Apache Knox Overview

Securing Access to Hadoop Cluster: Apache Knox

The Apache Knox Gateway (“Knox”) is a system to extend the reach of Apache™ Hadoop® services to users outside of a Hadoop cluster without reducing Hadoop Security. Knox also simplifies Hadoop security for users who access the cluster data and execute jobs. The Knox Gateway is designed as a reverse proxy.

Establishing user identity with strong authentication is the basis for secure access in Hadoop. Users need to reliably identify themselves and then have that identity propagated throughout the Hadoop cluster to access cluster resources.

Layers of Defense for a CDP Private Cloud Base Cluster

- Authentication: Kerberos

Cloudera uses Kerberos for authentication. Kerberos is an industry standard used to authenticate users and resources within a Hadoop cluster. CDP also includes Cloudera Manager, which simplifies Kerberos setup, configuration, and maintenance.

- Perimeter Level Security: Apache Knox

Apache Knox Gateway is used to help ensure perimeter security for Cloudera customers. With Knox, enterprises can confidently extend the Hadoop REST API to new users without Kerberos complexities, while also maintaining compliance with enterprise security policies. Knox provides a central gateway for Hadoop REST APIs that have varying degrees of authorization, authentication, SSL, and SSO capabilities to enable a single access point for Hadoop.

- Authorization: Ranger

OS Security: Data Encryption and HDFS

Apache Knox Gateway Overview

A conceptual overview of the Apache Knox Gateway, a reverse proxy.

Overview

Knox integrates with Identity Management and SSO systems used in enterprises and allows identity from these systems be used for access to Hadoop clusters.

Knox Gateway provides security for multiple Hadoop clusters, with these advantages:

- Simplifies access: Extends Hadoop’s REST/HTTP services by encapsulating Kerberos to within the Cluster.
- Enhances security: Exposes Hadoop’s REST/HTTP services without revealing network details, providing SSL out of the box.
- Centralized control: Enforces REST API security centrally, routing requests to multiple Hadoop clusters.
- Enterprise integration: Supports LDAP, Active Directory, SSO, SAML and other authentication systems.

Typical Security Flow: Firewall, Routed Through Knox Gateway

Knox can be used with both unsecured Hadoop clusters, and Kerberos secured clusters. In an enterprise solution that employs Kerberos secured clusters, the Apache Knox Gateway provides an enterprise security solution that:

- Integrates well with enterprise identity management solutions
- Protects the details of the Hadoop cluster deployment (hosts and ports are hidden from end users)
- Simplifies the number of services with which a client needs to interact

Knox Gateway Deployment Architecture

Users who access Hadoop externally do so either through Knox, via the Apache REST API, or through the Hadoop CLI tools.

Knox Supported Services Matrix

A support matrix showing which services Apache Knox supports for Proxy and SSO, for both Kerberized and Non-Kerberized clusters.

Table 1: Knox Supported Components

Component	UI Proxy (with SSO)	API Proxy
Atlas API	#	#
Atlas UI	#	#
Beacon		
Cloudera Manager API	#	#
Cloudera Manager UI	#	
Data Analytics Studio (DAS)	#	
Druid		
Falcon		
Flink		
HBase REST API(aka WebHBase & Stargate)		#
HBase UI	#	
HDFS UI	#	
HiveServer2 HTTP JDBC API (HS2 via HTTP)		#
HiveServer2 LLAP JDBC API		
HiveServer2 LLAP UI		
HiveServer2 UI		
Hue	#	
Impala HTTP JDBC API		#

Livy API + UI	#	#
LogSearch		
NameNode	#	#
NiFi	#	#
NiFi Registry	#	#
Oozie API	#	#
Oozie UI	#	
Phoenix (aka Avatica)		#

Component	UI Proxy (with SSO)	API Proxy
Profiler	#	
Ranger API	#	#
Ranger UI	#	
ResourceManager API	#	#
Schema Registry API + UI	#	#
Streams Messaging Manager (SMM) API	#	#
Streams Messaging Manager (SMM) UI	#	
Solr	#	#
Spark3History UI	#	
SparkHistory UI	#	
Storm		
Storm LogViewer		
Superset		
WebHCat		
WebHDFS		#
YARN UI	#	
YARN UI V2	#	
Zeppelin UI	#	
Zeppelin WS	#	

**Note:**

APIs, UIs, and SSO in the Apache Knox project that are not listed above are considered Community Features.

Community Features are developed and tested by the Apache Knox community but are not officially supported by Cloudera. These features are excluded for a variety of reasons, including insufficient reliability or incomplete test case coverage, declaration of non-production readiness by the community at large, and feature deviation from Cloudera best practices. Do not use these features in your production environments.

Proxy Cloudera Manager through Apache Knox

In order to have Cloudera Manager proxied through Knox, there are some steps you must complete.

Procedure

- Set the value for `frontend_url`: Cloudera Manager Administration Settings Cloudera Manager Frontend URL :
 - Non-HA value: `https://$Knox_host:$knox_port`
 - HA value: `https://$Knox_loadbalancer_host:$Knox_loadbalancer_port`
- Set allowed groups, hosts, and users for Knox Proxy: Cloudera Manager Administration Settings External Authentication :
 - Allowed Groups for Knox Proxy: *
 - Allowed Hosts for Knox Proxy: *
 - Allowed Users for Knox Proxy: *

3. Enable Kerberos/SPNEGO authentication for the Admin Console and API: Cloudera Manager Administration Settings External Authentication Enable SPNEGO/Kerberos Authentication for the Admin Console and API: : true
4. From Cloudera Manager Administration Settings External Authentication , set Knox Proxy Principal: knox.

What to do next

External authentication must be set up correctly. Cloudera Manager must be configured to use LDAP, following the standard procedure for setting up LDAP. This LDAP server should be the same LDAP that populates local users on Knox hosts (if using PAM authentication with Knox), or the same LDAP that Knox is configured to use (if using LDAP authentication with Knox).

Installing Apache Knox

This document provides instructions on how to install Apache Knox using the installation process.

About this task

Apache Knox is an application gateway for interacting with the REST APIs and UIs. The Knox Gateway provides a single access point for all REST and HTTP interactions in your Cloudera Data Platform cluster.

Before you begin

When installing Knox, you must have Kerberos enabled on your cluster.

Procedure

1. From your Cloudera Manager homepage, go to Status tab \$Cluster Name ... Add Service

2. From the list of services, select Knox and click Continue.
3. On the **Select Dependencies** page, choose the dependencies you want Knox to set up:

HDFS, Ranger, Solr, Zookeeper

For users that require Apache Ranger for authorization. HDFS with Ranger. HDFS depends on Zookeeper, and Ranger depends on Solr.

HDFS, Zookeeper

HDFS depends on Zookeeper.

No optional dependencies

For users that do not wish to have Knox integrate with HDFS or Ranger.

4. On the **Assign Roles** page, select role assignments for your dependencies and click Continue:

Knox service roles	Description	Required?
Knox Gateway	If Knox is installed, at least one instance of this role should be installed. This role represents the Knox Gateway which provides a single access point for all REST and HTTP interactions with Apache Hadoop clusters.	Required

Knox service roles	Description	Required?
KnoxIDBroker*	It is strongly recommended that this role is installed on its own dedicated host. As its name suggests this role will allow you to take advantage of Knox's Identity Broker capabilities, an identity federation solution that exchanges cluster authentication for temporary cloud credentials.*	Optional*
Gateway	This role comes with the CSD framework. The gateway structure is used to describe the client configuration of the service on each host where the gateway role is installed.	Optional

* Note: KnoxIDBroker appears in the Assign Roles page, but it is not currently supported in CDP Private Cloud.

5. On the **Review Changes** page, most of the default values are acceptable, but you must Enable Kerberos Authentication and supply the Knox Master Secret. There are additional parameters you can specify or change, listed in "Knox Install Role Parameters".
 - a) Click Enable Kerberos Authentication
Kerberos is required where Knox is enabled.
 - b) Supply the Knox Master Secret, e.g. `knoxsecret`.
 - c) Click Continue.
6. The **Command Details** page shows the status of your operation. After completion, your system admin can view logs for your installation under stdout.

Apache Knox Install Role Parameters

Reference information on all the parameters available for Knox service roles.

Service-level parameters

Table 2: Required service-level parameters

Name	In Wizard	Type	Default Value
<code>kerberos.auth.enabled*</code>	Yes	Boolean	false
<code>ranger_knox_plugin_hdfs_audit_directory</code>	No	Text	<code>\${ranger_base_audit_url}/knox</code>
<code>autorestart_on_stop</code>	No	Boolean	false
<code>knox_pam_realm_service</code>	No	Text	login
<code>save_alias_command_input_password</code>	No	Text	-

Knox Gateway role parameters

Table 3: Required parameters for Knox Gateway role

Name	In Wizard	Type	Default Value
<code>gateway_master_secret</code>	Yes	Password	-
<code>gateway_conf_dir</code>	Yes	Path	<code>/var/lib/knox/gateway/conf</code>
<code>gateway_data_dir</code>	Yes	Path	<code>/var/lib/knox/gateway/data</code>
<code>gateway_port</code>	No	Port	8443
<code>gateway_path</code>	No	Text	gateway

Name	In Wizard	Type	Default Value
gateway_heap_size	No	Memory	1 GB (min = 256 MB; soft min = 512 MB)
gateway_ranger_knox_plugin_conf_path	No	Path	/var/lib/knox/ranger-knox-plugin
gateway_ranger_knox_plugin_policy_cache_directory	No	Path	/var/lib/ranger/knox/gateway/policy-cache
gateway_ranger_knox_plugin_hdfs_audit_spool_directory	No	Path	/var/log/knox/gateway/audit/hdfs/spool
gateway_ranger_knox_plugin_solr_audit_spool_directory	No	Path	/var/log/knox/gateway/audit/solr/spool

Table 4: Optional parameters for Knox Gateway role

Name	Type	Default Value
gateway_default_topology_name	Text	cdp-proxy
gateway_auto_discovery_enabled	Boolean	true
gateway_cluster_configuration_monitor_interval	Time	60 seconds (minimum = 30 seconds)
gateway_auto_discovery_advanced_configuration_monitor_interval	Time	10 seconds (minimum = 5 seconds)
gateway_cloudera_manager_descriptors_monitor_interval	Time	10 seconds (minimum = 5 seconds)
gateway_auto_discovery_cdp_proxy_enabled_*	Boolean	true
gateway_auto_discovery_cdp_proxy_api_enabled_*	Boolean	true
gateway_descriptor_cdp_proxy	Text Array	Contains the required properties of cdp-proxy topology
gateway_descriptor_cdp_proxy_api	Text Array	Contains the required properties of cdp-proxy-api topology
gateway_sso_authentication_provider	Text Array	Contains the required properties of the authentication provider used by the UIs using the Knox SSO capabilities (Admin UI and Home Page). Defaults to PAM authentication.
gateway_api_authentication_provider	Text Array	Contains the required properties of the authentication provider used by pre-defined topologies such as admin, metadata or cdp-proxy-api. Defaults to PAM authentication.

Knox IDBroker role parameters

Note: Knox IDBroker is not currently supported in CDP Private Cloud.

Table 5: Required parameters for Knox IDBroker role

Name	In Wizard	Type	Default Value
idbroker_master_secret	Yes	Password	-
idbroker_conf_dir	Yes	Path	/var/lib/knox/idbroker/conf
idbroker_data_dir	Yes	Path	/var/lib/knox/idbroker/data
idbroker_gateway_port	No	Port	8444
idbroker_gateway_path	No	Text	gateway

Name	In Wizard	Type	Default Value
idbroker_heap_size	No	Memory	1 GB (min = 256 MB; soft min = 512 MB)

Table 6: Optional parameters for Knox IDBroker role

Name	Type	Default Value
idbroker_aws_user_mapping	Text	-
idbroker_aws_group_mapping	Text	-
idbroker_aws_user_default_group_mapping	Text	-
idbroker_aws_credentials_key	Password	-
idbroker_aws_credentials_secret	Password	-
idbroker_gcp_user_mapping	Text	-
idbroker_gcp_group_mapping	Text	-
idbroker_gcp_user_default_group_mapping	Text	-
idbroker_gcp_credential_key	Password	-
idbroker_gcp_credential_secret	Password	-
idbroker_azure_user_mapping	Text	-
idbroker_azure_group_mapping	Text	-
idbroker_azure_user_default_group_mapping	Text	-
idbroker_azure_adls2_tenant_name	Text	-
idbroker_azure_vm_assumer_identity	Text	-
idbroker_relaodable_refresh_interval_ms	Time	10 seconds (minimum = 1 second)
idbroker_kerberos_dt_proxyuser_block	Text Array	A comma-separated list of proxy user configuration used in Knox's dt topology in case Kerberos is enabled
idbroker_knox_token_ttl_ms	Time	1 hour (minimum = 1 second)

Knox Gateway token integration

As of CDP 7.2.14, you can use Apache Knox homepage to generate and manage Knox Gateway tokens for CDP Public Cloud.

Related Information

[Knox token management \(in v1.6.0 and above\)](#)

Overview

Instead of using a basic username/password pair, you can improve security by generating Knox Gateway tokens. Tokens are more secure than plaintext username/password because they are signed, anonymized from the source data, and have a specified lifetime (by default, one hour).

About Knox gateway tokens

Before CDP 7.2.14, Knox on CDP Public Cloud had two default topologies: cdp-proxy and cdp-proxy-api. To enable passcode tokens, a third Knox topology was added: cdp-proxy-token. While very similar to cdp-proxy-api, the

authentication provider for cdp-proxy-token is configured with the JWTFederation provider, so that newly generated tokens can be used.

View Knox token integration

Knox token integration can be accessed via Cloudera Manager or the Knox homepage:

- (Recommended) Cloudera Manager: Cloudera Manager Clusters Knox Configuration and search for “Knox Token Integration”.

The screenshot shows the Cloudera Manager interface for configuring Knox Gateway token integration. The left sidebar contains navigation links for Clusters, Hosts, Diagnostics, Charts, and Administration. The main panel is titled 'Knox' and shows the 'Configuration' tab. A search bar at the top of the main panel contains 'Knox Token Integration'. Below the search bar, there are filters for 'SCOPE' (Knox (Service Wide), Gateway, Knox Gateway, Knox Cluster) and 'CATEGORY' (Main, Advanced, Database, Login, Monitoring, Performance, Ports and Addresses, Resource Management, Security, Stack Collection). The 'STATUS' section shows 'Error' (0), 'Warning' (0), 'Info' (0), 'Non-Default' (1), and 'Include Overrides' (0). The main configuration area is divided into two columns. The left column lists various configuration items with their current values and links to the configuration page. The right column shows the 'Knox Gateway Default Group' for each item, with a dropdown menu to select a group. The items include:

- Knox Token Integration - Token State Service Implementation:** org.apache.knox.gateway.services.token.impl.AlIASBasedTokenStateService (selected) or org.apache.knox.gateway.services.token.impl.JDBCTokenStateService.
- Knox Token Integration - Configured Token TTL:** gateway.token_generation.knox.token_ttl (1 hour(s)).
- Knox Token Integration - Allowed Token Management Implementations:** gateway.token_generation.allowed.token_backends (JDBCTokenStateService, AliasBasedTokenStateService).
- Knox Token Integration - Enable Lifespan Input:** gateway.token_generation.enable.lifespan_input (checked).
- Knox Token Integration - Expiration Grace Period:** gateway.knox.token.expiration.grace.period (day(s)).
- Knox Token Integration - User Limit:** gateway.knox.token.limit.per.user (10).
- Knox Token Integration - Renewer Whitelist:** gateway.knox.token.renewer.whitelist.

 Each item has a description on the right side of the configuration area. At the bottom right, there is a 'Save Changes' button.

- Navigate to the Management Console service > Data Lakes > (Your cluster) > Token Integration (under the Services tab). This will bring you to the Knox homepage. There are two new links on your Knox homepage: Token Management and Token Generation.

Token configurations

The default configurations for Knox token integration are as follows.

Default configurations

Table 7: Default token configurations

Property	Sample values	Default
Knox Token Integration - Configured Token TTL See "Token TTL details" for more information.	1 hour(s) 40 second(s)	1 day(s)

Property	Sample values	Default
Knox Token Integration - Enable Lifespan Input	true false	true
Knox Token Integration - User Limit	-1 (infinite) 10	10

Default configurations seen from Cloudera Manager:

The screenshot shows the Cloudera Manager Configuration page for Knox Token Integration. The left sidebar contains navigation links for Clusters, Hosts, Diagnostics, Charts, and Administration. The main content area is titled 'Knox Token Integration' and includes a search bar, filters, and a list of configuration properties. The properties are organized into sections: Knox Token Integration - Token State Service Implementation, Knox Token Integration - Configured Token TTL, Knox Token Integration - Allowed Token Management Implementations, Knox Token Integration - Enable Lifespan Input, Knox Token Integration - Expiration Grace Period, Knox Token Integration - User Limit, and Knox Token Integration - Renewer Whitelist. Each property has a value field and a description. The 'Knox Gateway Default Group' is set to 'org.apache.knox.gateway.services.token.impl.AlIASBasedTokenStateService'.

Default configurations seen from the Knox homepage UI:

The screenshot shows the Cloudera Knox homepage UI. The header displays the Cloudera logo. The main section is titled 'Token Generation' and includes a message: 'Token management backend is properly configured for HA and production deployments.' Below this, there is a 'Generate Token' button. The generated token details are displayed, including the JWT Token, Passcode Token, Expiration (01/02/2022, 23:41:40), User, Target Base URL, and Homepage URL.

Database connection properties

Optional database connection properties that you can declare individually:

- gateway.database.type: Set to postgresql or mysql.
- gateway.database.host: Host where your DB server is running.
- gateway.database.port: Port that your DB server is listening on.
- gateway.database.name: Name of the database you are connecting to.

Token TTL details

Out of the box, Knox will display the custom lifetime spinners on the Token Generation page. However, they can be hidden by disabling the Knox Token Integration - Enable Lifespan Input checkbox on the CM UI. Given that input property, and the configured maximum lifetime property, the generated token can have the following TTL value:

- If there is no configured token TTL and lifespan inputs are disabled, the default TTL is used (30 seconds).
- If there is configured TTL and lifespan inputs are disabled, the configured TTL is used.
- If there is configured TTL and lifespan inputs are enabled and lifespan inputs result in a value that is less than or equal to the configured TTL, the lifespan query param is used.
- If there is configured TTL and lifespan inputs are enabled and lifespan inputs result in a value that is greater than the configured TTL, the configured TTL is used.

Generate-jwk options

CM automatically creates a token hash key for you. But if you want to do this manually, such as when scripting, configure the `knox.token.hash.key` alias with:

```
generate-jwk --saveAlias knox.token.hash.key
```

This generates a JSON Web Key using the supplied algorithm name.

Table 8: Options

Option	Description	Sample values
jwkAlg	(Optional) The desired JSON Web Signature algorithm name. Determines if the gateway-level alias is configured with a 256, 384, or 512-bit length JWK.	HS256 (Default) HS384 HS512
saveAlias	(Optional, Recommended) Given alias name used to save the generated JWK, instead of printing this sensitive information on the screen.	knox.token.hash.key
topology	(Optional) Name of the topology (i.e., the cluster) to be used when saving the JWK as an alias. If none specified, the alias is going to be saved for the Gateway.	cdp-proxy (Default) cdp-proxy api

Generate tokens

How to generate Knox gateway tokens from the Knox homepage.

Procedure

1. To access Knox generation management, go to `https://KNOX_GATEWAY_HOST:PORT/GATEWAY_PATH/homepage/home`, e.g. `https://localhost:8443/gateway/homepage/home`. Click on Token Generation.

- Status bar: Message about the configured token state backend. There are 3 different statuses:
 - ERROR: Displayed in red. Indicates a problem with the service backend which makes the feature not work. Usually, this is visible when end-users configure JDBC token state service, but they make a mistake in their DB settings.
 - WARN: Displayed in yellow. Indicates that the feature is enabled and working, but there are some limitations.
 - INFO: Displayed in green. Indicates when the token management backend is properly configured for HA and production deployments.
- Information label: Explains the purpose of the **Token Generation** page.
- Comment: Optional input field that allows end-users to add meaningful comments (mnemonics) to their generated tokens. The maximum length is 255 characters.
- Configured maximum lifetime: Informs the clients about the `knox.token.ttl` property set in the homepage topology (defaults to 1 day(s)). If that property is not set (e.g. someone removes it from the homepage topology), Knox uses a hard-coded value of 30 seconds (aka. default Knox token TTL).
- Custom maximum (token) lifetime: Can be set by adjusting the days/hours/minutes fields. The default configuration will yield one hour.

CLUSTERA

Token Generation

Token management backend is properly configured for HA and production deployments.

i

Token Generation enables integration and API invocations by using the token as an authorization bearer token. Copy the JWT token from the resulting text box and protect it securely from others as this token represents your identity and is active until expired.

Comment:

i

Configured maximum lifetime:

1 days

⌚

Lifetime (days, hours, mins):

0

1

0

Generate Token

3. Click Generate Token.

[illegible]

4. Use the token to authenticate your request. Click the icon beside your choice on the page to copy the value to the clipboard:
 - JWT token: serialized JWT, fully compatible with the old-style bearer authorization method. You can use it as the 'Token' user:

```
$ curl -ku Token:eyJqa3U[...]uT5AxQGyMMP3VLGw https://localhost:8443/gateway/cdp-proxy-token/webhdfs/v1?op=LISTSTATUS

{"FileStatuses":{"FileStatus":[{"accessTime":0,"blockSize":0,"childrenNum":1,"fileId":16386,"group":"supergroup","length":0,"modificationTime":1621238405734,"owner":"hdfs","pathSuffix":"tmp","permission":"1777","replication":0,"storagePolicy":0,"type":"DIRECTORY"},{"accessTime":0,"blockSize":0,"childrenNum":1,"fileId":16387,"group":"supergroup","length":0,"modificationTime":1621238326078,"owner":"hdfs","pathSuffix":"user","permission":"755","replication":0,"storagePolicy":0,"type":"DIRECTORY"}]}}
```

- Passcode token: Serialized passcode token, which can be used as the 'Passcode' user:

```
$ curl -ku Passcode:WkRFmk1XTmh[...]RVNFpXRTA= https://localhost:8443/gateway/cdp-proxy-token/webhdfs/v1?op=LISTSTATUS

{"FileStatuses":{"FileStatus":[{"accessTime":0,"blockSize":0,"childrenNum":1,"fileId":16386,"group":"supergroup","length":0,"modificationTime":1621238405734,"owner":"hdfs","pathSuffix":"tmp","permission":"1777","replication":0,"storagePolicy":0,"type":"DIRECTORY"},{"accessTime":0,"blockSize":0,"childrenNum":1,"fileId":16387,"group":"supergroup","length":0,"modificationTime":1621238326078,"owner":"hdfs","pathSuffix":"user","permission":"755","replication":0,"storagePolicy":0,"type":"DIRECTORY"}]}}
```

Manage Knox Gateway tokens

You can enable, disable, or revoke tokens via the Knox homepage.

Procedure

1. To access Knox token management, go to `https://KNOX_GATEWAY_HOST:PORT/GATEWAY_PATH/homepage/home`, e.g. `https://localhost:8443/gateway/homepage/home`. Click on Token Management.

Active token will be displayed in green; expired tokens are red.

Token ID	Issued	Expires	Comment	Actions
XXXXXXXX-XXXX-XXXX-XXXX-XXXXXXXXXXXX	01/02/2022, 22:41:40	01/02/2022, 23:41:40	Test comment - 1 hour token	Disable Revoke
XXXXXXXX-XXXX-XXXX-XXXX-XXXXXXXXXXXX	01/02/2022, 22:46:07	02/02/2022, 22:46:07	Test comment - 1 days token	Disable Revoke

2. On this page, you will see basic information about your generated token(s) and you can execute the following actions:

- Enable/Disable: Temporarily enable/disable a token.

Note: Disabled tokens are not allowed to be used for authentication purposes.

- Revoke: Permanently remove the token from the persistent store.

Caution: This action cannot be undone; once you revoke a token, Knox will delete it from the in-memory cache and the underlying persistent token storage.

3. Click the Refresh icon above the table.
