## The Embedded Container Service (ECS)

Cloudera Manager provides tools for managing and monitoring the CDP Private Cloud Embedded Container Service.

The Embedded Container Service (ECS) service enables you to run CDP Private Cloud Data Services by creating container-based clusters in your data center. In addition to the option to use OpenShift, which requires that you deploy and manage the Kubernetes infrastructure, you can also deploy a Embedded Container Service cluster, which creates and manages an embedded Kubernetes infrastructure for use with CDP Private Cloud Data Services. Installing, configuring, and managing OpenShift is not required. You only need to provide hosts on which to install the service and Cloudera Manager sets up the Embedded Container Service cluster and also provides management and monitoring of the cluster.

When you create an Embedded Container Service cluster, two new services are added to the cluster:

- Embedded Container Service (ECS) service. The ECS service has two roles:
  - ECS Server -- runs on a single host in the Embedded Container Service cluster.
  - ECS Agent -- runs on all hosts except the host running the Server role in the Embedded Container Service Cluster.
- Docker service. The Docker service has a single role:
  - Docker Server -- runs on all hosts in the Embedded Container Service Cluster.

## Configuring the Embedded Container Service

You use Cloudera Manager to configure the Embedded Container Service and clusters.

### Procedure

1. Open the Cloudera Manager Admin Console
2. From the Home page, Click on the Embedded Container Service Cluster
3. Click the Hosts, ECS service, or the Docker service links.
4. Click the Configuration tab.
5. Use the Filters or Search functions to locate the configuration property you are looking for.
6. Enter your change.
7. Click Save Changes.

### Related Information

[Modifying Configuration Properties Using Cloudera Manager](#)

## Adding hosts to a Embedded Container Service Cluster

You can add hosts to a Embedded Container Service (ECS) cluster to increase capacity and performance.

### About this task

## Procedure

1. On the Cloudera Manager home page, click the ECS Cluster, then select Actions > Add Hosts.

The screenshot shows the Cloudera Manager interface for the ECS Cluster (ID: 152-b883). The left sidebar contains navigation links for Clusters, Hosts, Diagnostics, Audits, Charts, Replication, Administration, and Data Services. The main content area shows the cluster status (ECS 1.5.2 (Parcels)) with 3 Hosts and DOCKER status. The 'Actions' dropdown menu is open, showing options like Start, Stop, Restart, Refresh Cluster, Upgrade Cluster, Inspect Hosts in Cluster, Rolling Restart, Rename Cluster, Enter Maintenance Mode, and View Maintenance Mode Status. The 'Add Hosts' option is highlighted. Below the status section, there are tags for the cluster. On the right, there are three charts: Cluster CPU (showing 11.3% usage), Cluster Disk IO (showing 17.6K/s and 7.1M/s), and Cluster Network IO (showing 7.2M/s and 7.5M/s).

2. On the Add Hosts page, click Add Hosts to Cluster and select the ECS Cluster, then click Continue.

The screenshot shows the 'Add Hosts' wizard in Cloudera Manager. The wizard explains that it allows installing the Cloudera Manager Agent on new hosts. There are two options: 'Add hosts to Cloudera Manager' and 'Add hosts to Cluster'. The 'Add hosts to Cluster' option is selected, and a dropdown menu shows the cluster ID '152-b883'. At the bottom right, there are 'Back' and 'Continue' buttons.

3. On the Specify Hosts page, hosts that have already been added to Cloudera Manager are listed on the Currently Managed Hosts tab. You can select one or more of these hosts to add to the ECS cluster.

**CLUSTER Deployment from 2023-Oct-23 11:55**

### Add Hosts

1 Specify Hosts  
2 Install Parcels  
3 Inspect Hosts  
4 Select Host Template  
5 Deploy Client Config

#### Specify Hosts

Currently Managed Hosts (1/4 Selected) New Hosts

These hosts do not belong to any clusters. Select some to form your cluster.

<input type="checkbox"/>	Hostname (FQDN) ↑	IP Address	Rack	Version	Cores
<input type="checkbox"/>	dh-centos79m-1.vpc.cloudera.com	10.65.202.225	/default	None	8
<input type="checkbox"/>	dh-centos79m-2.vpc.cloudera.com	10.65.203.223	/default	None	8
<input type="checkbox"/>	dh-centos79m-3.vpc.cloudera.com	10.65.202.91	/default	None	8
<input checked="" type="checkbox"/>	ecst-2.vpc.cloudera.com	10.65.203.79	/default	None	8

1 - 4 of 4

Cancel ← Back Continue →

You can also click the New Hosts tab to specify one or more hosts that have not been added to Cloudera Manager. Enter a Fully Qualified Domain Name in the Hostname box, then click Search.

**Note:** Click the pattern link under the Hostname box to display more information about allowed FQDN patterns.

7.1.1 to 7.1.8	OpenJDK 8, 11 or Oracle JDK 8, 11
7.0 and above	OpenJDK 8 or Oracle JDK 8
6.3 and above	OpenJDK 8 or Oracle JDK 8
6.2	OpenJDK 8 or Oracle JDK 8
6.1 or 6.0	Oracle JDK 8
5.16 and above	OpenJDK 8 or Oracle JDK 8
5.7 to 5.15	Oracle JDK 8

1 - 8 of 8

[More details on supported JDK version.](#)

If you plan to use JDK 11 with CDH 7.1.x and above or JDK 17 with CDH 7.1.9 and above, you will need to install it manually on all hosts and then select the **Manually manage JDK** option below.

Manually manage JDK

Please ensure that a supported JDK is **already installed** on all hosts. You will need to manage installing the unlimited strength JCE policy file, if necessary.

Install a Cloudera-provided version of OpenJDK

By proceeding, Cloudera will install a supported version of OpenJDK version 8.

Install a system-provided version of OpenJDK

By proceeding, Cloudera will install the default version of OpenJDK version 8 provided by the Operating System.

- On the Enter Login Credentials page, All hosts accept the same password is selected by default. Enter the user name in the SSH Username box, and type in and confirm the password. You can also select the All hosts accept the same private key option and provide the Private Key and passphrase.

The screenshot shows the Cloudera Manager interface during the 'Add Hosts' process. On the left is a dark sidebar with the Cloudera Manager logo and a navigation menu including 'Parcels', 'Running Commands', 'Support', and 'admin'. Below the menu is the version '7.11.3' and a double-left arrow icon. The main area is titled 'Add Hosts' with a timestamp 'CDEP Deployment from 2023-Oct-23 11:55'. A progress bar on the left lists steps: 'Specify Hosts', 'Select Repository', 'Select JDK', 'Enter Login Credentials' (current step), 'Install Agents', 'Install Parcels', 'Inspect Hosts', 'Select Host Template', and 'Deploy Client Config'. The 'Enter Login Credentials' section contains a warning: 'Root access to your hosts is required to install the Cloudera packages. This installer will connect to your hosts via SSH and log in either directly as root or as another user with password-less sudo/pbrun privileges to become root.' Below this are fields for 'SSH Username' (set to 'root'), 'Authentication Method' (radio buttons for 'All hosts accept same password' (selected) and 'All hosts accept same private key'), 'Password' (masked with dots), 'Confirm Password' (masked with dots), 'SSH Port' (set to '22'), and 'Simultaneous Installations' (set to '10' with a note: '(Running a large number of installations at once can consume large amounts of network bandwidth and other system resources)'). At the bottom are 'Cancel', 'Back', and 'Continue' buttons.

[Run Again](#)

Status	Description
✓	Inspector ran on all 4 hosts.
✓	Individual hosts resolved their own hostnames correctly.
✓	No errors were found while looking for conflicting init scripts.
✓	No errors were found while checking /etc/hosts.
✓	All hosts resolved localhost to 127.0.0.1.
✓	All hosts checked resolved each other's hostnames correctly and in a timely manner.
✓	Host clocks are approximately in sync (within ten minutes).
✓	Host time zones are consistent across the cluster.
✓	No users or groups are missing.
✓	No conflicts detected between packages and parcels.
✓	No kernel versions that are known to be bad are running.
✓	No problems were found with /proc/sys/vm/swappiness on any of the hosts.
⚠	Transparent Huge Page Compaction is enabled and can cause significant performance problems. Run "echo never > /sys/kernel/mm/transparent_hugepage/defrag" and "echo never > /sys/kernel/mm/transparent_hugepage/enabled" to disable this, and then add the same command to an init script such as /etc/rc.local so it will be set on system reboot. The following hosts are affected: > <a href="#">View Details</a>
⚠	Hue Python version dependency is satisfied. Starting with CDH 6, PostgreSQL-backed Hue requires Psycopg2 version to be at least 2.5.4, see the documentation for more information. The following hosts are missing a compatible version of the Psycopg2 library: > <a href="#">View Details</a>
✓	A compatible version of the operating system is installed on the hosts in a Private Cloud Containerized Cluster.
✓	Ports 80 and 443 are available for use on the hosts in a Private Cloud Containerized Cluster.

9. The Select Host Template page lists available host templates. Click Create.

**Note:**

The following three steps describe how to create a host template to assign the Docker Server and Ecs Agent role groups to the new host. You can also select None and add these role instances after adding the new host to the cluster, as described at the end of this topic.

The screenshot shows the Cloudera Manager interface during the 'Add Hosts' process. On the left is a dark sidebar with the Cloudera Manager logo and a list of navigation items: Parcels, Running Commands, Support, and a user profile for 'admin'. The main area is titled 'Add Hosts' and features a progress bar with nine steps. Steps 1 through 7 are completed, and step 8, 'Select Host Template', is the current active step. The 'Select Host Template' panel contains the instruction 'Select a host template to apply to the new hosts in order to populate them with role instances.' and a radio button labeled 'None' which is selected. Below the radio button is a 'Create...' button. At the bottom of the wizard, there are 'Cancel', 'Back', and 'Continue' buttons. A status bar at the very bottom shows the version '7.11.3' and a double-left arrow icon.

10. On the Create New Host Template pop-up, enter a template name and select the Docker Server and Ecs Agent role groups, then click Create.

The screenshot shows the 'Add Hosts' page in Cloudera Manager. A modal window titled 'Create New Host Template For 152-b883' is open. The 'Template Name' field contains 'ecsworker'. Under 'Select Role Groups to Include:', the 'DOCKER' section has 'Docker Server' checked with a dropdown set to 'Docker Server Default Group'. The 'ECS' section has 'Ecs Agent' checked with a dropdown set to 'Ecs Agent Default Group', and 'Ecs Server' is unchecked. The modal has 'Cancel' and 'Create' buttons at the bottom right. The background shows the 'Add Hosts' progress bar and navigation buttons.

11. On the Select Host Template page, select the new template, then click Continue.

The screenshot shows the 'Add Hosts' page in Cloudera Manager. The 'Select Host Template' modal is open. On the left, a progress bar shows steps from 'Specify Hosts' to 'Deploy Client Config', with 'Select Host Template' highlighted as step 8. The modal title is 'Select Host Template'. Below it, the text says 'Select a host template to apply to the new hosts in order to populate them with role instances.' There are two radio buttons: 'None' and 'ecsworker', with 'ecsworker' selected. A 'Create...' button is next to the 'ecsworker' radio button. Below the radio buttons, there is a checked checkbox labeled 'Start newly created roles after applying the host template.' The modal has 'Cancel' and 'Continue' buttons at the bottom right. The background shows the 'Add Hosts' progress bar and navigation buttons.

12. The Apply Host Template page appears. After the roles have successfully started, click Continue.

- 15.** If your ECS hosts are running the CentOS 8.4, OEL 8.4, RHEL 7.9, or RHEL 8 operating systems, you must install iptables on all the ECS hosts.

For CentOS 8.4, OEL 8.4, or RHEL 8, run the following command on each ECS host:

```
yum --setopt=tsflags=noscripts install -y iptables
```

For RHEL 7.9, run the following command on each ECS host:

```
yum install -y iptables
```

16. If you did not apply a host template to assign roles, perform the following steps to assign the Docker Server and Ecs Agent role groups to the new host.

To assign the Docker Server role group:

- a. Click DOCKER on the ECS cluster home page, select Instances, then click Add Role Instances.

The screenshot shows the Cloudera Manager interface for a DOCKER cluster. The left sidebar contains navigation links for Clusters, Hosts, Diagnostics, Audits, Charts, Replication, Administration, and Data Services. The main content area shows the cluster status as 'Good Health' with 4 instances. The 'Instances' tab is selected, and the 'Add Role Instances' button is highlighted. Below the table, there is a '1 - 4 of 4' indicator.

Status	Role Type	Tags	State	Hostname	Commission State	Role Group
<input type="checkbox"/>	✓ Docker Server		Started	dh-centos79-3.vpc.cloudera.com	Commissioned	Docker Server Default Group

- e. On the Review Changes page, click Finish.

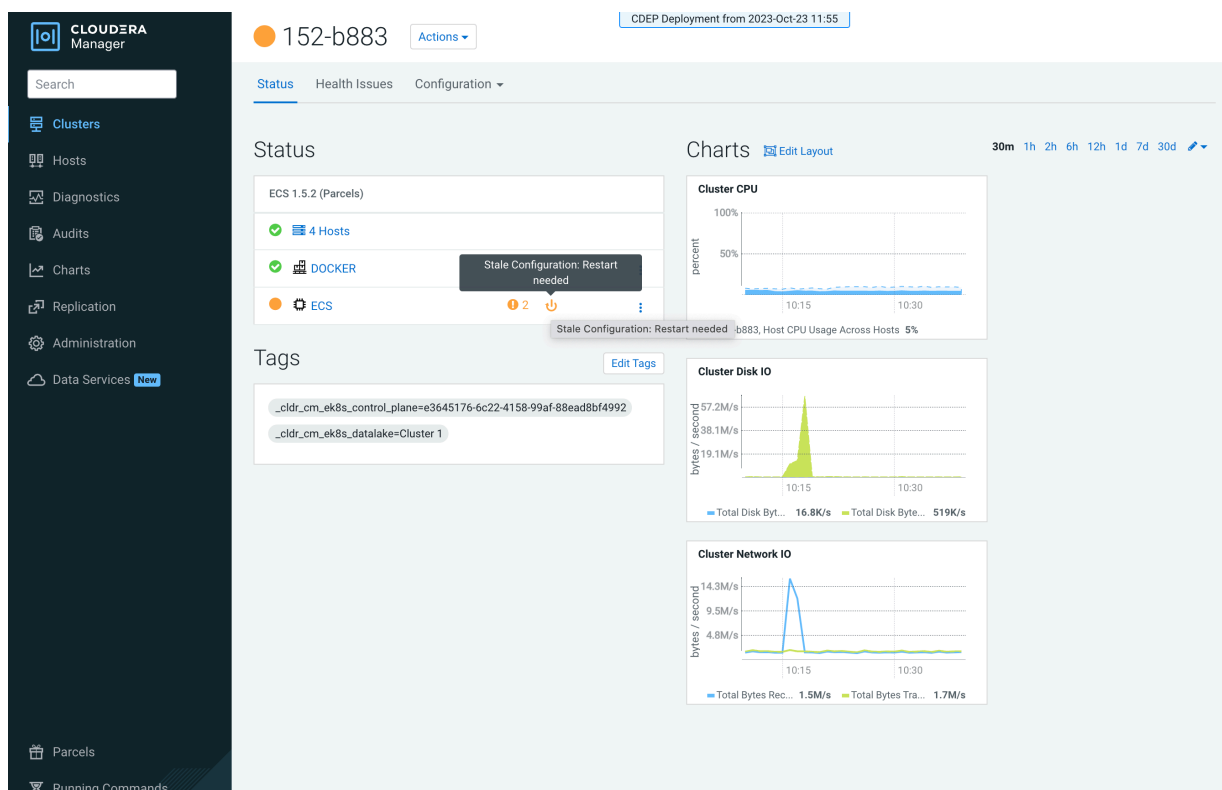

f. The new host is listed on the ECS Instances page.

17. Restart the ECS cluster by clicking the ECS Restart icon, or by selecting Actions > Restart on the ECS cluster home page.

18. Click ECS on the ECS cluster home page, then select Actions > Unseal Vault.

## Starting, stopping, restarting, and refreshing Embedded Container Service Clusters

Procedures to start, stop, restart, and refresh Private Cloud Experience clusters

## Starting a Embedded Container Service Cluster

### Procedure

1. On the HomeStatus tab, click the Actions Menu to the right of the Embedded Container Service cluster name and select Start.
2. Click the Start button that appears in the next screen to confirm. The Command Details window shows the progress of starting services.

### Results

When the All services successfully started message appears, the task is complete and you can close the Command Details window.

## Stopping a CDP Private Cloud Data Services Cluster

### Procedure

1. On the HomeStatus tab, click the Actions Menu to the right of the Embedded Container Service cluster name and select Stop.
2. Click the Stop button in the confirmation screen. The Command Details window shows the progress of stopping services.

### Results

When the All services successfully stopped message appears, the task is complete and you can close the Command Details window.

**Note:** The cluster-level Stop action does not stop the Cloudera Management Service. You must stop the Cloudera Management Service separately.

## Restarting a Embedded Container Service Cluster

### Procedure

1. On the HomeStatus tab, click the Actions Menu to the right of the cluster name and select Restart.
2. Click the Restart button that appears in the next screen to confirm.  
The Command Details window shows the progress of stopping services. When the All services successfully started message appears, the task is complete and you can close the Command Details window.
3. Click ActionsUnseal Vault

## Refreshing a Embedded Container Service Cluster

### Procedure

To refresh a cluster, in the HomeStatus tab, click the Actions Menu to the right of the cluster name and select Refresh Cluster.

## Monitoring Embedded Container Service Clusters

Procedures to monitor Embedded Container Service clusters

### Related Information

[ECS Server Metrics](#)

## Viewing Health Status

### Procedure

1. Open the Cloudera Manager Admin Console.
2. From the Home page, Click on the Embedded Container Service cluster.
3. Click on the ECS or Docker service.

### Results

The Service status page displays the Health Test, Status Summary and Health History of the services.

## Viewing the Kubernetes Dashboard

### About this task

The Kubernetes Dashboard displays configuration and other information about the embedded Kubernetes infrastructure used in the Embedded Container Service cluster. Although you can make configuration changes using the dashboard (if you have the appropriate permissions), you should not make any changes using the dashboard. Cloudera Support may use the dashboard to diagnose problems with the cluster.

### Procedure

1. In the Cloudera Manager Admin Console, go to the ECS service.
2. Click Web UI ECS Web UI

### Results

The Kubernetes Dashboard displays.

## Viewing the Private Cloud Management Console

### Procedure

1. In the Cloudera Manager Admin Console, go to the ECS service.
2. Click Web UI Console

### Results

The CDP Management Console displays.

## Performing maintenance on an Embedded Container Service cluster

You can perform maintenance on the nodes in your ECS cluster by shutting down the nodes one at a time while keeping your Data Services running with slightly diminished capacity.

## Before you begin

- The containerized cluster must be configured for ECS Server high availability. Contact Cloudera Professional Services for assistance in setting up high availability.
- You must be able to log into the nodes as root or have sudo privileges.
- The node to be maintained must have a status of Ready. A status of NotReady may suggest the node is having other complicating issues. Run the following command on an ECS server node to verify status of the nodes.

```
/var/lib/rancher/rke2/bin/kubectl --kubeconfig=/etc/rancher/rke2/rke2.yaml
get nodes
```

## Procedure

1. Inform Kubernetes that it should no longer use this node for any new pods. This process is called cordon and Kubernetes tracks the node status as Ready,SchedulingDisabled.

- a) Run the following command to list the nodes:

```
/var/lib/rancher/rke2/bin/kubectl --kubeconfig=/etc/rancher/rke2/rke2.ya
ml get nodes
```

- b) Run the following command for the node you are taking off line:

```
/var/lib/rancher/rke2/bin/kubectl --kubeconfig=/etc/rancher/rke2/rke2.ya
ml cordon **node-name**
```

- c) Run the following command to verify the node status shows Ready,SchedulingDisabled:

```
/var/lib/rancher/rke2/bin/kubectl --kubeconfig=/etc/rancher/rke2/rke2.ya
ml get nodes
```

2. Inform Kubernetes to evict this node's Data Services pods and cleanly detach any storage volumes. This allows the pods to be started up on other Ready nodes in the cluster and any replica volumes are migrated. The process is invoked by the drain command:

```
/var/lib/rancher/rke2/bin/kubectl --kubeconfig=/etc/rancher/rke2/rke2.yaml
drain *node-name* --delete-emptydir-data --ignore-daemonsets --pod-select
or='app!=csi-attacher,app!=csi-provisioner,app!=longhorn-admission-webho
ok,app!=longhorn-conversion-webhook,app!=longhorn-driver-deployer'
```

You will see a message

```
"WARNING: ignoring DaemonSet-managed Pods:....
```

You can ignore this warning.

You will see repeating messages like this:

```
error when evicting pods/"instance-manager-r-xxxxxxx" -n "longhorn-syst
em" (will retry after 5s): Cannot evict pod as it would violate the pod's
disruption budget.
```

This is normal, after several iterations those pods will be evicted and the drain is completed.

3. Log in to the Cloudera Manager Admin Console.
4. Go to the ECS service page and verify that the Vault is not sealed. This information displays in the Health Tests section.
5. If the Vault is sealed, click ActionsUnseal Vault.
6. Click the Action menu next to the ECS cluster and select Stop.

7. Shutdown ECS roles.
  - a) Click the Instances tab.
  - b) Select the hosts where the ECS Agent role is running and click ActionsStop.
  - c) Select two of the hosts running the ECS Server role is running and click ActionsStop.
8. Perform the maintenance.
9. Reboot the hosts.
10. Log in to the Cloudera Manager Admin Console.
11. Click the Action menu next to the ECS cluster and select Start.
12. Uncordon the node to start the Data Services by running the following command:

```
/var/lib/rancher/rke2/bin/kubectl --kubeconfig=/etc/rancher/rke2/rke2.yaml
uncordon **node-name**
```

13. Run the following command to verify that the node status is Ready:

```
/var/lib/rancher/rke2/bin/kubectl get nodes
```

14. Click ActionsRefresh ECS Cluster.

## Configuring a containerized cluster with SELinux

You can configure a containerized cluster with SELinux to enable it to run the Embedded Container Service (ECS).

### Procedure

1. Ensure that the hosts you use for the containerized cluster meet all [hardware](#) and [software](#) requirements for use with CDP Private Cloud Data Services.
2. Enable SELinux in Permissive mode by updating the /etc/selinux/config file on all ECS hosts by running the following commands:

```
sed -i 's/SELINUX=disabled/SELINUX=permissive/' /etc/selinux/config
reboot
```

3. Add the SELinux policies provided by RKE2 by installing the RPMs on all ECS hosts. Use the following commands:

```
yum localinstall -y http://mirror.centos.org/centos/7/extras/x86_64/Packages/container-selinux-2.107-3.el7.noarch.rpm
wget https://github.com/rancher/rke2-selinux/releases/download/v0.8.stable.2/rke2-selinux-0.8-2.el7.noarch.rpm
yum install -y rke2-selinux-0.8-2.el7.noarch.rpm
```

4. Uninstall the nscd service by running the following command on all ECS hosts :

```
yum erase -y nscd
```

5. Install a containerized cluster on all hosts. See [Adding a CDP Private Cloud Data Services cluster](#).
6. Enable SELinux in Enforced mode by running the following commands on all ECS hosts:

```
setenforce 1
```

You can confirm that SELinux is running in Enforced mode by running the following command:

```
getenforce
```

7. Verify that the ECS cluster hosts are sending heartbeats to the Cloudera Manager server.
  - a) Open the Cloudera Manager Admin Console.
  - b) Click Hosts All Hosts .
  - c) Check the Last Heartbeat column for heartbeat status.
8. Verify that your workloads are functioning as expected.

## Decommissioning ECS Hosts

You can decommission ECS hosts and remove them from the cluster.

### About this task

1. Cordon the node. Longhorn will automatically disable the node scheduling when a Kubernetes node is cordoned. Run the following command on any ECS Server host:

```
kubectl cordon [***node***]
```

2. Drain the node to move the workload to somewhere else. Run the following command on any ECS Server host:

```
kubectl drain [***node***] --ignore-daemonsets --pod-selector='app!=csi-attacher,app!=csi-provisioner' --delete-emptydir-data
```

3. Detach all the volumes on the node. Navigate to the ECS Service page on Cloudera Manager UI.

- a. In the Web UI dropdown, select Storage UI to open the Longhorn UI.
- b. Under the Volume tab in Longhorn UI, select the volumes on this node. Click Detach and select Yes on the screen prompt.

If the node has been drained, all the workloads should be migrated to another node already.

If there are any other volumes remaining attached, detach them before continuing.

4. Remove the node from Longhorn using the Delete in the Node tab. Or, remove the node from Kubernetes. Run the following command on any ECS Server host:

```
kubectl delete node [***node-name***]
```

Longhorn will automatically remove the node from the cluster.

5. Uninstall ECS and Docker artifacts from the host. Run below commands on the host:

```
cd /opt/cloudera/parcels/ECS/bin
./rke2-killall.sh # usually 2 times is sufficient
./rke2-uninstall.sh
rm -rf /ecs/* # assumes the default defaultDataPath and IsoDataPath
rm -rf /var/lib/docker_server/* # deletes the auth and certs
rm -rf /etc/docker/certs.d/* # delete the ca.crt
rm -rf /docker # assumes the default defaultDataPath for docker
```

6. Go to the Hosts page for the ECS Cluster, select that host, and under Actions for Selected, click Begin Maintenance (Suppress Alerts/Decommission)

## Dedicating ECS nodes for specific workloads

You use Cloudera Manager to dedicate Embedded Container Service (ECS) cluster nodes for specific workloads. You can dedicate GPU nodes for CML workloads, and NVME nodes for CDW workloads.

### Dedicating ECS nodes when creating a new cluster

1. Check the [ECS installation requirements](#).
2. [Add the new hosts to Cloudera Manager](#).
3. In Cloudera Manager, click Hosts > All Hosts, then select one or more of the new ECS hosts.
4. Click the Configuration tab, then use the Search box to locate the node\_taint configuration property.
5. Select Dedicated GPU Node to dedicate the node for CML workloads, or select Dedicated NVME node to dedicate the node for CDW workloads.

When either of these options are selected, no other workload pods will be allowed to run on the dedicated node.

The screenshot shows the Cloudera Manager interface. On the left is a dark sidebar with navigation links: Clusters, Hosts (selected), Diagnostics, Audits, Charts, Replication, Administration, Data Services (New), Parcels, Running Commands, Support, and a user profile 'admin'. The main area is titled 'Hosts Configuration' and has a search bar containing 'node\_taint'. Below the search bar are filters for SCOPE (All Hosts: 1), CATEGORY (Advanced: 1, Monitoring: 0, Parcels: 0, Resource Management: 0), and STATUS (Error: 0, Warning: 0, Edited: 1, Non-Default: 1, Include Overrides: 0). The configuration details for 'node\_taint' show 'Data Services: Restrict workloads types' with three radio button options: 'Dedicated GPU Node' (selected), 'Dedicated NVME Node', and 'None'. There are links for 'Show All Descriptions', 'Undo', and 'Add Host Overrides'. At the bottom, a status bar indicates '1 Edited Value' and 'Reason for change: Modified Data Services: Restrict workloads types', with a 'Save Changes(CTRL+S)' button.

6. Click Save Changes.
7. Repeat the previous steps to add the other ECS hosts to Cloudera Manager and assign workload types.
8. Follow the [ECS installation procedure](#). When you reach the Specify Hosts page in the installation wizard, the hosts you added to Cloudera Manager appear. Select the hosts, click Continue, then proceed through the rest of the installation wizard.
9. After the installation is complete, the applicable workloads will only run on the specified dedicated nodes.

### Dedicating ECS nodes in an existing cluster

1. Open the Cloudera Manager Admin Console.
2. On the Home page, click the ECS Cluster.
3. Click Hosts, select one or more of the ECS hosts, then click the Configuration tab.
4. Click the Configuration tab, then use the Search box to locate the node\_taint configuration property.

5. Select Dedicated GPU Node to dedicate the node for CML workloads, or select Dedicated NVME node to dedicate the node for CDW workloads.

When either of these options are selected, no other workload pods will be allowed to run on the dedicated node.

6. Click Save Changes.
7. Repeat the previous steps to assign workload types to the other ECS hosts.
8. On the ECS Cluster landing page, click Actions > Refresh Cluster.
9. After the Refresh is complete, click Actions > Rolling Restart.

## Specifying racks for ECS clusters

You use Cloudera Manager to assign Embedded Container Service (ECS) cluster hosts to a specific rack.

### About this task

- All hosts in an ECS cluster must have the same assigned rack name and path structure. A configuration error will occur if the rack names do not match.
- ECS cluster hosts with no specified rack name are assigned the default rack name value. The default value means that no rack name has been specified for the ECS cluster hosts.

### Specifying a rack name for an ECS cluster

1. In Cloudera Manager, select the ECS cluster, then click Hosts.

2. In the Hosts list, click the top checkbox to select all of the cluster hosts.

1 - 3 of 3

- On the Assign Rack popup, enter a rack name in the New Rack box, then click Confirm.

- Cloudera Manager detects this configuration change, and displays a Stale Configuration warning. You must restart the cluster in order for the updated configuration to take effect.

6. Click the Stale Configuration icon, then click Restart Stale Services and click through the Restart wizard.

The screenshot shows the Cloudera Manager interface for cluster 152-b813. The 'Stale Configurations' page is active, displaying a list of filters (FILE, SERVICE, ROLE TYPE) and three configuration files (config.yaml) with their respective line numbers and changes. A 'Restart Stale Services' button is visible at the bottom right.

7. When the Restart is complete, you can use the Assign Rack popup to confirm that the new rack name has been applied to the ECS cluster hosts.

The screenshot shows the Cloudera Manager interface for cluster 152-b813. The 'Hosts' page is active, displaying a list of hosts. An 'Assign Rack' popup is shown, allowing the user to assign a new rack to the host 'dh-centos79-[1-3].vpc.cloudera.com'. The current rack is '/testcab2/rack3'. The popup includes a warning message about the transient state of mis-replicated blocks in HDFS.

- You can also use the ECS Web UI to view cluster host rack assignments. Select the ECS cluster, click ECS, then click Web UI > ECS Web UI . In the Web UI, select the CDP namespace, then click Nodes.

Note that in Kubernetes periods are used as separators (rather than slashes) in the rack name path. The leading slash is also not used in Kubernetes.

### Specifying a rack name when creating a new ECS cluster

Currently the ECS installation wizard does not enable you to assign rack names when creating a new ECS cluster. Therefore, you should first add the new set of ECS hosts to Cloudera Manager, and then assign the rack name in Cloudera Manager. You can then use the ECS installation wizard to create a new ECS cluster using these hosts.

- Check the [ECS installation requirements](#).
- [Add the new hosts to Cloudera Manager](#).

3. In Cloudera Manager, click Hosts > All Hosts, then select the hosts you just added.

### Adding a host to an ECS cluster with a previously specified rack name

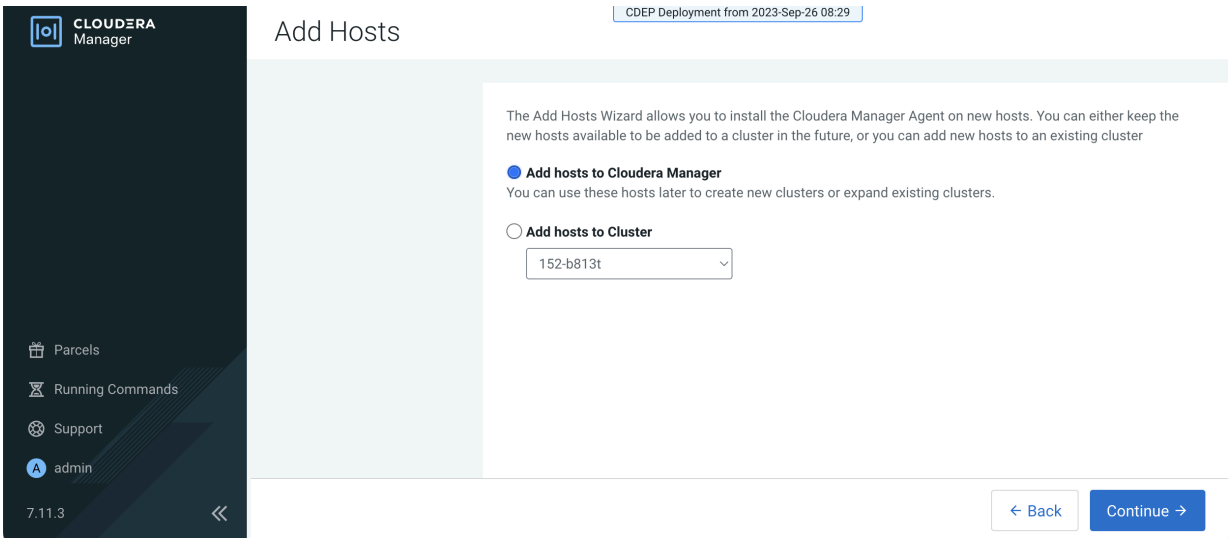

When you add a host directly to an ECS cluster, there is no way to specify a rack name for the new host, so it will be assigned the default rack name. A configuration error will occur if you try to add a new host directly to an ECS cluster with a previously specified rack name, since the default rack name of the new host does not match the rack name previously assigned to the other cluster hosts.

Therefore, you should first add the new ECS host to Cloudera Manager, and then use Cloudera Manager to assign the same rack name as the other ECS cluster hosts to the new host. You can then add the new host to the ECS cluster.

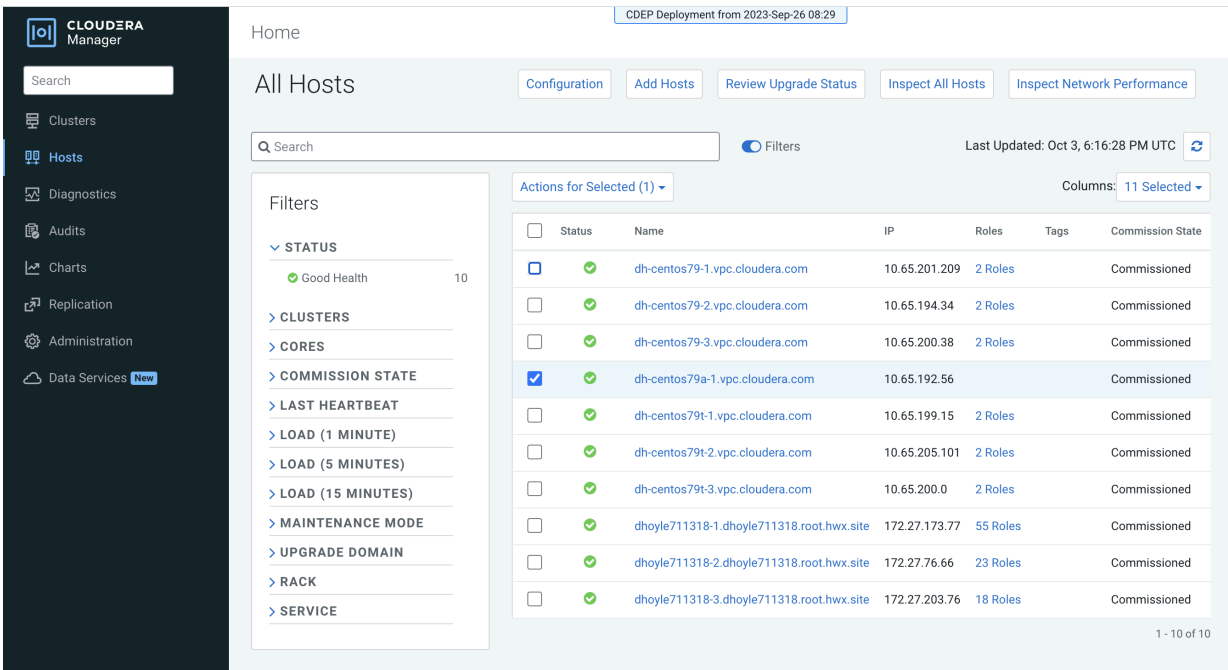

1. Check the [ECS installation requirements](#).

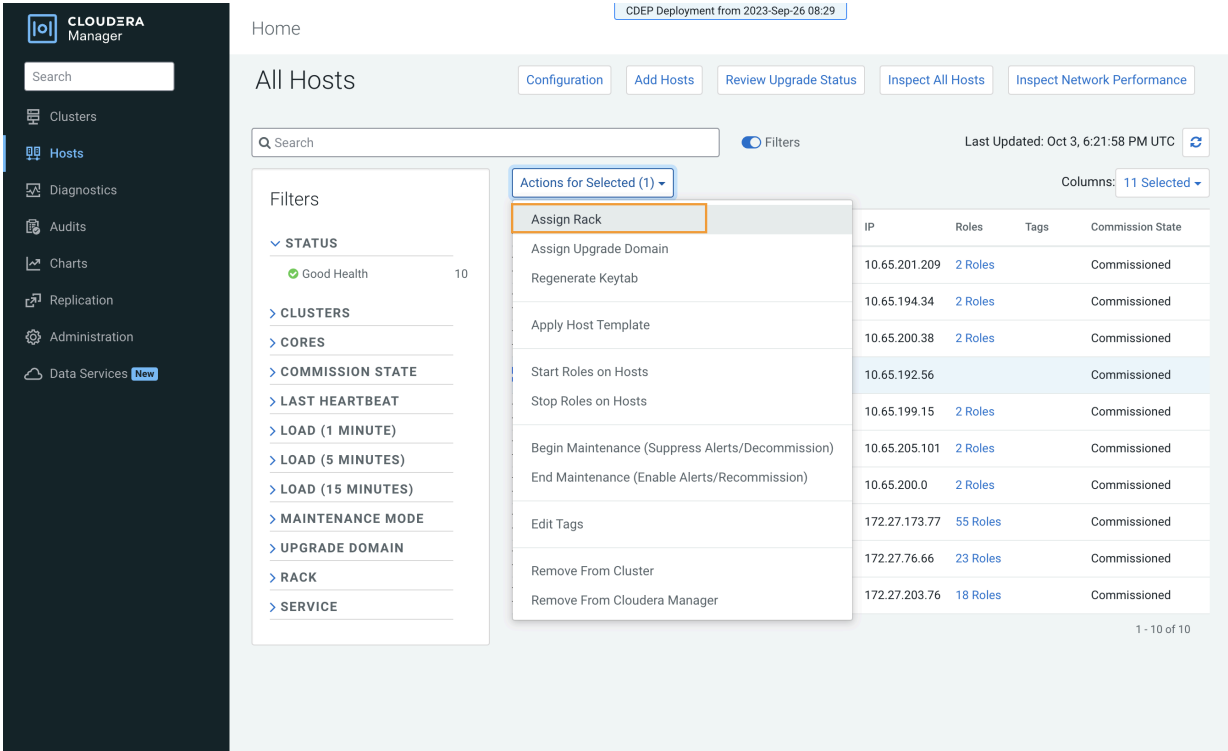

2. [Add the new hosts to Cloudera Manager](#). You can also access the Add Hosts wizard by clicking Hosts in the ECS cluster, and then clicking Add Hosts. Select Add hosts to Cloudera Manager.

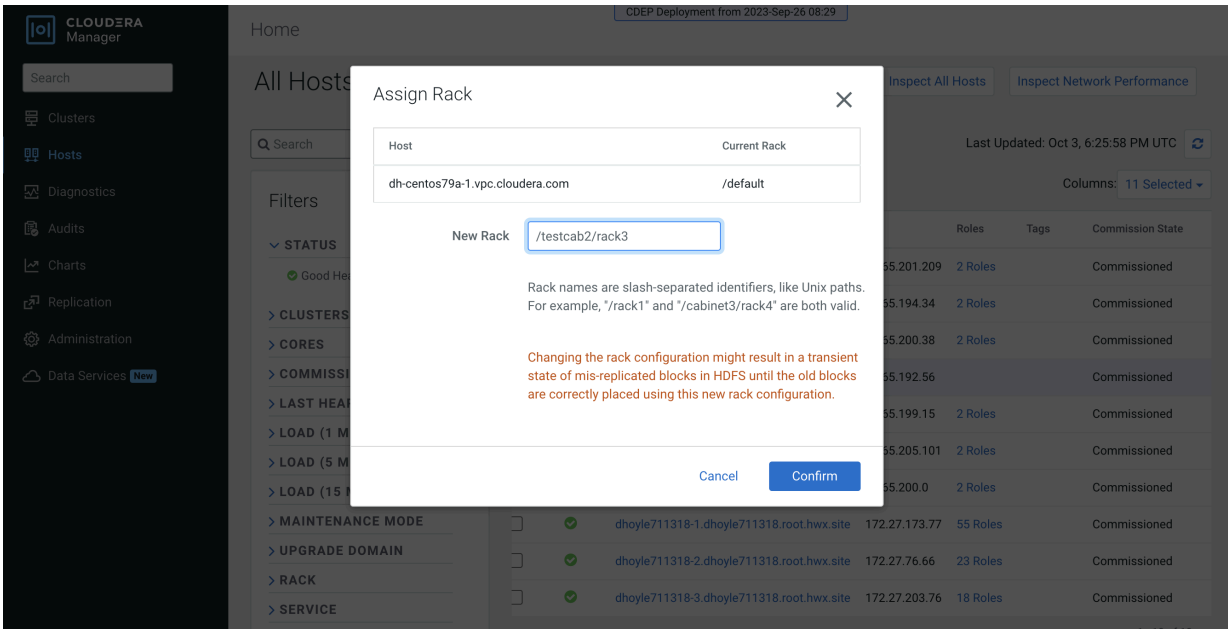

3. In Cloudera Manager, click Hosts, then select the host you just added.

4. Click Actions for Selected, then click Assign Rack.

5. On the Assign Rack popup, enter the same rack name assigned to the other ECS cluster hosts in the New Rack box, then click Confirm.

6. In the ECS cluster, click Hosts, then click Add Hosts. Select Add hosts to Cluster, then click Continue.

40

9. You can use the Assign Rack popup to view the rack assignments for the ECS cluster hosts and confirm that the rack name for the new host matches the rack name of the other cluster hosts.

## ECS unified time zone

You can synchronize the Embedded Container Service (ECS) cluster time zone with the Cloudera Manager Base time zone.

In previous CDP Private Cloud Data Services versions, containers running on an ECS Kubernetes cluster did not inherit the time zone settings from the Cloudera Manager Base host. In most cases, Kubernetes containers use Coordinated Universal Time (UTC) by default.

In Private Cloud Data Services 1.5.2, you can unify the time zone in the ECS cluster with the Cloudera Manager Base time zone. All workload pods in the ECS cluster run under the Cloudera Manager time zone, and workload logs on the ECS cluster are correlated with the Cloudera Manager Base logs. Timestamp-related SQL queries are also correlated.

- Unified time zone is enabled by default for new CDP Private Cloud Data Services 1.5.2 installs.
- When upgrading from earlier versions of CDP Private Cloud Data Services to 1.5.2, unified time zone is disabled by default to avoid affecting timestamp-sensitive logic.

You can enable or disable unified time zone using the following script in the ECS parcel:

```
bash /opt/cloudera/parcels/ECS/k8tz-webhook/configure-k8tz-webhook.sh -h
```

This script modifies the k8tz webhook settings.

Syntax:

```
configure-k8tz-webhook.sh [-i|-h]
```

Options:

- **i** – This option enables the unified time zone feature
- **No options** – To disable the unified time zone feature, run the configure-k8tz-webhook.sh script without any options.
- **-h** – Use the -h flag to print Help information

To complete the process of enabling the unified time zone feature:

- Restart the workload pods where you want the Cloudera Manager Server timezone to be applied.

-OR-

- Initiate an ECS cluster rolling restart. This will inject the time zone information into all workload pods.

When the unified time zone feature is disabled, all running pods are not affected. To apply the new disabled setting so they run with the default UTC time zone, a pod restart or a rolling restart is required.

## Adjusting the expiration time of ECS cluster certificates

The internal ECS cluster self-signed certificate expiration times are set to one year by default. To avoid certificate expiration errors, you may want to extend the ECS cluster expiration times.

### About this task

#### Note:

This topic only applies to internal certificates within ECS. It does not apply to the ingress controller certificate.

- These steps describe how to adjust the expiration time of internal cluster certificates in an existing ECS cluster.
- For a new cluster, if the nodes have been added to Cloudera Manager before creating the ECS cluster, you can add the new safety valve configuration properties in Cloudera Manager before creating the ECS cluster.

### Adjusting the expiration time of the RKE Kubernetes cluster certificate

- In Cloudera Manager, select the ECS cluster, then click ECS.
- Click the Configuration tab, then use the Search box to locate the Ecs Server Environment Advanced Configuration Snippet (Safety Valve) configuration property.
- Click the + icon, then enter the following configuration setting. In this example, the certificate expiration is set to 5 years (1825 days):
  - Key: CATTLE\_NEW\_SIGNED\_CERT\_EXPIRATION\_DAYS
  - Value: 1825

4. Click Save Changes.
5. On the ECS Cluster landing page, click Actions > Refresh Cluster.
6. After the Refresh is complete, click Actions > Rolling Restart.
7. After the restart is complete, the certificate expiration time is reset to the new value. You can also use the CLI to verify the new certificate expiration setting:

```

### Adjusting the expiration time of the Vault certificate

1. In Cloudera Manager, select the ECS cluster, then click ECS.
2. Click the Configuration tab, then use the Search box to locate the Ecs Server Advanced Configuration Snippet (Safety Valve) for config.yaml configuration property.
3. Enter the following configuration setting. In this example, the certificate expiration is set to 5 years (43800 hours):

```

kube-controller-manager-arg:
- "cluster-signing-duration=43800h"

```

The screenshot shows the Cloudera Manager interface. On the left is a dark sidebar with the Cloudera Manager logo and a search bar. Below the search bar are navigation links: Clusters, Hosts, Diagnostics, Audits, Charts, Replication, Administration, and Data Services (marked as 'New'). The main panel has a header with '152-b883' and 'CDEP Deployment from 2023-Oct-23 11:55'. Below this is a tabbed interface with 'ECS' selected. The 'Configuration' tab is active, showing a search bar with the text 'Ecs Server Advanced Configuration Snippet (Safety Valve) for config.yaml'. To the left of the main configuration area is a filter sidebar with sections for SCOPE (ECS Service-Wide: 0, Ecs Agent: 0, Ecs Server: 1), CATEGORY (Main: 0, Advanced: 1, Monitoring: 0, Performance: 0, Ports and Addresses: 0, Resource Management: 0, Security: 0), and STATUS (Error: 0, Warning: 0, Edited: 1, Non-Default: 1, Include Overrides: 0). The main configuration area shows a snippet titled 'Ecs Server Advanced Configuration Snippet (Safety Valve) for config.yaml' with the content 'kube-controller-manager-arg: - \"cluster-signing-duration=43800h\"'. There is a 'Show All Descriptions' link and a '1 - 1 of 1' indicator at the bottom right of the snippet area.

4. Click Save Changes.
5. Contact Cloudera support and ask them to provide you with a copy of the rotate-vault-cert.sh file.
6. Copy the rotate-vault-cert.sh file to the ECS master host. Set JAVA\_HOME if needed.
7. Run the following command:
 

```
./rotate-vault-cert.sh APP_DOMAIN
```
8. Unseal Vault.
9. Restart all of the pods in the CDP namespace.
10. If you are using a default self-signed ingress controller certificate, update the ingress controller certificate (follow the steps in the script output).

**11.** You can use the CLI to verify the new certificate expiration setting:

```

root      49076    48970    2 16:49 ?          00:00:10 kube-controller-mana
ger

### Adjusting the expiration time of the ECS webhook certificate

1. In Cloudera Manager, select the ECS cluster, then click ECS.
2. Click the Configuration tab, then use the Search box to locate the Ecs Server Advanced Configuration Snippet (Safety Valve) for config.yaml configuration property.
3. Enter the following configuration setting. In this example, the certificate expiration is set to 5 years (43800 hours):

```
kube-controller-manager-arg:
- "cluster-signing-duration=43800h"
```

#### Note:

The kube-controller-manager-arg property controls the expiration time of both the Vault and the ECS webhook certificates.

4. Click Save Changes.
5. Contact Cloudera support and ask them to provide you with a copy of the rotate-webhook-cert.sh file.
6. Copy the rotate-webhook-cert.sh file to the ECS master host.
7. Run the following command:
 

```
./rotate-webhook-cert.sh APP_DOMAIN
```
8. Check for any pods in the Pending state whose status shows that they cannot tolerate the node-role.kubernetes.io/control-plane toleration. Restart those pods.
9. You can use the CLI to verify the new certificate expiration setting:

```
root      49076    48970    2 16:49 ?        00:00:10 kube-controller-mana
ger
```

```
--flex-volume-plugin-dir=/var/lib/kubelet/volumeplugins --terminated-pod-
gc-threshold=1000 --permit-port-sharing=true
--allocate-node-cidrs=true --authentication-kubeconfig=/var/lib/rancher/
rke2/server/cred/controller.kubeconfig
--authorization-kubeconfig=/var/lib/rancher/rke2/server/cred/controller.
kubeconfig --bind-address=127.0.0.1
--cluster-cidr=10.42.0.0/16 --cluster-signing-duration=43800h
<snip!>
```

```

## Configuring multiple Base clusters with one ECS cluster

You can configure one Embedded Container Service (ECS) cluster to work with multiple CDP Private Cloud Base clusters managed by separate instances of Cloudera Manager. In order to do this you must first create a combined truststore .pem file that contains the ECS Control Plane truststore .pem file appended with the certificate files of each of the CDP Private Cloud Base clusters.

### About this task

Use the following steps to configure one ECS cluster to work with multiple CDP Private Cloud Base clusters:

1. Append the ECS Control Plane truststore .pem file with the certificate files from the additional CDP Private Cloud Base clusters.
2. Register an ECS environment with each of the additional CDP Private Cloud Base clusters.
3. Create data services within each environment.

### Step 1: Append the ECS Control Plane truststore .pem file with the certificate files from the Base clusters

1. On the ECS Control Plane, run the following `kubectl` command to get the contents of the configmap:

```
kubectl get configmap cdp-private-installer-truststore -n cdp -o yaml >
cdp-private-installer-truststore.yaml
```

2. Copy the truststorePEM content, decode it, and store it in a file. For example:

echo LS0tLS1CRUDjT1iBDRVJUSUZJQ0FURS0tLS0tCk1JSURhakNDQWxJQ0NRRG5iNnhmK0d  
QR1l6QU5CZ2txaGtpRzI3MEJBUXNGQURCwklRc3dDUV

NFUlRJRklDQVRFLS0tLS0= | base64 -d > cdp-private-installer-truststore.pem
```

3. Obtain the truststore .pem file from the first additional Cloudera Manager host from /var/lib/cloudera-scm-agent/agent-cert/cm-auto-global\_cacerts.pem or /opt/cloudera/CMCA/trust-store/cm-auto-global\_cacerts.pem and copy the contents.
4. Append the cdp-private-installer-truststore.pem file created previously with the contents of the Cloudera Manager .pem file.
5. Repeat the previous two steps for all additional Cloudera Manager hosts you would like to register environments with.
6. Log in to the ECS cluster Management Console and click Administration > CA Certificates. Select Datalake in the CA Certificate Type drop-down, click Choose File, then select the appended cdp-private-installer-truststore.pem file and click Upload. Click Save to save your changes.

You can also use the following CLI commands to upload the cdp-private-installer-truststore.pem file and update the global truststore with the encoded certificate file content:

```
cat cdp-private-installer-truststore.pem | base64
cdp environments --set-environment-setting --settings truststorePEM=<base64
encoded CM cert> --no-verify-tls
```

## Step 2: Register an ECS environment with each of the additional Base clusters

1. Log in to the ECS cluster Management Console and [Register an environment](#) for the first additional Base cluster using the applicable Cloudera Manager URL and credentials.
2. Repeat the previous step for the rest of the additional Base clusters.

## Step 3: Create data services within each environment

Refer to the following topics to create the data services of your choice in each environment:

- [Adding a Cloudera Data Engineering service](#)
- [Activate ECS environments \(CDW\)](#)
- [Provision an ML Workspace](#)
