALA-5154](#) - Handle 'unpartitioned' Kudu tables
- [IMPALA-5172](#) - Buffer overrun for Snappy decompression
- [IMPALA-5187](#) - Bump breakpad version to include the fix for Breakpad #681, re-enable the strict check that was disabled in IMPALA-3794.
- [IMPALA-5189](#) - Pin version of setuptools-scm
- [IMPALA-5197](#) - Erroneous corrupted Parquet file message
- [IMPALA-5198](#) - Error messages are sometimes dropped before reaching client
- [IMPALA-5217](#) - KuduTableSink checks null constraints incorrectly
- [IMPALA-5223](#) - Add waiting for HBase Zookeeper nodes to retry loop
- [IMPALA-5301](#) - Set Kudu minicluster memory limit
- [IMPALA-5318](#) - Generate access events with fully qualified table names
- [IMPALA-5355](#) - Fix the order of Sentry roles and privileges
- [IMPALA-5363](#) - Reset probe_batch_ after reaching limit
- [IMPALA-5419](#) - Check for cancellation when building hash tables
- [IMPALA-5469](#) - Fix exception when processing catalog update
- [IMPALA-5487](#) - Fix race in RuntimeProfile::toThrift()
- [IMPALA-5524](#) - Fixes NPE during planning with DISABLE_UNSAFE_SPILLS=1
- [IMPALA-5554](#) - sorter DCHECK on null column
- [IMPALA-5580](#) - fix Java UDFs that return NULL strings
- [IMPALA-5615](#) - Fix compute incremental stats for general partition exprs
- [IMPALA-5623](#) - Fix lag() on STRING cols to release UDF mem
- [IMPALA-5638](#) - Fix Kudu table set tblproperties inconsistencies
- [IMPALA-5657](#) - Fix a couple of bugs with FunctionCallExpr and IGNORE NULLS
- [IMPALA-5172](#) - fix incorrect cast in call to LZO decompress
- [KITE-1155](#) - Deleting an already deleted empty path should not fail the job
- [OOZIE-2816](#) - Strip out the first command word from Sqoop action if its "sqoop"
- [OOZIE-2844](#) - Increase stability of Oozie actions when log4j.properties is missing or not readable
- [OOZIE-2872](#) - Address backward compatibility issue introduced by OOOZIE-2748
- [OOZIE-2908](#) - Fix typo in oozie.actions.null.args.allowed property in oozie-default.xml
- [OOZIE-2923](#) - Improve Spark options parsing
- [OOZIE-2984](#) - Parse spark-defaults.conf values with spaces without needing the quotes
- [PARQUET-389](#) - Support predicate push down on missing columns.
- [PIG-3567](#) - LogicalPlanPrinter throws OOM for large scripts

- [PIG-3655](#) - BinStorage and InterStorage approach to record markers is broken
- [SENTRY-1644](#) - Partition ACLs disappear after renaming Hive table with partitions.
- [SENTRY-1646](#) - Unable to truncate table <database>.<tablename>; from "default" databases
- [SENTRY-1759](#) - UpdatableCache leaks connections
- [SENTRY-1811](#) - Optimize data structures used in HDFS sync
- [SENTRY-1827](#) - Minimize TPathsDump thrift message used in HDFS sync
- [SOLR-6673](#) - MDC-based logging of collection, shard, etc.
- [SOLR-8836](#) - /update should return BAD REQUEST when invalid JSON provided.
- [SOLR-9153](#) - Update beanutils version to 1.9.2
- [SOLR-9527](#) - Solr RESTORE API doesn't distribute the replicas uniformly
- [SOLR-10076](#) - Hiding keystore and truststore passwords from /admin/info/* outputs.
- [SOLR-10889](#) - Stale zookeeper information is used during failover check.
- [SPARK-13278](#) - Launcher fails to start with JDK 9 EA
- [SPARK-15067](#) - YARN executors are launched with fixed perm gen size
- [SPARK-16845](#) - org.apache.spark.sql.catalyst.expressions.GeneratedClass\$SpecificOrdering `grows beyond 64 KB
- [SPARK-19019](#) - PySpark does not work with Python 3.6.0
- [SPARK-19688](#) - Spark on YARN Credentials File set to different application directory.
- [SPARK-20393](#) - Strengthen Spark to prevent XSS vulnerabilities
- [SPARK-20904](#) - Task failures during shutdown cause problems with preempted executors.
- [SPARK-20922](#) - Unsafe deserialization in Spark LauncherConnection.
- [ZOOKEEPER-1653](#) - zookeeper fails to start because of inconsistent epoch.
- [ZOOKEEPER-2040](#) - Server to log underlying cause of SASL connection problems.

Issues Fixed in CDH 5.11.1

CDH 5.11.1 fixes the following issues:

Upstream Issues Fixed

The following upstream issues are fixed in CDH 5.11.1:

- [FLUME-3080](#) - Close failure in HDFS Sink might cause data loss
- [FLUME-3085](#) - HDFS Sink can skip flushing some BucketWriters, might lead to data loss
- [HADOOP-11400](#) - GraphiteSink does not reconnect to Graphite after 'broken pipe'
- [HADOOP-11599](#) - Client#getTimeout should use IPC_CLIENT_PING_DEFAULT when IPC_CLIENT_PING_KEY is not configured
- [HADOOP-12672](#) - RPC timeout should not override IPC ping interval
- [HADOOP-13503](#) - Improve SaslRpcClient failure logging
- [HADOOP-13926](#) - S3Guard: S3AFileSystem::listLocatedStatus() to employ MetadataStore
- [HADOOP-14019](#) - Fix some typos in the s3a docs
- [HADOOP-14028](#) - S3A BlockOutputStreams doesn't delete temporary files in multipart uploads or handle part upload failures
- [HADOOP-14051](#) - S3Guard: link docs from index, fix typos
- [HADOOP-14059](#) - typo in s3a rename(self, subdir) error message
- [HADOOP-14092](#) - Typo in hadoop-aws index.md
- [HADOOP-14104](#) - Client should always ask namenode for kms provider path
- [HADOOP-14144](#) - s3guard: CLI diff non-empty after import on new table
- [HADOOP-14172](#) - S3Guard: import does not import empty directory
- [HADOOP-14195](#) - CredentialProviderFactory\$getProviders is not thread-safe
- [HADOOP-14204](#) - S3A multipart commit failing, "UnsupportedOperationException at java.util.Collections\$UnmodifiableList.sort".
- [HADOOP-14215](#) - DynamoDB client should waitForActive on existing tables
- [HADOOP-14236](#) - S3Guard: S3AFileSystem::rename() should move non-listed sub-directory entries

- [HADOOP-14255](#) - S3A to delete unnecessary fake directory objects in mkdirs()
- [HADOOP-14256](#) - [S3A DOC] Correct the format for "Seoul" example
- [HADOOP-14268](#) - Fix markdown itemization in hadoop-aws documents
- [HADOOP-14282](#) - S3Guard: DynamoDBMetadata::prune() should self interrupt correctly
- [HADOOP-14417](#) - Update default SSL cipher list for KMS
- [HDFS-10715](#) - NPE when applying AvailableSpaceBlockPlacementPolicy
- [HDFS-10797](#) - Revert "Disk usage summary of snapshots causes renamed blocks to get counted twice"
- [HDFS-11499](#) - Decommissioning stuck because of failing recovery
- [HDFS-11515](#) - -du throws ConcurrentModificationException
- [HDFS-11689](#) - New exception thrown by DFSClient%isHDFSEncryptionEnabled broke hacky hive code
- [HDFS-11816](#) - Update default SSL cipher list for HttpFS
- [YARN-3251](#) - Fixed a deadlock in CapacityScheduler when computing absoluteMaxAvailableCapacity in LeafQueue
- [YARN-6042](#) - Dump scheduler and queue state information into FairScheduler DEBUG log.
- [YARN-6360](#) - Prevent FS state dump logger from cramming other log files
- [YARN-6432](#) - FairScheduler: Reserve preempted resources for corresponding applications.
- [YARN-6433](#) - Only accessible cgroup mount directories should be selected for a controller.
- [YARN-6453](#) - fairscheduler-statedump.log gets generated regardless of service
- [YARN-6500](#) - Do not mount inaccessible cgroups directories in CgroupsLCEResourcesHandler.
- [HBASE-15125](#) - BackportHBaseFsck's adoptHdfsOrphan function creates region with wrong end key boundary
- [HBASE-15941](#) - HBase repair should not unsplit healthy splitted region
- [HBASE-15955](#) - Disable action in CatalogJanitor#setEnabled should wait for active cleanup scan to finish
- [HBASE-16032](#) - Possible memory leak in StoreScanner
- [HBASE-16238](#) - It's useless to catch SESSIONEXPIRED exception and retry in RecoverableZooKeeper
- [HBASE-16350](#) - Undo server abort from HBASE-14968
- [HBASE-16429](#) - FSHLog: deadlock if rollWriter called when ring buffer filled with appends
- [HBASE-16663](#) - JMX ConnectorServer stopped when unauthorized user try to stop HM/RS/cluster
- [HBASE-16721](#) - Concurrency issue in WAL unflushed seqId tracking
- [HBASE-17265](#) - Region left unassigned in master failover when region failed to open
- [HBASE-17328](#) - Properly dispose of looped replication peers
- [HBASE-17460](#) - enable_table_replication can not perform cyclic replication of a table
- [HBASE-17717](#) - Explicitly use "sasl" ACL scheme for hbase superuser
- [HBASE-17779](#) - disable_table_replication returns misleading message and does not turn off replication
- [HBASE-17792](#) - Use a shared thread pool for AtomicityWriter, AtomicGetReader, AtomicScanReader's connections in TestAcidGuarantees
- [HIVE-11141](#) - Improve RuleRegExp when the Expression node stack gets huge
- [HIVE-11428](#) - Performance: Struct IN() clauses are extremely slow
- [HIVE-11671](#) - Optimize RuleRegExp in DPP codepath
- [HIVE-11842](#) - Improve RuleRegExp by caching some internal data structures
- [HIVE-12179](#) - Add option to not add spark-assembly.jar to Hive classpath
- [HIVE-12768](#) - Thread safety: binary sortable serde decimal deserialization
- [HIVE-14210](#) - ExecDriver should call jobclient.close() to trigger cleanup
- [HIVE-14380](#) - Queries on tables with remote HDFS paths fail in "encryption" checks.
- [HIVE-15282](#) - Different modification times are used when an index is built and when its staleness is checked
- [HIVE-15782](#) - query on parquet table returns incorrect result when hive.optimize.index.filter is set to true

- [HIVE-16175](#) - Possible race condition in InstanceCache

- [HIVE-16205](#) - Improving type safety in Objectstore
- [HIVE-16297](#) - Improving hive logging configuration variables
- [HIVE-16394](#) - HoS does not support queue name change in middle of session
- [HIVE-16459](#) - Forward channelInactive to RpcDispatcher
- [HIVE-16646](#) - Alias in transform ... as clause shouldn't be case sensitive
- [HUE-6109](#) - [core] Remove the restriction on Document2 invalid chars
- [HUE-6144](#) - [oozie] Add generic XSL template to workflow graph parser
- [HUE-6154](#) - [core] Ace paste event shouldn't reset the cursor position
- [HUE-6155](#) - [core] Remove table extender header throttling for Firefox
- [HUE-6158](#) - [autocomplete] The autocompleter eats characters to the right of the cursor on insert
- [HUE-6193](#) - [converter] Retain last_executed time when creating doc2 object
- [HUE-6197](#) - [impala] Fix XSS Vulnerability in the old editors' error messages
- [HUE-6207](#) - [editor] Avoid to always show the horizontal scroll bar when there's no scrolling needed
- [HUE-6208](#) - [core] The scroll left anchor should reset the horizontal scrollbar position
- [HUE-6212](#) - [oozie] Prevent XSS injection in coordinator cron frequency field
- [HUE-6223](#) - [autocomplete] Fix issue where tables from subsequent statements appear in the autocomplete results
- [HUE-6228](#) - [core] Disable touchscreen detection on Nicescroll
- [HUE-6251](#) - [editor] Log warnings and continue on failed bulk delete and copy actions
- [IMPALA-3641](#) - Fix catalogd RPC responses to DROP IF EXISTS.
- [IMPALA-4088](#) - Assign fix values to the minicluster server ports
- [IMPALA-4293](#) - query profile should include error log
- [IMPALA-4544](#) - ASAN should ignore SEGV and leaks
- [IMPALA-4615](#) - Fix create_table.sql command order
- [IMPALA-4733](#) - Change HBase ports to non-ephemeral
- [IMPALA-4787](#) - Optimize APPX_MEDIAN() memory usage
- [IMPALA-4822](#) - Implement dynamic log level changes
- [IMPALA-4899](#) - Fix parquet table writer dictionary leak
- [IMPALA-4902](#) - Copy parameters map in HdfsPartition.toThrift().
- [IMPALA-4998](#) - Fix missing table lock acquisition.
- [IMPALA-5028](#) - Lock table in /catalog_objects endpoint.
- [IMPALA-5055](#) - Fix DCHECK in parquet-column-readers.cc ReadPageHeader()
- [IMPALA-5088](#) - Fix heap buffer overflow
- [IMPALA-5115](#) - Handle status from HdfsTableSink::WriteClusteredRowBatch
- [IMPALA-5145](#) - Do not constant fold null in CastExprs
- [IMPALA-5156](#) - Drop VLOG level passed into Kudu client
- [IMPALA-5186](#) - Handle failed CreateAndOpenScanner() in MT scan.
- [IMPALA-5193](#) - Initialize decompressor before finding first tuple
- [IMPALA-5251](#) - Fix propagation of input exprs' types in 2-phase agg
- [IMPALA-5252](#) - Fix crash in HiveUdfCall::GetStringVal() when mem_limit exceeded
- [IMPALA-5253](#) - Use appropriate transport for StatestoreSubscriber
- [IMPALA-5322](#) - Fix a potential crash in Frontend & Catalog JNI startup
- [OOZIE-2739](#) - Remove property expansion pattern from ShellMain's log4j properties content
- [OOZIE-2818](#) - Can't overwrite oozie.action.max.output.data on a per-workflow basis
- [OOZIE-2819](#) - Make Oozie REST API accept multibyte characters for script Actions
- [SENTRY-1508](#) - Revert ""REVERT: MetastorePlugin.java does not handle properly initialization failure
- [SENTRY-1605](#) - SENTRY-1508 need to be fixed because of Kerberos initialization issue
- [SENTRY-1683](#) - MetastoreCacheInitializer has a race condition in handling results list
- [SENTRY-1714](#) - MetastorePlugin.java should quietly return from renameAuthzObject() when both paths are null
- [SOLR-9836](#) - Add ability to recover from leader when index corruption is detected on SolrCore creation.
- [SOLR-9848](#) - Lower solr.cloud.wait-for-updates-with-stale-state-pause back down from 7 seconds.

- [SOLR-10360](#) - Remove an extra space from Hadoop distcp cmd used by Solr backup/restore
- [SOLR-10430](#) - Add ls command to ZkCLI for listing sub-dirs
- [SPARK-14930](#) - [SPARK-13693] Fix race condition in CheckpointWriter.stop()
- [SPARK-19178](#) - [SQL][Backport-to-1.6] convert string of large numbers to int should return null
- [SPARK-19263](#) - DAGScheduler should avoid sending conflicting task set.
- [SPARK-19537](#) - Move pendingPartitions to ShuffleMapStage.
- [SPARK-20435](#) - [CORE] More thorough redaction of sensitive information
- [SQOOP-3123](#) - Introduce escaping logic for column mapping parameters (same what Sqoop already uses for the DB column names), thus special column names (e.g. containing '#' character) and mappings related to those columns can be in the same format (thus not confusing the end users), and also eliminates the related AVRO format clashing issues.
- [SQOOP-3140](#) - Removing deprecated mapred.map.max.attempts, mapred.reduce.max.attempts entries and using the new constants directly from Hadoop instead
- [SQOOP-3159](#) - Sqoop (export + --table) with Oracle table_name having '\$' fails with error

Issues Fixed in CDH 5.11.0

CDH 5.11.0 fixes the following issues.

Upstream Issues Fixed

The following upstream issues are fixed in CDH 5.11.0:

- [AVRO-1973](#) - Upgrade netty to the latest 3.x release
- [FLUME-2318](#) - Make SpoolingDirectorySource able to handle empty files
- [FLUME-2514](#) - Speed up TestFileChannelRestart tests
- [FLUME-2567](#) - Remove external Maven repositories
- [FLUME-2593](#) - ResettableFileInputStream returns negate values from read() method
- [FLUME-2619](#) - SpoolDir source should log channel exceptions
- [FLUME-2704](#) - Configurable poll delay for spooling directory source
- [FLUME-2718](#) - HTTP Source to support generic Stream Handler
- [FLUME-2725](#) - HDFS Sink does not use configured timezone for rounding
- [FLUME-2761](#) - Move Hive sink out of preview mode
- [FLUME-2798](#) - Malformed Syslog messages can lead to OutOfMemoryException
- [FLUME-2801](#) - Performance improvement on TailDir source
- [FLUME-2806](#) - flume-ng.ps1 Error running script to start an agent on Windows
- [FLUME-2810](#) - Add static Schema URL to AvroEventSerializer configuration
- [FLUME-2812](#) - Fix semaphore leak causing java.lang.Error: Maximum permit count exceeded in MemoryChannel
- [FLUME-2835](#) - Hive Sink tests need to create table with transactional property set
- [FLUME-2857](#) - Make Kafka Source/Channel/Sink restore default values when live updating config
- [FLUME-2875](#) - Allow RollingFileSink to specify a file prefix and a file extension.
- [FLUME-2881](#) - Windows Launch Script fails in plugins dir code
- [FLUME-2889](#) - Fixes to DateTime computations
- [FLUME-2890](#) - Typo in Twitter source warning
- [FLUME-2911](#) - Add include pattern option in SpoolDir source
- [FLUME-2936](#) - KafkaSource tests: Use loopback instead of host address
- [FLUME-2937](#) - Integrate checkstyle for non-test classes
- [FLUME-2939](#) - Update recursive SpoolDir source to use Java 7 APIs
- [FLUME-2941](#) - Integrate checkstyle for test classes
- [FLUME-2949](#) - checkstyle: Make suppressions compatible with Windows
- [FLUME-2950](#) - ReliableSpoolingFileEventReader.rollCurrentFile is broken
- [FLUME-2952](#) - SyslogAgent: Avoid NPE on stop()
- [FLUME-2955](#) - Add file path to the header in TaildirSource

- [FLUME-2959](#) - Fix issues with flume-checkstyle module
- [FLUME-2966](#) - Fix NPE in JMS Source
- [FLUME-2971](#) - Add secure Kafka Sink/Source/Channel setup to the User Guide
- [FLUME-2974](#) - Fix some broken SpoolDirSource unit tests
- [FLUME-2998](#) - Add a missing configuration parameter to SequenceSource docs
- [FLUME-2999](#) - Kafka channel and sink should enable statically assigned partition per event via header
- [FLUME-3027](#) - Change Kafka Channel to clear offsets map after commit
- [FLUME-3049](#) - Make HDFS sink rotate more reliably in secure mode
- [HADOOP-10823](#) - TestReloadingX509TrustManager is flaky
- [HADOOP-11447](#) - Add a more meaningful toString method to SampleStat and MutableStat.
- [HADOOP-11619](#) - FTPFileSystem should override getDefaultPort.
- [HADOOP-11859](#) - PseudoAuthenticationHandler fails with httpcomponents v4.4
- [HADOOP-11878](#) - FileContext#fixRelativePart should check for not null for a more informative exception.
- [HADOOP-12009](#) - Clarify FileSystem.listStatus() sorting order & fix FileSystemContractBaseTest:testListStatus.
- [HADOOP-12655](#) - TestHttpServer.testBindAddress bind port range is wider than expected.
- [HADOOP-12667](#) - s3a to support createNonRecursive API
- [HADOOP-12774](#) - s3a should use UGI.getCurrentUser.getShortname() for username
- [HADOOP-12977](#) - s3a to handle delete("/", true) robustly
- [HADOOP-13037](#) - Refactor Azure Data Lake Store as an independent FileSystem
- [HADOOP-13119](#) - Add ability to secure log servlet using proxy users. Contribute by Yuanbo Liu.
- [HADOOP-13164](#) - Optimize S3AFileSystem::deleteUnnecessaryFakeDirectories
- [HADOOP-13204](#) - Add support for SSE-KMS and SSE-C in s3a filesystem.
- [HADOOP-13207](#) - Specify FileSystem listStatus, listFiles and Remoteliterator
- [HADOOP-13257](#) - Improve Azure Data Lake contract tests
- [HADOOP-13309](#) - Document S3A known limitations in file ownership and permission model
- [HADOOP-13336](#) - S3A to support per-bucket configuration (S3Guard specific changes)
- [HADOOP-13345](#) - S3Guard: Ensure GenericOptionsParser is used for S3Guard CLI
- [HADOOP-13375](#) - o.a.h.security.TestGroupsCaching.testBackgroundRefreshCounters seems flaky.
- [HADOOP-13433](#) - Race in UGI.reloginFromKeytab
- [HADOOP-13446](#) - Support running isolated unit tests separate from AWS integration tests
- [HADOOP-13448](#) - S3Guard: Define MetadataStore interface.
- [HADOOP-13449](#) - S3Guard: Implement DynamoDBMetadataStore
- [HADOOP-13452](#) - S3Guard: Implement access policy for intra-client consistency with in-memory metadata store
- [HADOOP-13455](#) - S3Guard: Write end user docs, change table autocreate default.
- [HADOOP-13496](#) - Include file lengths in Mismatch in length error for distcp
- [HADOOP-13502](#) - Split fs.contract.is-blobstore flag into more descriptive flags for use by contract tests
- [HADOOP-13508](#) - FsPermission string constructor does not recognize sticky bit
- [HADOOP-13540](#) - improve section on troubleshooting s3a auth problems
- [HADOOP-13560](#) - S3ABlockOutputStream to support huge (many GB) file writes
- [HADOOP-13573](#) - S3Guard: create basic contract tests for MetadataStore implementations
- [HADOOP-13589](#) - S3Guard: Allow execution of all S3A integration tests with S3Guard enabled
- [HADOOP-13599](#) - s3a close() to be non-synchronized, so avoid risk of deadlock on shutdown
- [HADOOP-13614](#) - Purge some superfluous/obsolete S3 FS tests that are slowing test runs down
- [HADOOP-13627](#) - Have an explicit KerberosAuthException for UGI to throw, text from public constants
- [HADOOP-13631](#) - S3Guard: implement move() for LocalMetadataStore, add unit tests
- [HADOOP-13650](#) - S3Guard: Provide command line tools to manipulate metadata store.
- [HADOOP-13651](#) - S3Guard: S3AFileSystem Integration with MetadataStore
- [HADOOP-13674](#) - S3A can provide a more detailed error message when accessing a bucket through an incorrect S3 endpoint
- [HADOOP-13680](#) - fs.s3a.readahead.range to use getLongBytes

- [HADOOP-13692](#) - hadoop-aws should declare explicit dependency on Jackson 2 jars to prevent classpath conflicts
- [HADOOP-13727](#) - S3A: Reduce high number of connections to EC2 Instance Metadata Service caused by InstanceProfileCredentialsProvider
- [HADOOP-13735](#) - ITestS3AFileContextStatistics.testStatistics() failing
- [HADOOP-13742](#) - Expose NumOpenConnectionsPerUser as a metric.
- [HADOOP-13749](#) - KMSClientProvider combined with KeyProviderCache can result in wrong UGI being used
- [HADOOP-13782](#) - Make MutableRates metrics thread-local write, aggregate-on-read
- [HADOOP-13793](#) - S3guard: add inconsistency injection, integration tests
- [HADOOP-13801](#) - regression: ITestS3AMiniYarnCluster failing
- [HADOOP-13804](#) - MutableStat mean loses accuracy if add(long, long) is used
- [HADOOP-13805](#) - UGI.getCurrentUser() fails if user does not have a keytab associated
- [HADOOP-13823](#) - s3a rename: fail if dest file exists
- [HADOOP-13826](#) - S3A Deadlock in multipart copy due to thread pool limits
- [HADOOP-13830](#) - Intermittent failure of ITestS3NContractRootDir#testRecursiveRootListing: "Can not create a Path from an empty string"
- [HADOOP-13847](#) - KMSWebApp should close KeyProviderCryptoExtension
- [HADOOP-13850](#) - s3guard to log choice of metadata store at debug
- [HADOOP-13855](#) - Fix a couple of the s3a statistic names to be consistent with the rest
- [HADOOP-13857](#) - S3AUtils.translateException to map (wrapped) InterruptedExceptions to InterruptedIOEs
- [HADOOP-13876](#) - S3Guard: better support for multi-bucket access
- [HADOOP-13877](#) - S3Guard: fix TestDynamoDBMetadataStore when fs.s3a.s3guard.ddb.table is set
- [HADOOP-13886](#) - s3guard: ITestS3AFileOperationCost.testFakeDirectoryDeletion failure
- [HADOOP-13893](#) - dynamodb dependency -> compile
- [HADOOP-13899](#) - S3Guard: tune dynamodb client & tests
- [HADOOP-13900](#) - Remove snapshot version of SDK dependency from Azure Data Lake Store File System
- [HADOOP-13903](#) - Improvements to KMS logging to help debug authorization errors.
- [HADOOP-13904](#) - DynamoDBMetadataStore to handle DDB throttling
- [HADOOP-13908](#) - S3Guard: Existing tables may not be initialized correctly in DynamoDBMetadataStore
- [HADOOP-13911](#) - Remove TRUSTSTORE_PASSWORD related scripts from KMS
- [HADOOP-13914](#) - S3guard: Improve S3AFileStatus#isEmptyDirectory handling
- [HADOOP-13928](#) - TestAdlFileContextMainOperationsLive.testGetFileContext1 runtime error.
- [HADOOP-13929](#) - ADLS connector should not check in contract-test-options.xml.
- [HADOOP-13931](#) - S3AGuard: Use BatchWriteItem in DynamoDBMetadataStore#put()
- [HADOOP-13934](#) - S3Guard: DynamoDBMetadataStore#move() could be throwing exception due to BatchWriteItem limits
- [HADOOP-13937](#) - S3Guard: Mock bucket locations in MockS3ClientFactory
- [HADOOP-13953](#) - Make FTPFileSystem's data connection mode and transfer mode configurable
- [HADOOP-13956](#) - Read ADLS credentials from Credential Provider.
- [HADOOP-13958](#) - Bump up release year to 2017
- [HADOOP-13960](#) - Initialize DynamoDBMetadataStore without associated S3AFileSystem.
- [HADOOP-13962](#) - Update ADLS SDK to 2.1.4.
- [HADOOP-13976](#) - Path globbing does not match newlines
- [HADOOP-13985](#) - s3guard: add a version marker to every table
- [HADOOP-13988](#) - KMSClientProvider does not work with WebHDFS and Apache Knox w/ProxyUser
- [HADOOP-13995](#) - s3guard cli: make tests easier to run and address failure
- [HADOOP-14001](#) - Improve delegation token validity checking.
- [HADOOP-14003](#) - Make additional KMS tomcat settings configurable
- [HADOOP-14013](#) - S3Guard: fix multi-bucket integration tests
- [HADOOP-14017](#) - User friendly name for ADLS user and group
- [HADOOP-14020](#) - Optimize dirListingUnion

- [HADOOP-14027](#) - S3Guard: Implicitly creating DynamoDB table ignores endpoint config
- [HADOOP-14029](#) - Fix KMSClientProvider for non-secure proxyuser use case
- [HADOOP-14040](#) - Use shaded aws-sdk uber-JAR 1.11.86
- [HADOOP-14041](#) - CLI command to prune old metadata
- [HADOOP-14044](#) - Synchronization issue in delegation token cancel functionality
- [HADOOP-14046](#) - Metastore destruction test creates table w/o version
- [HADOOP-14049](#) - Honour AclBit flag associated to file/folder permission for Azure datalake account
- [HADOOP-14050](#) - Add process name to kms process
- [HADOOP-14079](#) - s3guard: fix breaking link in s3guard.md
- [HADOOP-14083](#) - KMS should support old SSL clients.
- [HADOOP-14085](#) - s3guard: drop unnecessary type assertion and cast.
- [HADOOP-14094](#) - Rethink S3GuardTool options
- [HADOOP-14096](#) - s3guard: regression in dirListingUnion
- [HADOOP-14102](#) - Relax error message assertion in S3A test ITestS3AEncryptionSSEC
- [HADOOP-14110](#) - In S3AFileSystem, make getAmazonClient() package private; export getBucketLocation()
- [HADOOP-14113](#) - Review ADL Docs
- [HADOOP-14114](#) - S3A can no longer handle unencoded + in URIs
- [HADOOP-14125](#) - s3guard tool tests aren't isolated; can't run in parallel
- [HADOOP-14129](#) - ITestS3ACredentialsInURL sometimes fails
- [HADOOP-14130](#) - Simplify DynamoDBClientFactory for creating Amazon DynamoDB clients
- [HADOOP-14131](#) - kms.sh creates bogus dir for tomcat logs
- [HADOOP-14168](#) - S3GuardTool tests should not run if S3Guard is not set up
- [HADOOP-14181](#) - S3Guard: Add validation of DynamoDB region
- [HDFS-3716](#) - Purger should remove stale fsimage ckpt files
- [HDFS-4366](#) - Block Replication Policy Implementation May Skip Higher-Priority Blocks for Lower-Priority Blocks.
- [HDFS-8307](#) - Spurious DNS Queries from hdfs shell
- [HDFS-8640](#) - Make reserved RBW space visible through JMX.
- [HDFS-8883](#) - NameNode Metrics : Add FSNameSystem lock Queue Length
- [HDFS-9145](#) - Tracking methods that hold FSNamesytemLock for too long
- [HDFS-9205](#) - Do not schedule corrupt blocks for replication.
- [HDFS-9390](#) - Block management for maintenance states.
- [HDFS-9391](#) - Update webUI/JMX to display maintenance state info.
- [HDFS-9467](#) - Fix data race accessing writeLockHeldTimeStamp in FSNamesystem
- [HDFS-10292](#) - Add block id when client got Unable to close file exception
- [HDFS-10534](#) - NameNode WebUI should display DataNode usage histogram
- [HDFS-10559](#) - DiskBalancer: Use SHA1 for Plan ID
- [HDFS-10713](#) - Throttle FsNameSystem lock warnings
- [HDFS-10733](#) - NameNode terminated after full GC thinking QJM is unresponsive
- [HDFS-10798](#) - Make the threshold of reporting FSNamesystem lock contention configurable
- [HDFS-10808](#) - DiskBalancer does not execute multi-steps plan-redux
- [HDFS-10817](#) - Add Logging for Long-held NN Read Locks
- [HDFS-10896](#) - Move lock logging logic from FSNamesystem into FSNamesystemLock
- [HDFS-10941](#) - Improve BlockManager#processMisReplicatesAsync log
- [HDFS-10966](#) - Enhance Dispatcher logic on deciding when to give up a source DataNode
- [HDFS-11087](#) - NamenodeFsck should check if the output writer is still writable
- [HDFS-11132](#) - Allow AccessControlException in contract tests when getFileStatus on subdirectory of existing files
- [HDFS-11160](#) - VolumeScanner reports write-in-progress replicas as corrupt incorrectly
- [HDFS-11180](#) - Intermittent deadlock in NameNode when failover happens.
- [HDFS-11197](#) - Listing encryption zones fails when deleting a EZ that is on a snapshotted directory
- [HDFS-11259](#) - Update fsck to display maintenance state info.

- [HDFS-11263](#) - ClassCastException when we use Bzipcodec for Fimage compression
- [HDFS-11265](#) - Extend visualization for Maintenance Mode under Datanode tab in the NameNode UI.
- [HDFS-11271](#) - Typo in NameNode UI
- [HDFS-11275](#) - Check groupEntryIndex and throw a helpful exception on failures when removing ACL.
- [HDFS-11280](#) - Allow WebHDFS to reuse HTTP connections to NN
- [HDFS-11292](#) - log lastWrittenTxId etc info in logSyncAll
- [HDFS-11296](#) - Maintenance state expiry should be an epoch time and not jvm monotonic.
- [HDFS-11306](#) - Print remaining edit logs from buffer if edit log can't be rolled
- [HDFS-11363](#) - Need more diagnosis info when seeing Slow waitForAckedSeqno.
- [HDFS-11378](#) - Verify multiple DataNodes can be decommissioned/maintenance at the same time.
- [HDFS-11379](#) - DFSInputStream may infinite loop requesting block locations
- [HDFS-11390](#) - Add process name to httpfs process
- [HDFS-11411](#) - Avoid OutOfMemoryError in TestMaintenanceState test runs.
- [HDFS-11412](#) - Maintenance minimum replication config value allowable range should be [0, DefaultReplication].
- [HDFS-11418](#) - HttpFS should support old SSL clients
- [HDFS-11441](#) - Add escaping to error message in KMS web UI
- [HDFS-11466](#) - Change dfs.namenode.write-lock-reporting-threshold-ms default from 1000ms to 5000ms
- [MAPREDUCE-5155](#) - Race condition in test case TestFetchFailure cause it to fail
- [MAPREDUCE-5335](#) - Rename Job Tracker terminology in ShuffleSchedulerImpl
- [MAPREDUCE-5883](#) - "Total megabyte-seconds" in job counters is slightly misleading
- [MAPREDUCE-5981](#) - Log levels of certain MR logs can be changed to DEBUG
- [MAPREDUCE-6172](#) - TestDbClasses timeouts are too aggressive
- [MAPREDUCE-6571](#) - JobEndNotification info logs are missing in AM container syslog
- [MAPREDUCE-6639](#) - Process hangs in LocatedFileStatusFetcher if FileSystem.get throws.
- [MAPREDUCE-6715](#) - Fix Several Unsafe Practices
- [MAPREDUCE-6817](#) - The format of job start time in JHS is different from those of submit and finish time.
- [MAPREDUCE-6829](#) - Add peak memory usage counter for each task.
- [YARN-1047](#) - Expose # of pre-emptions as a queue counter
- [YARN-2301](#) - Improved yarn container command
- [YARN-2306](#) - Add test for leakage of reservation metrics in fair scheduler.
- [YARN-2336](#) - Fair scheduler's REST API returns a missing '[' bracket JSON for deep queue tree
- [YARN-2902](#) - Addendum. Killing a container that is localizing can orphan resources in the DOWNLOADING state
- [YARN-2988](#) - Graph#save() may leak file descriptors.
- [YARN-3269](#) - Yarn.nodemanager.remote-app-log-dir could not be configured to fully qualified path
- [YARN-3396](#) - Handle URISyntaxException in ResourceLocalizationService.
- [YARN-3933](#) - FairScheduler: Multiple calls to completedContainer are not safe.
- [YARN-3957](#) - FairScheduler NPE In FairSchedulerQueueInfo causing scheduler page to return 500.
- [YARN-4232](#) - TopCLI console support for HA mode
- [YARN-4363](#) - In TestFairScheduler, testcase should not create FairScheduler redundantly.
- [YARN-4544](#) - All the log messages about rolling monitoring interval are shown with WARN level
- [YARN-4555](#) - TestDefaultContainerExecutor#testContainerLaunchError fails on non-english locale environment
- [YARN-4719](#) - Add a helper library to maintain node state and allows common queries.
- [YARN-4752](#) - Improved preemption in FairScheduler.
- [YARN-4805](#) - Don't go through all schedulers in ParameterizedTestBase.
- [YARN-4882](#) - Change the log level to DEBUG for recovering completed applications
- [YARN-5136](#) - Error in handling event type APP_ATTEMPT_REMOVED to the scheduler
- [YARN-5181](#) - ClusterNodeTracker: add method to get list of nodes matching a specific resourceName.
- [YARN-5182](#) - MockNodes.newNodes creates one more node per rack than requested.
- [YARN-5257](#) - Fix unreleased resources and null dereferences
- [YARN-5308](#) - FairScheduler: Move continuous scheduling related tests to TestContinuousScheduling

- [YARN-5752](#) - TestLocalResourcesTrackerImpl#testLocalResourceCache times out
- [YARN-5798](#) - Set UncaughtExceptionHandler for all FairScheduler threads.
- [YARN-5830](#) - FairScheduler: Avoid preempting AM containers.
- [YARN-5859](#) - TestResourceLocalizationService#testParallelDownloadAttemptsForPublicResource sometimes fails
- [YARN-5890](#) - FairScheduler should log information about AM-resource-usage and max-AM-share for queues
- [YARN-5920](#) - Fix deadlock in TestRMHA.testTransitionedToStandbyShouldNotHang
- [YARN-6061](#) - Add an UncaughtExceptionHandler for critical threads in RM.
- [YARN-6112](#) - UpdateCallDuration is calculated only when debug logging is enabled.
- [YARN-6125](#) - The application attempt's diagnostic message should have a maximum size
- [YARN-6131](#) - FairScheduler: Lower update interval for faster tests.
- [YARN-6144](#) - FairScheduler: preempted resources can become negative.
- [YARN-6163](#) - FS Preemption is a trickle for severely starved applications.
- [YARN-6171](#) - ConcurrentModificationException on FSAppAttempt.containersToPreempt.
- [YARN-6172](#) - FSLeafQueue demand update needs to be atomic.
- [YARN-6193](#) - FairScheduler might not trigger preemption when using DRF.
- [YARN-6194](#) - Cluster capacity in SchedulingPolicy is updated only on allocation file reload.
- [YARN-6210](#) - FairScheduler: Node reservations can interfere with preemption.
- [YARN-6215](#) - Custom Cloudera version. FairScheduler preemption and update should not run concurrently.
- [YARN-6218](#) - Fix TestAMRMClient when using FairScheduler.
- [YARN-6264](#) - AM not launched when a single vcore is available on the cluster.
- [YARN-6448](#) - Continuous scheduling thread crashes while sorting nodes.
- [HBASE-6721](#) - RegionServer Group based Assignment. Adds new rsgroups feature which allows isol
- [HBASE-12949](#) - Scanner can be stuck in infinite loop if the HFile is corrupted
- [HBASE-15295](#) - MutateTableAccess.multiMutate() does not get high priority causing a deadlock
- [HBASE-15315](#) - Remove always set super user call as high priority
- [HBASE-15322](#) - Operations using Unsafe path broken for platforms not having sun.misc.Unsafe.
- [HBASE-15325](#) - ResultScanner allowing partial result will miss the rest of the row if the region is moved between two rpc requests
- [HBASE-15328](#) - sanity check the redirect used to send master info requests to the embedded regionserver.
- [HBASE-15378](#) - Scanner cannot handle heartbeat message with no results
- [HBASE-15435](#) - Add WAL (in bytes) written metric
- [HBASE-15441](#) - Fix WAL splitting when region has moved multiple times
- [HBASE-15587](#) - FSTableDescriptors.getDescriptor() logs stack trace erroneously
- [HBASE-15645](#) - hbase.rpc.timeout is not used in operations of HTable
- [HBASE-15931](#) - Add log for long-running tasks in AsyncProcess
- [HBASE-16062](#) - Improper error handling in WAL Reader/Writer creation
- [HBASE-16165](#) - Decrease RpcServer.callQueueSize before writeResponse causes OOM
- [HBASE-16237](#) - Blocks for hbase:meta table are not cached in L1 cache
- [HBASE-16266](#) - Do not throw ScannerTimeoutException when catch UnknownScannerException
- [HBASE-16304](#) - HRegion#RegionScannerImpl#handleFileNotFoundException may lead to deadlock when trying to obtain write lock on updatesLock
- [HBASE-16460](#) - Can't rebuild the BucketAllocator's data structures when BucketCache uses FileIOEngine
- [HBASE-16527](#) - IOExceptions from DFS client still can cause CatalogJanitor to delete referenced files
- [HBASE-16604](#) - Scanner retries on IOException can cause the scans to miss data
- [HBASE-16649](#) - Truncate table with splits preserved can cause both data loss and truncated data appeared again
- [HBASE-16662](#) - Fix open POODLE vulnerabilities
- [HBASE-16754](#) - All WALSplitter OutputSinks should process compaction events
- [HBASE-16765](#) - backportNew SteppingRegionSplitPolicy, avoid too aggressive spread of regions for small tables. Includesand the amendmentAmend: Make SteppingSplitPolicy the default.
- [HBASE-16807](#) - , RegionServer will fail to report new active Hmaster until HMaster/RegionServer failover.

- [HBASE-16841](#) - Data loss in MOB files after cloning a snapshot and deleting that snapshot
- [HBASE-16931](#) - Setting cell's seqId to zero in compaction flow might cause RS down.
- [HBASE-16960](#) - RegionServer hang when aborting
- [HBASE-16981](#) - Expand Mob Compaction Partition policy from daily to weekly, monthly
- [HBASE-17020](#) - keylen in midkey() dont computed correctly
- [HBASE-17023](#) - Region left unassigned due to AM and SSH each thinking others would do the assignment work
- [HBASE-17044](#) - Fix merge failed before creating merged region leaves meta inconsistent
- [HBASE-17069](#) - RegionServer writes invalid META entries for split daughters in some circumstances
- [HBASE-17206](#) - FSHLog may roll a new writer successfully with unflushed entries
- [HBASE-17238](#) - Wrong in-memory hbase:meta location causing SSH failure
- [HBASE-17241](#) - Avoid compacting already compacted mob files with _del files
- [HBASE-17243](#) - Reuse CompactionPartitionId and avoid creating MobFileName in PartitionedMobCompactor to avoid unnecessary new objects
- [HBASE-17243](#) - Reuse CompactionPartitionId and avoid creating MobFileName in PartitionedMobCompactor to avoid unnecessary new objects
- [HBASE-17275](#) - Assign timeout may cause region to be unassigned forever
- [HBASE-17309](#) - Fix connection leaks in TestAcidGuarantees
- [HBASE-17381](#) - ReplicationSourceWorkerThread can die due to unhandled exceptions
- [HBASE-17409](#) - Limit jsonp callback name to prevent xss
- [HBASE-17437](#) - Support specifying a WAL directory outside of the root directory
- [HBASE-17452](#) - Failed taking snapshot - region Manifest proto-message too large
- [HBASE-17522](#) - Handle JVM throwing runtime exceptions when we ask for details on heap usage the same as a correctly returned 'undefined'.
- [HBASE-17558](#) - ZK dumping jsp should escape HTML.
- [HBASE-17561](#) - table status page should escape values that may contain arbitrary characters.
- [HBASE-17624](#) - ADDENDUMincluding missing parts of TestWALObserver changes from
- [HBASE-17640](#) - Unittest error in TestMobCompactor with different timezone
- [HBASE-17653](#) - [HBASE-17624](#) rsgroup synchronizations will (distributed) deadlock
- [HBASE-17654](#) - RSGroup refactoring.
- [HBASE-17675](#) - ReplicationEndpoint should choose new sinks if a SaslException occurs
- [HBASE-17677](#) - ServerName parsing from directory name should be more robust to errors from guava's HostAndPort
- [HIVE-7723](#) - Explain plan for complex query with lots of partitions is slow due to in-efficient collection used to find a matching ReadEntity
- [HIVE-9138](#) - Add some explain to PTF operator
- [HIVE-9481](#) - allow column list specification in INSERT statement
- [HIVE-10641](#) - create CRC32 UDF
- [HIVE-11147](#) - MetaTool doesn't update FS root location for partitions with space in name
- [HIVE-11293](#) - HiveConnection.setAutoCommit(true) throws exception
- [HIVE-11376](#) - Removes legacy code wrt skipping files with codec to HiveInputFormat from CombineHiveInputFormat
- [HIVE-11594](#) - Analyze Table for column names with embedded spaces
- [HIVE-11849](#) - NPE in HiveHBaseTableShapshotInputFormat in query with just count(*)
- [HIVE-11882](#) - Fetch optimizer should stop source files traversal once it exceeds the hive.fetch.task.conversion.threshold
- [HIVE-11920](#) - ADD JAR failing with URL schemes other than file/ivy/hdfs
- [HIVE-12222](#) - Define port range in property for RPCServer
- [HIVE-12236](#) - Enable SimpleFetchOptimizer for more query types
- [HIVE-12261](#) - schematool version info exit status should depend on compatibility, not equality
- [HIVE-12349](#) - NPE in ORC SARG for IS NULL queries on Timestamp and Date columns
- [HIVE-12465](#) - Hive might produce wrong results when (outer) joins are merged
- [HIVE-12780](#) - Fix the output of the history command in Beeline

- [HIVE-12789](#) - Fix output twice in the history command of Beeline
- [HIVE-12897](#) - Improve dynamic partition loading
- [HIVE-12976](#) - MetaStoreDirectSql doesn't batch IN lists in all cases
- [HIVE-13149](#) - Remove some unnecessary HMS connections from HS2
- [HIVE-13179](#) - Allow custom HiveConf to be passed to Authentication Providers
- [HIVE-13240](#) - GroupByOperator: Drop the hash aggregates when closing operator
- [HIVE-13463](#) - Fix ImportSemanticAnalyzer to allow for different src/dst filesystems
- [HIVE-13510](#) - Dynamic partitioning doesn't work when remote metastore is used
- [HIVE-13726](#) - Improve dynamic partition loading VI
- [HIVE-13864](#) - Beeline ignores the command that follows a semicolon and comment
- [HIVE-13866](#) - flatten callstack for directSQL errors
- [HIVE-13895](#) - HoS start-up overhead in yarn-client mode
- [HIVE-13901](#) - Hivemetastore add partitions can be slow depending on filesystems
- [HIVE-13902](#) - [Refactor] Minimize metastore jar dependencies on task nodes
- [HIVE-13904](#) - Ignore case when retrieving ColumnInfo from RowResolver
- [HIVE-13966](#) - DbNotificationListener: can loose DDL operation notifications

- [SQOOP-3072](#) - Reenable escaping in ImportTest#testProductWithWhiteSpaceImport for proper execution
- [SQOOP-3081](#) - use OracleEscapeUtils.escapeldentifier in OracleUpsertOutputFormat instead of inline appending quotes
- [SQOOP-3124](#) - Fix ordering in column list query of PostgreSQL connector to reflect the logical order instead of adhoc ordering
- [ZOOKEEPER-1045](#) - Backport — Support Quorum Peer mutual authentication via SASL
- [ZOOKEEPER-2044](#) - Backport — Fix CancelledKeyException on ZooKeeper server (zookeeper branch-3.4)

Cloudera Search

Security vulnerability resolved

An attacker can download any file accessible to Solr superuser using the path manipulation vulnerability in Solr (CVE-2017-3163; see [Cloudera Security Bulletins](#) more information). This release provides the fix for it. In addition,

attackers can leverage this vulnerability to manipulate files unrelated to Solr index, by launching a “man in the middle” attack between individual Solr servers. To avoid this issue, enable TLS and Kerberos authentication.

Issues Fixed in CDH 5.10.x

The following topics describe issues fixed in CDH 5.10.x, from newest to oldest release. You can also review [What's New in CDH 5.10.x](#) on page 1824 or [Known Issues in CDH 5](#) on page 1944.

Issues Fixed in CDH 5.10.2

Upstream Issues Fixed

The following upstream issues are fixed in CDH 5.10.2:

- [FLUME-2798](#) - Malformed Syslog messages can lead to OutOfMemoryException
- [FLUME-3080](#) - Close failure in HDFS Sink might cause data loss
- [FLUME-3085](#) - HDFS Sink can skip flushing some BucketWriters, might lead to data loss
- [HADOOP-11400](#) - GraphiteSink does not reconnect to Graphite after 'broken pipe'
- [HADOOP-11599](#) - Client#getTimeout should use IPC_CLIENT_PING_DEFAULT when IPC_CLIENT_PING_KEY is not configured
- [HADOOP-12672](#) - RPC timeout should not override IPC ping interval
- [HADOOP-12751](#) - While using kerberos Hadoop incorrectly assumes names with '@' to be non-simple.
- [HADOOP-13503](#) - Improve SaslRpcClient failure logging
- [HADOOP-13749](#) - KMSClientProvider combined with KeyProviderCache can result in wrong UGI being used
- [HADOOP-13826](#) - S3A Deadlock in multipart copy due to thread pool limits
- [HADOOP-14050](#) - Add process name to kms process
- [HADOOP-14083](#) - Add missing file
hadoop-common-project/hadoop-kms/src/main/tomcat/catalina-default.properties
- [HADOOP-14083](#) - KMS should support old SSL clients.
- [HADOOP-14104](#) - Client should always ask namenode for kms provider path
- [HADOOP-14141](#) - Store KMS SSL keystore password in catalina.properties
- [HADOOP-14195](#) - CredentialProviderFactory\$getProviders is not thread-safe
- [HADOOP-14242](#) - Make KMS Tomcat SSL property sslEnabledProtocols and clientAuth configurable
- [HDFS-10715](#) - NPE when applying AvailableSpaceBlockPlacementPolicy
- [HDFS-11390](#) - Add process name to httpfs process
- [HDFS-11418](#) - HttpFS should support old SSL clients
- [HDFS-11515](#) - -du throws ConcurrentModificationException
- [HDFS-11579](#) - Make HttpFS Tomcat SSL property sslEnabledProtocols and clientAuth configurable
- [HDFS-11689](#) - New exception thrown by DFSClient%isHDFSEncryptionEnabled broke hacky hive code
- [MAPREDUCE-6165](#) - [JDK8] TestCombineFileInputFormat failed on JDK8
- [MAPREDUCE-6201](#) - TestNetworkedJob fails on trunk
- [MAPREDUCE-6839](#) - TestRecovery.testCrashed failed
- [YARN-3251](#) - Fixed a deadlock in CapacityScheduler when computing absoluteMaxAvailableCapacity in LeafQueue
- [YARN-6042](#) - Dump scheduler and queue state information into FairScheduler DEBUG log.
- [YARN-6264](#) - AM not launched when a single vcore is available on the cluster.
- [YARN-6359](#) - TestRM#testApplicationKillAtAcceptedState fails rarely due to race condition
- [YARN-6360](#) - Prevent FS state dump logger from cramming other log files
- [YARN-6453](#) - fairscheduler-statedump.log gets generated regardless of service
- [YARN-6615](#) - AmIpFilter drops query parameters on redirect
- [HBASE-15837](#) - Memstore size accounting is wrong if postBatchMutate() throws exception
- [HBASE-15941](#) - HBase repair should not unsplit healthy splitted region
- [HBASE-16350](#) - Undo server abort from HBASE-14968
- [HBASE-16630](#) - Fragmentation in long running Bucket Cache
- [HBASE-16931](#) - Setting cell's seqId to zero in compaction flow might cause RS down.

- [HBASE-16977](#) - VerifyReplication should log a printable representation of the row keys
- [HBASE-17460](#) - enable_table_replication can not perform cyclic replication of a table
- [HBASE-17501](#) - guard against NPE while reading FileTrailer and HFileBlock
- [HBASE-17574](#) - Clean up how to run tests under hbase-spark module
- [HBASE-17673](#) - Monitored RPC Handler not shown in the WebUI
- [HBASE-17688](#) - MultiRowRangeFilter not working correctly if given same start and stop RowKey
- [HBASE-17710](#) - HBase in standalone mode creates directories with 777 permission
- [HBASE-17717](#) - Explicitly use "sasI" ACL scheme for hbase superuser
- [HBASE-17731](#) - Fractional latency reporting in MultiThreadedAction
- [HBASE-17761](#) - Test TestRemoveRegionMetrics.testMoveRegion fails intermittently because of race condition
- [HBASE-17779](#) - disable_table_replication returns misleading message and does not turn off replication
- [HBASE-17798](#) - RpcServer.Listener.Reader can abort due to CancelledKeyException
- [HBASE-17970](#) - Set yarn.app.mapreduce.am.staging-dir when starting MiniMRCluster
- [HBASE-18096](#) - Limit HFileUtil visibility and add missing annotations
- [HIVE-9481](#) - allow column list specification in INSERT statement
- [HIVE-9567](#) - JSON SerDe not escaping special chars when writing char/varchar data
- [HIVE-10329](#) - Hadoop reflectionutils has issues
- [HIVE-11141](#) - Improve RuleRegExp when the Expression node stack gets huge
- [HIVE-11418](#) - Dropping a database in an encryption zone with CASCADE and trash enabled fails
- [HIVE-11428](#) - Performance: Struct IN() clauses are extremely slow
- [HIVE-11671](#) - Optimize RuleRegExp in DPP codepath
- [HIVE-11842](#) - Improve RuleRegExp by caching some internal data structures
- [HIVE-12179](#) - Add option to not add spark-assembly.jar to Hive classpath
- [HIVE-12768](#) - Thread safety: binary sortable serde decimal deserialization
- [HIVE-13390](#) - Partial backport of HIVE-13390. Backported only httpclient 4.5.2 and httpcore 4.4.4 to fix the Apache Hive SSL vulnerability bug.
- [HIVE-14210](#) - ExecDriver should call jobclient.close() to trigger cleanup
- [HIVE-14380](#) - Queries on tables with remote HDFS paths fail in "encryption" checks.
- [HIVE-14564](#) - Column Pruning generates out of order columns in SelectOperator which cause ArrayIndexOutOfBoundsException.
- [HIVE-14819](#) - FunctionInfo for permanent functions shows TEMPORARY FunctionType
- [HIVE-14943](#) - Partial backport of HIVE-14943 - Base Implementation (of [HIVE-10924](#))
- [HIVE-15282](#) - Different modification times are used when an index is built and when its staleness is checked
- [HIVE-15572](#) - Improve the response time for query canceling when it happens during acquiring locks
- [HIVE-15997](#) - Resource leaks when query is cancelled
- [HIVE-16024](#) - MSCK Repair Requires nonstrict hive.mapred.mode
- [HIVE-16156](#) - FileSinkOperator should delete existing output target when renaming
- [HIVE-16175](#) - Possible race condition in InstanceCache
- [HIVE-16297](#) - Improving hive logging configuration variables
- [HIVE-16394](#) - HoS does not support queue name change in middle of session
- [HIVE-16413](#) - Create table as select does not check ownership of the location
- [HIVE-16459](#) - Forward channelInactive to RpcDispatcher
- [HIVE-16593](#) - SparkClientFactory.stop may prevent JVM from exiting
- [HIVE-16646](#) - Alias in transform ... as clause shouldn't be case sensitive
- [HIVE-16660](#) - Not able to add partition for views in hive when sentry is enabled
- [HIVE-16693](#) - beeline "source" command freezes if you have a comment in it?
- [HUE-5659](#) - [home] Ignore history dependencies when importing document from different cluster
- [HUE-5684](#) - [oozie] Remove duplicates in node data for graph and disable graph tab for large workflows
- [HUE-5714](#) - [hive] Close SQL canary query "Select "Hello World""
- [HUE-5742](#) - [core] Allow user to provide schema name for database via ini

- [HUE-5816](#) - Changing default setting as "allowed_hosts=*"
- [HUE-5873](#) - [editor] The download in progress modal doesn't close automatically on IE11
- [HUE-5984](#) - [search] Escaping corrupts link-meta for building external links in grid dashboard
- [HUE-6045](#) - [pig] Progress bar doesn't turn green on completion
- [HUE-6075](#) - [oozie] Remove email body while displaying external graphs in dashboard
- [HUE-6090](#) - Hue to do a keep alive on idle sessions to HiveServer2
- [HUE-6103](#) - [fb] Log filesystem initialization exceptions
- [HUE-6104](#) - [aws] Check if boto configuration section exists before adding it
- [HUE-6109](#) - [core] Remove the restriction on Document2 invalid chars
- [HUE-6115](#) - [core] Document paths have encoding problems
- [HUE-6131](#) - [hive] Select partition values based on the actual datatypes of the partition column
- [HUE-6133](#) - [home] Typing on the search box crashes IE 11
- [HUE-6144](#) - [oozie] Add generic XSL template to workflow graph parserv
- [HUE-6161](#) - [doc2] Move document conversion upgrade into a migration
- [HUE-6193](#) - [converter] Retain last_executed time when creating doc2 object
- [HUE-6197](#) - [impala] Fix XSS Vulnerability in the old editor error messages
- [HUE-6212](#) - [oozie] Prevent XSS injection in coordinator cron frequency field
- [HUE-6228](#) - [core] Disable touchscreen detection on Nicescroll6228
- [HUE-6250](#) - [frontend] Losing # fragment of full URL on login redirect
- [HUE-6261](#) - [oozie] Avoid JS error preventing workflow action status update
- [HUE-6262](#) - [core] Converter should separate history docs from saved docs
- [HUE-6263](#) - [converter] Delete Doc2 object incase of exception
- [HUE-6264](#) - [converter] Decrease memory usage for users with very high document1 objects
- [HUE-6266](#) - [converter] Remove unnecessary call to document link
- [HUE-6295](#) - [doc2] Avoid unrelated DB calls in sync_documents after import
- [HUE-6310](#) - [doc2] Create missing doc1 links for delete and copy operations
- [HUE-6407](#) - [pig] Play button doesn't come back after killing the running pig job
- [HUE-6446](#) - [oozie] User cant edit shared coordinator or bundle
- [HUE-6604](#) - [oozie] Fix timestamp conversion to server timezone
- [IMPALA-3641](#) - Fix catalogd RPC responses to DROP IF EXISTS.
- [IMPALA-4088](#) - Assign fix values to the minicluster server ports
- [IMPALA-4293](#) - query profile should include error log
- [IMPALA-4544](#) - ASAN should ignore SEGV and leaks

- [SENTRY-1512](#) - Refactor the database transaction management Backport Refactor the Sentry database transaction management
- [SENTRY-1476](#) - SentryStore is subject to JDQL injection (Alexander Kolbasov via Vamsee Yarlagadda) Sentry is subject to JDOQL injection
- [SENTRY-1505](#) - CommitContext isn't used by anything and should be removed (CommitContext isn't used by anything and should be removed)
- [SENTRY-1515](#) - Cleanup exception handling in SentryStore
- [SENTRY-1517](#) - SentryStore should actually use function getMSentryRole to get roles
- [SENTRY-1557](#) - getRolesForGroups(), getRoleNamesForGroups() does too many trips to the the DB
- [SENTRY-1594](#) - TransactionBlock should become generic
- [SENTRY-1609](#) - DelegateSentryStore is subject to JDQL injection DelegateSentryStore is subject to JDQL injection
- [SENTRY-1615](#) - SentryStore should not allocate empty objects that are immediately returned
- [SENTRY-1625](#) - PrivilegeOperatePersistence can use QueryParamBuilder Fix [SQL Injection: JDO] in [sentry-provider/sentry-provider-db/src/main/java/org/apache/sentry/provider/db/generic/service/persistent/PrivilegeOperatePersistence.java]
- [SENTRY-1636](#) - Remove thrift dependency on fb303
- [SENTRY-1683](#) - MetastoreCacheInitializer has a race condition in handling results list
- [SENTRY-1714](#) - MetastorePlugin.java should quietly return from renameAuthzObject() when both paths are null
- [SENTRY-1759](#) - UpdatableCache leaks connections

- [SOLR-5776](#) - backportEnabled SSL tests can easily exhaust random generator entropy and block. Set the server side to SHA1PRNG as in Steve's original patch. Use less SSL in a test run. refactor SSLConfig so that SSLTestConfig can provide SSLContexts using a NullSecureRandom to prevent SSL tests from blocking on entropy starved machines Alternate (psuedo random) NullSecureRandom for Constants.SUN_OS replace NullSecureRandom w/ NotSecurePsuedoRandom
- [SOLR-8836](#) - Return 400, and a SolrException when an invalid json is provided to the update handler instead of 500.
- [SOLR-9153](#) - Update Apache commons beanutils version to 1.9.2
- [SOLR-9527](#) - Improve distribution of replicas when restoring a collection
- [SOLR-9836](#) - Add ability to recover from leader when index corruption is detected on SolrCore creation.
- [SOLR-9848](#) - Lower solr.cloud.wait-for-updates-with-stale-state-pause back down from 7 seconds.
- [SOLR-10076](#) - ofHide keystore and truststore passwords from /admin/info/* outputs. - Updated JMXJsonServlet to use new API - Set redaction default true
- [SOLR-10338](#) - backportConfigure SecureRandom non blocking for tests.
- [SOLR-10360](#) - Remove an extra space from Hadoop distcp cmd used by Solr backup/restore
- [SOLR-10430](#) - Add ls command to ZkCLI for listing sub-dirs
- [SPARK-13693](#) - [STREAMING][TESTS] Stop StreamingContext before deleting checkpoint dir
- [SPARK-14930](#) - [SPARK-13693] Fix race condition in CheckpointWriter.stop()
- [SPARK-18922](#) - [SQL][CORE][STREAMING][TESTS] Fix all identified tests failed due to path and resource-not-closed problems on Windows
- [SPARK-19178](#) - [SQL][Backport-to-1.6] convert string of large numbers to int should return null
- [SPARK-19263](#) - DAGScheduler should avoid sending conflicting task set.
- [SPARK-19537](#) - Move pendingPartitions to ShuffleMapStage.
- [SPARK-20922](#) - [CORE][HOTFIX] Don't use Java 8 lambdas in older branches.
- [SPARK-20922](#) - [CORE] Add whitelist of classes that can be deserialized by the launcher.
- [SQOOP-2896](#) - Sqoop exec job fails with SQLException Access denied for user
- [SQOOP-3123](#) - Introduce escaping logic for column mapping parameters (same what Sqoop already uses for the DB column names), thus special column names (e.g. containing '#' character) and mappings related to those columns can be in the same format (thus not confusing the end users), and also eliminates the related AVRO format clashing issues.
- [SQOOP-3140](#) - Removing deprecated mapred.map.max.attempts, mapred.reduce.max.attempts entries and using the new constants directly from Hadoop instead
- [SQOOP-3159](#) - Sqoop (export + --table) with Oracle table_name having '\$' fails with error
- [ZOOKEEPER-2044](#) - Back port to fix CancelledKeyException on ZooKeeper server.

Issues Fixed in CDH 5.10.1

Upstream Issues Fixed

The following upstream issues are fixed in CDH 5.10.1:

- [FLUME-2812](#) - Fix semaphore leak causing java.lang.Error: Maximum permit count exceeded in MemoryChannel.
- [FLUME-2889](#) - Fixes to DateTime computations.
- [FLUME-2889](#) - Fixes to DateTime computations.
- [FLUME-2999](#) - Kafka channel and sink should enable statically assigned partition per event via header.
- [FLUME-3027](#) - Change Kafka Channel to clear offsets map after commit.
- [FLUME-3049](#) - Make HDFS sink rotate more reliably in secure mode.
- [HADOOP-11619](#) - FTPFileSystem should override getDefaultPort.
- [HADOOP-12655](#) - TestHttpServer.testBindAddress bind port range is wider than expected.
- [HADOOP-13433](#) - Race in UGI.reloginFromKeytab.
- [HADOOP-13627](#) - Have an explicit KerberosAuthException for UGI to throw, text from public constants.
- [HADOOP-13805](#) - UGI.getCurrentUser() fails if user does not have a keytab associated.
- [HADOOP-13903](#) - Improvements to KMS logging to help debug authorization errors.
- [HADOOP-13911](#) - Remove TRUSTSTORE_PASSWORD related scripts from KMS.

- [HADOOP-13953](#) - Make FTPFileSystem's data connection mode and transfer mode configurable.
- [HADOOP-14003](#) - Make additional KMS tomcat settings configurable.
- [HADOOP-14114](#) - S3A can no longer handle unencoded + in URIs.
- [HDFS-11160](#) - VolumeScanner reports write-in-progress replicas as corrupt incorrectly.
- [HDFS-11275](#) - Check groupEntryIndex and throw a helpful exception on failures when removing ACL.
- [HDFS-11292](#) - log lastWrittenTxId etc info in logSyncAll.
- [HDFS-11306](#) - Print remaining edit logs from buffer if edit log can't be rolled.
- [HDFS-11363](#) - Need more diagnosis info when seeing Slow waitForAckedSeqno.
- [HDFS-11379](#) - DFSInputStream may infinite loop requesting block locations.
- [MAPREDUCE-5155](#) - Race condition in test case TestFetchFailure cause it to fail.
- [MAPREDUCE-6172](#) - TestDbClasses timeouts are too aggressive.
- [MAPREDUCE-6571](#) - JobEndNotification info logs are missing in AM container syslog.
- [MAPREDUCE-6817](#) - The format of job start time in JHS is different from those of submit and finish time.
- [YARN-2306](#) - Add test for leakage of reservation metrics in fair scheduler.
- [YARN-2336](#) - Fair scheduler's REST API returns a missing '[' bracket JSON for deep queue tree.
- [YARN-3269](#) - Yarn.nodemanager.remote-app-log-dir could not be configured to fully qualified path.
- [YARN-3933](#) - FairScheduler: Multiple calls to completedContainer are not safe.
- [YARN-3957](#) - FairScheduler NPE In FairSchedulerQueueInfo causing scheduler page to return 500.
- [YARN-4363](#) - In TestFairScheduler, testcase should not create FairScheduler redundantly.
- [YARN-4544](#) - All the log messages about rolling monitoring interval are shown with WARN level.
- [YARN-4555](#) - TestDefaultContainerExecutor#testContainerLaunchError fails on non-english locale environment.
- [YARN-5136](#) - Error in handling event type APP_ATTEMPT_REMOVED to the scheduler.
- [YARN-5308](#) - FairScheduler: Move continuous scheduling related tests to TestContinuousScheduling.
- [YARN-5752](#) - TestLocalResourcesTrackerImpl#testLocalResourceCache times out.
- [YARN-5859](#) - TestResourceLocalizationService#testParallelDownloadAttemptsForPublicResource sometimes fails.
- [YARN-5890](#) - FairScheduler should log information about AM-resource-usage and max-AM-share for queues.
- [YARN-5920](#) - Fix deadlock in TestRMHA.testTransitionedToStandbyShouldNotHang,
- [YARN-6151](#) - FS preemption does not consider child queues over fairshare if the parent is under.
- [YARN-6175](#) - FairScheduler: Negative vcore for resource needed to preempt.
- [HBASE-12949](#) - Scanner can be stuck in infinite loop if the HFile is corrupted.
- [HBASE-15125](#) - BackportHBaseFsck's adoptHdfsOrphan function creates region with wrong end key boundary.
- [HBASE-15328](#) - sanity check the redirect used to send master info requests to the embedded regionserver.
- [HBASE-15378](#) - Scanner cannot handle heartbeat message with no results.
- [HBASE-15587](#) - FSTableDescriptors.getDescriptor() logs stack trace erroneously.
- [HBASE-15931](#) - Add log for long-running tasks in AsyncProcess HBASE-16289 AsyncProcess stuck messages need to print region/server.
- [HBASE-15955](#) - Disable action in CatalogJanitor#setEnabled should wait for active cleanup scan to finish.
- [HBASE-16032](#) - Possible memory leak in StoreScanner.
- [HBASE-16062](#) - Improper error handling in WAL Reader/Writer creation.
- [HBASE-16237](#) - Blocks for hbase:meta table are not cached in L1 cache.
- [HBASE-16238](#) - It's useless to catch SESSIONEXPIRED exception and retry in RecoverableZooKeeper.
- [HBASE-16266](#) - Do not throw ScannerTimeoutException when catch UnknownScannerException.
- [HBASE-16304](#) - HRegion#RegionScannerImpl#handleFileNotFoundException may lead to deadlock when trying to obtain write lock on updatesLock.
- [HBASE-16429](#) - FSHLog: deadlock if rollWriter called when ring buffer filled with appends.
- [HBASE-16460](#) - Can't rebuild the BucketAllocator's data structures when BucketCache uses FileIOEngine.
- [HBASE-16604](#) - Scanner retries on IOException can cause the scans to miss data.
- [HBASE-16649](#) - Truncate table with splits preserved can cause both data loss and truncated data appeared again.
- [HBASE-16662](#) - Fix open POODLE vulnerabilities.
- [HBASE-16721](#) - Concurrency issue in WAL unflushed seqId tracking.

- [HBASE-16807](#) - RegionServer will fail to report new active Hmaster until HMaster/RegionServer failover.
- [HBASE-16841](#) - Data loss in MOB files after cloning a snapshot and deleting that snapshot.
- [HBASE-16960](#) - RegionServer hang when aborting.
- [HBASE-17020](#) - keylen in midkey() dont computed correctly.
- [HBASE-17023](#) - Region left unassigned due to AM and SSH each thinking others would do the assignment work.
- [HBASE-17044](#) - Fix merge failed before creating merged region leaves meta inconsistent.
- [HBASE-17069](#) - RegionServer writes invalid META entries for split daughters in some circumstances.
- [HBASE-17206](#) - FSHLog may roll a new writer successfully with unflushed entries.
- [HBASE-17241](#) - Avoid compacting already compacted mob files with _del files.
- [HBASE-17265](#) - Region left unassigned in master failover when region failed to open.
- [HBASE-17275](#) - Assign timeout may cause region to be unassigned forever.
- [HBASE-17328](#) - Properly dispose of looped replication peers.
- [HBASE-17381](#) - ReplicationSourceWorkerThread can die due to unhandled exceptions.
- [HBASE-17409](#) - Limit jsonp callback name to prevent xss.
- [HBASE-17452](#) - Failed taking snapshot - region Manifest proto-message too large.
- [HBASE-17522](#) - Handle JVM throwing runtime exceptions when we ask for details on heap usage the same as a correctly returned 'undefined'.
- [HBASE-17558](#) - ZK dumping jsp should escape HTML.
- [HBASE-17561](#) - table status page should escape values that may contain arbitrary characters.
- [HBASE-17675](#) - ReplicationEndpoint should choose new sinks if a SaslException occurs.
- [HIVE-7723](#) - Explain plan for complex query with lots of partitions is slow due to in-efficient collection used to find a matching ReadEntity.
- [HIVE-11594](#) - Analyze Table for column names with embedded spaces.
- [HIVE-11849](#) - NPE in HiveHBaseTableShapshotInputFormat in query with just count(*).
- [HIVE-12349](#) - part of the patch which solves IS NULL queries can trigger NPE for timestamp and date columns.
- [HIVE-12465](#) - Hive might produce wrong results when (outer) joins are merged.
- [HIVE-12780](#) - Fix the output of the history command in Beeline HIVE-12789: Fix output twice in the history command of Beeline.
- [HIVE-12976](#) - MetaStoreDirectSql doesn't batch IN lists in all cases.
- [HIVE-13149](#) - Remove some unnecessary HMS connections from HS2.
- [HIVE-13240](#) - GroupByOperator: Drop the hash aggregates when closing operator.
- [HIVE-13864](#) - Beeline ignores the command that follows a semicolon and comment.
- [HIVE-13866](#) - flatten callstack for directSQL errors.
- [HIVE-13895](#) - HoS start-up overhead in yarn-client mode.
- [HIVE-14693](#) - Some partitions will be left out when partition number is the multiple of the option hive.msck.repair.batch.size.
- [HIVE-14764](#) - Enabling "hive.metastore.metrics.enabled" throws OOM in HiveMetastore.
- [HIVE-14820](#) - RPC server for spark inside HS2 is not getting server address properly.
- [HIVE-15338](#) - Wrong result from non-vectorized DATEDIFF with scalar parameter of type DATE/TIMESTAMP.
- [HIVE-15346](#) - "values temp table" should not be an input.
- [HIVE-15359](#) - skip.footer.line.count doesnt work properly for certain situations.
- [HIVE-15410](#) - WebHCat supports get/set table property with its name containing period and hyphen.
- [HIVE-15485](#) - Addendum toInvestigate the DoAs failure in HoS.
- [HIVE-15485](#) - Investigate the DoAs failure in HoS.
- [HIVE-15517](#) - NOT (x <=> y) returns NULL if x or y is NULL.
- [HIVE-15551](#) - memory leak in directsql for mysql+bonecp specific initialization.
- [HIVE-15735](#) - In some cases, view objects inside a view do not have parents.
- [HIVE-15782](#) - query on parquet table returns incorrect result when hive.optimize.index.filter is set to true.
- [HIVE-15872](#) - The PERCENTILE_APPROX UDAF does not work with empty set.
- [HIVE-16019](#) - Query fails when group by/order by on same column with uppercase name.

- [HIVE-16047](#) - Shouldn't try to get KeyProvider unless encryption is enabled.
- [HUE-4969](#) - [core] Rename ini properties for sasl buffer to be standard.
- [HUE-5310](#) - [search] Use Doc2 modal in search_controller.
- [HUE-5408](#) - [oozie] Support old docs while saving shared workflow.
- [HUE-5476](#) - [core] Fix TTL is_idle middleware check.
- [HUE-5482](#) - [home] Handle multiple home/trash directories by merging them into one.
- [HUE-5533](#) - [home] Improve home page load time
- [HUE-5552](#) - [editor] Japanese improvement for new SQL Editor #466
- [HUE-5602](#) - [job] Add start time filter in jobs page
- [HUE-5604](#) - [core] Update localization for de, es, fr, ja, ko, zh
- [HUE-5670](#) - [doc2] Prevent exception when doc2 object is not linked to doc1
- [HUE-5717](#) - [backend] Some operating system incorrectly detect javascript mime-type as text/x-js instead of application/javascript
- [HUE-5722](#) - [core] Avoid query redaction when string is None
- [HUE-5742](#) - [core] Allow user to provide schema name for database via ini
- [HUE-5756](#) - [doc2] Workaround for improving the query history search time
- [HUE-5758](#) - [oozie] Fix parsing nodes from XML definition
- [HUE-5769](#) - [oozie] Remove mandatory inclusion of Kill row in the workflow dashboard graph
- [HUE-5823](#) - [editor] Cancel running doc search requests when the query has changed
- [HUE-5850](#) - [sentry] Prevent creating roles with empty names
- [HUE-5958](#) - [pig] Fix unicode errors when handling exceptions
- [HUE-5962](#) - [hiveserver2] Update HiveServerClient user object when opening session
- [IMPALA-2605](#) - Omit the sort and mini stress tests.
- [IMPALA-4055](#) - Speed up to_date() with custom implementation.
- [IMPALA-4263](#) - Fix wrong omission of agg/analytic hash exchanges.
- [IMPALA-4282](#) - Remove max length check for type strings.
- [IMPALA-4449](#) - Revisit table locking pattern in the catalog.
- [IMPALA-4675](#) - Case-insensitive matching of Parquet fields.
- [IMPALA-4702](#) - Fix command line help for webserver_private_key_file.
- [IMPALA-4705](#), [IMPALA-4779](#), [IMPALA-4780](#) - Fix some Expr bugs with codegen.
- [IMPALA-4742](#) - Change "{}".format() to "{0}".format() for Py 2.6.
- [IMPALA-4749](#) - hit DCHECK in sorter with scratch limit.
- [IMPALA-4767](#) - Workaround for HIVE-15653 to preserve table stats.
- [IMPALA-4808](#) - old hash join can reference invalid memory.
- [IMPALA-4828](#) - Alter Kudu schema outside Impala may crash on read.
- [IMPALA-4854](#) - Fix incremental stats with complex types.
- [IMPALA-4916](#) - Fix maintenance of set of item sets in DisjointSet.
- [IMPALA-4981](#) - Re-enable spilling with MT_DOP.
- [IMPALA-4995](#) - Fix integer overflow in TopNNode::PrepareForOutput.
- [IMPALA-4997](#) - Fix overflows in Sorter::TupleIterator.
- [OOZIE-2243](#) - Kill Command does not kill the child job for java action.
- [OOZIE-2519](#) - Oozie HA with SSL info is slightly incorrect.
- [OOZIE-2584](#) - Eliminate Thread.sleep() calls in TestMemoryLocks.
- [OOZIE-2742](#) - Unable to kill applications based on tag.
- [OOZIE-2748](#) - NPE in LauncherMapper.printArgs().
- [OOZIE-2757](#) - Malformed xml is Spark action doc page.
- [OOZIE-2777](#) - Config-default.xml longer than 64k results in java.io.UTFDataFormatException.
- [OOZIE-2787](#) - Oozie distributes application jar twice making the spark job fail.
- [OOZIE-2802](#) - Spark action failure on Spark 2.1.0 due to duplicate sharelibs.
- [SENTRY-1508](#) - MetastorePlugin.java does not handle properly initialization failure.

- [SENTRY-1520](#) - Provide mechanism for triggering HMS full snapshot.
- [SENTRY-1564](#) - Improve error detection and reporting in MetastoreCacheInitializer.java.
- [SENTRY-1605](#) - 'SENTRY-1508 need to be fixed because of Kerberos initialization issue.
- [SOLR-9284](#) - The HDFS BlockDirectoryCache should not let its keysToRelease or names maps grow indefinitely.
- [SOLR-9330](#) - Fix AlreadyClosedException on admin/mbeans?stats=true.
- [SOLR-9699](#), [SOLR-4668](#) - fix exception from core status in parallel with core reload.
- [SOLR-9819](#) - Upgrade Apache commons-fileupload to 1.3.2, fixing a security vulnerability.
- [SOLR-9859](#) - backport of replication.properties cannot be updated after being written and neither replication.properties or index.properties are durable in the face of a crash. Don't log error on NoSuchFileException.
- [SOLR-9901](#) - backport of, SOLR-9899Implement move in HdfsDirectoryFactory. SOLR-9899: StandardDirectoryFactory should use optimizations for all FilterDirectorys not just NRTCachingDirectory.
- [SOLR-10031](#) - Validation of filename params in ReplicationHandler.
- [SOLR-10114](#), [SOLR-9941](#) - Reordered delete-by-query can delete or omit child documents
- [SOLR-10119](#) - TestReplicationHandler assertion fixes part of.
- [SOLR-10121](#), [SOLR-10116](#) - BlockCache corruption with high concurrency.
- [SPARK-12241](#) - [YARN] Improve failure reporting in Yarn client obtainTokenForHBase().
- [SPARK-12523](#) - [YARN] Support long-running of the Spark On HBase and hive meta store.
- [SPARK-18750](#) - [YARN] Follow up: move test to correct directory in 2.1 branch.
- [SPARK-18750](#) - [YARN] Avoid using "mapValues" when allocating containers.
- [SQOOP-2349](#) - Add command line option for setting transaction isolation levels for metadata queries.
- [SQOOP-2896](#) - Sqoop exec job fails with SQLException Access denied for user.
- [SQOOP-2909](#) - Oracle related ImportTest fails after SQOOP-2737.
- [SQOOP-2911](#) - Fix failing HCatalogExportTest caused by SQOOP-2863.
- [SQOOP-2950](#) - Sqoop trunk has consistent UT failures - need fixing.
- [SQOOP-3053](#) - Create a cmd line argument for sqoop.throwOnError and use it through SqoopOptions.
- [SQOOP-3055](#) - Fixing MySQL tests failing due to ignored test inputs/configuration.
- [SQOOP-3057](#) - Fixing 3rd party Oracle tests failing due to invalid case of column names.
- [SQOOP-3068](#) - Enhance error (tool.ImportTool: Encountered IOException running import job: java.io.IOException: Expected schema) to suggest workaround.
- [SQOOP-3071](#) - Fix OracleManager to apply localTimeZone correctly in case of Date objects too
- [SQOOP-3072](#) - Reenable escaping in ImportTest#testProductWithWhiteSpaceImport for proper execution.
- [SQOOP-3081](#) - use OracleEscapeUtils.escapeIdentifier in OracleUpsertOutputFormat instead of inline appending quotes.
- [SQOOP-3124](#) - Fix ordering in column list query of PostgreSQL connector to reflect the logical order instead of adhoc ordering.

Issues Fixed in CDH 5.10.0

CDH 5.10.0 fixes the following issues.

Apache Hadoop Common

Have Hadoop use commons-daemon version from root pom

Apache Commons Daemon 1.0.3 has been removed in favor of Apache Commons Daemon 1.0.13.

Apache HBase

HBase shell commands correctly return missing namespace name

In prior releases, passing a non-existent namespace with GRANT and REVOKE commands to the HBase shell returned an error message displaying the user name, rather than the name of the namespace. In this release, the error message correctly displays the missing namespace name. This change is a result of an underlying change to the error handling for the HBase shell; specifically, the boolean `namespace_exists?` method now returns `false` when the namespace is not found, rather than the `NamespaceNotFoundException`.

Apache HDFS

fsck should also report decommissioning replicas**Bug:** [HDFS-7933](#)**Cloudera Bug:** CDH-47416

The output of HDFS fsck now also contains information about decommissioning replicas.

du reports false used space after appending to snapshoted files and deleting them**Bug:** [HDFS-7933](#)**Cloudera Bug:** CDH-40502

Disk usage summaries previously incorrectly counted files twice if they had been renamed (including files moved to Trash) since the last snapshot. Summaries now include current data plus snapshot data that is no longer under the directory either due to deletion or being moved outside of the directory.

Fixed in Versions: 5.10, 5.10, 5.11.0***ACL inheritance conflicts with umaskmode*****Bug:** [HDFS-6962](#)**Cloudera Bug:** CDH-26136

Previously, HDFS ACLs applied the client `umask` to the permissions when inheriting default ACLs from the parent directory. This differs from the POSIX ACL specification. HDFS can now ignore the client `umask` to comply with the POSIX ACL specification.

Because this is a [backward-incompatible](#) change, this behavior is disabled by default. To enable it, set `dfs.namenode.posix.acl.inheritance.enabled` to `true` in `hdfs-site.xml`.

Hue

Security and Administration

- [HUE-4541](#), CDH-44287 - Support Kerberos mutual authentication across HUE
- [HUE-4969](#), CDH-34544 - Support HiveServer2 + SASL (`hive.server2.thrift.sasl.qop="auth-conf"`)
- [HUE-4372](#), CDH-42194 - Turn off HSTS header in Hue Load Balancer (server only)
- [HUE-3079](#), CDH-41093 - Display YARN jobs and logs from JHS when not in RM
- **Cloudera Bug:** OPSAPS-34608 - Support Oracle DB connectivity for CDH package installations

SQL Editor and General UX

- [HUE-5070](#), CDH-40886 - Stabilize Import documents
- [HUE-4032](#), CDH-44094 - Improve Sample Popup performance
- [HUE-4073](#) - Optimize SQL Assist rendering for large scrolls
- [HUE-4039](#) - Refine Autocompleter results
- [HUE-4726](#), CDH-35007 - Improve viewing Parquet formatted data

Apache Oozie

After enabling HA, Oozie may fail to start due to "NoSuchFieldError: EXTERNAL_PROPERTY"**Bug:** [HIVE-1640](#)**Cloudera Bug:** CDH-42408

This issue happens in rare cases. Due to an incompatibility with the version of Jackson used by Oozie and Hive, and depending on the order that jars are loaded into Oozie's classpath, Oozie may fail to start.

Upstream Issues Fixed

The following upstream issues are fixed in CDH 5.10.0:

- [AVRO-1584](#) - Java: Escape characters not allowed in JSON in toString

- [AVRO-1642](#) - Java: Do not generate invalid all-args constructor
- [AVRO-1684](#) - Add time types to the specific compiler
- [AVRO-1799](#) - Fix GenericRecord#toString ByteBuffer bug
- [AVRO-1847](#) - IDL compiler should use BigDecimal to represent decimal logical type
- [AVRO-1869](#) - Java: Fix Decimal conversion from ByteBuffer
- [AVRO-1877](#) - Restore correct javaUnbox in Specific Compiler
- [AVRO-1895](#) - Fix deepCopy() to get correct logical type conversion
- [AVRO-1895](#) - Java: Fix GenericData#deepCopy() to support logical types
- [CRUNCH-616](#) - Replace (possibly copyrighted) Maugham text with Dickens
- [FLUME-2171](#) - Add Interceptor to remove headers from event
- [FLUME-3025](#) - Expose FileChannel.open on JMX
- [FLUME-3031](#) - Change sequence source to reset its counter for event body on channel exception
- [HADOOP-3733](#) - "s3x:" URLs break when Secret Key contains a slash, even if encoded
- [HADOOP-7930](#) - Kerberos relogin interval in UserGroupInformation should be configurable
- [HADOOP-10062](#) - Race condition in MetricsSystemImpl#publishMetricsNow that causes incorrect results
- [HADOOP-11381](#) - Fix findbugs warnings in hadoop-distcp, hadoop-aws, hadoop-azure, and hadoop-openstack
- [HADOOP-11412](#) - POMs mention "The Apache Software License" rather than "Apache License"
- [HADOOP-11520](#) - Clean incomplete multi-part uploads in S3A tests
- [HADOOP-11720](#) - [JDK8] Fix javadoc errors caused by incorrect or illegal tags in hadoop-tools
- [HADOOP-11780](#) - Prevent IPC reader thread death
- [HADOOP-11922](#) - Misspelling of threshold in log4j.properties for tests in hadoop-tools
- [HADOOP-12169](#) - ListStatus on empty dir in S3A lists itself instead of returning an empty list
- [HADOOP-12169](#) - ListStatus on empty dir in S3A lists itself instead of returning an empty list
- [HADOOP-12292](#) - Make use of DeleteObjects optional
- [HADOOP-12325](#) - RPC Metrics : Add the ability track and log slow RPCs
- [HADOOP-12444](#) - Support lazy seek in S3AInputStream
- [HADOOP-12597](#) - In kms-site.xml configuration hadoop.security.keystore.JavaKeyStoreProvider.password should be updated with new name
- [HADOOP-12696](#) - Add tests for S3FileSystem Contract
- [HADOOP-12801](#) - Suppress obsolete S3FileSystem tests
- [HADOOP-12807](#) - S3AFileSystem should read AWS credentials from environment variables
- [HADOOP-12846](#) - Credential Provider Recursive Dependencies
- [HADOOP-12851](#) - S3AFileSystem Uptake of ProviderUtils.excludeIncompatibleCredentialProviders
- [HADOOP-12891](#) - S3AFileSystem should configure Multipart Copy threshold and chunk size
- [HADOOP-12994](#) - Specify PositionedReadable, add contract tests, fix problems
- [HADOOP-13028](#) - Add low level counter metrics for S3A; use in read performance tests
- [HADOOP-13056](#) - Print expected values when rejecting a server's determined principal
- [HADOOP-13065](#) - Add a new interface for retrieving FS and FC Statistics
- [HADOOP-13113](#) - Enable parallel test execution for hadoop-aws
- [HADOOP-13116](#) - Jets3tNativeS3FileSystemContractTest does not run
- [HADOOP-13122](#) - Customize User-Agent header sent in HTTP requests by S3A
- [HADOOP-13130](#) - s3a failures can surface as RTEs, not IOEs
- [HADOOP-13131](#) - Add tests to verify that S3A supports SSE-S3 encryption
- [HADOOP-13139](#) - Branch-2: S3a to use thread pool that blocks clients
- [HADOOP-13145](#) - In DistCp, prevent unnecessary getFileStatus call when not preserving metadata
- [HADOOP-13158](#) - S3AFileSystem#toString might throw NullPointerException due to null cannedACL
- [HADOOP-13162](#) - Consider reducing number of getFileStatus calls in S3AFileSystem.mkdirs
- [HADOOP-13171](#) - Add StorageStatistics to S3A; instrument some more operations
- [HADOOP-13183](#) - S3A proxy tests fail after httpClient/httpcore upgrade
- [HADOOP-13188](#) - S3A file-create should throw error rather than overwrite directories

- [HADOOP-13201](#) - Print the directory paths when ViewFs denies the rename operation on internal dirs
- [HADOOP-13203](#) - S3A: Support fadvise "random" mode for high performance readPositioned() reads
- [HADOOP-13208](#) - S3A listFiles(recursive=true) to do a bulk listObjects instead of walking the pseudo-tree of directories
- [HADOOP-13212](#) - Provide an option to set the socket buffers in S3AFileSystem
- [HADOOP-13237](#) - s3a initialization against public bucket fails if caller lacks any credentials
- [HADOOP-13239](#) - Deprecate s3:// in branch-2
- [HADOOP-13241](#) - Document s3a better
- [HADOOP-13252](#) - Tune S3A provider plugin mechanism
- [HADOOP-13280](#) - FileSystemStorageStatistics#getLong("readOps") should return readOps + largeReadOps
- [HADOOP-13283](#) - Support reset operation for new global storage statistics and per FS storage stats
- [HADOOP-13284](#) - FileSystemStorageStatistics must not attempt to read non-existent rack-aware read stats in branch-2.8
- [HADOOP-13287](#) - TestS3ACredentials#testInstantiateFromURL fails if AWS secret key contains +
- [HADOOP-13288](#) - Guard null stats key in FileSystemStorageStatistics
- [HADOOP-13291](#) - Probing stats in DFSOpsCountStatistics/S3AStorageStatistics should be correctly implemented
- [HADOOP-13305](#) - Define common statistics names across schemes
- [HADOOP-13324](#) - s3a tests don't authenticate with S3 frankfurt (or other V4 auth only endpoints)
- [HADOOP-13368](#) - DFSOpsCountStatistics\$OpType#fromSymbol and s3a.Statistic#fromSymbol should be O(1) operation
- [HADOOP-13387](#) - Users always get told off for using S3 —even when not using it
- [HADOOP-13389](#) - TestS3ATemporaryCredentials.testSTS error when using IAM credentials
- [HADOOP-13396](#) - Allow pluggable audit loggers in KMS
- [HADOOP-13405](#) - Doc for fs.s3a.acl.default indicates incorrect values
- [HADOOP-13406](#) - S3AFileSystem: Consider reusing filestatus in delete() and mkdirs()
- [HADOOP-13442](#) - Optimize UGI group lookups
- [HADOOP-13447](#) - Refactor S3AFileSystem to support introduction of separate metadata repository and tests
- [HADOOP-13512](#) - ReloadingX509TrustManager should keep reloading in case of exception.
- [HADOOP-13541](#) - Explicitly declare the Joda time version S3A depends on
- [HADOOP-13590](#) - Retry until TGT expires even if the UGI renewal thread encountered exception
- [HADOOP-13601](#) - Fix a log message typo in AbstractDelegationTokenSecretManager
- [HADOOP-13641](#) - Update UGI#spawnAutoRenewalThreadForUserCreds to reduce indentation
- [HADOOP-13684](#) - Snappy may complain Hadoop is built without snappy if libhadoop is not found
- [HADOOP-13698](#) - Document caveat for KeyShell when underlying KeyProvider does not delete a key
- [HADOOP-13838](#) - KMSTokenRenewer should close providers
- [HADOOP-13864](#) - KMS should not require truststore password
- [HDFS-742](#) - A down DataNode makes Balancer to hang on repeatedly asking NameNode its partial block list
- [HDFS-2390](#) - dfsadmin -setBalancerBandwidth does not validate -ve value
- [HDFS-4396](#) - Add START_MSG/SHUTDOWN_MSG for ZKFC
- [HDFS-6565](#) - Use jackson instead jetty json in hdfs-client
- [HDFS-7224](#) - Allow reuse of NN connections via webhdfs
- [HDFS-7384](#) - getfacl command and getAclStatus output should be in sync
- [HDFS-7411](#) - Change decommission logic to throttle by blocks rather than nodes in each interval
- [HDFS-7537](#) - Add "UNDER MIN REPL'D BLOCKS" count to fsck
- [HDFS-7933](#) - fsck should also report decommissioning replicas
- [HDFS-8037](#) - CheckAccess in WebHDFS silently accepts malformed FsActions parameters
- [HDFS-8039](#) - Fix TestDebugAdmin#testRecoverLease and testVerfiyBlockChecksumCommand on Windows
- [HDFS-8405](#) - Fix a typo in NamenodeFsck
- [HDFS-8542](#) - WebHDFS getHomeDirectory behavior does not match specification
- [HDFS-8721](#) - Add a metric for number of encryption zones

- [HDFS-8826](#) - In Balancer, add an option to specify the source node list so that balancer only selects blocks to move from those nodes
- [HDFS-8923](#) - Add -source flag to balancer usage message
- [HDFS-8986](#) - Add option to -du to calculate directory space usage excluding snapshots
- [HDFS-9005](#) - Provide support for upgrade domain script
- [HDFS-9019](#) - Adding informative message to sticky bit permission denied exception
- [HDFS-9063](#) - Correctly handle snapshot path for getContentSummary
- [HDFS-9214](#) - Add missing license header
- [HDFS-9214](#) - Support reconfiguring dfs.datanode.balance.max.concurrent.moves without DN restart
- [HDFS-9223](#) - Code cleanup for DatanodeDescriptor and HeartbeatManager
- [HDFS-9257](#) - Improve error message for "Absolute path required" in INode.java to contain the rejected path
- [HDFS-9279](#) - Decommissioned capacity should not be considered for configured/used capacity
- [HDFS-9389](#) - Add maintenance states to AdminStates
- [HDFS-9392](#) - Admins support for maintenance state
- [HDFS-9444](#) - Add utility to find set of available ephemeral ports to ServerSocketUtil
- [HDFS-9500](#) - Fix software version counts for DataNodes during rolling upgrade
- [HDFS-9724](#) - Degraded performance in WebHDFS listing as it does not reuse ObjectMapper
- [HDFS-9745](#) - TestSecureNNWithQJM#testSecureMode sometimes fails with timeouts
- [HDFS-9790](#) - HDFS Balancer should exit with a proper message if upgrade is not finalized
- [HDFS-9839](#) - Reduce verbosity of processReport logging
- [HDFS-9885](#) - Correct the distcp counters name while displaying counters
- [HDFS-9926](#) - MiniDFSCluster leaks dependency Mockito via DataNodeTestUtils
- [HDFS-9934](#) - ReverseXML oiv processor should bail out if the XML file's layoutVersion doesn't match oiv's
- [HDFS-9951](#) - Use string constants for XML tags in OfflinelImageReconstructor
- [HDFS-10276](#) - HDFS should not expose path info that user has no permission to see
- [HDFS-10277](#) - PositionedReadable test testReadFullyZeroByteFile failing in HDFS
- [HDFS-10291](#) - TestShortCircuitLocalRead failing
- [HDFS-10415](#) - TestDistributedFileSystem#MyDistributedFileSystem attempts to set up statistics before initialize() is called
- [HDFS-10423](#) - Increase default value of httpfs maxHTTPHeaderSize
- [HDFS-10505](#) - OIV's ReverseXML processor should support ACLs
- [HDFS-10549](#) - Correctly revoke file leases when closing files
- [HDFS-10553](#) - DiskBalancer: Rename Tools/DiskBalancer class to Tools/DiskBalancerCLI
- [HDFS-10599](#) - DiskBalancer: Execute CLI via Shell
- [HDFS-10627](#) - Volume Scanner marks a block as "suspect" even if the exception is network-related
- [HDFS-10628](#) - Log HDFS Balancer exit message to its own log
- [HDFS-10655](#) - Fix path related byte array conversion bugs
- [HDFS-10656](#) - Optimize conversion of byte arrays back to path string
- [HDFS-10674](#) - Optimize creating a full path from an inode
- [HDFS-10694](#) - processReport() should print blockReportId in each log message
- [HDFS-10738](#) - MR1Fix TestRefreshUserMappings.testRefreshSuperUserGroupsConfiguration test failure
- [HDFS-10747](#) - o.a.h.hdfs.tools.DebugAdmin usage message is misleading
- [HDFS-10756](#) - Expose getTrashRoot to HTTPFS and WebHDFS
- [HDFS-10763](#) - Open files can leak permanently due to inconsistent lease update
- [HDFS-10784](#) - Implement WebHdfsFileSystem#listStatusIterator
- [HDFS-10797](#) - Disk usage summary of snapshots causes renamed blocks to get counted twice
- [HDFS-10807](#) - Doc about upgrading to a version of HDFS with snapshots may be confusing
- [HDFS-10809](#) - getNumEncryptionZones causes NPE in branch-2.7
- [HDFS-10823](#) - Implement HttpFSFileSystem#listStatusIterator
- [HDFS-10832](#) - Propagate ACL bit and isEncrypted bit in HttpFS FileStatus permissions

- [HDFS-10837](#) - Standardize serialization of WebHDFS DirectoryListing
- [HDFS-10870](#) - Wrong dfs.namenode.acls.enabled default in HdfsPermissionsGuide.appt.vm
- [HDFS-10875](#) - Optimize du -x to cache intermediate result
- [HDFS-10876](#) - Dispatcher#dispatch should log IOException stacktrace
- [HDFS-10878](#) - TestDFSClientRetries#testIdempotentAllocateBlockAndClose throws ConcurrentModificationException
- [HDFS-10883](#) - `getTrashRoot`'s behavior is not consistent in DFS after enabling EZ
- [HDFS-10915](#) - Fix time measurement bug in TestDatanodeRestart
- [HDFS-10918](#) - Add a tool to get FileEncryptionInfo from CLI
- [HDFS-10960](#) - TestDataNodeHotSwapVolumes#testRemoveVolumeBeingWritten fails at disk error verification after volume remove
- [HDFS-11009](#) - Add a tool to reconstruct block meta file from CLI
- [HDFS-11015](#) - Enforce timeout in balancer
- [HDFS-11053](#) - Unnecessary superuser check in versionRequest()
- [HDFS-11069](#) - Tighten the authorization of datanode RPC
- [HDFS-11080](#) - Update HttpFS to use ConfigRedactor
- [HDFS-11120](#) - TestEncryptionZones should waitActive
- [HDFS-11229](#) - HDFS-11056 failed to close meta file
- [MAPREDUCE-6497](#) - Fix wrong value of JOB_FINISHED event in JobHistoryEventHandler
- [MAPREDUCE-6541](#) - Exclude scheduled reducer memory when calculating available mapper slots from headroom to avoid deadlock
- [MAPREDUCE-6579](#) - JobStatus#getFailureInfo should not output diagnostic information when the job is running
- [MAPREDUCE-6740](#) - Enforce mapreduce.task.timeout to be at least mapreduce.task.progress-report.interval
- [MAPREDUCE-6750](#) - Fix TestHSAdminServer#testRefreshSuperUserGroups
- [MAPREDUCE-6763](#) - Shuffle server listen queue is too small
- [MAPREDUCE-6764](#) - Teragen LOG initialization bug
- [MAPREDUCE-6765](#) - MR should not schedule container requests in cases where reducer or mapper containers demand resource larger than the maximum supported
- [MAPREDUCE-6776](#) - yarn.app.mapreduce.client.job.max-retries should have a more useful default
- [MAPREDUCE-6789](#) - Fix TestAMWebApp failure
- [YARN-2246](#) - Made the proxy tracking URL always be http(s)://proxy addr:port/proxy/<appld> to avoid duplicate sections
- [YARN-2913](#) - DOCS. Fair scheduler should have ability to set MaxResourceDefault for each queue
- [YARN-2980](#) - Move health check script related functionality to hadoop-common
- [YARN-3094](#) - Reset timer for liveness monitors after RM recovery
- [YARN-3223](#) - Resource update during NM graceful decommission
- [YARN-3239](#) - WebAppProxy does not support a final tracking url which has query fragments and params
- [YARN-3375](#) - NodeHealthScriptRunner.shouldRun() check is performing 3 times for starting NodeHealthScriptRunner
