### **YARN** tuning overview

Abstract description of a YARN cluster and the goals of YARN tuning.

This topic applies to YARN clusters only, and describes how to tune and optimize YARN for your cluster.

**Note:** Download the Cloudera YARN tuning spreadsheet to help calculate YARN configurations. For a short video overview, see Tuning YARN Applications.

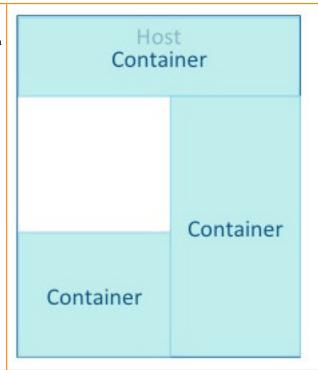

This overview provides an abstract description of a YARN cluster and the goals of YARN tuning.

A YARN cluster is composed of host machines. Hosts provide memory and CPU resources. A vcore, or virtual core, is a usage share of a host CPU.

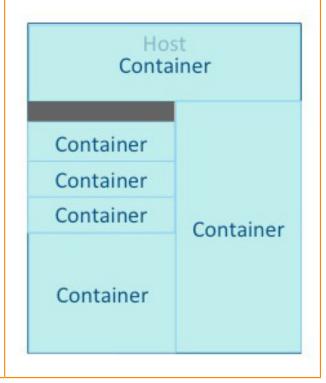

Host

memory and vcores Tuning YARN consists primarily of optimally defining containers on your worker hosts. You can think of a container as a rectangular graph consisting of memory and vcores. Containers perform tasks. Memory Container vcores Some tasks use a great deal of memory, with minimal processing on a large volume of data. Host Container Container

Other tasks require a great deal of processing power, but use less memory. For example, a Monte Carlo Simulation that evaluates many possible "what if?" scenarios uses a great deal of processing power on a relatively small dataset.

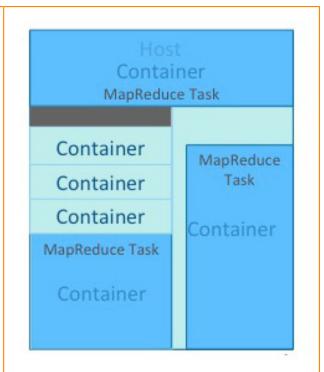

The YARN ResourceManager allocates memory and vcores to use all available resources in the most efficient way possible. Ideally, few or no resources are left idle.

Cloudera Runtime YARN tuning overview

An application is a YARN client program consisting of one or more tasks. Typically, a task uses all of the available resources in the container. A task cannot consume more than its designated allocation, ensuring that it cannot use all of the host CPU cycles or exceed its memory allotment.

Tune your YARN hosts to optimize the use of vcores and memory by configuring your containers to use all available resources beyond those required for overhead and other services.

YARN tuning has three phases. The phases correspond to the tabs in the YARN tuning spreadsheet.

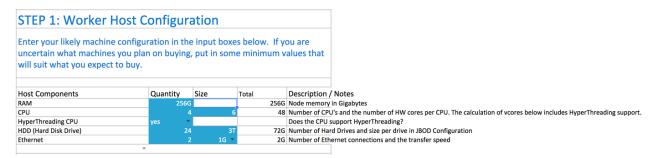

- 1. Cluster configuration, where you configure your hosts.
- 2. YARN configuration, where you quantify memory and vcores.
- **3.** MapReduce configuration, where you allocate minimum and maximum resources for specific map and reduce tasks.

YARN and MapReduce have many configurable properties. The YARN tuning spreadsheet lists the essential subset of these properties that are most likely to improve performance for common MapReduce applications.

#### **Step 1: Worker host configuration**

Define the configuration for a single worker host computer in your cluster

Step 1 is to define the configuration for a single worker host computer in your cluster.

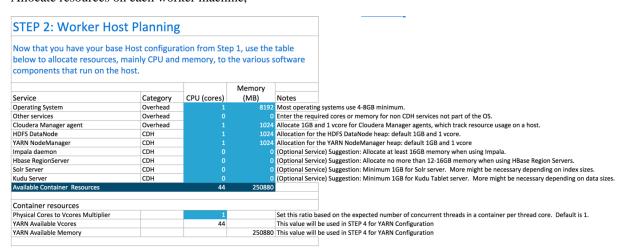

As with any system, the more memory and CPU resources available, the faster the cluster can process large amounts of data. A machine with 4 CPUs with HyperThreading, each with 6 cores, provides 48 vcores per host.

3 TB hard drives in a 2-unit server installation with 12 available slots in JBOD (Just a Bunch Of Disks) configuration is a reasonable balance of performance and pricing at the time the spreadsheet was created. The cost of storage decreases over time, so you might consider 4 TB disks. Larger disks are expensive and not required for all use cases.

Two 1-Gigabit Ethernet ports provide sufficient throughput at the time the spreadsheet was published, but 10-Gigabit Ethernet ports are an option where price is of less concern than speed.

#### Step 2: Worker host planning

Allocate resources on each worker machine,

Start with at least 8 GB for your operating system, and 1 GB for Cloudera Manager. If services outside of Cloudera Runtime require additional resources, add those numbers under Other Services.

The HDFS DataNode uses a minimum of 1 core and about 1 GB of memory. The same requirements apply to the YARN NodeManager.

The spreadsheet lists several optional services:

- Impala daemon requires at least 16 GB for the daemon.
- HBase Region Servers requires 12-16 GB of memory.

Cloudera Runtime Step 3: Cluster size

- Solr server requires a minimum of 1 GB of memory.
- Kudu Tablet server requires a minimum of 1 GB of memory.

Any remaining resources are available for YARN applications (Spark and MapReduce). In this example, 44 CPU cores are available. Set the multiplier for vcores you want on each physical core to calculate the total available vcores.

#### Step 3: Cluster size

Having defined the specifications for each host in your cluster, enter the number of worker hosts needed to support your business case.

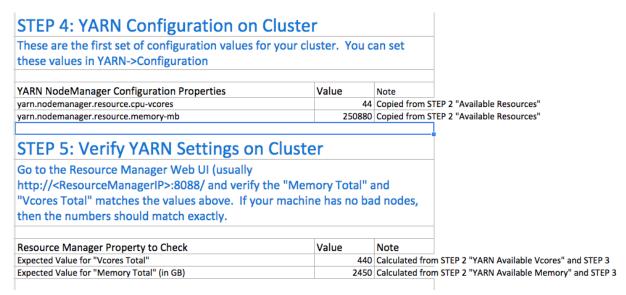

To see the benefits of parallel computing, set the number of hosts to a minimum of 10.

STEP 3: Cluster Size						
Enter the number of nodes you have (or expect to have) in the cluster						
			Quantity			
Number of Worker Hosts in the cluster 10						

#### Steps 4 and 5: Verify settings

Verify the memory and vcore settings.

Step 4 pulls forward the memory and vcore numbers from step 2. Step 5 shows the total memory and vcores for the cluster.

#### Step 6: Verify container settings on cluster

You can change the values that impact the size of your containers.

The minimum number of vcores should be 1. When additional vcores are required, adding 1 at a time should result in the most efficient allocation. Set the maximum number of vcore reservations to the size of the node.

Set the minimum and maximum reservations for memory. The increment should be the smallest amount that can impact performance. Here, the minimum is approximately 1 GB, the maximum is approximately 8 GB, and the increment is 512 MB.

STEP 6: Verify Container Settings on C	luster		
In order to have YARN jobs run cleanly, you need to con properties.	figure the co	ntainer	
YARN Container Configuration Properties (Vcores)	Value	Description	
yarn.scheduler.minimum-allocation-vcores	1	Minimum vcore reservation for a contain	ner
yarn.scheduler.maximum-allocation-vcores	44	Maximum vcore reservation for a contai	ner
yarn.scheduler.increment-allocation-vcores	1	Vcore allocations must be a multiple of t	his value
YARN Container Configuration Properties (Memory)	Value	Description	
yarn.scheduler.minimum-allocation-mb	1024	Minimum memory reservation for a con-	tainer in MegaByte
yarn.scheduler.maximum-allocation-mb	250880	Maximum memory reservation for a con	tainer in MegaByte
yarn.scheduler.increment-allocation-mb	512	Memory allocations must be a multiple of	of this value in MegaByte

## **Step 6A: Cluster container capacity**

Validate the minimum and maximum number of containers in your cluster, based on the numbers you entered

Step 6A: Cluster Container Capacity					
This section will tell you the capacity of your cluster (in terms of containers).					
Cluster Container Estimates	Minimum	Maximum			
Max possible number of containers, based on memory configuration		2450			
Max possible number of containers, based on vcore configuration		440			
Container number based on 2 containers per disk spindles		480			
Main massible number of containing based on manage configuration	10				
Min possible number of containers, based on memory configuration					

## Step 6B: Container sanity checking

See whether you have over-allocated resources.

STEP 6B: Container Sanity Checking			
This section will do some basic checking of your containe against the hosts.	r paramete	rs in STEP 6	
	Check		
Sanity Check	Status	Description	
Scheduler maximum vcores must be larger than minimum	GOOD	yarn.scheduler.maximum-allocation-vcores >= yarn.scheduler.minimum-allocation-vcores	
Scheduler maximum allocation MB must be larger than minimum	GOOD	yarn.scheduler.maximum-allocation-mb >= yarn.scheduler.minimum-allocation-mb	
Scheduler minimum vcores must be greater than or equal to 0	GOOD	yarn.scheduler.minimum-allocation-vcores >= 0	
Scheduler maximum vcores must be greater than or equal to 1	GOOD	yarn.scheduler.maximum-allocation-vcores >= 1	
Host vcores must be larger than scheduler minimum vcores	GOOD	yarn.nodemanager.resource.cpu-vcores >= yarn.scheduler.minimum-allocation-vcores	
Host vcores must be larger than scheduler maximum vcores	GOOD	yarn.nodemanager.resource.cpu-vcores >= yarn.scheduler.maximum-allocation-vcores	
Host allocation MB must be larger than scheduler minimum	GOOD	yarn.nodemanager.resource.memory-mb >= yarn.scheduler.maximum-allocation-mb	
Host allocation MB must be larger than scheduler maximum vcores	GOOD	yarn.nodemanager.resource.memory-mb >= yarn.scheduler.minimum-allocation-mb	
Small container limit	GOOD	If yarn.scheduler.minimum-allocation-mb is less than 1GB, containers will likely get killed by YARN due to OutOfMemory issues	

#### **Step 7: MapReduce configuration**

You can increase the memory allocation for the ApplicationMaster, map tasks, and reduce tasks.

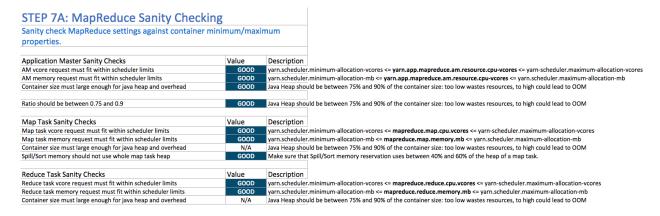

The minimum vcore allocation for any task is always 1. The Spill/Sort memory allocation of 400 should be sufficient, and should be (rarely) increased if you determine that frequent spills to disk are hurting job performance.

The common MapReduce parameters mapreduce.map.java.opts, mapreduce.reduce.java.opts, and yarn.app.mapreduce.am.command-opts are configured for you automatically based on the *HEAP TO CONTAINER SIZE RATIO*.

STEP 7: MapReduce Configuration			
For CDH 5.5 and later we recommend that only the hear is specified for map and reduce tasks. The value that is not calculated based on the setting mapreduce.job.heap.met calculation follows Cloudera Manager and calculates the the ratio and the container size.	ot spe	cified mb.ra	will be tio. This
Application Master Configuration properties	Value		Description
yarn.app.mapreduce.am.resource.cpu-vcores		1	AM container vcore reservation
yarn.app.mapreduce.am.resource.mb		1024	AM container memory reservation in MegaByte
yarn.app.mapreduce.am.command-opts -Xm2	(	800	AM Java heap size in MegaByte
Task auto heap sizing			
Use task auto heap sizing	yes	•	
mapreduce.job.heap.memory-mb.ratio		0.8	Ratio between the container size and task heap size
Map Task Configuration properties			
mapreduce.map.cpu.vcores		1	Map task vcore reservation
mapreduce.map.memory.mb		1024	Map task memory reservation in MegaByte
mapreduce.map.java.opts ignored		800	Map task Java heap size in MegaByte
mapreduce.task.io.sort.mb		400	Spill/Sort memory reservation
ReduceTask Configuration properties			
mapreduce.reduce.cpu.vcores		1	Reduce task vcore reservation
mapreduce.reduce.memory.mb		1024	Reduce task memory reservation in MegaByte
mapreduce.reduce.java.opts ignored		800	Reduce Task Java heap size in MegaByte

#### Step 7A: MapReduce sanity checking

Verify at a glance that all of your minimum and maximum resource allocations are within the parameters you set.

## Set properties in Cloudera Manager

When you are satisfied with the cluster configuration estimates, use the values in the spreadsheet to set the corresponding properties in Cloudera Manager

**Table 1: Cloudera Manager Property Correspondence** 

Step	YARN/MapReduce Property	Cloudera Manager Equivalent
4	yarn.nodemanager.resource.cpu-vcores	Container Virtual CPU Cores
4	yarn.nodemanager.resource.memory-mb	Container Memory
6	yarn.scheduler.minimum-allocation-vcores	Container Virtual CPU Cores Minimum
6	yarn.scheduler.maximum-allocation-vcores	Container Virtual CPU Cores Maximum
6	yarn.scheduler.increment-allocation-vcores	Container Virtual CPU Cores Increment
6	yarn.scheduler.minimum-allocation-mb	Container Memory Minimum
6	yarn.scheduler.maximum-allocation-mb	Container Memory Maximum
6	yarn.scheduler.increment-allocation-mb	Container Memory Increment
7	yarn.app.mapreduce.am.resource.cpu-vcores	ApplicationMaster Virtual CPU Cores
7	yarn.app.mapreduce.am.resource.mb	ApplicationMaster Memory
7	mapreduce.map.cpu.vcores	Map Task CPU Virtual Cores
7	mapreduce.map.memory.mb	Map Task Memory
7	mapreduce.reduce.cpu.vcores	Reduce Task CPU Virtual Cores
7	mapreduce.reduce.memory.mb	Reduce Task Memory
7	mapreduce.task.io.sort.mb	I/O Sort Memory

#### **Configure memory settings**

The memory configuration for YARN and MapReduce memory is important to get the best performance from your cluster.

Several different settings are involved. The table below shows the default settings, as well as the settings that Cloudera recommends, for each configuration option.

**Table 2: YARN and MapReduce Memory Configuration** 

Cloudera Manager Property Name	Cloudera Runtime Property Name	Default Configuration	Cloudera Tuning Guidelines
Container Memory Minimum	yarn.scheduler.minimum-allocatio n-mb	1 GB	0
Container Memory Maximum	yarn.scheduler.maximum-alloc ation-mb	64 GB	amount of memory on largest host
Container Memory Increment	yarn.scheduler.increment-allocat ion-mb	512 MB	Use a fairly large value, such as 128 MB
Container Memory	yarn.nodemanager.resource.me mory-mb	8 GB	8 GB
Map Task Memory	mapreduce.map.memory.mb	1 GB	1 GB

Cloudera Manager Property Name	Cloudera Runtime Property Name	Default Configuration	Cloudera Tuning Guidelines
Reduce Task Memory	mapreduce.reduce.memory.mb	1 GB	1 GB
Map Task Java Opts Base	mapreduce.map.java.opts	-Djava.net.preferIPv4Stack=true	-Djava.net.preferIPv4Stack=true - Xmx768m
Reduce Task Java Opts Base	mapreduce.reduce.java.opts	-Djava.net.preferIPv4Stack=true	-Djava.net.preferIPv4Stack=true - Xmx768m
ApplicationMaster Memory	yarn.app.mapreduce.am.resour ce.mb	1 GB	1 GB
ApplicationMaster Java Opts Base	yarn.app.mapreduce.am.comman d-opt	-Djava.net.preferIPv4Stack=true	-Djava.net.preferIPv4Stack=true - Xmx768m
