Upgrade the SMM REST Server Management Pack

A management pack (mpack) bundles service definitions, stack definitions, and stack add-on service definitions so they do not need to be included with the Ambari core functionality and can be updated in between major releases. To upgrade the SMM REST Server mpack, stop Ambari Services, run the upgrade-mpack command, and restart the Ambari Server.

Procedure

1. From Ambari Services section, choose Streams Messaging Manager. Go to Actions and Stop, to stop the SMM service.
2. Upgrade the SMM REST Server mpack:

```
ambari-server upgrade-mpack --mpack=/path/to/smm-ambari-mpack-<version>-<build>.tar.gz --verbose
```

Where:

- Version – is the version of the SMM REST Server mpack to which you are upgrading.
- Build – is the build number of the SMM REST Server mpack to which you are upgrading.

Both the version and the build number are available in the Hortonworks Customer Portal, which you can access following the instructions provided to you as part of the subscription fulfillment process.

3. Restart Ambari Server:

```
ambari-server restart
```

Update the SMM REST Server Base URL

Adding the base URL tells Ambari where to look for the SMM repository. The base URL will be included in the customer support portal, where you get the repository. This step is necessary because you are using an existing Ambari instance that is already managing an HDP or HDF cluster.

Procedure

1. Update the SMM Base URL.

From Ambari, go to Manage Versions and update the current HDF or HDP version. Click the current HDF or HDP version, and find the SMM-1.0 section and update SMM base URL.

2. Verify that `/etc/yum.repos.d/ambari-hdp-1.repo` or `ambari-hdf-1.repo` has the updated SMM base URL. If it does not, manually edit this file to set the correct base URL.

For example:

```
baseurl=http://s3.amazonaws.com/dev.hortonworks.com/SMM/centos7/1.x/BUILD/1.2.0.0-73
```

Upgrading the SMM REST Server

To upgrade the SMM REST Server, you must verify your existing installation, install the version to which you want to upgrade, and then verify the new installation.

Procedure

1. Confirm the current SMM component and version. For example:

```
yum list installed | grep streams-messaging-manager  
streams-messaging-manager_1.1.0.0-19.noarch
```

2. Display the current version associated with each component. For example:

```
smm-select status | grep streams-messaging-manager  
streams-messaging-manager - 1.1.0.0-19
```

3. Install binaries for the SMM services to which you want to upgrade.

```
yum install -y streams-messaging-manager_<build>_<version>
```

4. Ensure that no SMM processes are present on your cluster node:

```
ps aux | grep streams-messaging-manager
```

5. Use smm-select to ensure that you have created the appropriate links to the new SMM installation:

```
smm-select set streams-messaging-manager 1.2.0.0-73
```

6. Confirm that smm-select displays the new SMM service versions. For example:

```
smm-select status | grep streams-messaging-manager  
streams-messaging-manager - 1.2.0.0-73
```

7. Add advanced configuration properties.

- a. Select Streams Messaging Manager from the Ambari services pane.
- b. Click Configs and select Custom streams-messaging-manager-common from the Advanced tab.
- c. Add the following properties and their corresponding values to Custom streams-messaging-manager-common:
 - providerClasses= ["com.hortonworks.smm.notifier.http.HttpNotifierProvider", "com.hortonworks.smm.notifier.email.EmailNotifierProvider"]
 - executor.thread.pool.size=16
 - executor.thread.count=30
 - kafka.alert.notifications.topic=__smm_alert_notifications
 - save.notification.read.status.per.user=true
 - allow.all.alert.notifications=true

8. Start Streams Messaging Manager from Service Section in Ambari.

What to do next

After you have upgraded the SMM REST Server, you must also upgrade the SMM Application.

Upgrading the SMM Application

To upgrade the SMM Application, you must back up your SMM Application repository, download and verify the SMM version to which you want to upgrade, set the SMM Application version to which you want to upgrade, and run the upgrade command.

Procedure

1. Back up your existing SMM Application repository (SMM.repo) file.

2. Download the upgrade repository tarball to the repository folder:

```
wget -nv <upgrade-repo-URL> -o /etc/yum.repos.d/SMM.repo
```

3. Verify that the repository is downloaded:

```
yum search smm
```

4. Update the repository by running the following command:

```
yum update smm
```

You should see two versions of the SMM Application.

5. List all the versions installed by running:

```
/usr/bin/smm-app-select versions
```

6. Set the version of the SMM Application to which you want to upgrade:

```
/usr/bin/smm-app-select set streams-messaging-manager <version>
```

Where:

<version> is the SMM Application version to which you want to upgrade.

7. Change into the current SMM Application directory:

```
cd /usr/smm-app/current/streams-messaging-manager/bin
```

8. Run the upgrade command:

```
./smmdeploy.sh upgrade
```
